

IBM Tivoli Storage Productivity Center  
Version 5.1

*User's Guide*

IBM Tivoli Storage Productivity Center  
Version 5.1

*User's Guide*

**Note:**

Before using this information and the product it supports, read the information in "Notices" on page 1501.

**Edition notice**

This edition applies to version 5, release 1 of IBM Tivoli Storage Productivity Center (product numbers 5725-F93, 5725-F98, and 5725-G33) and to all subsequent releases and modifications until otherwise indicated in new editions.

<b>Figures</b> . . . . .	<b>ix</b>	SAN Volume Controller topics. . . . .	126
<b>Tables</b> . . . . .	<b>xi</b>	<b>Chapter 3. Scenarios</b> . . . . .	<b>135</b>
<b>Preface</b> . . . . .	<b>xiii</b>	Monitoring and reporting on I/O utilization . . . . .	135
Who should read this guide . . . . .	xiii	Storage provisioning by using workflows . . . . .	138
Publications . . . . .	xiii	Archive and delete files . . . . .	142
Accessing publications online . . . . .	xiii	Create a profile with a filter . . . . .	146
IBM Redbooks . . . . .	xv	Creating a performance threshold within an alert . . . . .	148
Translation . . . . .	xv	Determine application performance problems . . . . .	151
Ordering publications . . . . .	xv	Identifying performance hot spots . . . . .	156
Providing feedback about publications . . . . .	xvi	Retiring underutilized storage systems . . . . .	158
Conventions used in this guide . . . . .	xvi	Tivoli Storage Productivity Center for Replication scenarios . . . . .	160
Contacting the IBM Support Center . . . . .	xvi	Identifying and investigating a suspended Metro Mirror session . . . . .	161
Reporting a problem . . . . .	xvii	Performing planned maintenance scenarios . . . . .	164
		Recovering from a disaster scenarios . . . . .	167
		Practicing disaster recovery scenarios . . . . .	170
<b>New for Tivoli Storage Productivity Center Version 5.1</b> . . . . .	<b>xix</b>	<b>Chapter 4. Administering</b> . . . . .	<b>175</b>
<b>Chapter 1. Getting started</b> . . . . .	<b>1</b>	Starting Tivoli Storage Productivity Center . . . . .	175
<b>Chapter 2. Product overview</b> . . . . .	<b>9</b>	Starting the Tivoli Storage Productivity Center stand-alone GUI . . . . .	175
Introducing IBM Tivoli Storage Productivity Center . . . . .	9	Starting the Tivoli Storage Productivity Center web-based GUI. . . . .	178
Architecture . . . . .	10	Starting Tivoli Storage Productivity Center for Replication . . . . .	179
IBM Tivoli Storage Productivity Center summary . . . . .	11	Starting the Tivoli Storage Productivity Center family of products through Tivoli Integrated Portal. . . . .	180
Product licenses for Tivoli Storage Productivity Center . . . . .	12	Overview of required user IDs for initial log on to the Tivoli Storage Productivity Center family of products . . . . .	181
User interfaces to Tivoli Storage Productivity Center . . . . .	19	Administering DB2 . . . . .	183
Data Manager . . . . .	44	Backing up the Tivoli Storage Productivity Center database . . . . .	183
Disk Manager . . . . .	46	Starting the Control Center. . . . .	184
Tape Manager . . . . .	48	Using the command line on UNIX and Linux . . . . .	184
Fabric Manager . . . . .	48	Manually starting DB2 on Windows. . . . .	185
Tivoli Storage Productivity Center for Replication . . . . .	49	Manually stopping DB2 on Windows . . . . .	185
Architecture . . . . .	51	Monitoring DB2 . . . . .	185
Interfaces for Tivoli Storage Productivity Center for Replication . . . . .	51	Adding a Tivoli Storage Productivity Center user group name to Tivoli Storage Productivity Center for Replication . . . . .	186
Tivoli Storage Productivity Center for Replication integration with Tivoli System Automation Application Manager . . . . .	52	Backing up and recovering all the Tivoli Storage Productivity Center for Replication . . . . .	187
Tivoli Integrated Portal . . . . .	53	Administering Tivoli Storage Productivity Center . . . . .	187
Key concepts . . . . .	53	Checking the Tivoli Storage Productivity Center version . . . . .	187
Single sign-on . . . . .	53	Viewing and managing services . . . . .	188
Launch and launch in context . . . . .	56	Starting and stopping the Tivoli Storage Productivity Center services . . . . .	196
User roles . . . . .	68	Starting and stopping the Tivoli Integrated Portal server. . . . .	199
User tasks . . . . .	70	Checking Tivoli Storage Productivity Center status . . . . .	199
Data collection . . . . .	74		
Data replication . . . . .	75		
Alerts . . . . .	108		
Provisioning planner . . . . .	109		
Reporting. . . . .	113		
Fabric and zones . . . . .	113		
Agents . . . . .	117		
Security . . . . .	124		

Increasing memory allocation . . . . .	200	Working with alerts . . . . .	385
Setting timeouts values for the Device server	202	Creating alerts . . . . .	385
Changing passwords . . . . .	204	Configuring alert destinations . . . . .	395
Checking for a fully qualified host name . . . . .	214	Deleting alerts . . . . .	396
Granting local administrative privileges to a domain account . . . . .	216	Disabling an alert . . . . .	397
Importing SSL certificates for VMware . . . . .	217	Editing alerts . . . . .	398
SQL access to Tivoli Storage Productivity Center views . . . . .	218	Renaming alerts . . . . .	399
Repocopy tool . . . . .	221	Viewing alerts . . . . .	399
Service tool: collecting information . . . . .	224	Viewing alert logs . . . . .	403
Administering Tivoli Integrated Portal . . . . .	229	Viewing tape library alerts . . . . .	404
Tivoli Integrated Portal port numbers . . . . .	229	Checking storage configurations . . . . .	404
Changing the user authentication configuration	231	Using configuration history . . . . .	404
Changing the LTPA token expiration for single sign-on . . . . .	248	Using configuration analysis . . . . .	409
Administering data sources . . . . .	249	Planning and modifying storage configurations . . . . .	419
Checking the health of your data sources . . . . .	249	Configuring a provisioning plan by using SAN Planner . . . . .	419
Manually changing the Windows service logon for the agent . . . . .	249	Working with storage resource group sessions	431
CIM agents . . . . .	249	Optimizing storage configurations . . . . .	432
Storage Resource agents . . . . .	256	Storage Optimizer overview . . . . .	432
In-band Fabric agents . . . . .	278	Using the Storage Optimizer . . . . .	433
Out-of-band Fabric agents . . . . .	278	Optimizing tiered storage . . . . .	441
Tivoli Storage Productivity Center servers . . . . .	280	Enforcing storage policies . . . . .	443
Storage systems . . . . .	286	Setting storage usage quotas . . . . .	445
VMware data source . . . . .	294	Storage usage for Network Appliance quotas	465
Managing schedules, jobs, and runs . . . . .	297	Setting file constraints . . . . .	470
Job Management - Recommendations . . . . .	304	Scheduling script-based actions . . . . .	479
		Archive and backup functions . . . . .	484
		Working with storage resource groups . . . . .	489
		Storage resource group management . . . . .	489
		Create or Edit a Storage Resource Group . . . . .	490
		Working with scripts . . . . .	493
		Running scripts with alerts . . . . .	493
		Running scripts using scheduled actions . . . . .	494
		How scripts are run . . . . .	496
		How the server and agent resolve script names	498
		Using the topology viewer . . . . .	499
		The topology viewer . . . . .	500
		Arranging entities in a group . . . . .	512
		Checking the status of entities and groups . . . . .	513
		Creating custom groups . . . . .	522
		Defining properties for grouping entities . . . . .	523
		Displaying data paths from one endpoint in the topology to another . . . . .	523
		Displaying membership in zones and zone sets	531
		Displaying detailed information about entities	532
		Displaying storage resource connections . . . . .	532
		Filtering entities based on health status . . . . .	533
		Labeling entities . . . . .	534
		Starting element managers . . . . .	534
		Launching SAN Planner . . . . .	535
		Starting Storage Optimizer . . . . .	535
		Locating storage resources in the topology . . . . .	536
		Managing Storage Subsystems . . . . .	536
		Managing Zone Control . . . . .	536
		Pinning entities . . . . .	537
		Printing information from the topology viewer	537
		Refreshing views . . . . .	537
		Removing entities from the database . . . . .	538
		Removing deleted entities . . . . .	538
		Selecting entities in graphical and table views	539
		Showing Alerts . . . . .	539
<b>Chapter 5. Managing resources in the stand-alone GUI . . . . .</b>	<b>307</b>		
Configure Devices wizard . . . . .	307		
Configuring storage subsystems . . . . .	308		
Configure fabrics and switches . . . . .	318		
Configure computers . . . . .	320		
Configure tape libraries . . . . .	322		
Discovering storage resources . . . . .	324		
Discovery overview . . . . .	325		
Discovering computers in the Windows domain, NAS, and SAN File System . . . . .	331		
Discovering computers . . . . .	332		
Discover storage subsystem, tape library, and fabric information with CIM agents . . . . .	333		
Discovering fabrics with Storage Resource agents . . . . .	335		
Discovering storage subsystems and switches	336		
Collecting data . . . . .	337		
Collecting storage statistics . . . . .	337		
Collecting storage statistics from Tivoli Storage Productivity Center servers . . . . .	342		
Collecting storage usage and trending information . . . . .	346		
Determining the availability of storage resources	366		
Data collection groups . . . . .	370		
Working with groups of resources . . . . .	373		
Collecting performance data . . . . .	377		
Monitoring switch performance . . . . .	377		
Monitoring storage-subsystem performance . . . . .	378		
Monitoring tape libraries . . . . .	383		
Viewing performance data . . . . .	383		

Showing the monitoring status of entities . . . . .	539	Viewing information about internal and related resources . . . . .	634
Working with tape libraries in the topology viewer. . . . .	539	Monitoring the status of resources . . . . .	635
Managing disk storage . . . . .	541	How status is determined . . . . .	636
Working with workload profiles . . . . .	541	Viewing the overall status of resources . . . . .	639
Working with provisioning profiles . . . . .	544	Viewing the status of top-level resources . . . . .	640
Thin provisioning profiles . . . . .	549	Viewing the status of internal resources . . . . .	641
Managing storage subsystems . . . . .	551	Acknowledging the status of resources . . . . .	641
Managing virtual disks . . . . .	561	Viewing jobs . . . . .	644
Managing volumes . . . . .	570	Configuring the display of jobs . . . . .	645
Managing fabrics . . . . .	576	Viewing all jobs . . . . .	645
Working with zones . . . . .	576	Viewing jobs for a type of resource . . . . .	646
Working with zone sets . . . . .	579	Viewing jobs for a specific resource . . . . .	646
Working with zone aliases . . . . .	581	Viewing job logs . . . . .	647
Managing Tape Libraries . . . . .	584	Managing alerts . . . . .	648
Discovering tape libraries . . . . .	584	Alert severities . . . . .	649
Viewing tape library information . . . . .	585	Viewing all alerts . . . . .	650
Monitoring tape libraries . . . . .	585	Viewing alerts for a type of resource . . . . .	651
Managing DS8000 storage systems using element managers. . . . .	585	Viewing alerts for a specific resource . . . . .	651
Configuring the DS8000 element manager . . . . .	586	Removing alerts . . . . .	652
Configuring other element managers for DS8000 . . . . .	591	Acknowledging alerts . . . . .	652
Managing other storage systems using element managers. . . . .	592	Exporting information about resources, jobs, and alerts . . . . .	653
Adding element managers using CIMOM discovery. . . . .	593	Customizing lists of resources, jobs, and alerts . . . . .	654
Modifying other element managers . . . . .	595	Filtering lists . . . . .	655
Starting other element managers . . . . .	596	Sorting lists . . . . .	655
Testing the connection to other element managers. . . . .	597	Showing, hiding, and reordering columns in lists . . . . .	656
Adding user-defined element managers for other storage systems. . . . .	597	<b>Chapter 7. Managing replication . . . . . 657</b>	
Removing user-defined element managers for other storage systems. . . . .	598	Administering . . . . .	657
Launch and launch in context . . . . .	598	Starting and stopping Tivoli Storage Productivity Center for Replication . . . . .	657
Inbound launch in context feature . . . . .	599	Verifying that components are running . . . . .	659
<b>Outbound launch and launch in context features . . . . .</b>	606	Identifying the version of IBM Tivoli Storage Productivity Center for Replication . . . . .	660
External tools . . . . .	610	Backing up and restoring IBM Tivoli Storage Productivity Center for Replication configuration data. . . . .	660
Adding external tools . . . . .	610	Managing management servers . . . . .	664
Modifying external tools. . . . .	611	Management servers . . . . .	664
Starting external tools . . . . .	612	SNMP alerts. . . . .	666
Removing external tools. . . . .	612	Setting up a standby management server . . . . .	669
Working with invoices . . . . .	613	Applying maintenance to an active management server . . . . .	670
Planning for chargeback. . . . .	614	Reconnecting the active and standby management servers . . . . .	671
Setting up invoices . . . . .	615	Performing a takeover on the standby management server . . . . .	671
Generating an invoice . . . . .	616	Configuring SNMP . . . . .	671
Viewing and printing invoices. . . . .	616	Adding SNMP managers . . . . .	672
Sample Invoices . . . . .	617	Changing the standby management server port number . . . . .	672
<b>Chapter 6. Managing resources in the web-based GUI. . . . . 623</b>		Changing the client port number . . . . .	672
Configuring resources for monitoring . . . . .	624	Managing storage systems . . . . .	673
Resources that you can monitor in the web-based GUI. . . . .	625	Storage systems . . . . .	673
Display differences in the interfaces . . . . .	628	Storage connections . . . . .	674
Viewing information about resources . . . . .	629	Protected volumes. . . . .	678
How information is organized. . . . .	629	Site awareness . . . . .	678
Viewing summary information about all resources . . . . .	631	Adding a storage connection . . . . .	679
Viewing information about top-level resources . . . . .	633	Removing a storage connection . . . . .	680

