Down and Dirty: Unraveling root cause of hangs and waits in CICS

Dan Zachary
CICS Level 2 Support

WebSphere® Support Technical Exchange

Agenda

- A request for when you take dumps of a hang or slowdown.
- Three different types of CICS hangs.
- Steps for analyzing a dump taken while CICS is hung.
- How to figure out what the application program last did.

The best way to take a dump

- Don't use CICS to take the dump.
 - ▶ It messes up some clues about what CICS was doing before you started taking the dump.
- Take a COMM dump through the console.
- The rest of this presentation assumes the dump was not taken by CICS.
- Here are some links to a couple of 'must gather' technotes. The COMM dump syntax is in there:

MustGather Read first -

<http://www.ibm.com/support/docview.wss?rs=1083&uid=swg21208053>

MustGather Wait or loop -

<http://www.ibm.com/support/docview.wss?rs=1083&uid=swg21214981>

Three different types of CICS hangs

- CICS is unhealthy – tasks are dispatchable but the dispatcher never gets control so it can dispatch tasks.
- CICS is healthy but there are no dispatchable tasks. They are all suspended on some resource.
- CICS is healthy but there are no user tasks at all.

CICS is unhealthy

- On each TCB, CICS dispatcher gives control to one task at a time.
- When this running task does something to cause the task to suspend, that causes control to return back to the CICS dispatcher so that another task can be dispatched.
- If the running task gets stuck doing something and never does anything to give control back to the CICS dispatcher, no other tasks can use that TCB.
- The CICS dispatcher has lost control.

CICS is healthy, but tasks are stuck

- The CICS dispatcher is getting control, but none of the user tasks are dispatchable.
- The user tasks are all or mostly all suspended on some CICS resource like FCIOWAITs or ALLOCATE waits.

CICS is healthy but there are no tasks

- The system that sends work to this CICS region has stopped sending work.
- Something is wrong with one of the CICS system tasks that receive new work.

Is CICS healthy?

- On a healthy busy CICS region, CICS dispatches tasks on the QR TCB frequently.
- So if the time the last task was dispatched on QR is a long time prior to dump time, CICS is not healthy.

What time was the dump taken:

- Do `systrace all`
- Max to the bottom
- Copy the bottom STCK timestamp
- Do `ip ltod xxxxxxxxxxxxxxxx` where xxx is the copied timestamp

Enter a free-form IPCS subcommand or a CLIST or REXX exec invocation below:

===> systrace all

- **Formatted STCK needed for Dispatcher Formatter**
- **Local time needed for most everything else**

When was the last task dispatched on the QR TCB?

- Do verbx dfhpd650 'csa=2'
- CSA +X'50' is updated each time a task is dispatched on the QR TCB
- It is also updated on each EXEC CICS ASKTIME
- It is a packed 4-byte field of the format HHMMSSSTF
- 1203425F means 12:03:42.5

Dump Time and CSA Time for main dump

```
06/16/2008 18:07:00.220259 STCK X'C28DCC72 F7563360'  
06/16/2008 18:07:00.220259 UTC X'C28DCC72 F7563360'  
06/16/2008 13:07:00.220259 LOCAL X'C28D8964 D4163360'
```

CSA+x'50' is 1303013F or 13:03:01.3

What do we know so far?

- If CSA time is real close to local dump time, then the CICS QR TCB is probably dispatching tasks in a normal manner. Probably the problem is that the user tasks are suspended on some CICS resource.
- If CSA time is much earlier than dump time, probably some task is not letting go of the QR TCB.
- The Dispatcher formatter will further clarify things.
- Verbx dfhpd650 'ds=3'

Things to notice in the Dispatcher Summary

- Time of Suspend
 - ▶ In STCK time, not adjusted for timezone or leap seconds.
 - ▶ Is Time of Suspend on the user tasks a long time prior to STCK time of dump?

Things to notice in the Dispatcher Summary

- State of Task
 - ▶ D=DISPATCHABLE Waiting to run. Waiting to be dispatched.
 - ▶ S=SUSPENDED Suspended on something.
 - ▶ R=RUNNING and A=RUNNING ABTERM YES and J=RUNNING IN JVM In control of the TCB.

Things to notice in the Dispatcher Summary

- Task Mode (M)
 - ▶ The mode of TCB the task is running on or waiting for or suspended on.

What do we know so far?

- Task 68778 has been running on the QR TCB since 13:03:01 local time.
- So since then up until dump time, 13:07:00, no other task has been able to run on the QR TCB.
- That is why this CICS region is hung.
- What has that task been doing on the QR ?

What is the QR doing now, at dump time

- Usually, what it is doing at dump time, is what it has been doing for the entire duration of the hang.
- Has the QR TCB been looping for the duration of the hang, or has it been waiting for something.
- The MVS system trace can help us answer that question.

Use the system trace

- Do `verbx dfhpdxxx 'tr=2'`
- Near the top, find the ASID for this CICS region

```
-- DFHPD0121I FORMATTING CONTROL BLOCKS FOR JOB PRODCICS  
ADDRESS SPACE ASID NUMBER (HEX) = 00DF
```

Use the system trace

- Find the address of the QR TCB by doing a find on the characters -qr

```
TASK-68778 KE_NUM-0035 TCB-QR /008F8360 RET-
```

Use the system trace

- Do `systrace asid(x'aaaa') tcb(x'ttttttt')` `time(local)` using the asid and tcb address noted previously.
- `Systrace asid(x'00DF') tcb(x'008F8360').time(local)`
- If there is no activity in the system trace for that TCB and ASID, it looks like this:

```
----- SYSTEM TRACE TABLE
--
***** TRACE DATA IS NOT AVAILABLE FROM ALL PROCESSORS BEFORE THIS TIME.
***** TRACE DATA IS NOT AVAILABLE FROM ALL PROCESSORS AFTER THIS TIME.
***** NO TRACE TABLE ENTRIES MEETING THE SELECTION CRITERIA WERE FOUND.
```

