

| IBM Software Group

Implementing SSL with HTTP nodes in Websphere Message Broker V6.x

Vivek Grover

WebSphere Message Broker Level 2 Support, IBM
vgrover@us.ibm.com

A horizontal bar containing a series of small, square icons. From left to right, the icons include: a green square, a yellow square, a red square, a purple square, a cyan square, a grayscale image of a highway interchange, a circular arrow icon, a grayscale image of a woman's face, a grayscale image of a hand holding a pen, a grayscale image of a person's profile, and several grayscale squares of varying shades.

@business on demand.

Agenda

- **SSL Basics**
- **HTTP Basics**
 - ▶ **HTTPRequest node**
 - ▶ **HTTPInput node & HTTPReply node**

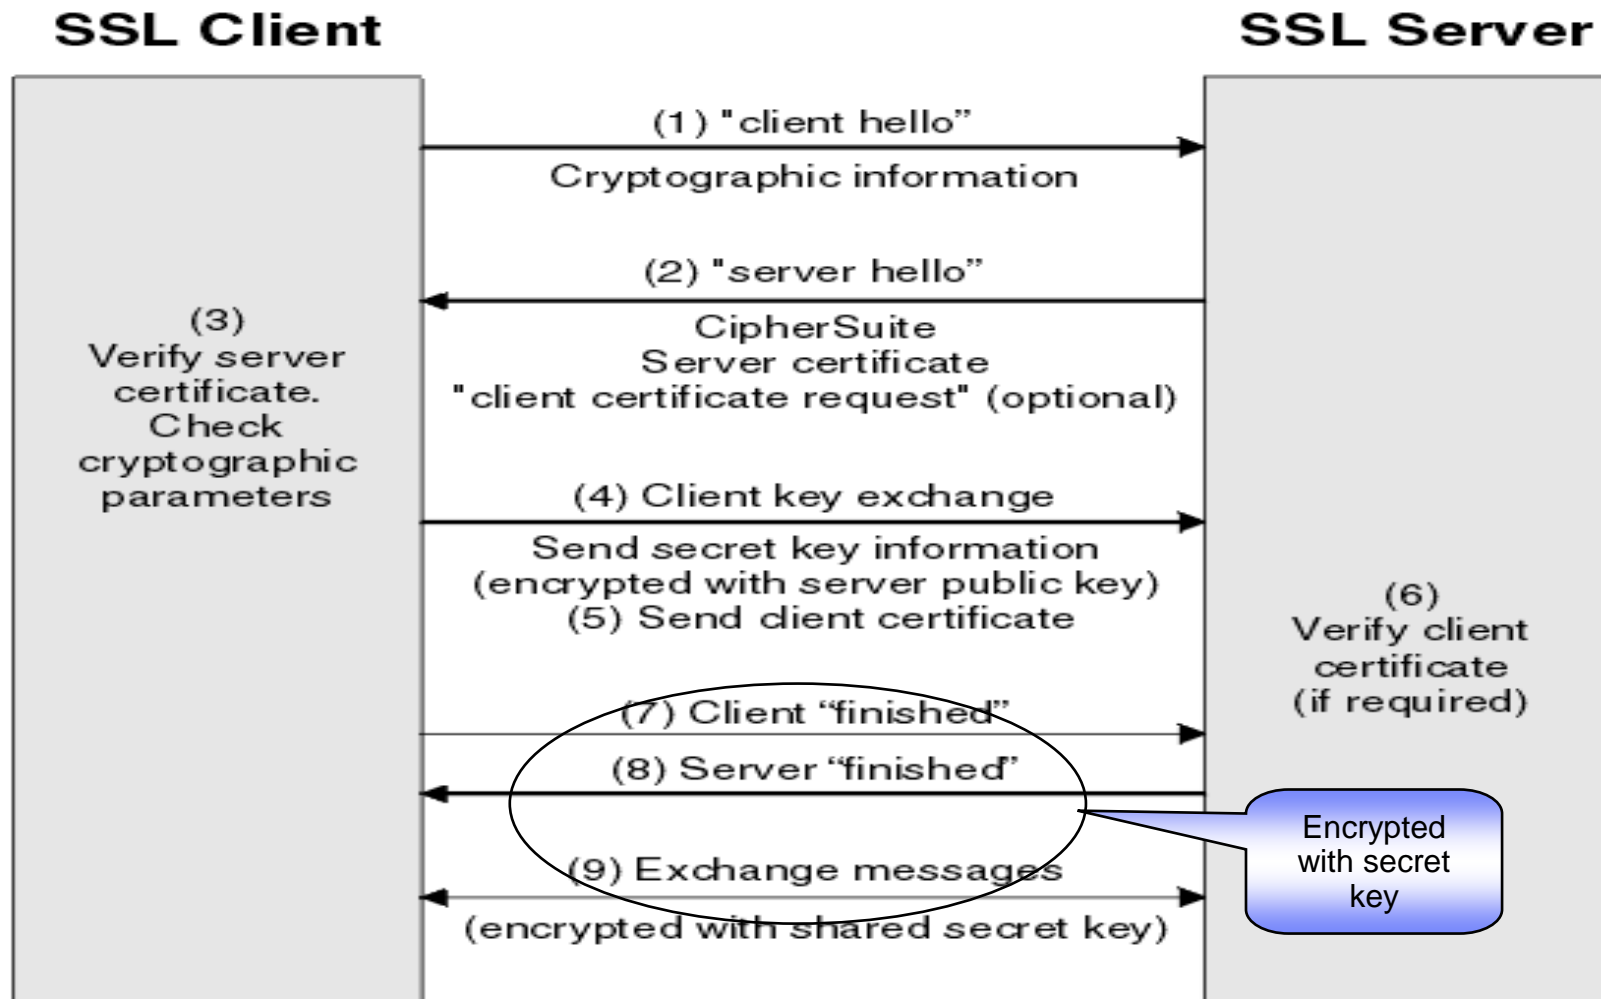

- **HTTPS Basics**
- **Certificate management tools**
- **Configuration of HTTPRequest nodes**
- **Configuration of HTTPInput nodes and HTTPReply nodes**
- **Troubleshooting tips**

SSL Basics

- Protocol developed by Netscape to manage the security of message transmission on the Internet
- Creates a secure connection between a client and a server, over which any amount of data can be sent securely
- Useful terms –
 - ▶ **KeyStore** – File or Database that stores the keys and digital certificates
 - Example – cacerts file located in - `C:\ProgramFiles\IBM\MQSI\6.0\jre\lib\security`
 - ▶ **Digital Certificates** – Provides security against impersonation by binding the key to its owner
 - Contains Public key + Information about the Owner and/or CA
 - Example - verisignserverca
 - ▶ **CipherSuites** – Set of algorithms providing means of Encryption, Hash (MAC) and Key exchanges
 - Example – DES_SHA_EXPORT