Removing a storage system . . . . .	681
Modifying the location of storage systems . . . . .	681
Modifying storage connection properties . . . . .	682
Refreshing the storage system configuration . . . . .	683
Setting volume protection . . . . .	683
Restoring data from a journal volume . . . . .	683
Managing host systems . . . . .	684
Adding a host system connection. . . . .	685
Modifying a host system connection. . . . .	685
Removing a host system connection . . . . .	686
Removing a session from a host system connection . . . . .	686
Managing logical paths . . . . .	687
Viewing logical paths. . . . .	687
Adding logical paths . . . . .	687
Adding logical paths using a CSV file . . . . .	688
Removing logical paths . . . . .	689
Setting up data replication . . . . .	689
Sessions . . . . .	689
Data replication . . . . .	696
Session commands . . . . .	729
Site awareness . . . . .	743
Preserve Mirror option . . . . .	744
Creating sessions and adding copy sets. . . . .	746
Using the Metro Mirror heartbeat . . . . .	754
Exporting copy set data . . . . .	756
Importing copy set data . . . . .	757
Exporting historical data for Global Mirror role pairs . . . . .	757
Modifying the location of session sites . . . . .	758
Removing sessions . . . . .	758
Removing copy sets . . . . .	759
Migrating an existing configuration to Tivoli Storage Productivity Center for Replication . . . . .	760
Practicing disaster recovery. . . . .	762
Practice volumes . . . . .	763
Practicing disaster recovery for a Metro Mirror Failover/Failback with Practice session. . . . .	763
Practicing disaster recovery for a Global Mirror either Direction with two-site Practice session . . . . .	763
Practicing disaster recovery for a Global Mirror Failover/Failback with Practice session. . . . .	764
Practicing disaster recovery for a Metro Global Mirror Failover/Failback with Practice session . . . . .	765
Monitoring health and status . . . . .	765
Viewing the health summary . . . . .	765
Viewing SNMP alerts. . . . .	766
Viewing sessions . . . . .	766
Viewing storage system details . . . . .	786
Viewing storage connection details . . . . .	786
Viewing volume details . . . . .	786
Viewing logical paths. . . . .	787
Viewing console messages . . . . .	787
Security . . . . .	787
Users and groups . . . . .	788
User roles . . . . .	788
Adding the IBM Tivoli Storage Productivity Center for Replication Administrator role to the IBM Tivoli Storage Productivity Center . . . . .	
Superuser group . . . . .	791
Granting access privileges for a user. . . . .	791

Viewing access privileges for a user . . . . .	792
Modifying access privileges for a user . . . . .	792
Removing access privileges for a user . . . . .	792

## Chapter 8. Reporting in the stand-alone GUI . . . . . 795

Choosing a reporting type . . . . .	795
Choosing a report category. . . . .	797
What can I find out using reports? . . . . .	803
Report considerations and limitations . . . . .	807
Working with reports. . . . .	811
Generating and viewing reports . . . . .	811
Sorting report columns . . . . .	812
Printing reports or charts . . . . .	812
Including charts in reports . . . . .	813
Drilling down a report row. . . . .	816
Navigating tabs . . . . .	816
Trending with historical data . . . . .	817
Working with user-defined online reports . . . . .	820
Generating reports . . . . .	820
Using reporting groups . . . . .	828
Data Manager reports . . . . .	831
Data Manager for Databases reports. . . . .	961
Data Manager for Chargeback reports . . . . .	990
Disk Manager reports . . . . .	990
Fabric Manager reports. . . . .	1003
Tape Manager reports . . . . .	1010
System reports . . . . .	1010
Generating and viewing system reports . . . . .	1010
System reports - Data . . . . .	1011
System reports - Data Manager for Databases . . . . .	1025
System Reports - Disk Manager . . . . .	1037
System reports - Fabric Manager . . . . .	1054
Batch reports . . . . .	1061
Creating batch reports . . . . .	1062
Editing batch reports . . . . .	1073
Viewing job information for a batch report . . . . .	1073
Displaying log files for a batch report . . . . .	1073
Displaying batch reports from the saved directory . . . . .	1073
Viewing CSV batch reports with spreadsheet applications . . . . .	1074
Exporting and importing settings that you define . . . . .	1074
User ID (saved) reports. . . . .	1075
Creating a user-defined report . . . . .	1075
Displaying user-defined reports . . . . .	1075
Editing user-defined reports . . . . .	1075
Rollup reports. . . . .	1075
Generating rollup reports . . . . .	1076
Rollup Reports - Asset . . . . .	1077
Rollup Reports - Database Asset. . . . .	1106
Rollup Reports - TPC Server Storage Space . . . . .	1112
Rollup Reports - Database Capacity . . . . .	1129
Data source reports - overview . . . . .	1133
Data source reports - CIMOM agents . . . . .	1133
Data source report - By CIMOM Agent . . . . .	1134
Data source report - By Managed Device . . . . .	1135
Tivoli Storage Productivity Center Monitoring Agent reports . . . . .	1137

## Chapter 9. Reporting in the web-based GUI . . . . . 1143

Viewing predefined and custom reports . . . . .	1143
Creating and viewing reports from the web-based GUI . . . . .	1144
Accessing report features in Tivoli Common Reporting . . . . .	1144
Setting options for reports . . . . .	1145
Predefined reports about resources . . . . .	1145
Relationship reports . . . . .	1146
Server reports . . . . .	1150
Storage virtualizer reports . . . . .	1154
Storage system reports . . . . .	1163
Predefined reports about performance . . . . .	1171
Switch reports . . . . .	1171
Storage virtualizer reports . . . . .	1177
Storage virtualizer performance details reports . . . . .	1186
Storage system reports . . . . .	1202
Storage system performance details reports . . . . .	1212
Predefined reports about historical information . . . . .	1223
Running the Storage Virtualizers - Historical Space Report . . . . .	1224
Storage Virtualizers - Historical Space Report . . . . .	1224
Running the Storage Virtualizer - Pools Historical Space Report . . . . .	1225
Storage Virtualizer - Pools Historical Space Report . . . . .	1226
Running the Storage Virtualizer - Volumes Historical Space Report . . . . .	1228
Storage Virtualizer - Volumes Historical Space Report . . . . .	1229
Running the Storage Systems - Historical Space Report . . . . .	1230
Storage Systems - Historical Space Report . . . . .	1230
Running the Storage System - Pools Historical Space Report . . . . .	1232
Storage System - Pools Historical Space Report . . . . .	1233
Running the Storage System - Volumes Historical Space Report . . . . .	1234
Storage System - Volumes Historical Space Report . . . . .	1235
Predefined reports about storage tiering . . . . .	1236
Running the MDisk Groups - Workload Activity Report . . . . .	1237
MDisk Groups - Workload Activity Report . . . . .	1238
Running the MDisk Groups - VDisk Workload Activity Report . . . . .	1242
MDisk Groups - VDisk Workload Activity Report . . . . .	1243
Running the MDisk Group - VDisk Workload Activity Details Report . . . . .	1247
MDisk Group - VDisk Workload Activity Details Report . . . . .	1247
Running the Storage Virtualizer - VDisk Workload Activity Report . . . . .	1251
Storage Virtualizer - VDisk Workload Activity Report . . . . .	1252
Running the Storage Resource Group - VDisk Workload Activity Report . . . . .	1256
Storage Resource Group - VDisk Workload Activity Report . . . . .	1256

Running the Storage Resource Group - VDisk Workload Activity Details Report . . . . .	1260
Storage Resource Group - VDisk Workload Activity Details Report . . . . .	1261
Running the MDisk Group Details Report . . . . .	1265
MDisk Group Details Report . . . . .	1265
Running the VDisk Details Report . . . . .	1268
VDisk Details Report . . . . .	1268
Running the Volume Migration Recommendation Report . . . . .	1271
Volume Migration Recommendation Report . . . . .	1271
Read I/O capability formula . . . . .	1272
Changing threshold values in storage tier reports . . . . .	1274
Threshold values in storage tier reports . . . . .	1274
Custom reports about performance . . . . .	1275
Creating custom performance reports in Tivoli Common Reporting . . . . .	1275
Data and properties in performance reports . . . . .	1277
Custom reports about resources . . . . .	1370
Creating custom resource reports in Tivoli Common Reporting . . . . .	1370
Data and properties in resource reports . . . . .	1376
Troubleshooting reports . . . . .	1413
Setting up multiple connections to the TPCDB data source in Tivoli Common Reporting . . . . .	1416

## Appendix A. Reference . . . . . 1419

Alerts and schedules associated with monitoring groups and templates . . . . .	1419
Supported Fabric Agent Types . . . . .	1426
Supported storage systems providing full disk encryption and solid-state drives . . . . .	1427
Frequently Asked Questions . . . . .	1427
General and Migration Information . . . . .	1428
Data Manager . . . . .	1429
Fabric Manager . . . . .	1429
Disk Manager . . . . .	1432
Arguments and window locations available with the inbound launch in context feature . . . . .	1432
Launch in context parameters . . . . .	1432
Launch in context task parameters . . . . .	1434
Available windows . . . . .	1435
Alerts . . . . .	1438
Triggering conditions for alerts . . . . .	1439
Alert suppression actions . . . . .	1453
Triggered actions for alerts . . . . .	1453
Alert display colors . . . . .	1455
Performance data . . . . .	1457
General performance guidelines . . . . .	1457
Performance thresholds . . . . .	1457
Performance metrics . . . . .	1468
Protocols and standards . . . . .	1490
Web Based Enterprise Management . . . . .	1490
Storage Management Initiative Specification . . . . .	1491
Service Location Protocol . . . . .	1492
Simple Network Management Protocol . . . . .	1492
Fibre Channel Methodologies of Interconnects . . . . .	1493

**Appendix B. Accessibility features  
for Tivoli Storage Productivity Center 1495**

**Appendix C. Accessibility features  
for Tivoli Storage Productivity Center  
for Replication . . . . . 1497**

---

## Preface

IBM® Tivoli® Storage Productivity Center is a storage infrastructure management software product that can centralize, automate, and simplify the management of complex and heterogeneous storage environments.

---

## Who should read this guide

The audience of this publication is administrators or users who have already installed the product and are now using IBM Tivoli Storage Productivity Center. This publication provides an overview of how to use the product and detailed information about various topics.

Administrators and users must be familiar, or become familiar, with the following concepts:

- IBM DB2
- IBM Tivoli Common Reporting
- IBM Tivoli Enterprise Console®
- IBM Tivoli Integrated Portal
- Storage Area Network (SAN)
- Simple Network Management Protocol (SNMP)
- Tivoli Storage Productivity Center
- Tivoli Storage Productivity Center for Replication

---

## Publications

This section lists publications in the IBM Tivoli Storage Productivity Center library and other related publications. It also describes how to access publications online, how to order publications, and how to submit comments on publications.

The publications are available from the IBM Publications Center at <http://www.ibm.com/e-business/linkweb/publications/servlet/pbi.wss>.

## Accessing publications online

Publications for this product and other related products are available online.

Information about installing, configuring, upgrading, and uninstalling IBM Tivoli Storage Productivity Center and related products is available online. Use Table 1 on page xiv to view and download these publications. Translated documents are available for some products.

