With the release of Vignette V6, e-business application provider Vignette is supporting IBM WebSphere Application Server on AIX, DB2 database on AIX and the IBM HTTP Server on AIX. Customers will be able to leverage and extend their investments in IBM technology while embracing the innovative e-business solutions provided by Vignette.

Vignette V6
Vignette develops and delivers world-class Internet software and services that enable organizations to interact online with their customers, employees and partners. Vignette is the leading provider of integrated content management applications used by successful organizations recognized worldwide.

The combination of advanced technology from both Vignette and IBM delivers unsurpassed customer-facing e-business application capabilities on a powerful, reliable and scalable platform.

Vignette V6
Vignette develops and delivers world-class Internet software and services that enable organizations to interact online with their customers, employees and partners. Vignette is the leading provider of integrated content management applications used by successful organizations recognized worldwide.
With Vignette V6, Vignette is extending its leadership in content management software by providing applications that deliver personalized information wherever it is needed, integrating online and enterprise systems within and between companies, and providing realtime analysis of customers’ needs and online experiences.

**Customers’ Choice for Web Applications**

**Vignette Content Suite V6**

The release of Vignette V6 enhances “out-of-the-box” capabilities tremendously by providing the Vignette Content Suite V6, an integrated yet modular suite of e-business applications that delivers baseline content management and aggregation, visual integration tools and technology adapters, as well as site analysis and reporting functionality that large customers require in their online business. Vignette Content Suite V6 enables organizations to:

- Grow their online strategies and initiatives at their own pace by providing powerful out-of-the-box capabilities as well as additional functionality that can be acquired and deployed on a modular basis as the business evolves.
- Achieve faster time-to-deployment for mission-critical e-business applications by providing standards-based, highly customizable applications that leverage industry standards.
- Leverage technology from IBM and other industry leaders that protects existing investments while taking advantage of the integrated content management applications used by some of the world’s most successful and demanding businesses.

Vignette Content Suite V6 is the most powerful and cost-efficient packaged content solution available in the market today.

**IBM e-business Platform**

IBM WebSphere Application Server makes building and deploying personalized, dynamic Web content quick and easy by providing an open, cross-platform solution using standards-based Java™ and Extensible Markup Language (XML) technologies. Using open Java-based technologies and application program interfaces (APIs), as well as the latest XML technologies, IBM WebSphere enables every company to leverage its existing resources, shorten Internet application development cycles and reduce administrative overhead.

The powerful IBM AIX platform runs some of the most complex commercial and technical workloads in the world. AIX runs across the entire range of the IBM @server pSeries™ systems, from entry-level servers and workstations to powerful supercomputers. Not only does AIX scale across systems of different sizes, it scales across different technologies and hardware platforms, improving performance and reliability while protecting investments.

As the foundation for many of the world’s largest e-businesses, IBM DB2 Universal Database™ is the industry’s first multi-media, Web-ready relational database management system, strong enough to meet the demands of large corporations while flexible enough to serve medium-sized and small businesses. DB2 works with Internet-standard technologies and makes it easy to ensure that information is accessible, available and secure.
Vignette and IBM Technology
The Vignette integrated content management applications work with Java 2 Platform, Enterprise Edition (J2EE™)-based application servers, including WebSphere, and provide native support for JavaBeans™ APIs and JavaServer Pages™ (JSP™) templates. Just as they take advantage of the proven capabilities of Vignette architecture, organizations can leverage their investment in Java developers and application servers such as IBM VisualAge® for Java and WebSphere.

Vignette V6 Extends Integration
Vignette V6 extends the integration of and support for sophisticated IBM technology. Vignette is optimizing its support for the J2EE standard in its content management, content integration and content analysis applications for IBM WebSphere infrastructure software, including the industry-leading WebSphere Application Server.

Vignette’s flagship software will also be available on the industry-leading AIX platform and will support DB2, demonstrating the commitment made by both IBM and Vignette to offer a broad and deep solution for enterprise customers. Customers will be able to extend their investments in proven, reliable IBM technology at the core of their e-business strategy and embrace the innovative, competitive edge available through Vignette software.

Summary
With Vignette V6, customers will have the ability to leverage a cost-efficient suite of content-rich applications that delivers unsurpassed scalability, reliability, manageability and security. Providing these capabilities while leveraging industry-standard technologies such as WebSphere Application Server and DB2 Universal Database, Vignette V6 helps customers streamline the construction and deployment of personalized, dynamic Web content while leveraging the powerful AIX platform that currently runs some of the world’s most complex workloads.

Working together, Vignette and IBM provide a robust combination of integrated content management applications and the most reliable platform on which to run them.

Key Benefits
• Leverage industry-leading integrated content management applications with the scalability and reliability of WebSphere, AIX and DB2.
• Leverage investments in J2EE and other Java technology such as WebSphere Application Server and VisualAge for Java to quickly build personalized, dynamic and highly scalable Web applications.

Technical Information
Vignette V6 offers enhanced support for the following IBM products.
• IBM AIX V4.3.3
• IBM DB2 Universal Database V7.1
• IBM DB2 Universal Database V7.2
• IBM WebSphere Application Server V3.5.4
• IBM HTTP Server V1.3.12.2