SSL Basics

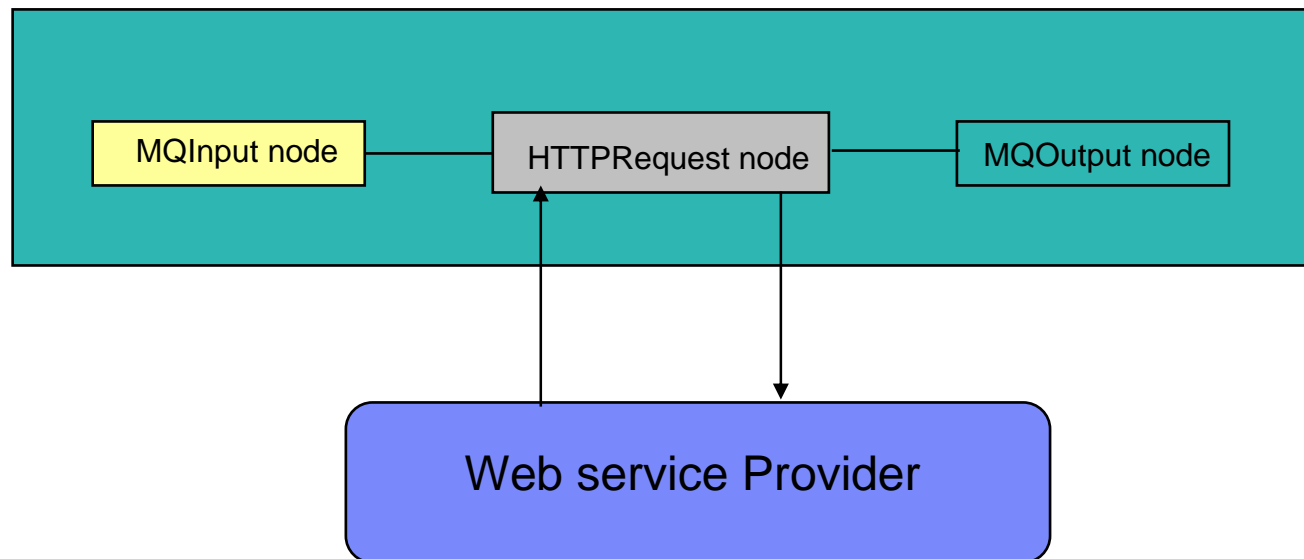

HTTP Basics

- Communications protocol used to transfer information on the World Wide web
- Useful questions -
- What is a Web service?
 - ▶ A standard way to allow functions/methods to be invoked using HTTP
 - ▶ Used for program to program interactions
 - ▶ Uses the XML, SOAP, WSDL and UDDI open standards over an Internet backbone
- How does WebSphere Message Broker fit in?
 - ▶ Convenient central point for Web services brokering – eg. Transform WSDL definitions or act as a SOAP intermediary etc.
 - ▶ Message Flow can be a requester (Client) – calls out to a Web Service
 - ▶ Message Flow can be a Service provider – lets Web Service clients to invoke it or other flows
 - ▶ Uses HTTPInput node, HTTPReply node, HTTPRequest node

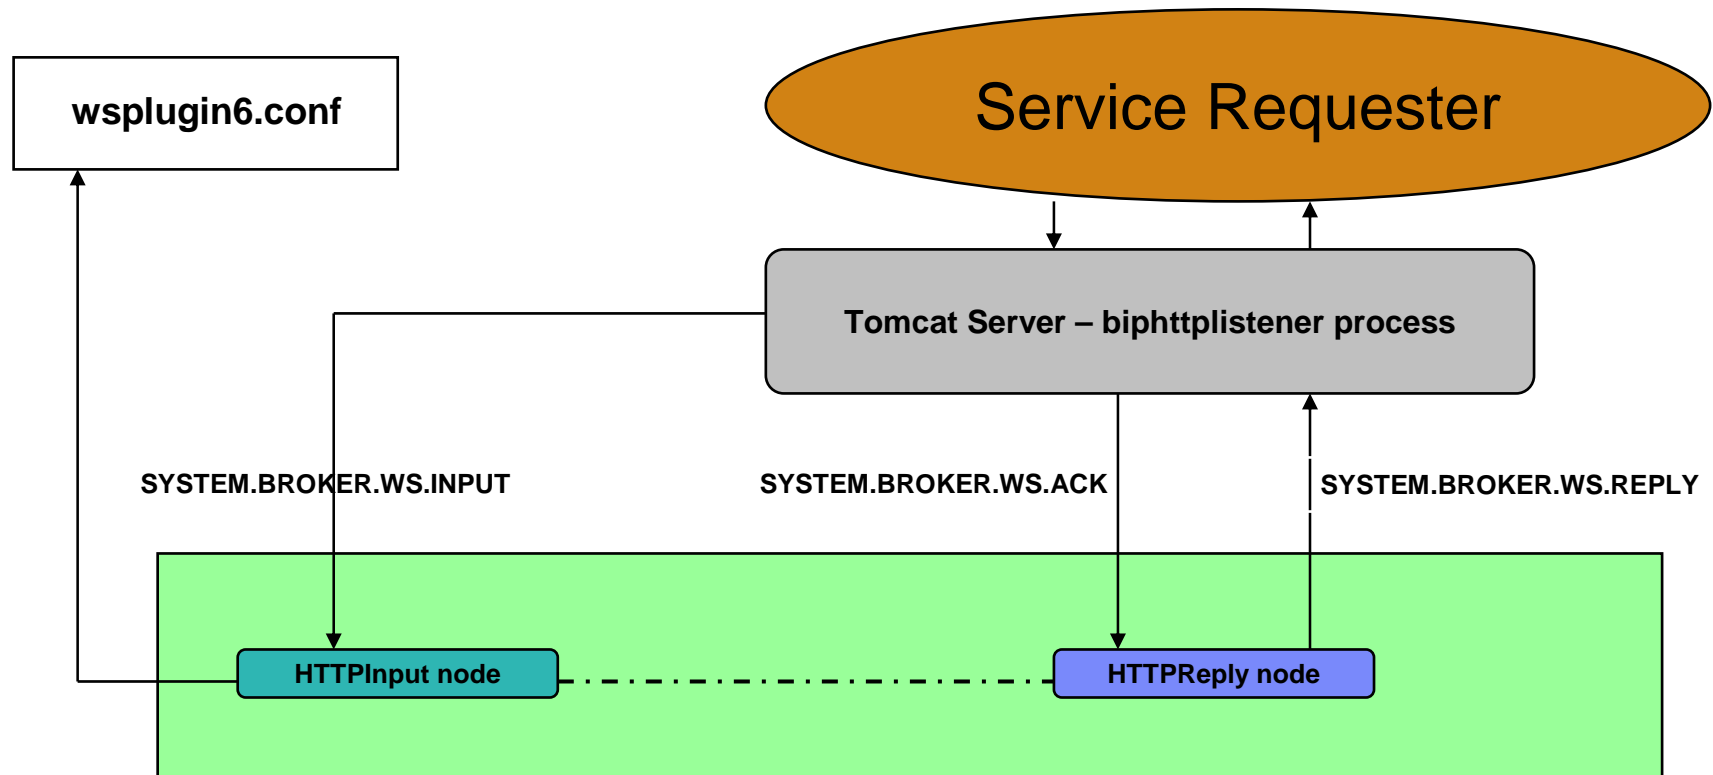

Web Service Requester

- HTTPRequest node serves as the gateway from a message flow to the broker network invoking Web services within the network
- Sends requests and receives responses from a Web service provider