Table 1. Locations of publications for Tivoli Storage Productivity Center and related products

Table 1. Locations of publications for Tivoli Storage Productivity Center and related products (continued)

Product	Online location (see Note)
IBM Storwize® V7000	<a href="http://publib.boulder.ibm.com/infocenter/storwize/ic/index.jsp">http://publib.boulder.ibm.com/infocenter/storwize/ic/index.jsp</a>
IBM Storwize V7000 Unified	<a href="http://publib.boulder.ibm.com/infocenter/storwize/unified_ic/index.jsp">http://publib.boulder.ibm.com/infocenter/storwize/unified_ic/index.jsp</a>
IBM XIV® Storage System	<a href="http://publib.boulder.ibm.com/infocenter/ibmxiv/r2/index.jsp">http://publib.boulder.ibm.com/infocenter/ibmxiv/r2/index.jsp</a>
IBM DB2® Database for Linux, UNIX, and Windows	<a href="http://publib.boulder.ibm.com/infocenter/db2luw/v9r7/index.jsp">http://publib.boulder.ibm.com/infocenter/db2luw/v9r7/index.jsp</a>
IBM System Storage N series	<a href="http://www.ibm.com/systems/storage/network/redbooks.html">http://www.ibm.com/systems/storage/network/redbooks.html</a>  For more information about IBM System Storage N series, see <a href="http://www.ibm.com/systems/storage/network/software/">http://www.ibm.com/systems/storage/network/software/</a> .
IBM Systems Director	<a href="http://www.ibm.com/systems/software/director/index.html">http://www.ibm.com/systems/software/director/index.html</a>
<b>Note:</b> If you print PDF documents on other than letter-sized paper, in the <b>Print</b> window select <b>Fit to Printable Area</b> in the Page Scaling field. This option is available when you click <b>File &gt; Print</b> . <b>Fit to Printable Area</b> ensures that the full dimensions of a letter-sized page print on the paper that you are using.	

## IBM Redbooks

The IBM Redbooks® are books on specialized topics.

You can order publications through your IBM representative or the IBM branch office serving your locality. You can also search for and order books of interest to you by visiting the IBM Redbooks home page at <http://www.redbooks.ibm.com/redbooks>.

## Translation

Translated publications are available from the information center which is available in certain translated languages. It is displayed in the language that is appropriate for the browser locale setting.

When a locale does not have a translated version, the information center is displayed in English, which is the default language. Translations of the PDFs are available when the information center is translated.

Contact your service representative for more information about the translated publications and whether translations are available in your language.

## Ordering publications

Information is provided for the ordering of IBM publications on the Internet or by telephone.

You can order many IBM publications online at <http://www.ibm.com/e-business/linkweb/publications/servlet/pbi.wss>.

You can also order by telephone. In the United States and Canada, call 800-879-2755. In other countries, contact your IBM service representative.

## Providing feedback about publications

Your feedback is important to help IBM provide the highest quality information. You can provide comments or suggestions about the documentation from the IBM Tivoli Storage Productivity Center Information Center.

Go to the information center at <http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp>. From any topic page, click the **Feedback** link.

---

## Conventions used in this guide

This section provides information about the conventions used in this publication.

This publication uses several conventions for special terms and actions, and operating system-dependent commands and paths.

The following typeface conventions are used in this publication:

### **Bold**

- Flags that appear with text
- Graphical user interface (GUI) elements (except for titles of windows and dialogs)
- Names of keys

### *Italic*

- Variables
- Values you must provide
- New terms
- Words and phrases that are emphasized
- Titles of documents

### **monospace**

- Commands and command options
- Flags that appear on a separate line
- Code examples and output
- Message text
- Names of files and directories
- Text strings you must type, when they appear within text
- Names of Java methods and classes
- HTML and XML tags also appear like this, in monospace type

For syntax notations, remember the following:

- In UNIX, the prompt for the root user is #.
- In UNIX and Linux, the commands are case sensitive, so you must type commands exactly as they are shown.

---

## Contacting the IBM Support Center

You can contact IBM Support Center in several ways.

- Go to the IBM Tivoli Storage Productivity Center technical support website at [http://www.ibm.com/support/entry/portal/Overview/Software/Tivoli/Tivoli\\_Storage\\_Productivity\\_Center\\_Standard\\_Edition](http://www.ibm.com/support/entry/portal/Overview/Software/Tivoli/Tivoli_Storage_Productivity_Center_Standard_Edition).  
To receive future support notifications, sign in under **Notifications**. You are required to enter your IBM ID and password. After you are authenticated, you can configure your subscription for Tivoli Storage Productivity Center technical support website updates.
- Customers in the United States can call 1-800-IBM-SERV (1-800-426-7378).
- For international customers, go to the Tivoli Storage Productivity Center technical support website to find support by country. Expand **Contact support** and click **Directory of worldwide contacts**.

You can also review the *IBM Software Support Handbook*, which is available at <http://www14.software.ibm.com/webapp/set2/sas/f/handbook/home.html>.

The support website offers extensive information, including a guide to support services; frequently asked questions (FAQs); and documentation for all IBM Software products, including Redbooks and white papers. Translated documents are also available for some products.

When you contact the IBM Support Center, be prepared to provide identification information for your company so that support personnel can readily assist you. Company identification information might also be needed to access various online services available on the website. See “Reporting a problem.”

## Reporting a problem

This topic provides a list of what information you should have ready when you encounter a problem.

Have the following information ready when you report a problem:

- The IBM Tivoli Storage Productivity Center version, release, modification, and service level number.
- The communication protocol (for example, TCP/IP), version, and release number that you are using.
- The activity that you were doing when the problem occurred, listing the steps that you followed before the problem occurred.
- The exact text of any error messages.

---

# New for Tivoli Storage Productivity Center Version 5.1

Learn about new features and enhancements in IBM Tivoli Storage Productivity Center Version 5.1.

## New Features

The following features are new in Tivoli Storage Productivity Center 5.1:

### Graphical user interfaces

Tivoli Storage Productivity Center provides two graphical user interfaces for managing the storage infrastructure in an enterprise environment: the stand-alone GUI and the web-based GUI. Each GUI provides different functions for working with monitored resources.

To view a comparison of the functions that are available in each GUI, see “Available functions and report information in the interfaces” on page 19.

### Viewing reports from the web-based GUI

From the web-based GUI, you can now run the following types of report in Tivoli Common Reporting:

#### Resources reports

Show the relationships between storage resources in your environment. Resources reports also provide a snapshot of the capacity, available space, and used space on servers, storage virtualizers, storage systems, and related storage resources.

#### Performance reports

Show performance statistics for the most active storage resources in your environment over a specified period. Performance reports also provide detailed statistics for specific storage resources.

#### Historical space reports

Show how space is used over a specified period on storage virtualizers, storage systems, and related storage resources.

#### Storage tiering reports

Show volumes that might require migration from a pool in a storage resource group to a pool in another storage resource group. You also use the Tivoli Storage Productivity Center web-based GUI to view the workload activity reports for managed disk groups and virtual disks.

### Creating and designing reports from the web-based GUI

From the web-based GUI, you can create custom reports and design custom reports. You can create and design the reports in report tools in Tivoli Common Reporting.

Custom reports can contain detailed information about the relationships between monitored resources, the properties of monitored resources, and detailed information about the performance of monitored resources. Unlike predefined reports, you can select the information that you want to include in custom reports.

You can create reports with basic formatting, or you can design more complex reports with advanced formatting features. The advanced

formatting features include inserting charts that you can customize in reports, and inserting links that open related reports.

### **Installing Tivoli Storage Productivity Center**

You can install Tivoli Storage Productivity Center in one of the following ways:

#### **Installation wizard**

The installation wizard provides a graphical user interface for installation.

#### **Command-line interface by using silent mode**

In silent mode, you run a command and provide the installation values in a response file. A silent-mode installation is useful if your system is running from a terminal that cannot display graphics.

### **Installation configurations**

When you install Tivoli Storage Productivity Center, your system can be configured in one of the following ways:

#### **Single server**

All Tivoli Storage Productivity Center components are installed on one server.

#### **Multiple servers**

In the multiple-servers environment, you can have these configurations:

- DB2 and the Tivoli Storage Productivity Center database repository on a remote server and the rest of the Tivoli Storage Productivity Center components on a local server.
- DB2 and the Tivoli Storage Productivity Center servers, stand-alone GUI, command-line interface, and Storage Resource agent on one server, and IBM Tivoli Integrated Portal, Tivoli Common Reporting, and web-based GUI on a remote server.

### **Installation components**

When you install Tivoli Storage Productivity Center, the following components are included:

- Database repository
- Data server
- Device server
- Replication server
- Stand-alone graphical user interface
- Web-based graphical user interface
- Command-line interface
- Storage Resource agent
- Tivoli Integrated Portal Version 2.2
- Tivoli Common Reporting Version 2.1.1

### **Lightweight Directory Access Protocol**

You no longer have to configure Lightweight Directory Access Protocol (LDAP) as an authentication method during the installation. You configure LDAP as a post-installation task. The Tivoli Storage Productivity Center installation program establishes a default authentication configuration by using the federated repositories feature of the WebSphere Application Server.

For more information about LDAP and how to add an LDAP repository, see the Tivoli Storage Productivity Center information center and search for *Administering Tivoli Integrated Portal*.

### **Tivoli Storage Productivity Center licenses**

The following licenses are available in Tivoli Storage Productivity Center 5.1:

#### **IBM Tivoli Storage Productivity Center**

This license contains the following functions:

- Data management. Data management includes enterprise-wide reporting and monitoring, and automated capacity provisioning for direct-attached storage (DAS), network-attached storage (NAS), and storage area networks (SAN) environments.
- Disk management. Disk management helps you manage SANs and heterogeneous storage from one console.
- Fabric management. Fabric management helps you manage the SAN fabric that connects the host systems and applications to the storage devices. This feature includes automatic resource and topology discovery, monitoring, alerts, and zone control.
- Tape management. Tape management helps you manage your tape libraries that must be SMI-S compliant.

#### **Tivoli Storage Productivity Center for Replication**

All of the Tivoli Storage Productivity Center for Replication functions, including the functions that were previously in the Two Site and Three Site Business Continuity licenses.

- Performance management. Disk and Fabric performance management functions.
- Device support. For the devices that you can use with Tivoli Storage Productivity Center, see <http://www.ibm.com/support/docview.wss?rs=40&uid=swg21386446>.

#### **IBM Tivoli Storage Productivity Center Select Edition**

This license contains all the functions of the IBM Tivoli Storage Productivity Center license.

#### **IBM Tivoli Storage Productivity Center Advanced**

This license contains all the functions in the Tivoli Storage Productivity Center license plus these additional analytical functions:

- Configuration Analysis
- Configuration History
- SAN Planner
- Storage Optimizer

#### **Tivoli Storage Productivity Center for data-related functions**

- Scans
- Policy management
- Server probes
- Profiles
- Data Manager for Databases
- Data Manager for Chargeback

### **IBM Scale Out Network Attached Storage**

IBM Scale Out Network Attached Storage (IBM SONAS) manages repositories of information in enterprise environments that require large capacities, high levels of performance, and high availability. IBM SONAS uses up to 2 petabytes (PB) of storage in a large file system.

### **Policy-based storage tier reports**

Use the Tivoli Storage Productivity Center command-line interface to issue commands that create user-defined storage tiering policies. Storage tiering policies set the conditions that must be met to determine whether a volume requires migration to another pool.

## **New for Tivoli Storage Productivity Center for Replication Version 5.1**

Use this information to learn about new features and enhancements in IBM Tivoli Storage Productivity Center for Replication Version 5.1. This information highlights the changes since the last release of Tivoli Storage Productivity Center for Replication.

### **Failover operations that are managed by other applications**

Applications such as the IBM Series i Toolkit, VMware Site Recovery Manager, and Veritas Cluster Server manage failover operations for certain session types and storage systems. If an application completes a failover operation for a session, the Severe status is displayed for the session. An error message is also generated for the role pairs for which the failover occurred.

For more information, see “Failover and failback operations” on page 695.

### **Additional support for space-efficient volumes in remote copy Tivoli Storage Productivity Center for Replication sessions**

You can use extent space-efficient volumes as copy set volumes for the following IBM System Storage DS8000 session types:

- FlashCopy® (System Storage DS8000 6.2 or later)
- Metro Mirror (System Storage DS8000 6.3 or later)
- Global Mirror or Metro Global Mirror (System Storage DS8000 6.3 or later)

For more information, see “Copy sets” on page 690.

### **New features**

The following features are new for Tivoli Storage Productivity Center for Replication version 5.1.

#### **Reflash After Recover option for Global Mirror Failover/Failback with Practice sessions**

You can use the **Reflash After Recover** option with System Storage DS8000 version 4.2 or later. Use this option to create a FlashCopy replication between the I2 and J2 volumes after the recovery of a Global Mirror Failover/Failback with Practice session. If you do not use this option, a FlashCopy replication is created only between the I2 and H2 volumes.