Use the system trace

- If there is a tight loop going on, the system trace would look something like this:

```
06 0148 00AEB5D8 EXT 1005 078D0000 929888E2 00001005
06 0148 00AEB5D8 I/O 00458 078D2000 929888E6 80C04007
06 0148 00AEB5D8 EXT 1005 078D0000 929888EE 00001005
06 0148 00AEB5D8 I/O 034D4 078D2000 929888EA 00404007
06 0148 00AEB5D8 EXT 1005 078D0000 929888EE 00001005
06 0148 00AEB5D8 I/O 03DF2 078D0000 929888E2 80C04007
06 0148 00AEB5D8 EXT 1005 078D0000 929888EE 00001005
06 0148 00AEB5D8 CLKC 078D0000 929888E2 00001004
06 0148 00AEB5D8 DSP 078D0000 929888E2 00000000
06 0148 00AEB5D8 I/O 0045A 078D2000 929888E6 80C04007
```

Use the system trace

- In the case of a loop, you would next find the program at the PSW address shown in the loop trace entries.
- Do `ip where 129888E2 asid(x'148')`
- If that doesn't show the name of the program, go to browse mode, go to that address, and back up to find the module header.

Use Summ Format

- In the case where we found no system trace entries for the QR TCB in the system trace, that suggests the QR TCB is in a wait somewhere.
- We need to do a `Summ Format` command to format the QR TCB and its RBs in order to find the PSW and Regs at time of the wait.
- Using the ASID and TCB address we already got, do `summ format asid(x'df')`
- Then find on the TCB address like this:
- F 'TCB: 008F8360'

Use Summ Format

- At the TCB, save the general purpose registers.
- Note the RBP address.

TCB: 008F8360

```
+0000 RBP..... 008FDBC0 PIE..... 0000AEA0 DE
+0018 MSS..... 7F5C81D8 PKF..... 80      FL
+0024 LLS..... 008AD070 JLB..... 008FCD80 JP
```

General purpose register values

```
0-3  00000001  1720521C  7EFC6500  01000030
4-7  000C28DC  B8F36DA9  00000200  7E7A3F50
8-11 17205208  17205000  9727832E  17278FD8
12-15 97277FD8  7E7A4A20  40000000  808FDBC0
```

Use Summ Format

- Find the RBP address like this: f 'rb: 008FDBC0'
- That takes you to the top RB.

```
SVRB: 008FDBC0
-0020 XSB..... 7FFFAE50  FLAGS2... 80          RTPSW1... 00000000  00000000
RTPSW2... 00000000  00000000
-0008 FLAGS1... 42800049  WLIC..... 00020001
+0000 RSV..... 00000000  00000000          SZSTAB... 001ED022  CDE..... 00000000
OPSW..... 073C1000  97278362
+0018 Q..... 00000000  LINK..... 018FD6E8
```

If the 1st byte of LINK is 01 and the OPSW address – 2 is 0A01, then the OPSW address points into the program that put the QR TCB into a wait.

Find the program that waited the QR TCB

- Take that OPSW address, 97278362, and subtract off the high-order 80000000 leaving 17278362.
- Do a `ip w 17278362 asid(x'df')`
- If that can't determine the program name, go in browse mode to the OPSW address and back up till you find a program header.
- Backing up shows the program PROG003X.

How did control get to PROG003X ?

- Use the CICS Program Domain formatter.

Verbx dfhpdxxx 'pg=1'

- The PLCB summary for the task shows the calling sequence for the application programs and any GLUEs or TRUEs currently invoked.
- Find on 'TRAN NUM : xxxxx' where xxxxx is the task number.
- Under that see the TASK PLCB SUMMARY

```
==PG: PTA SUMMARY FOR TRAN NUM : 68778 PTA ADDRESS : 17FFA858
LOG-LVL : 3          SYS-LVL : 0          TASK-LLE : 18E60860  PLCB : 18AD4840
==PG: TASK LLE SUMMARY
LLE-ADDR  PROGRAM  PPTE-ADD
18E60860  PROCAAZZ  19E04138
==PG: TASK PLCB SUMMARY

```

- In this example, the 1st program, PROG0001, has linked to PROG0002 which has linked to PROG002B which has XCTL'd to PROG0003.
- At time of dump PROG0003 is in control, although it could have invoked some non-CICS service without CICS knowing about it.

Verbx dfhpdxxx 'tr=2'

- If you are lucky, there will be some trace entries for this task, and they might even reach back in time to 13:03:01 when the task was dispatched.
- It is possible that the task is looping making CICS calls since being dispatched at 13:03:01.
- Or perhaps there are no trace entries until right around the beginning of the hang.
- Max to the bottom and find previous on –QR .
- The latest trace entry for task 68778 on the QR TCB is at 13:03:01.

```

Verbx dfhpdxxx 'tr=2'

- So there were no CICS services, and therefore no CICS trace entries, during the hang.
- Task 68778 used CICS services to get to PROG0003.
- Somehow without CICS services control got to PROG003X which issued the operating system wait for some reason. That hangs CICS.
- You would need to investigate PROG003X to understand what that wait is all about.

Summary:

- Find the time of dump, both formatted STCK (for use in DS=3) and Local (for use everywhere else.)
- Find the last time task was dispatched on the QR from CSA+X'50'.
- Note how far apart those times are.
- Armed with those times, look at Dispatcher Summary and at trace.
- If a task has been running on the QR for a long time but is not making CICS trace entries, use Systrace and Summ format to investigate.