Web Service Provider

- Uses HTTPInput node to receive Web service requests from clients at a certain port
- Uses HTTPReply node to send replies back to the clients
- Uses Internal Tomcat servlet engine running as biphttplistener process

HTTP + SSL = HTTPS

- HTTP over SSL or SSL over HTTP
- Secure messaging over HTTP
- Handled by Tomcat Servlet (Internal or External) - when Web service provider
- Relies on Java JSSE code in JVM
- Must use HTTP/1.1 to implement SSL support
- Uses Port#7083 by default for SSL
- Broker uses CACERTS keystore located in - `C:\ProgramFiles\IBM\MQS1\6.0\jre\lib\security`

Certificate Management Tools

- Enables users to administer their public/private key pairs and associated certificates used in SSL
- Different CMTs are available:
 - ▶ Keytool – Tested and supported with WMB V6.0
 - Supplied with IBM JRE
 - Default location for WMB V6 on Windows - C:\Program Files\IBM\MQSI\6.0\jre\bin
 - Default location for WMB V6 on UNIXes - /opt/IBM/mqsi/6.0/jre/bin
 - Command line tool
 - ▶ Ikeyman – Known to work and is supported with WMB V6.0
 - Supplied with IBM JRE
 - Default location for WMB V6 on Windows - C:\Program Files\IBM\MQSI\6.0\jre\bin
 - Default location for WMB V6 on UNIXes - /opt/IBM/mqsi/6.0/jre/bin
 - GUI-based tool

Configuration of HTTPRequest nodes

- **Configure the HTTPRequest node for SSL with server authentication –**
 - ▶ The receiver of the requests will present certificates to the Broker and the Broker will validate them with the signer's certificates stored in the "cacerts" keystore
 - ▶ Add signer's (or trusted) certificates to the existing "cacerts" keystore –

Using "keytool" -

```
keytool -import -alias mykey -file <name of certificate file> -keystore  
"C:\Program Files\IBMMQSI\6.0\jre15\lib\security\cacerts" -storepass  
changeit
```