For more information, see “Session properties” on page 771.

### **No Copy option for Global Mirror Failover/Failback with Practice and Metro Global Mirror with Practice sessions**

You can use the **No Copy** option with System Storage DS8000 version 4.2 or later. Use this option if you do not want the hardware to write the background copy until the source track is written to.

For more information, see “Session properties” on page 771.

### **Recovery Point Objective Alerts option for Global Mirror sessions**

You can use the **Recovery Point Objective Alerts** option with IBM TotalStorage Enterprise Storage Server® Model 800, System Storage DS8000, and System Storage DS6000. Use this option to specify the length of time that you want to set for the recovery point objective (RPO) thresholds. The values determine whether a Warning or Severe alert is generated when the RPO threshold is exceeded for a role pair. The RPO represents the length of time in seconds of data exposure that is acceptable in the event of a disaster.

For more information, see “Session properties” on page 771.

### **StartGC H1->H2 command for Global Mirror sessions**

You can use the StartGC H1->H2 command with TotalStorage Enterprise Storage Server Model 800, System Storage DS8000, and System Storage DS6000. This command establishes Global Copy relationships between site 1 and site 2, and begins asynchronous data replication from H1 to H2.

This command is available only for Global Mirror Failover/Failback and Global Mirror Failover/Failback with Practice sessions.

For more information about this command, see “Session commands” on page 729.

### **Export Global Mirror Data command for Global Mirror role pairs**

You can use this option to export data for a Global Mirror role pair that is in a session to a comma-separated value (CSV) file. You can then use the data in the CSV file to analyze trends in your storage environment that affect your recovery point objective (RPO).

For more information, see “Exporting historical data for Global Mirror role pairs” on page 757.

### **New chsess command parameters**

The command-line interface command **chsess** has new parameters:

- **-reflash**
- **-dsRPOwarning**
- **-dsRPOsevere**
- **-enableHardenedFreeze**

For more information, go to the Tivoli Storage Productivity Center for Replication information center at <http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp> and search for *chsess*.

**Related tasks:**

“Running the Volume Migration Recommendation Report” on page 1271

To see volumes that might require migration to other pools, run the Volume Migration Recommendation Report.

**Related reference:**

“Volume Migration Recommendation Report” on page 1271

The Volume Migration Recommendation Report, shows the volumes that comply with the criteria for migrating volumes to a pool in another storage resource group. Use the report to identify volumes that might require migration based on the conditions that are set in tiering policies.

---

## Chapter 1. Getting started

Use this task list as a getting started guide for installing and using IBM Tivoli Storage Productivity Center. The tasks are in sequential order to help you learn how the product works and how to get started administering and managing your storage environment.

Complete the following tasks as shown and click the included links to learn more about the capabilities of Tivoli Storage Productivity Center. Follow the tasks as outlined: planning, installing, configuring, administering, managing storage devices, and reporting. Troubleshooting contains procedures for debugging any problems that you might encounter.

**Learn more:** See the topics about planning and installing the Tivoli Storage Productivity Center in the IBM Tivoli Storage Productivity Center Information Center (<http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp>).

Task	Description	When and how often must I perform this task?
<b>Determine prerequisites and plan for installation.</b>	<p>The first installation task is planning for Tivoli Storage Productivity Center. The time you invest in planning directly affects your ease of implementation. Planning includes:</p> <ul style="list-style-type: none"><li>• Ensuring that your systems meet hardware and software requirements</li><li>• Determining where to deploy Storage Resource agents</li><li>• Ensuring that ports are open for use by Tivoli Storage Productivity Center components</li><li>• Granting privileges to the user ID used to install the Tivoli Storage Productivity Center components</li><li>• Setting up for LDAP Support</li></ul>	Perform this task before you install Tivoli Storage Productivity Center.
<b>Install Tivoli Storage Productivity Center.</b>	<p>The second task is installing Tivoli Storage Productivity Center.</p> <p>You can install all the Tivoli Storage Productivity Center components using typical installation or custom installation. It is recommended that for a production environment you use custom installation.</p> <p>Tivoli Storage Productivity Center has the following installable components:</p> <ul style="list-style-type: none"><li>• Database schema</li><li>• Data server</li><li>• Device server</li><li>• Graphical user interface (GUI)</li><li>• Command-line interface (CLI)</li><li>• Storage Resource agent</li><li>• IBM Tivoli Integrated Portal</li></ul>	Perform this task after you have completed planning and ensuring that you meet the installation prerequisites. You can also install components separately depending on your needs, so you might perform a portion of the installation process a number of times after the initial installation. For example, you can install Storage Resource agents at any time on the computers whose storage you want to monitor.

Task	Description	When and how often must I perform this task?
<b>Start and Configure Tivoli Storage Productivity Center.</b>	<p>Perform this task after installing Tivoli Storage Productivity Center to configure it according to the standards within your organization, including:</p> <ul style="list-style-type: none"> <li>• Starting the Tivoli Storage Productivity Center GUI.</li> <li>• Running the Configuration Utility as a guide to help you through the steps required to configure and manage Tivoli Storage Productivity Center for your environment.</li> <li>• Using the Help menu to access the online help system, launch the product information center, and access information about the appropriate levels of software, firmware, and hardware that is needed to run the product.</li> <li>• Assigning roles to individuals who use the product.</li> <li>• Entering licensing information.</li> <li>• Setting SNMP and e-mail alerts.</li> <li>• Entering retention settings for log files, resource history, and removed resources.</li> <li>• Defining rules for generating e-mail addresses of quota violators.</li> <li>• Scheduling history aggregation and agent upgrades.</li> <li>• Setting up NAS filer access.</li> <li>• Setting up IBM TotalStorage Enterprise Storage Server or SAN Volume Controller access.</li> <li>• Using configuration history to analyze historical data that identifies possible problems with a storage area network (SAN) configuration.</li> <li>• Using configuration analysis to determine whether an existing SAN configuration complies with predefined best practices.</li> </ul>	<p>Typically, you perform this step immediately after installing the product. Once Tivoli Storage Productivity Center is configured, you do not have to perform this step again unless changes within your organization require it.</p>

Task	Description	When and how often must I perform this task?
<b>Administer DB2 and Tivoli Storage Productivity Center.</b>	<p>Once Tivoli Storage Productivity Center is installed and configured, perform the following administrative tasks as needed:</p> <ul style="list-style-type: none"> <li>• Authorizing users.</li> <li>• Managing Agent Manager.</li> <li>• Administering data sources (agents): CIMOM, Data, Storage Resource, Inband Fabric, Out of Band Fabric, Storage Subsystems, TPC Servers, VMWare VI.</li> <li>• Starting and stopping Tivoli Storage Productivity Center services</li> <li>• Increasing the memory allocation and checking the status of Tivoli Storage Productivity Center components.</li> <li>• Setting timeout values for the Device server.</li> <li>• Changing passwords for Tivoli Storage Productivity Center components</li> <li>• Configuring the launch of the IBM Tivoli Storage Productivity Center for Replication GUI and other web GUIs or local executable files.</li> <li>• Collecting information with the service tool.</li> </ul>	<p>Perform administrative tasks at any time during the use of Tivoli Storage Productivity Center. These tasks are meant to provide you with the tools to maintain a successful implementation of the product during its lifecycle.</p>
<b>Configure storage devices for monitoring</b>	<p>Before you can use Tivoli Storage Productivity Center to monitor the storage devices in your environment, you must configure them within the user interface. Configuring devices includes the following tasks:</p> <ul style="list-style-type: none"> <li>• Discovering storage devices.</li> <li>• Including storage devices in monitoring groups (optional).</li> <li>• Defining data collection schedules.</li> <li>• Determining the conditions that must occur before you are alerted to a problem related to the devices you are monitoring.</li> </ul> <p>There are two methods for configuring storage devices in Tivoli Storage Productivity Center</p> <ul style="list-style-type: none"> <li>• Use the Configure Devices wizard to guide you through the steps of configuring devices. The wizard is available under the <b>IBM Tivoli Storage Productivity Center</b> node in the navigation tree.</li> <li>• Manually configure devices using the corresponding nodes in the navigation tree.</li> </ul> <p>The following rows in the table provide more information about these tasks.</p>	<p>Perform this task when you want to configure storage devices for monitoring by Tivoli Storage Productivity Center. You can configure devices that are already known to Tivoli Storage Productivity Center but not included in a probe schedule, or configure devices that have not yet been discovered.</p>

Task	Description	When and how often must I perform this task?
<b>Configure storage devices:</b> running discovery schedules	<p>Perform discovery to detect the storage devices and network topology within your environment. Discovery schedules collect basic information about the storage devices, including computers, CIMOMs, storage subsystems, fabrics, filers, clusters, and tape libraries.</p> <p>To discover storage devices, use either of the following methods:</p> <ul style="list-style-type: none"> <li>• Use the discovery step in the Configure Devices wizard to automate the detection of storage devices.</li> <li>• Go to the <b>Administrative Services &gt; Discovery</b> node in the navigation tree and manually define a schedule for the device type that you want to detect.</li> </ul>	<p>You must run discovery schedules before you can collect more detailed information about storage resources. Once discovery has run, use data collection schedules such as probes, scans, and pings to collect more detailed information about the discovered storage devices.</p> <p>See Discover resources in your system for more information.</p>
<b>Configure storage devices:</b> defining monitoring groups for the related storage devices in your environment	<p>Organize related storage devices into groups (optional). Use groups when you want to perform the same action against multiple devices. For example, if you create a group that contains all the storage systems for the Sales division within your organization, you can include that group in a data collection schedule. The schedule then collects information about the all the storage systems in the Sales group without requiring you to add them individually to a schedule.</p> <p>As new devices are introduced into the environment, you can add them to existing groups. The same actions that are already associated with the group are then applied to the new devices.</p> <p>To create groups, use either of the following methods:</p> <ul style="list-style-type: none"> <li>• Use the monitoring group step in the Configure Devices wizard to automate the grouping of devices.</li> <li>• Use the Monitoring &gt; Groups facility within each of Tivoli Storage Productivity Center managers to define a group that corresponds to that manager. For example, use Disk Manager to create storage subsystem monitoring groups; use Fabric Manager to create fabric groups; use Data Manager to create computer, file system, directory, user, and OS user monitoring groups.</li> </ul>	<p>Create monitoring groups before you do the following:</p> <ul style="list-style-type: none"> <li>• Define data collection schedules (probes, scans, and pings) to collect information about storage devices.</li> <li>• Define Data Manager quotas and constraints to enforce storage policies.</li> </ul> <p>Creating groups is not required, but they are meant to help you better organize your storage devices for monitoring in a large environment.</p> <p>See the following topics for more information:</p> <ol style="list-style-type: none"> <li>1. "Data collection groups" on page 370</li> <li>2. "Working with groups of resources" on page 373</li> </ol>

Task	Description	When and how often must I perform this task?
<p><b>Configure storage devices:</b> determining the information you want to gather about the devices in your environment and defining data collection schedules.</p>	<p>Determining what information you want to gather about the storage devices within your enterprise is critical to helping you implement a storage management strategy.</p> <p>Once you have determined the types of information you want to collect about your storage devices, you can use data collection schedules to gather that information. Use the following schedules to collect data about storage devices:</p> <ul style="list-style-type: none"> <li>• Probes: collect detailed statistics about storage devices.</li> <li>• Scans: collect data about the usage and trending of your storage consumption.</li> <li>• Pings: collect information about the availability (uptime) of computers.</li> <li>• Storage Subsystem Performance Monitors: collect statistics about the performance of storage subsystems.</li> <li>• Fabric Performance Monitors: collect statistics about the performance of fabrics.</li> <li>• TPC Server probes: gather the information that has been collected by multiple Tivoli Storage Productivity Center servers.</li> </ul> <p>To create data collection schedules, use either of the following methods:</p> <ul style="list-style-type: none"> <li>• For creating probes and pings, you can use the data collection step in the Configure Devices wizard.</li> <li>• Go to the Monitoring &gt; <i>schedule_name</i> node available in each manager, where <i>schedule_name</i> represents the schedule type (for example, probe, scan, ping, performance monitor). For example, to create a scan, go to the <b>Data Manager &gt; Monitoring &gt; Scan</b> node in the navigation tree.</li> </ul>	<p>Define data collection schedules after you determine the type of data you want to collect. You must collect data about storage devices before you can perform the other tasks within Tivoli Storage Productivity Center, such as viewing reports, enforcing storage policies, setting alerts, using the topology viewer, and managing storage subsystems.</p> <p>After you define a data collection schedule, you do not need to redefine that schedule in the future unless you want to add or remove devices. The schedule runs at the times you specified in its definition.</p> <p>See the following topics for more information:</p> <ul style="list-style-type: none"> <li>• Collect data from system resources</li> <li>• “Collecting storage statistics” on page 337</li> <li>• “Collecting storage usage and trending information” on page 346</li> <li>• “Determining the availability of storage resources” on page 366</li> <li>• “Collecting performance data” on page 377</li> <li>• “Managing fabrics” on page 576</li> <li>• “Collecting storage statistics from Tivoli Storage Productivity Center servers” on page 342</li> </ul>