file – Name of the certificate being imported

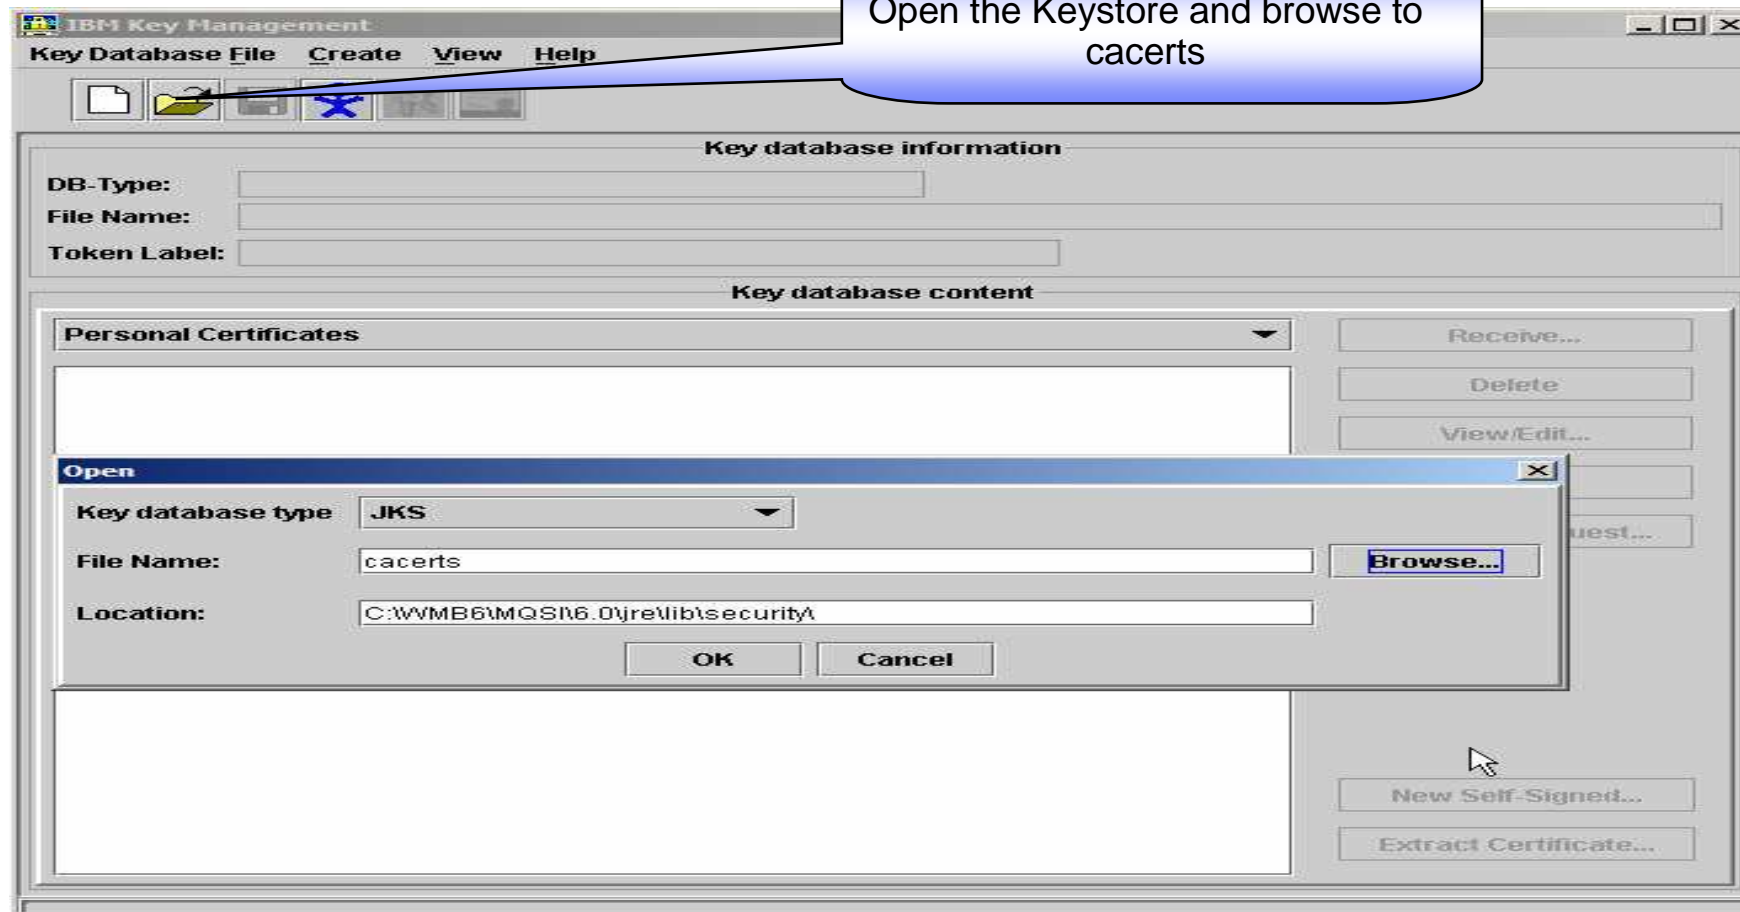

alias – Name it will show in the keystore

keystore – Keystore DB being used

storepass – password for the above keystore

Configuration of HTTPRequest nodes

- Using “ikeyman”

- The password for this file is – “changeit”

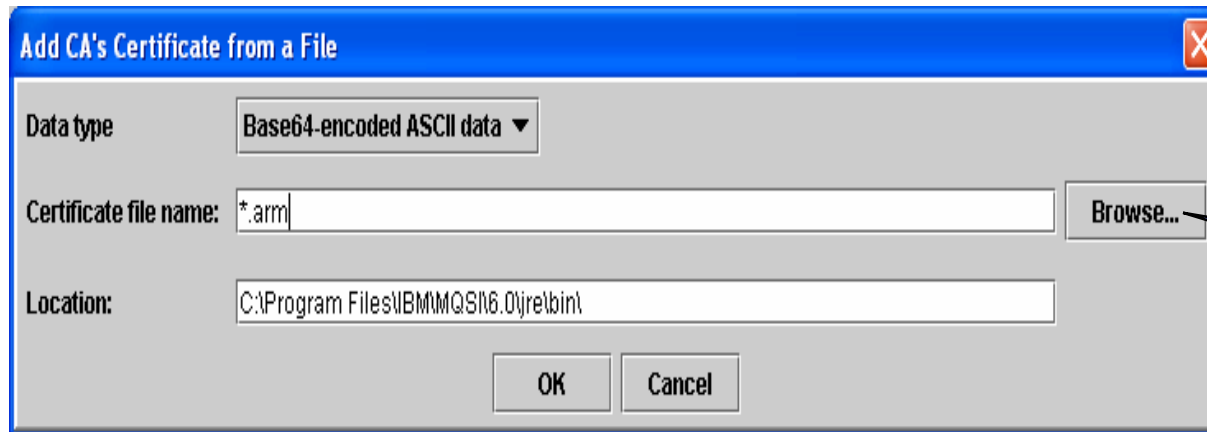

Configuration of HTTPRequest nodes

Go to Signer Certificates under – Key database content

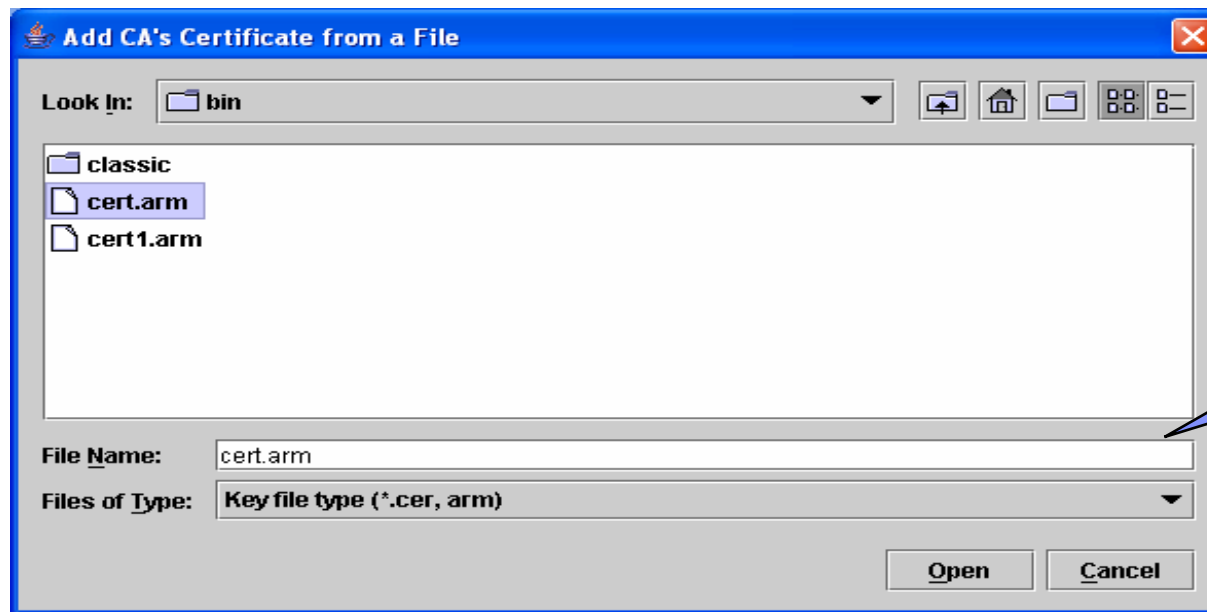

Click Add

Configuration of HTTPRequest nodes

Browse to the certificate file

Select the Certificate to be added and click open

Configuration of HTTPRequest nodes

- **Configure the HTTPRequest node for SSL with mutual authentication**
 - ▶ The receiver and the sender of the requests need to present their certificates to each other and each end will validate using the local copies of the signer's certificates
 - Create a keystore file
 - Create a self-signed certificate (or use a CA certificate)

Using keytool -

```
keytool -genkey -storepass <password > -keystore <keystore file> -alias <self-signed certificate>
```

Answer the options it asks you while creating the certificate

- Ensure the server keystore contains the above created certificate
- Ensure that the servers signers certificate is imported into cacerts on broker side (extracted as discussed later)

Configuration of HTTPRequest nodes

- For V6.0 - Update the mqsiprofile.cmd to add the following environment variables with the location of the keystore and the password –

IBM_JAVA_OPTIONS=

-Djavax.net.ssl.keyStore=<keystore_path>/<keystore_filename>

-Djavax.net.ssl.keyStorePassword=<keystore_password>

- Stop and start the broker

Configuration of HTTPRequest nodes

- For V6.1 – Run the `mqsichangeproperties` command to point the broker to the keystore file –

```
mqsichangeproperties <Broker name> -o BrokerRegistry –  
n brokerKeystoreFile -v <Fully qualified name of the new Keystore>
```

- The password can be changed using `mqsisetdbparms` command –

```
mqsisetdbparms <Broker name> -n brokerkeystore::password -u temp -p  
<password>
```

The user ID (-u) can be any value

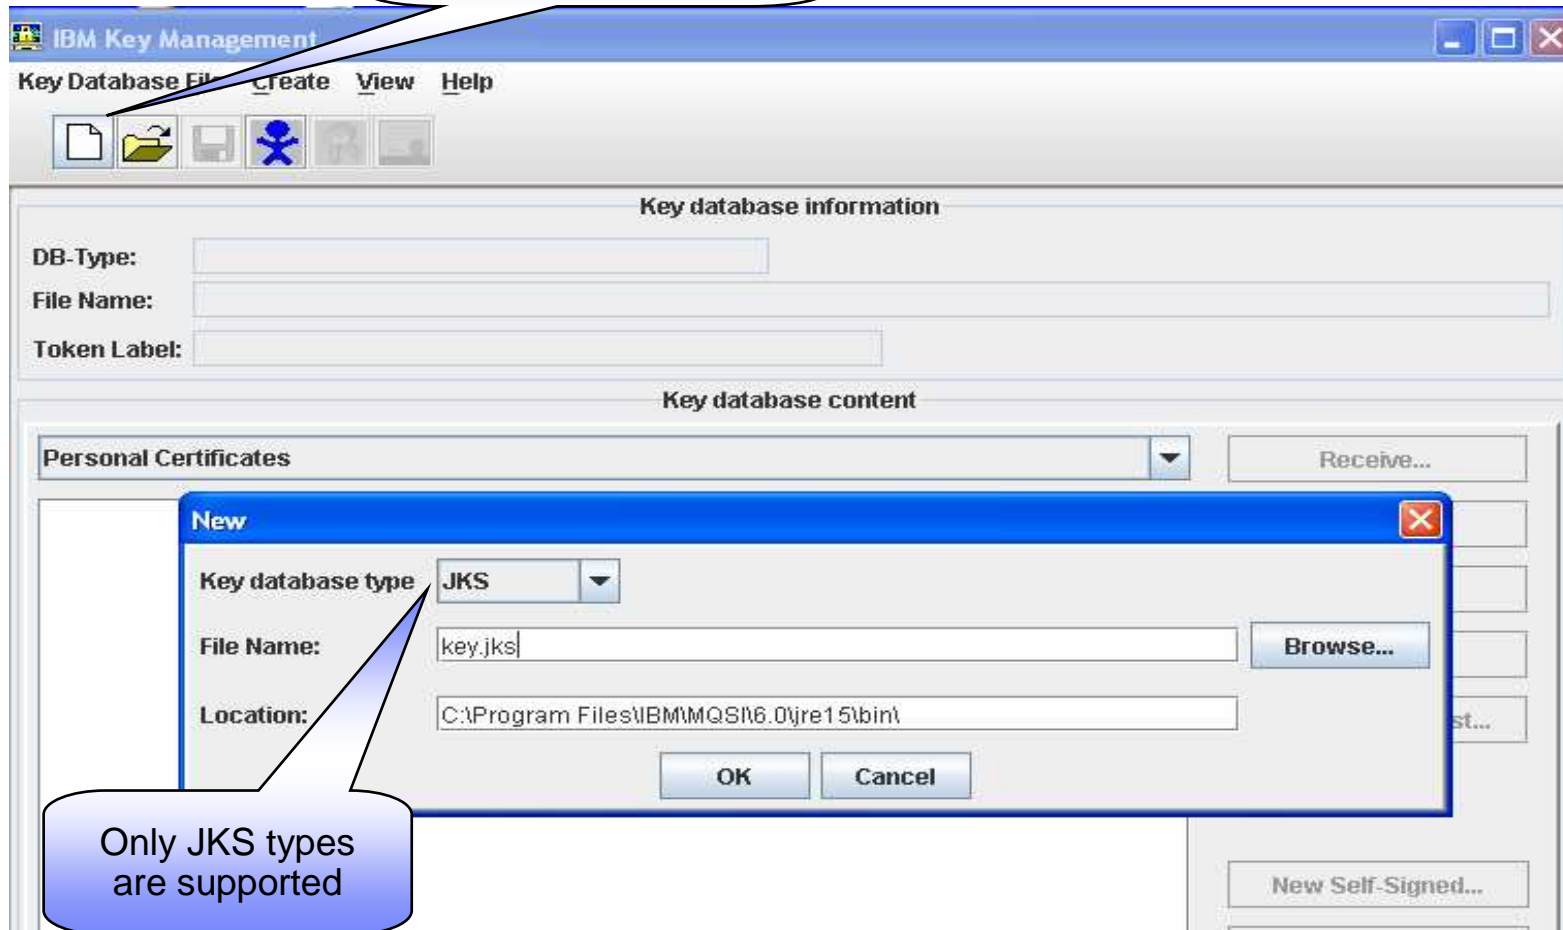

- Stop and Start the broker

Configuration of HTTPRequest nodes

- Using ikeyman-

Create a new keystore file

Only JKS types are supported

Configuration of HTTPRequest nodes

Create new Self-Signed certificate

Configuration of HTTPRequest nodes

- **Configure the node in the Toolkit**
 - ▶ Ensure that the destination URL starts with **https**
 - ▶ In the SSL tab (following options) –
 - **Protocol - SSL** – Try SSLv3 first, allows fallback on SSLv2
 - SSLv3 – Try SSLv3 only
 - TLS (Transport Layer Security) – try TLS only
 - **Allowed SSL ciphers**
 - default of empty means all broker JVM supported ciphers
 - Can specify 1 or more ciphers
- **Configure the bar file in the Toolkit**
 - Same above mentioned properties can be configured via bar file
 - Protocol, URL, Ciphers

Configuration of HTTPInput & HTTPReply nodes

- ***Configure the HTTPInput & HTTPReply nodes for SSL with server authentication***

- ▶ biphttplistener is used to receive HTTP requests on behalf of any message flow that is using HTTPInput nodes
- ▶ The responses generated by HTTPReply nodes are also handled by the biphttplistener
 - Create a keystore file for the broker
 - Create a self-signed certificate (for testing SSL)

Using keytool -

```
keytool -genkey -storepass <password > -keystore <keystore file name> -alias  
<self-signed certificate>
```

- Change the broker properties to set the following:

Configuration of HTTPInput & HTTPReply nodes

- Enable the HTTPSConnector:

```
mqsichangeproperties <broker_name> -b httplistener -o HTTPListener -n  
enableSSLConnector -v true
```

- Point the broker to above created keystore

```
mqsichangeproperties <broker_name> -b httplistener -o HTTPSConnector -n  
keystoreFile -v <keystore file name>
```