Task	Description	When and how often must I perform this task?
<p><b>Configure storage devices:</b> determining the conditions that must occur before you are alerted to a problem within your storage environment.</p>	<p>Determining when and how you are alerted to conditions within your storage environment is important to helping you maintain and administer storage devices. Tivoli Storage Productivity Center provides an extensive list of conditions from which you can choose. See “Triggering conditions for alerts” on page 1439 for a list of triggering conditions for storage devices.</p> <p>When a condition is met and alert is triggered, you can choose to be notified through an SNMP trap, IBM Tivoli Enterprise Console event, login notification, event log (Windows), syslog (UNIX), or e-mail.</p> <p>To associate alert conditions with storage devices, use either of the following methods:</p> <ul style="list-style-type: none"> <li>• Use the Configure Devices wizard to guide you through the steps for associating alert conditions with the storage devices that you want to monitor.</li> <li>• Go to the <b>Alerting</b> node available in each manager to manually associate a specific type of alert condition with storage devices. For example, to associate alert conditions with computers, go to the <b>Data Manager &gt; Alerting &gt; Computer Alerts</b> node in the navigation tree.</li> </ul>	<p>Define alerts:</p> <ul style="list-style-type: none"> <li>• After defining data collection schedules</li> <li>• Based on the information gathered by data collection schedules</li> </ul> <p>Alerts are checked whenever a probe or scan schedule is collects data about storage devices. Computer, fabric, switch, and endpoint alerts are triggered by probes. Directory and storage subsystem alerts are triggered by scans. File system free space alerts are triggered by both probes and scans. All other file system alerts are triggered only by probes.</p> <p>After you define an alert, you do not need to redefine it in the future (unless you want to change it). Defining an alert is a one-time only task.</p> <p>See “Working with alerts” on page 385 for more information.</p>

Task	Description	When and how often must I perform this task?
<p><b>Manage storage resources:</b> determining the storage policies that you want to enforce.</p>	<p>Enforcing storage policies within your organization can be critical to ensuring the proper and most cost-effective use of your storage devices. Use the following policy management functions to set policies for devices that are monitored by Tivoli Storage Productivity Center:</p> <ul style="list-style-type: none"> <li>• Use quotas to define limits on the amount of storage that a user or a group of users can consume.</li> <li>• Use Network Appliance Quotas to import, view, and report on the NetApp Quotas defined on NAS filers.</li> <li>• Use constraints to define the acceptable and unacceptable file types, file sizes, and file owners for a computer or a set of computers in your environment.</li> <li>• Use file system extensions to automatically extend file systems when utilization reaches a specified threshold.</li> <li>• Use scheduled actions to run scripts against storage devices on a schedule that you define.</li> </ul>	<p>A quota runs according to the schedule that you specified. Because quotas look at the information gathered by scans to determine quota violations, you must schedule quotas to run after the appropriate scan. For example, if you want to restrict the amount of space consumed by users on specific computers, run a scan on those computers to collect usage information before running the quota to enforce that usage restriction.</p> <p>Constraints are automatically checked whenever a scan is run against the storage devices to which the constraint applies.</p> <p>Schedule file system extensions after running probes of the related storage devices and file systems.</p> <p>Run scheduled actions immediately, once at a specified time, or repeatedly according to a schedule you specify.</p> <p>See the following topics for more information:</p> <ol style="list-style-type: none"> <li>1. Creating and enforcing storage policies</li> <li>2. “Setting storage usage quotas” on page 445</li> <li>3. “Setting file constraints” on page 470</li> <li>4. “Scheduling script-based actions” on page 479</li> </ol>
<p><b>Manage storage devices:</b> working with storage systems and fabrics.</p>	<p>Use the following functions to manage the storage systems and fabrics that are monitored by Tivoli Storage Productivity Center:</p> <ul style="list-style-type: none"> <li>• Use the Storage Optimizer identify performance bottlenecks and recommend changes to improve performance.</li> <li>• Use the SAN Planner to assist in the end-to-end planning of fabrics, hosts, storage controllers, storage pools, volumes, paths, ports, zones, and zone sets.</li> <li>• Define storage resource groups to logically group related storage entities such as hosts, storage subsystems, fabrics, and switches.</li> <li>• Define element managers for storage subsystems.</li> <li>• Manage virtual disks: assign host ports, create virtual disks, delete virtual disks, add a managed disk to a managed-disk group, view virtual-disk information.</li> <li>• Manage volumes: assign host ports, create volumes, delete volumes, view information about volumes.</li> </ul>	<p>You can manage storage subsystems at any time after collecting information about them through discovery and monitoring jobs.</p> <p>See the following topics for more information:</p> <ul style="list-style-type: none"> <li>• “Optimizing storage configurations” on page 432</li> <li>• “Planning and modifying storage configurations” on page 419</li> <li>• “Working with workload profiles” on page 541</li> <li>• “Managing storage subsystems” on page 551</li> <li>• “Managing virtual disks” on page 561</li> <li>• “Managing volumes” on page 570</li> </ul>

Task	Description	When and how often must I perform this task?
<b>Manage storage devices:</b> charging for storage usage	Use the storage usage information gathered by data collection schedules to generate invoices that charge back for storage usage.	Generate invoices whenever you want to charge users or groups of users in your organization for their storage usage.  See “Working with invoices” on page 613 for more information.
<b>Manage storage devices:</b> setting up and managing replication	Use Tivoli Storage Productivity Center for Replication to manage the advanced copy services for storage systems, including setting up management servers, adding storage connections and paths, creating sessions and copy sets, setting up data replication, performing planned maintenance, and recovering from a disaster.	Access the Tivoli Storage Productivity Center for Replication user interface at any time to set up management servers and connections to storage systems.  See Chapter 7, “Managing replication,” on page 657 for more information.
<b>View information about storage devices:</b> using the topology viewer	Use the topology viewer to see a graphical representation of the physical and logical storage resources that have been discovered in your environment. You can view the health status, performance, and other details about storage resources through this function.  The topology viewer consists of two views, a graphical view and a table view. The table view shows the same information as the graphical view, but in a tabular format.	You can use the topology viewer at any time after running monitoring jobs to collect the information about your storage environment.  See “Using the topology viewer” on page 499 for more information.
<b>View information about storage devices:</b> using any of the following report types: predefined, user-defined, batch, and rollup reports.	Use reports to view the information that is gathered by data collection and quota schedules.  Consider the following steps when determining how to best use Tivoli Storage Productivity Center reports: <ol style="list-style-type: none"><li>1. Determine how you want to generate and view reports by selecting a reporting type that best meets your needs.</li><li>2. Identify which reports contain the most important information about your storage environment.</li><li>3. Run the appropriate data collection schedules.</li><li>4. Generate the reports you want to view.</li></ol>	Perform this task after the appropriate data collection schedules have run and you want to view information about your storage devices.  See the following topics for more information: <ol style="list-style-type: none"><li>1. “Choosing a reporting type” on page 795</li><li>2. “Choosing a report category” on page 797</li><li>3. “What can I find out using reports?” on page 803</li><li>4. “Working with reports” on page 811</li></ol>
<b>Troubleshooting</b>	Use troubleshooting tips to resolve any problems you might have with Tivoli Storage Productivity Center.	Perform troubleshooting tasks when you encounter problems while working with the product. Troubleshooting information is meant to help you with resolving issues that might occur during the use of the product.

---

## Chapter 2. Product overview

IBM Tivoli Storage Productivity Center provides a set of policy-driven automated tools for managing storage capacity, availability, events, performance and assets in your enterprise environment, including NAS, SSA, TotalStorage Enterprise Storage Server, and Microsoft Cluster Server technologies, as well as RDBMSs such as Oracle, Sybase SQL Server, Microsoft SQL Server, and DB2 UDB. Tivoli Storage Productivity Center provides storage management from the host and application to the target storage device. It provides disk and tape subsystem configuration and management, performance management, SAN fabric management and configuration, and usage reporting and monitoring.

Tivoli Storage Productivity Center can help you identify, evaluate, control and predict your enterprise storage management assets. Because it is policy-based, it can detect potential problems and automatically make adjustments based on the policies and actions that you define. For example, it can notify you when your system is running out of disk space or warn you of impending storage hardware failure. By alerting you to these and other issues related to your stored data, it enables you to prevent unnecessary system and application downtime.

Tivoli Storage Productivity Center:

- Simplifies the management of storage infrastructures
- Manages, configures, and provisions SAN-attached storage
- Monitors and tracks performance of SAN-attached devices
- Monitors, manages, and controls (through zones) SAN fabric components
- Manages the capacity utilization and availability of file systems and databases

For select IBM hardware orders only, IBM Tivoli Storage Productivity Center Limited Edition, limited to 2 TB storage managed, is provided at no charge, and with one year software maintenance. IBM Tivoli Storage Productivity Center Advanced Edition includes support for TS3500 and limited support for 3494 tape libraries.

---

### Introducing IBM Tivoli Storage Productivity Center

This section provides an overview of IBM Tivoli Storage Productivity Center.

IBM Tivoli Storage Productivity Center provides a set of policy-driven automated tools for managing storage capacity, availability, events, performance and assets in your enterprise environment. Tivoli Storage Productivity Center provides storage management from the host and application to the target storage device. It provides disk and tape subsystem configuration and management, performance management, SAN fabric management and configuration, and usage reporting and monitoring.

Tivoli Storage Productivity Center can help you identify, evaluate, control and predict your enterprise storage management assets. Because it is policy-based, it can detect potential problems and automatically make adjustments based on the policies and actions that you define. For example, it can notify you when your system is running out of disk space or warn you of impending storage hardware

failure. By alerting you to these and other issues related to your stored data, it enables you to prevent unnecessary system and application downtime.

Tivoli Storage Productivity Center:

- Simplifies the management of storage infrastructures
- Manages, configures, and provisions SAN-attached storage
- Monitors and tracks performance of SAN-attached devices
- Monitors, manages, and controls (through zones) SAN fabric components
- Manages the capacity utilization and availability of file systems and databases

## Architecture

The IBM Tivoli Storage Productivity Center consists of several key components. This topic identifies these components and shows how they are related.

### Data server

This component is the control point for product scheduling functions, configuration, event information, reporting, and graphical user interface (GUI) support. It coordinates communication with and data collection from agents that scan file systems and databases to gather storage demographics and populate the database with results. Automated actions can be defined to perform file system extension, data deletion, and Tivoli Storage Productivity Center backup or archiving, or event reporting when defined thresholds are encountered. The Data server is the primary contact point for GUI user interface functions. It also includes functions that schedule data collection and discovery for the Device server.

### Device server

This component discovers, gathers information from, analyzes performance of, and controls storage subsystems and SAN fabrics. It coordinates communication with and data collection from agents that scan SAN fabrics and storage devices.

### Replication server

This component coordinates communication and processes tasks that are related to replication and Tivoli Storage Productivity Center for Replication.

### Database

A single database instance serves as the repository for all Tivoli Storage Productivity Center components.

### Agents

Storage Resource agent, CIM agents, and Out of Band fabric agents gather host, application, storage system, and SAN fabric information and send that information to the Data Server or Device server.

**Tip:** Data agents and Fabric agents are supported in V4.2. However, no new functions were added to those agents for that release. For optimal results when using Tivoli Storage Productivity Center, migrate the Data agents and Fabric agents to Storage Resource agents.

**GUI** Tivoli Storage Productivity Center provides two graphical user interfaces for managing the storage infrastructure in an enterprise environment. a stand-alone GUI and the web-based GUI. Each GUI provides different functions for working with monitored resources. To view a comparison of the functions that are available in each GUI, see “Available functions and report information in the interfaces” on page 19.

**CLI** Use the command-line interface (CLI) to issue commands for key Tivoli Storage Productivity Center functions.

### Tivoli Integrated Portal

The Tivoli Storage Productivity Center installation program includes IBM Tivoli Integrated Portal. Tivoli Integrated Portal is a standards-based architecture for Web administration. Tivoli Integrated Portal enables developers to build administrative interfaces for IBM and independent software products as individual plug-ins to a common console network. The installation of Tivoli Integrated Portal is required to enable single sign-on for Tivoli Storage Productivity Center. *Single sign-on* is an authentication process that you can use to enter one user ID and password to access multiple applications. Single sign-on integrates with launch in context features so you can move smoothly from one application to another application.