- Set the keystore password

```
mqsichangeproperties <broker_name> -b httplistener -o HTTPSConnector -n  
keystorePass -v <MyKeystorePass>
```

- Set the Port # (if 7083 is busy)

```
mqsichangeproperties broker name -b httplistener -o HTTPSConnector -n  
port -v <Port to listen on for https>
```

- Use the following commands to verify and display the HTTP Listener properties:

```
mqsireportproperties <broker_name> -b httplistener -o HTTPListener -a
```

```
mqsireportproperties <broker_name> -b httplistener -o HTTPSConnector -a
```

Configuration of HTTPInput & HTTPReply nodes

- Extract the certificate to be imported onto client's machine

```
keytool -export -alias tomcat -file <name of certificate file> -keystore  
<keystore file> -storepass <password>
```

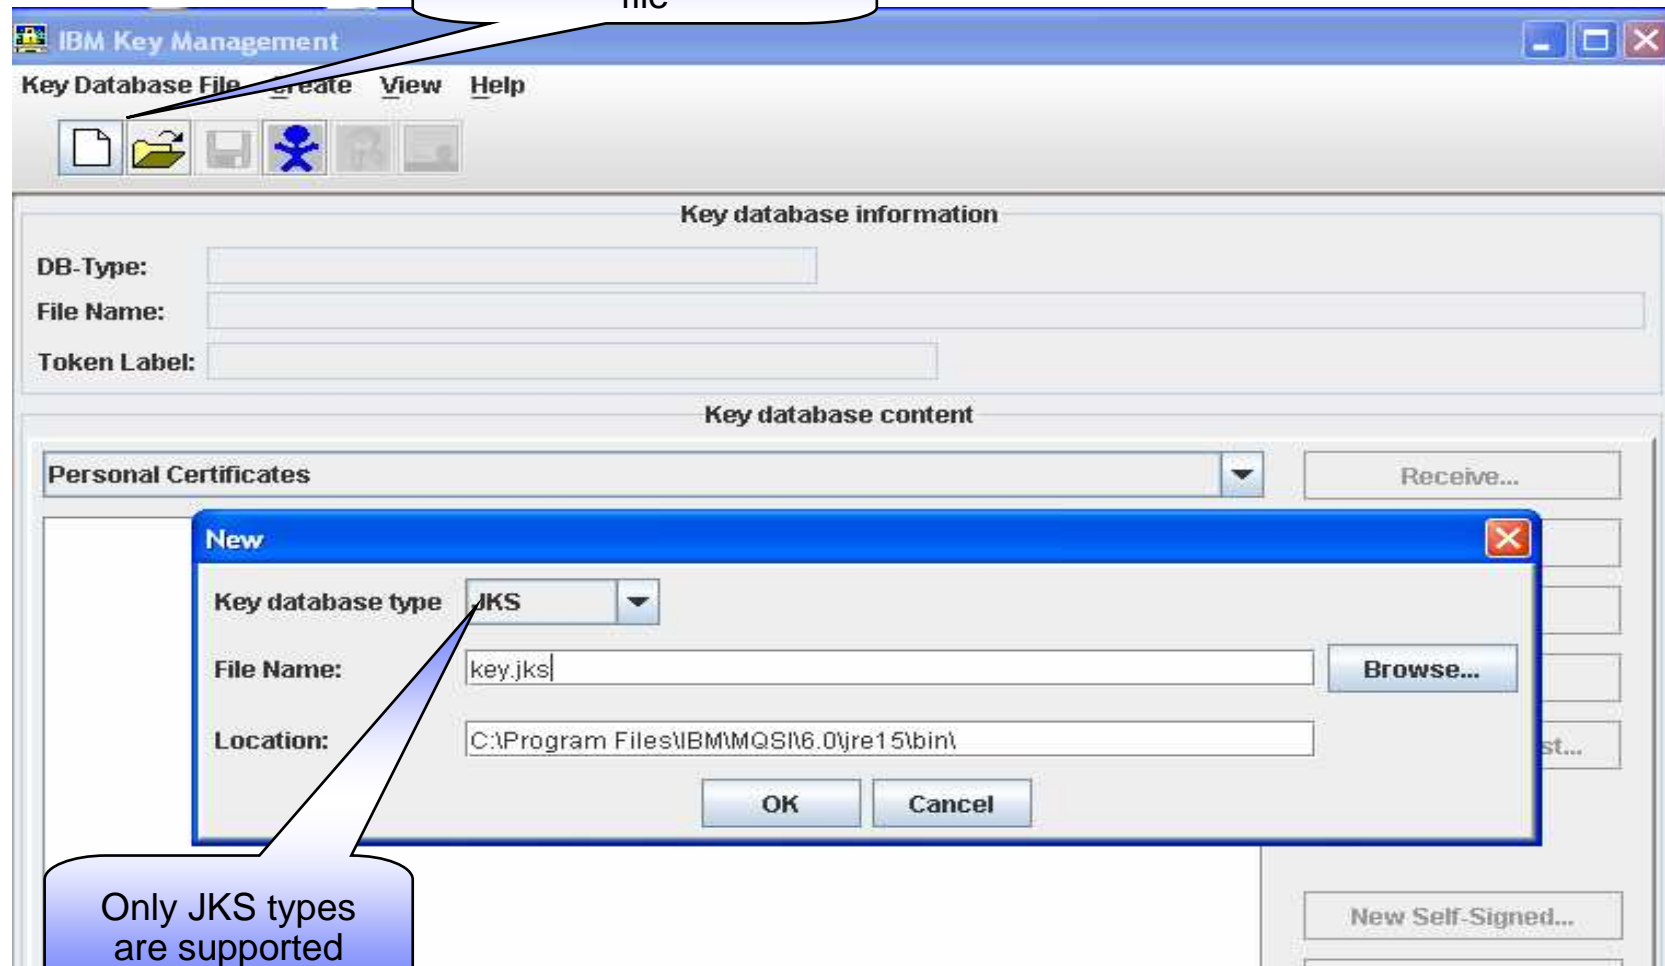

- alias – whatever alias is specified when creating the certificate in the keystore

- Send the certificates file to the client machine to be imported into its keystore

Configuration of HTTPInput & HTTPReply nodes

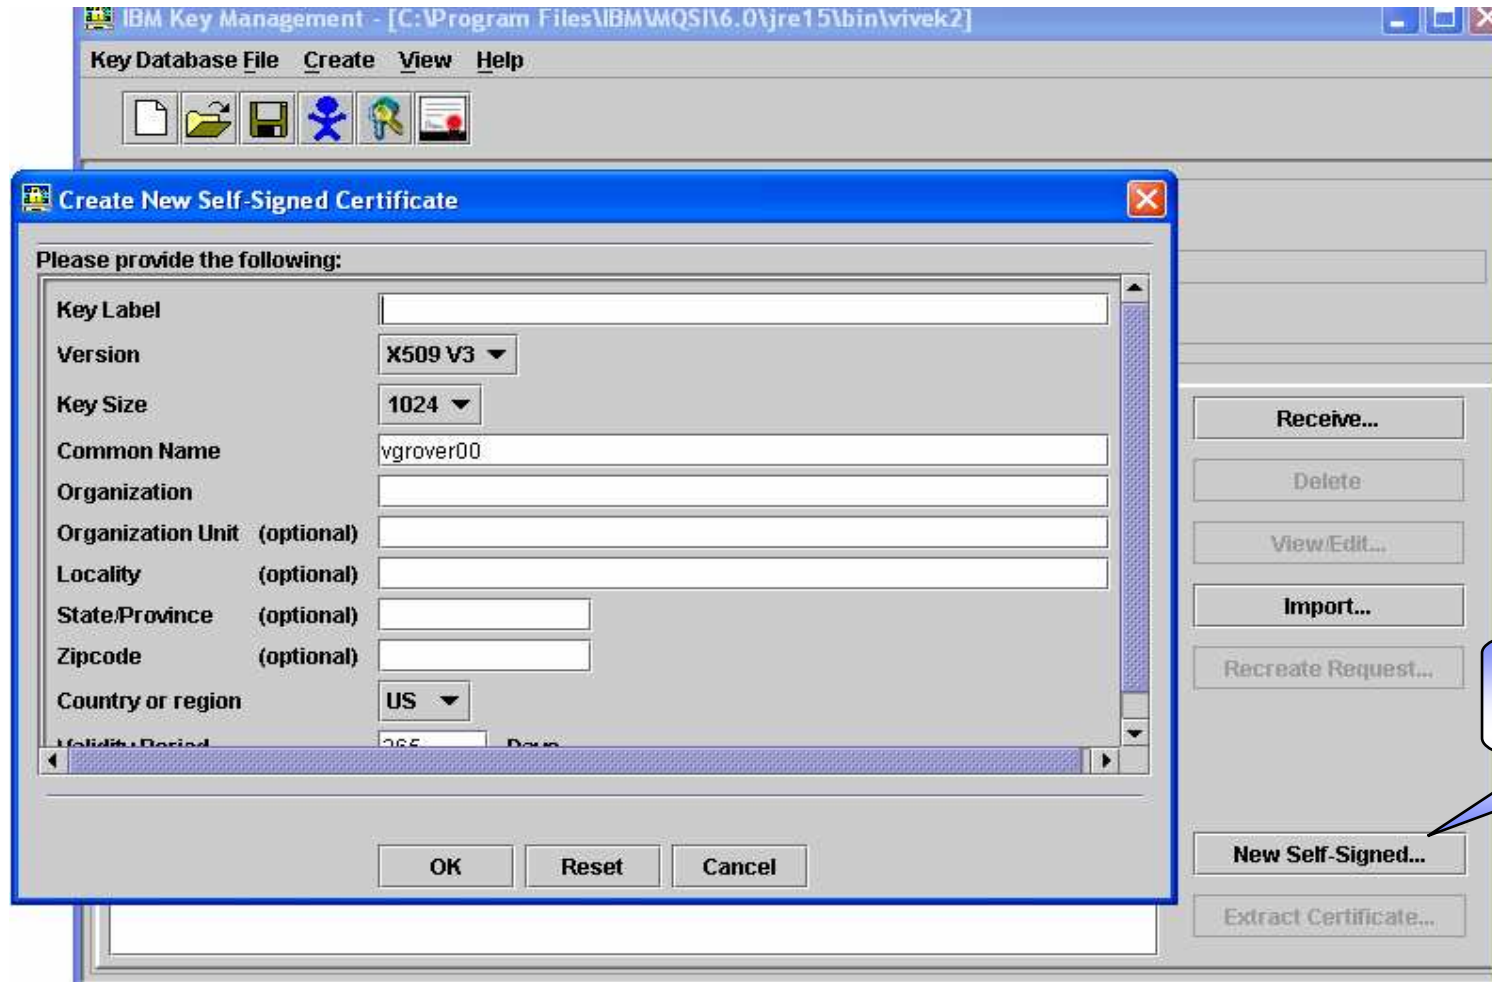

Using ikeyman

Create a new keystore file

Only JKS types are supported

Configuration of HTTPInput & HTTPReply nodes

Create new Self-Signed certificate

New Self-Signed...

Extract Certificate...

OK

Reset

Cancel

Receive...

Delete

View/Edit...

Import...

Recreate Request...

Configuration of HTTPInput & HTTPReply nodes

Key Database Information

DB-Type: JKS database file
 File Name: C:\Program Files\IBM\MQSI\6.0\jre15\bin\Wivek.jks
 Token Label:

Key Database Content

Personal Certificates
 testalias

Extract Certificate to a File

Data type: Base64-encoded ASCII data
 Certificate file name: cert.arm
 Location: C:\Program Files\IBM\MQSI\6.0\jre\bin\

Buttons: Receive..., Delete, Browse..., OK, Cancel, New Self-Signed..., Extract Certificate...

Speech bubble 1: Certificates can be extracted in Base64 encoded ASCII data (.arm) or Binary DER data (.der)