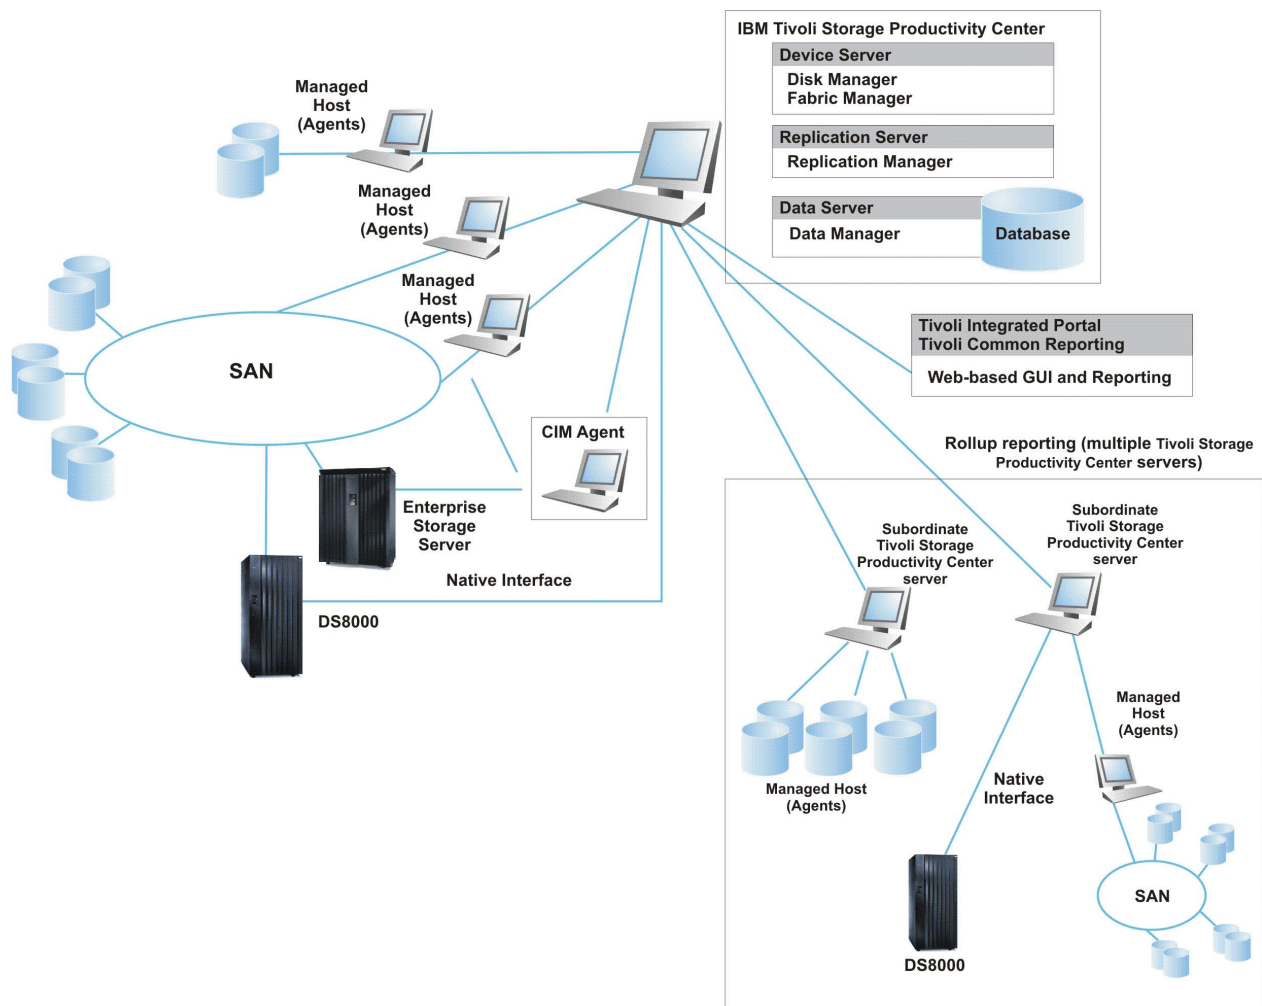

Figure 1. Tivoli Storage Productivity Center components

## IBM Tivoli Storage Productivity Center summary

This topic provides a summary of the functionality provided by Tivoli Storage Productivity Center.

The Tivoli Storage Productivity Center functions are shown in Table 2 on page 12.

Table 2. Tivoli Storage Productivity Center summary of functions

Data management	Disk management	Fabric management	Tape management
Host-centric: <ul style="list-style-type: none"> <li>• Discovery of storage resources</li> <li>• Monitoring of storage resources</li> <li>• Filesystem extension</li> <li>• Enterprise-wide reporting</li> </ul> Application-centric: <ul style="list-style-type: none"> <li>• Monitoring of relational databases DB2, Oracle, SQL Server, Sybase</li> <li>• Chargeback</li> </ul>	For storage subsystems: <ul style="list-style-type: none"> <li>• Discovery of storage resources</li> <li>• Monitoring of storage resources</li> <li>• Configuration (for example, creating volumes)</li> <li>• Performance management</li> </ul>	For fabrics: <ul style="list-style-type: none"> <li>• Discovery of storage resources</li> <li>• Monitoring of storage resources</li> <li>• Configuration (for example, zoning)</li> <li>• Performance management</li> </ul>	For tape libraries: <ul style="list-style-type: none"> <li>• Discovery of storage resources</li> <li>• Monitoring of storage resources</li> </ul>

## Product licenses for Tivoli Storage Productivity Center

Product licenses are available for IBM Tivoli Storage Productivity Center. Each license determines the functions that are accessible in the stand-alone GUI, command-line interface, and the API. You can review the functions that are included with each license and determine which license meets your storage management needs.

### IBM Tivoli Storage Productivity Center

This license contains the following functions:

#### Data management

A file and capacity management solution for heterogeneous storage environments. Data management includes enterprise-wide reporting and monitoring, and automated capacity provisioning for Direct Attached Storage (DAS), network-attached storage (NAS), and Storage Area Network (SAN) environments.

#### Disk management

Disk management helps you manage SANs and heterogeneous storage from one console.

#### Fabric management

Fabric management helps you manage the SAN fabric that connects the host systems and applications to the storage devices. This feature is a comprehensive management solution for multi-vendor SANs and includes automatic resource and topology discovery, monitoring, alerts, and zone control.

#### Tape management

Tape management helps you manage your SMI-S compliant tape libraries.

### Tivoli Storage Productivity Center for Replication

This license includes all the Tivoli Storage Productivity Center for Replication functions.

#### Performance management

Disk and Fabric performance management functions.

### Device support

You can see a complete list of devices that can be used with Tivoli Storage Productivity Center at <https://www.ibm.com/support/docview.wss?uid=swg21386446>. Click the appropriate release under **Storage**.

### IBM Storage Productivity Center Select Edition

This license contains all the functions of the IBM Tivoli Storage Productivity Center license. This license is priced by enclosure rather than by capacity.

### IBM Tivoli Storage Productivity Center Advanced

This license contains everything in IBM Tivoli Storage Productivity Center license and the following functions:

#### Analytical functions

- Configuration analysis
- Configuration history
- SAN Planner
- Storage Optimizer

#### Tivoli Storage Productivity Center for data-related functions

- Scans
- Policy management
- Server probes
- Scans
- Profiles
- Data Manager for databases
- Data Manager for Chargeback

Use the following tables to view the specific functions, reports, and elements of the user interface that are available with each license.

## User interfaces to Tivoli Storage Productivity Center

Tivoli Storage Productivity Center provides several user interfaces for managing the storage infrastructure in an enterprise environment.

The following user interfaces are provided:

- A stand-alone GUI for completing all the storage management tasks that are available in Tivoli Storage Productivity Center. This interface is the same interface that was used in previous versions, and provides full access to all the new functions (except for web-based GUI reporting) and existing functions in the product.
- A web-based GUI for monitoring and troubleshooting the condition of storage resources in your environment. From the web-based GUI, you can view predefined reports, create custom reports, and design custom reports about storage resources. This new, improved interface provides quick access to key storage asset, status, and performance information that is collected by Tivoli Storage Productivity Center. You can access this interface from anywhere that you have a web browser and connectivity to a network.
- A command-line interface for running Tivoli Storage Productivity Center commands from a command prompt.

Each GUI provides different functions for working with monitored resources. Determine which GUI to use based on the tasks that you need to complete.

### Related concepts:

Chapter 6, “Managing resources in the web-based GUI,” on page 623

You can use the web-based GUI to monitor the condition, capacity, and relationships of the monitored resources within your storage environment.

### Available functions and report information in the interfaces

IBM Tivoli Storage Productivity Center 5.1 provides two graphical user interfaces (GUI) for managing the resources in a storage environment: a stand-alone GUI and a web-based GUI. Each interface provides different functions for working with monitored resources.

### GUI overview

Use the following information to determine which interface best helps you complete your storage-management tasks.

#### stand-alone GUI

This interface contains the functions that you can use to monitor the condition of storage resources, and all the tools to manage data, disk, fabric, tape, and replication. The stand-alone GUI is the same interface that is available in previous versions of the product, and provides full access to all the functions that were available in those versions.

#### web-based GUI

This interface provides quick access to pages that you can use to monitor the condition, capacity, and relationships of the resources within your storage environment. Specifically, use the web-based GUI to complete the following tasks:

- View and acknowledge the status of resources that are monitored by Tivoli Storage Productivity Center. Resources include storage systems, servers, hypervisors, fabrics, and switches. Use this information to quickly determine the state of your storage environment.

- View summary and detailed information about resources, including properties, storage usage, storage capacity, and several key performance metrics. Use this information to monitor the storage on your hardware. For example, when migrating large amounts of data, you can identify the target resources that have enough storage capacity to accommodate the data and require the least amount of reconfiguration.
- View the relationships and storage mapping among resources. For example, you can view the resources such as servers and hypervisors to which volumes from a storage system are assigned.
- Identify potential problems and troubleshoot existing problems in a storage environment. For example, you can locate the internal resources of a storage system that might be causing a bottleneck in storage utilization.
- In the reporting, web-based interface, use a drag-and-drop approach to design custom reports that contain detailed information about the properties and performance of monitored resources. All the performance metrics from the stand-alone GUI are available in the reporting interface. For example, you can drag key metrics into a report to create and generate a performance chart for a specific volume of a storage system. The reporting interface also includes a set of predefined reports that provides quick access to preformatted data about resources.

## Configuring and administering

Use the following list to view the specific configuring and administering tasks that you can complete in each GUI.

*Table 6. Available configuring and administering tasks in each GUI*

Tasks	Available in web-based GUI	Available in stand-alone GUI
Adding and managing data sources, including agents	No	Yes
Discovering resources for monitoring	No	Yes
Configuring resources for monitoring	No	Yes
Configuring Tivoli Storage Productivity Center	No	Yes
Starting element managers in context		
<ul style="list-style-type: none"> <li>• Storage systems</li> <li>• Switches</li> </ul>	<ul style="list-style-type: none"> <li>• No</li> <li>• Yes</li> </ul>	<ul style="list-style-type: none"> <li>• Yes</li> <li>• Yes</li> </ul>
Administering Tivoli Storage Productivity Center services	No	Yes
Managing Tivoli Storage Productivity Center jobs:		
<ul style="list-style-type: none"> <li>• Viewing information about jobs</li> <li>• Administering jobs</li> </ul>	<ul style="list-style-type: none"> <li>• Yes</li> <li>• No</li> </ul>	<ul style="list-style-type: none"> <li>• Yes</li> <li>• Yes</li> </ul>

## Monitoring

Use the following list to view the specific monitoring tasks that you can complete in each GUI.

Table 7. Available monitoring tasks in each GUI

Tasks	Available in web-based GUI	Available in stand-alone GUI
Creating data collection schedules and groups	No	Yes
Creating storage resource groups	No	Yes
Managing replication	No	Yes
Viewing information about the following resources:		
<ul style="list-style-type: none"> <li>• Storage systems</li> <li>• Servers</li> <li>• Hypervisors</li> <li>• Switches</li> <li>• Fabrics</li> <li>• Tape libraries</li> <li>• Databases</li> </ul>	<ul style="list-style-type: none"> <li>• Yes</li> <li>• Yes</li> <li>• Yes</li> <li>• Yes</li> <li>• Yes</li> <li>• No</li> <li>• No</li> </ul>	<ul style="list-style-type: none"> <li>• Yes</li> <li>• Yes</li> <li>• Yes</li> <li>• Yes</li> <li>• Yes</li> <li>• Yes</li> <li>• Yes</li> </ul>
Viewing the following information about resources:		
<ul style="list-style-type: none"> <li>• Status</li> <li>• Capacity (including used and available space)</li> <li>• Relationships between resources</li> <li>• Data paths</li> </ul>	<ul style="list-style-type: none"> <li>• Yes</li> <li>• Yes</li> <li>• Yes</li> <li>• No</li> </ul>	<ul style="list-style-type: none"> <li>• Yes</li> <li>• Yes</li> <li>• Yes</li> <li>• Yes</li> </ul>
Exporting information about resources to a file	Yes	Yes
Running analytics:		
<ul style="list-style-type: none"> <li>• Configuration history</li> <li>• Storage optimizer</li> <li>• SAN Planner</li> <li>• Configuration analysis</li> </ul>	<ul style="list-style-type: none"> <li>• No</li> <li>• No</li> <li>• No</li> <li>• No</li> </ul>	<ul style="list-style-type: none"> <li>• Yes</li> <li>• Yes</li> <li>• Yes</li> <li>• Yes</li> </ul>
Managing zones and zone sets	No	Yes
Viewing a visual topology of resources	No	Yes
Creating storage policies	No	Yes
Charging back for storage usage	No	Yes

## Alerting

Use the following list to view the specific alerting tasks that you can complete in each GUI.

Table 8. Available alerting tasks in each GUI

Tasks	Available in web-based GUI	Available in stand-alone GUI
Creating alerts	No	Yes
Viewing alert conditions that are detected on monitored resources	Yes	Yes

Table 8. Available alerting tasks in each GUI (continued)

Tasks	Available in web-based GUI	Available in stand-alone GUI
Acknowledging the status of alerts	Yes	Yes
Removing alerts	Yes	Yes

## Reporting

Use the following lists to view the specific reporting tasks and information that you can complete in each GUI.

### Reporting tasks

Table 9. Available reporting tasks in each GUI

Tasks	Available in web-based GUI	Available in stand-alone GUI
Accessing the web-based reporting interface	Yes	No
Saving reports	Yes	Yes
Scheduling reports	Yes	Yes

### Reporting information

Table 10. Available reporting information in each GUI

Information	Available in web-based GUI	Available in stand-alone GUI
Resource properties	Yes*	Yes
Performance	Yes	Yes
Capacity (including used and available space)	Yes	Yes
Historical capacity	Yes	Yes
Storage tiering	Yes	No
Policy violations	No	Yes
Rollup servers	No	Yes
File statistics	No	Yes
Tape libraries	No	Yes
Data sources	No	Yes
Databases	No	Yes
<b>Note:</b> * Information about the properties of fabrics is not available.		

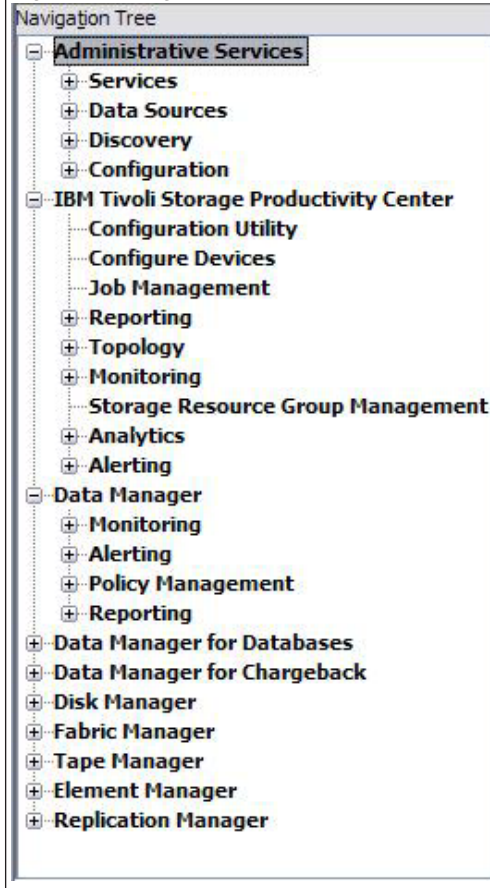

## The stand-alone GUI

Use the stand-alone GUI to complete all your storage management tasks. The main window for this interface is organized into two main sections: the navigation tree and the content pane.

### Navigation tree

The navigation tree is displayed on the left side of the main window. You can expand, select, and collapse the nodes in the tree to navigate through the interface. Each node represents a function or task for managing storage.

Figure 2. Navigation tree

When you start Tivoli Storage Productivity Center, the navigation tree is expanded to show all the high-level functions in the product. To view the nodes within each high-level function, click the expand icon next to the node or double click the name of the node.

**Expanding and collapsing the navigation tree:** If the navigation tree gets too large, or if you want to return it to its original state, right-click on the major nodes of the tree and select **Collapse Branch** or **Expand Branch**. For example, right-click the **IBM Tivoli Storage Productivity Center** node and select **Collapse Branch** to collapse all the nodes in that branch of tree. To expand all the nodes in the **IBM Tivoli Storage Productivity Center** branch, right click the node and select **Expand Branch**.

**Printing the navigation tree:** Right-click on a node and choose **Print Branch** to print all the subnodes within that node.

### Content pane

The content pane is displayed on the right side of the main window. When you select a node in the navigation tree, a corresponding panel is displayed in the content pane. Use the panels in the content pane to complete tasks such as configuring Tivoli Storage Productivity Center, creating data collection schedules, defining alerts, and viewing reports.

Figure 3. Content pane

### Navigation tree:

The navigation tree shows all of the available resource management tasks, organized by major topic nodes for Administrative Services, IBM Tivoli Storage Productivity Center, Data Manager, Disk Manager, Fabric Manager, and Tape Manager.

#### Administrative Services

Provides product configuration functions for Tivoli Storage Productivity Center.

This node is always present.

#### Tivoli Storage Productivity Center

Provides operational functions for Tivoli Storage Productivity Center.

This node is always present.

#### Data Manager

Provides operational functions for the Data Manager.

This node is present when Data Manager is installed and licensed.

For Data Manager functions, you must use Data agents or Storage Resource agents to collect data about your storage resources. For example, use scans, pings, and probes to collect data about the computers on which the agents are installed.

#### Data Manager for Databases

Provides operational functions for Data Manager for Databases.

This node is present when Data Manager is installed and licensed.

### **Data Manager for Chargeback**

Provides operational functions for Data Manager for Chargeback.

This node is present when Data Manager is installed and licensed.

### **Disk Manager**

Provides operational functions for the Disk Manager.

This node is present when Disk Manager is installed and licensed. A subset of the functions is provided when you install the Data Server.

For Disk Manager functions, the subsystem CIMOMs and data collection are required (for example, through probes), except for devices that use Native API connection, for example: System Storage DS8000, SAN Volume Controller, and the XIV system.

### **Fabric Manager**

Provides operational functions for the Fabric Manager.

This node is present when Fabric Manager is installed.

For Fabric Manager functions, the available agent types are CIM agents, in-band fabric agents, out-of-band fabric agents, and Storage Resource Agents. You must run a data collection job (for example, through probe jobs). If you want to perform zone control actions, the in-band fabric agents for QLogic and Cisco fabrics must be deployed. For Fabric Manager features such as zone control and performance monitoring, you must perform data collection from performance monitors. For a list of current agent types supported for the Switch Performance Management functionality and the Fabric Zone Configuration functionality, see “Fabric Manager” on page 1429.

### **Tape Manager**

Provides operational functions for the tape library.

This node is present when the Device server is installed.

For Tape Manager functions, the library CIMOMs and data collection are required (for example, probes).

### **Element Manager**

Allows you to access the **Element Manager** tab of the Configuration Utility where you can configure and administer IBM System Storage DS8000 and other storage subsystems.

### **Replication Manager**

Allows you to access the **Replication Manager** tab of the Configuration Utility where you can manage IBM Tivoli Storage Productivity Center for Replication and to set the triggering condition and actions for alerts associated with Tivoli Storage Productivity Center for Replication.

### **Dashboard:**

The dashboard provides a concise, yet detailed overview of the health of your storage environment. It quickly points out potential problem areas that need further investigation.

When you first log in to IBM Tivoli Storage Productivity Center you are asked if you want to collect statistics. You must answer yes in order for the dashboard information to be displayed. The dashboard then appears whenever you start the product or close all the active windows in a running session.

The dashboard contains four display areas and seven panels that you can cycle through to view your environment's storage information.

Using the dashboard:

Use the dashboard to monitor the overall status of your storage resources.

### Purpose

When you first log on to Tivoli Storage Productivity Center or close all the active panels, the topic pane shows the "dashboard". The dashboard provides a concise, yet detailed overview of the status of your storage environment. Use it to quickly point out potential problem areas that need further investigation. The dashboard contains four displayable areas and eight panels that you can cycle through to view the storage information that has been collected about your environment.

Keep in mind the following considerations when viewing the information about the dashboard:

- The information in the dashboard is collected by data collection schedules and aggregated by the History Aggregator. To ensure that the latest information is displayed in the dashboard, run the history aggregator regularly. See the information center for instructions about how to create and schedule history aggregator jobs.
- The value in the **All** field on the Alerts Pending panel might be higher than the sum of the alerts shown in the other fields on that panel. This situation occurs because some alerts are not associated with a specific category, and are reflected in the value that is shown in the **All** field only.

- The names of some fields have been updated. For your reference, the original names of those fields are shown within parentheses ( ) next to their new names in this topic.
- Click **Refresh** to update the displayed panels. You must click **Refresh** to ensure that the latest information from the history aggregator is displayed in the dashboard.
- Click **Cycle Panels** to cycle through the panels in the dashboard and view information about your storage assets.

### TPC-wide Summary panel

Use this panel to view an enterprise-wide summary of your storage through the following values:

#### File System Space (Capacity)

Total amount of unique file system storage space on computers where a Data agent or Storage Resource agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this field:

- File systems that become missing after a probe.
- File systems discovered on virtual machines where an agent is installed.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

#### Consumed File System Space (Filesystem Used Space)

Total amount of unique file system storage space that is used or consumed by the computers where a Data agent or Storage Resource agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this field:

- File systems that become missing after a probe.
- File systems on discovered hypervisors that are assigned to virtual machines where an agent is installed.
- File systems on virtual machines where an agent is installed, but the hypervisors for the virtual machines have not been discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

#### Available File System Space (Filesystem Free Space)

Total amount of unique file system storage space that is not used or available to the computers where a Data agent or Storage Resource agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this field:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.

#### Fibre Attached Computer Disk Space (Computer Fibre Attached Disk Space)

Total amount of unique disk space on computers where a Data agent or Storage Resource agent is installed and the disks are attached through a

fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this field:

- Computer disks that are behind a fibre channel port that has not been identified by an agent.
- Computer disks that are not behind a fibre channel port.
- Computer disks discovered on virtual machines where an agent is installed.
- Computer disks that become missing after a probe.

**Non-Fibre Attached Computer Disk Space (Computer Non-fibre Attached Disk Space)**

Total amount of unique disk space on computers where a Data agent or Storage Resource agent is installed and the disks are not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this field:

- Computer disks that are behind a fibre channel port.
- Computer disks discovered on virtual machine where an agent is installed.
- Computer disks that become missing after a probe.

**Physical Storage Subsystem Disk Space (Storage Subsystem Physical Disk Space)**

Total amount of unique internal physical disk space on the storage subsystem arrays that are monitored by subordinate servers and the master server. Tivoli Storage Productivity Center does not include the following storage space in its calculation of the value for this field:

- Storage subsystem disks that become missing after a storage subsystem probe.
- Back-end storage volumes on monitored storage subsystem virtualizers (for example, SAN Volume Controller) that are attached from a storage subsystem.
- Storage subsystem disks that are on storage subsystems that have not been probed by the subordinate servers or the master server.

**Storage Subsystem Volume Space (LUN Capacity)**

Total amount of unique storage subsystem volume space and virtual storage volume space on the storage subsystem arrays that are monitored by subordinate servers and the master server. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this field:

- Storage subsystem volumes or virtual storage volumes that become missing after a storage subsystem probe.
- Storage subsystem volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage subsystem virtualizers (for example, SAN Volume Controller).
- Storage subsystem disks that are on storage subsystems that have not been probed by the subordinate servers or the master server.

**Consumable Storage Subsystem Volume Space (Usable LUN Capacity)**

Amount of file system storage space for a file system. Total amount of unique storage subsystem volume space and virtual storage volume space on monitored storage subsystem arrays that can be assigned or are assigned to systems within the network. Tivoli Storage Productivity Center does not include the following columns in its calculation of the value for this field:

- Storage subsystem volumes or virtual storage volumes that become missing after a storage subsystem probe.
- Storage subsystem volumes or virtual storage volumes that are used as FlashCopy targets.
- Storage subsystem volumes or virtual storage volumes that are identified as Business Continuance Volume extended (BCVx).
- Storage subsystem volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database.
- Storage subsystem volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage subsystem virtualizers (for example, SAN Volume Controller).