Speech bubble 2: Extract this certificate

Configuration of HTTPInput & HTTPReply nodes

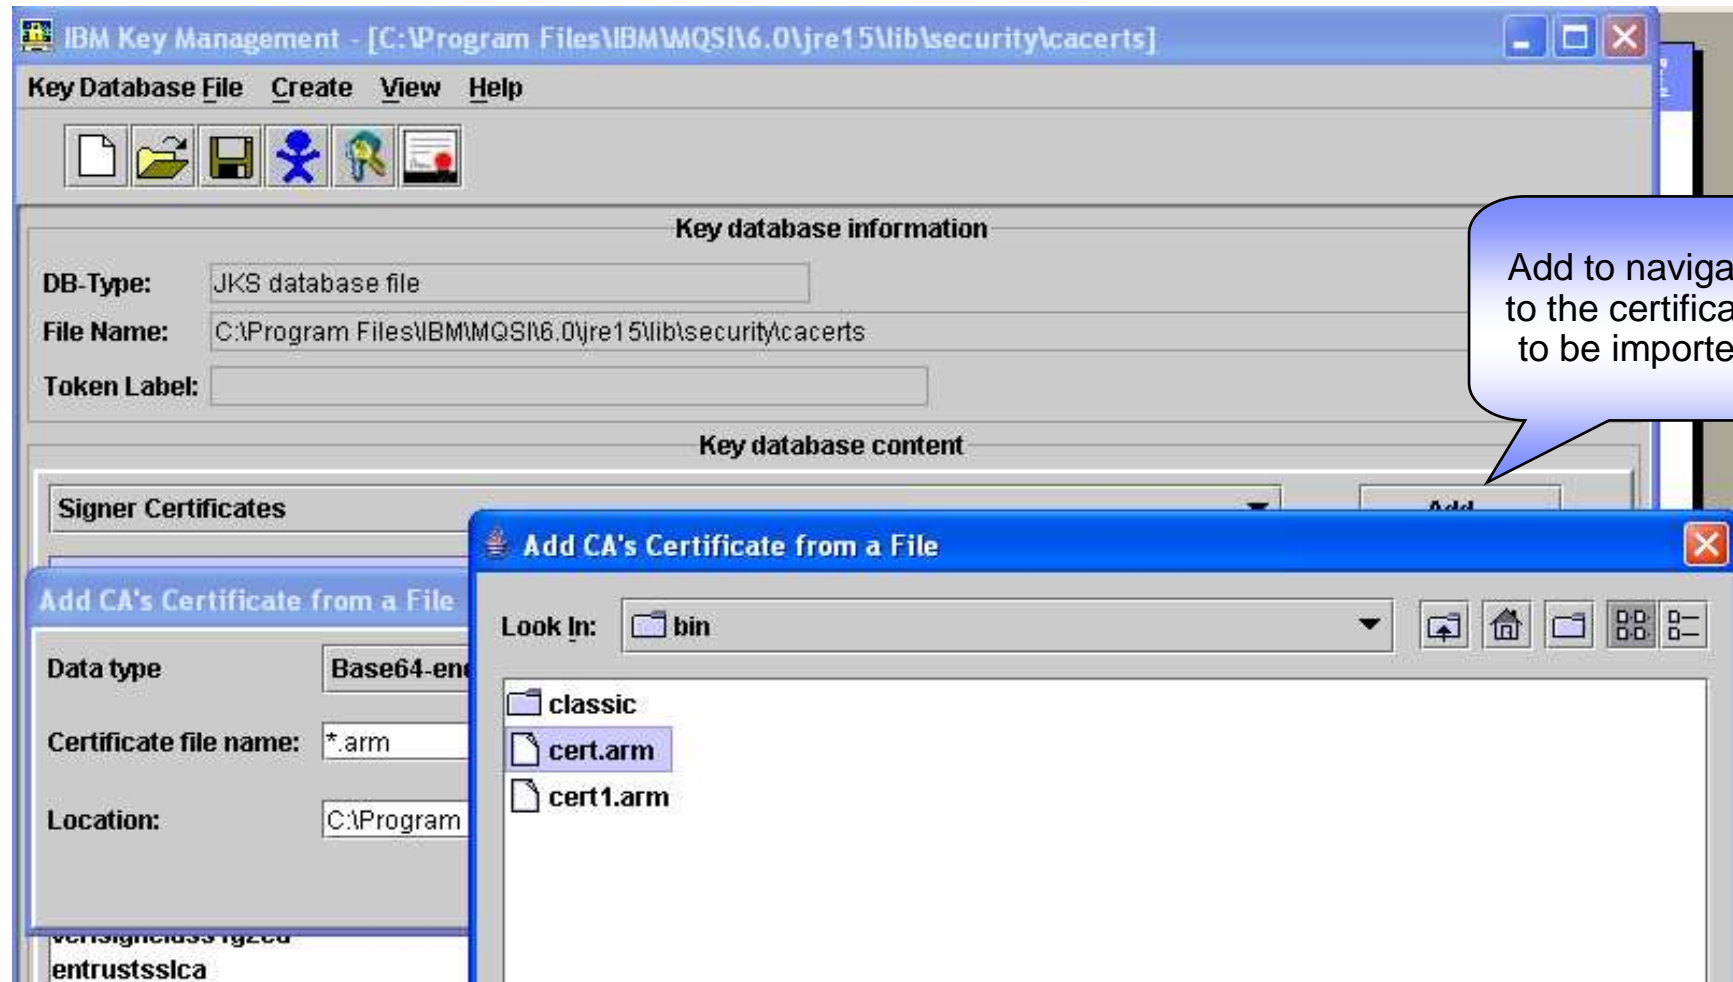

- ***Configure the HTTPInput & HTTPReply nodes for SSL with mutual authentication***
 - ▶ Follow the above slides # 20 -25
 - ▶ Enable Client Authentication for broker listener
 - **mqsichangeproperties <broker_name> -b httplistener -o HTTPSCConnector -n clientAuth -v true**
 - ▶ The Trusted (Signer or CA) Certificates from the client must be added to the broker's default keystore – cacerts

Using keytool -

```
keytool -import -alias mykey -file <name of certificate file> -keystore cacerts -  
keypass changeit
```

Configuration of HTTPInput & HTTPReply nodes

Using ikeyman

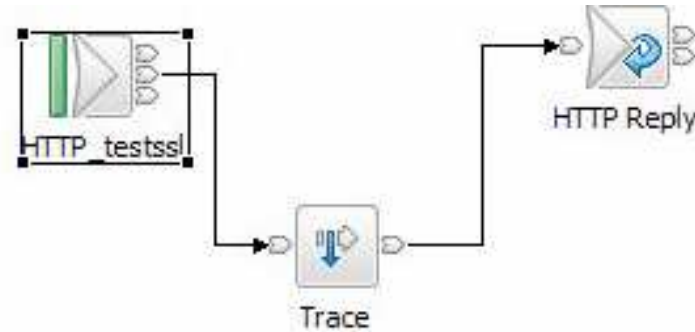

Configuration of HTTPInput & HTTPReply nodes

- Configure the nodes in the Toolkit
 - ▶ HTTPInput node Properties
 - Select “Use HTTPS”
 - Path suffix for URL – the path part of the URL from which this node receives Web service requests (Not the full URL).
 - For example, specify /path/to/service, where the full URL is <http://server/path/to/service> or If the URL is <http://server/testHTTPS> then “testHTTPS”
 - ▶ HTTPReply node Properties
 - There are no parameters to be configured
- Configure the bar file in the Toolkit
 - ▶ Ensure that “Use HTTPS” box is checked for the HTTPInput node
- Deploy and Confirm with – BIP3132I message in the logs indicating https listener has been enabled

Configuration of HTTPInput & HTTPReply nodes

- Test the configuration –

- Start a web browser and type the URL: <https://localhost:7083/<Path suffix>>

- Accept the certificate when the pop up Window appears and it shows -
“XML document must have a top level element. Error processing resource <https://localhost:7083/<Path suffix>>”

Troubleshooting configuration issues

- Ensure the message flow works fine with HTTP configured only
- Ensure the certificates have been imported in the correct keystore files located in the correct directories
- Ensure the certificates are X.509
- Ensure the keystore are in .jks format
- Capture the traces (if needed)

Tracing

- When Broker is the Client (with HTTPRequest node) –
 - ▶ Collect EG service trace
 - ▶ Collect JSSE trace

- When Broker is the server (with HTTPInput node) –
 - ▶ Collect the EG service trace
 - ▶ Collect the biphttplistener trace