#### **FlashCopy Target Storage Subsystem Volume Space (FlashCopy Target Capacity)**

Total amount of unique storage subsystem volume space and virtual storage volume space on monitored storage subsystem arrays that is identified as FlashCopy target space. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this field:

- Storage subsystem volumes or virtual storage volumes that become missing after a storage subsystem probe.
- Storage subsystem volumes or virtual storage volumes that are not used as FlashCopy targets.

#### **Monitored Computers (Servers)**

Total number of computers where a Data agent or Storage Resource agent is installed and are detected by the Data server. Tivoli Storage Productivity Center does not include the following systems in its calculation of the value for this field:

- Systems where an agent is installed but was not started or was unable to communicate with the Data server.
- Systems where an agent is not installed.
- Systems where an agent is installed but that agent communicates with a different Tivoli Storage Productivity Center server.
- Systems that have been removed from the Administrative Services > Data Sources > Data/ or Storage Resource agents panel.
- Hypervisors

#### **Unmonitored Computers (Servers)**

Total number of computers found in a Windows domain that do not have a Data agent or Storage Resource agent communicating with the Data server. Tivoli Storage Productivity Center does not include the following systems in its calculation of the value for this field:

- Systems that are not running a Windows operating system.
- Systems that are not in a Windows domain.
- Systems where an agent is installed and is communicating with a Data server.

#### **Storage subsystems**

Total number of storage subsystems that have been discovered and probed. Tivoli Storage Productivity Center does not include the following storage subsystems in its calculation of the value for this field:

- Storage Subsystems that have been discovered but not probed.
- Storage Subsystem that have not been discovered.

- Storage Subsystems that have been removed from the Disk Manager > Storage Subsystems panel.

**Users** Total number of user accounts discovered by Data agents or Storage Resource agents.

**Disks** Total number of unique disks discovered by Data agent or Storage Resource agent probes, hypervisor probes, network storage filer probes, and storage subsystem probes. This value does not include disks that have become missing after a successful probe.

**Storage Subsystem Volumes (LUNS)**

Total number of unique storage volumes and virtual storage volumes discovered by storage subsystem probes. This value does not include storage volumes or virtual storage volumes that have become missing after a successful storage subsystem probe.

**Filesystems**

Total number of unique file systems discovered by probes. This value excludes file systems that have become missing after a successful probe.

**Directories**

Total number of directories discovered by scans. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this field:

- Directories within file systems that were discovered by a probe but were not scanned.
- Directories that have become missing after a successful probe.

**Files** Total number of files discovered by scans. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this field:

- Files within file systems that were discovered by a probe but were not scanned.
- Files that have become missing after a successful probe.

**Rollup Summary panel**

Use this panel to view a summary of information collected by the master server and by Tivoli Storage Productivity Center servers that are subordinate servers.

**File System Space (Capacity)**

Total amount of unique file system storage space on the computers that are monitored by subordinate servers and the master server. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this field:

- File systems that become missing after a probe.
- File systems discovered on virtual machines where the Data agent or Storage Resource agent is installed.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.
- File systems that have not been probed by subordinate servers or the master server.

**Consumed File System Space (Used Space)**

Total amount of unique file system storage space that is used or consumed by the computers that are monitored by subordinate servers and the

master server. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this field:

- File systems that become missing after a probe.
- File systems on discovered hypervisors that are assigned to virtual machines where the Data agent or Storage Resource agent is installed.
- File systems on virtual machines where the Data agent or Storage Resource agent is installed, but the hypervisors for the virtual machines have not been discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.
- File systems that have not been probed by subordinate servers or the master server.

#### **Available File System Space (Filesystem Free Space)**

Total amount of unique file system storage space that is not used or available to the systems that are monitored by subordinate servers and the master server. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this field:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network-attached storage server.
- File systems that are not mounted.
- File systems that have not been probed by subordinate servers or the master server.

#### **Physical Storage Subsystem Disk Space (Storage Subsystem Physical Disk Space)**

Total amount of unique internal physical disk space on monitored storage subsystem arrays. Tivoli Storage Productivity Center does not include the following storage space in its calculation of the value for this field:

- Storage subsystem disks that become missing after a storage subsystem probe.
- Back-end storage volumes on monitored storage subsystem virtualizers (for example, SAN Volume Controller) that are attached from a storage subsystem.

#### **Storage Subsystem Volume Space (LUN Capacity)**

Total amount of unique storage subsystem volume space and virtual storage volume space on monitored storage subsystem arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this field:

- Storage subsystem volumes or virtual storage volumes that become missing storage subsystem probe.
- Storage subsystem volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage subsystem virtualizers (for example, SAN Volume Controller).

#### **Consumable Storage Subsystem Volume Space (Usable LUN Capacity)**

Total amount of unique storage subsystem volume space and virtual storage volume space on storage subsystem arrays that are monitored by subordinate servers and the master server and can be assigned or are

assigned to systems within the network. Tivoli Storage Productivity Center does not include the following storage space in its calculation of the value for this field:

- Storage subsystem volumes or virtual storage volumes that become missing after a storage subsystem probe.
- Storage subsystem volumes or virtual storage volumes that are used as FlashCopy targets.
- Storage subsystem volumes or virtual storage volumes that are identified as Business Continuance Volume extended (BCVx).
- Storage subsystem volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database.
- Storage subsystem volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage subsystem virtualizers (for example, SAN Volume Controller).
- Storage subsystem disks that are on storage subsystems that have not been probed by the subordinate servers or the master server.

#### **Monitored TPC Servers**

Total number of subordinate servers that are monitored by the master server.

#### **Monitored Computers (Servers)**

Total number of computers that are monitored by Tivoli Storage Productivity Center and are detected by the subordinate and the master server. Tivoli Storage Productivity Center does not include the following systems in its calculation of the value for this field:

- Systems where an agent is installed but was not started or was unable to communicate with the Data server.
- Systems where an agent is not installed.
- Systems where an agent is installed but that agent communicates with a Tivoli Storage Productivity Center server that is not a subordinate server or the master server.
- Systems that have been removed from the Administrative Services > Data Sources > Data/ or Storage Resource agents panel.

#### **Storage subsystems**

Total number of storage subsystems that have been discovered and probed by subordinate servers and the master server. Tivoli Storage Productivity Center does not include the following storage subsystems in its calculation of the value for this field:

- Storage Subsystems that have been discovered but not probed.
- Storage Subsystem that have not been discovered.
- Storage Subsystems that have been removed because of the storage subsystem settings on the Removed Resource Retention panel.

#### **Consumed File System Space (Filesystem Used Space panel)**

Use the chart on this panel to view the total amount of used file system storage space across the entire network.

### **Users Consuming the Most Space (chart) panel**

Use this panel to view the following information:

- A list of the users consuming the most space within your environment
- A graphical view of the amount of space they are consuming

The chart on this panel shows information about users across the network. If multiple hosts contain the same user name, the value displayed for that user represents the space consumed on all the hosts. For example, if the user "root" exists on three hosts that are monitored by Tivoli Storage Productivity Center, then the value displayed on this chart represents the space consumed by "root" on those three hosts.

**Note:** The space usage of administrative users within your environment is not included as part of this dashboard report.

### **Monitored Computer Summary panel**

Use this panel to view the following information:

- The number of monitored computers running each Operating System type
- Total amount of file system and disk capacity per Operating System type

### **Filesystems with Least Free Space Percentage panel**

Use this panel to view the monitored computers with the least percentage of free space, including the following values:

- Percent of free space on each computer
- Total file system capacity on each computer
- Name of the computers, file systems, and mount points

### **Users Consuming the Most Space Report panel**

Use this panel to view the following information:

- A list of the users consuming the most space within your environment
- The total amount of storage each user is consuming

### **Alerts Pending panel**

Use this panel to view the active alerts that are still pending.

**Note:** The number of alerts on this panel might be less than the number of alerts shown in the IBM Tivoli Storage Productivity Center > Alerting > Alert Log. Alerts for failed jobs (pings, probes, and scans) are not listed in separate rows on this panel, but are included in the total displayed in the **All** row.

These alerts are organized into the following categories:

- All
- Computer
- Disk
- Filesystem
- Directory
- User Quota

- OS User Group Quota
- Directed to *user*
- Storage Subsystem
- Switch
- Fabric
- Endpoint Device
- External
- Tape Library
- Hypervisor
- Authentication Configuration
- Replication
- Configuration Analysis
- NAS Node
- NAS File Set
- Export

### Working with the navigation tree and content pane:

This section describes some methods for working with the nodes and windows in the navigation tree and content pane.

#### *Right-clicking and pop-up menus:*

Right-click nodes in the navigation tree to access menus that contain actions you can perform.

As you navigate through the IBM Tivoli Storage Productivity Center user interface, notice that you can right-click nodes in the navigation tree to access menus that contain actions related to that node. Use these actions to quickly access many product functions.

The following actions are available for the nodes in the navigation tree:

Option	Description
<b>Create &lt;object&gt;</b>	Create an object, including a group, data collection schedule, policy, batch report, or alert.
<b>Delete</b>	Delete the selected object definition, such as a data collection schedule, policy, batch report, group, or alert. This action is not available for definitions owned by TPCUser.
<b>Rename</b>	Rename the object definition. This action is not available for definitions owned by TPCUser.
<b>Refresh</b>	Refresh the list of objects in the navigation tree. The navigation tree is not updated automatically. You must click <b>Refresh</b> for a node to view the latest objects related to that node. For example, right-click the <b>Tivoli Storage Productivity Center &gt; Monitoring &gt; Probes</b> node and select <b>Refresh</b> to update the probe schedules that are listed in the navigation tree.
<b>Job History</b>	View the list of jobs related to a data collection or batch report schedule on the Job Management panel.
<b>Run Now</b>	Run a data collection or batch report schedule immediately.
<b>Collapse Branch</b>	Minimize the navigation tree under the selected node.

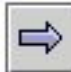

Option	Description
<b>Expand Branch</b>	Open the navigation tree under the selected node.
<b>Print Branch</b>	Print the contents of the navigation tree under the selected node.

*Selecting panels in the content pane:*

The content pane is displayed on the right side of the stand-alone GUI. When you click a node in the navigation tree, a corresponding panel is displayed in the content pane. Use the panels in the content pane to complete storage management tasks.

Each time you select a node in the navigation tree, the panel for the previously selected node is not deleted. Instead, it moves into the background and is

accessible by clicking  and  on the toolbar. You can also select currently active panels from the **Window > Show Window List** in the menu bar.

In the **Window** menu, a > is shown next to the name of the active panel. Objects that you are editing (such as data collection schedules) are marked with a black arrow if they have no pending changes; a solid red arrow indicates objects that have pending changes.

#### **Menu bar:**

Use the menu bar of the main window to access some of the main functions within IBM Tivoli Storage Productivity Center.

The following sections describe the options available from the menu bar.

*File menu:*

Use the options in the File menu to save objects and jobs, export report data, print, refresh alerts, close the current window, and exit the product session.

Menu Option	Description
<b>Save</b>	Save the changes for the current object (for example, groups, profiles, etc.) or job (for example, probes, scans, pings, etc.) that you are editing.
<b>Save As</b>	Save the changes for the current object or job that you are editing under a different name.
<b>Export Data</b>	Export the report data to other formats: <ul style="list-style-type: none"> <li>• Formatted Report file (.txt)</li> <li>• Comma delimited file (.csv)</li> <li>• Comma delimited file with headers</li> <li>• HTML file</li> </ul> <p>This allows you to import the data to another application, such as Excel, if needed.</p>
<b>Print</b>	Print the current data in the content pane. You can print tabular reports or report charts. You can also save the output to a PDF file or HTML file, and print those files at a later time.

<b>Menu Option</b>	<b>Description</b>
<b>Print Tree</b>	Print the expanded contents of the navigation tree. You can also save output to a PDF or HTML file, and print those files at a later time.
<b>Refresh Alerts</b>	Refresh all the alerts from the database repository and update the GUI by highlighting the appropriate objects and showing all the new alerts in the alert logs.
<b>Close</b>	Close the current window that occupies the content pane.
<b>Exit</b>	End the current session.

*View menu:*

Use the options in the View menu to hide or show the navigation tree and highlight the node in the navigation tree for the currently open window.

<b>Menu Option</b>	<b>Description</b>
<b>Tree</b>	Hide and show the navigation tree. If you want to increase the size of the content pane to occupy the entire window, clear the check box for the <b>Tree</b> option. To redisplay the navigation tree next to the content pane in the main window, select the <b>Tree</b> option.
<b>Current Page in Tree</b>	Display the highlighted node on the navigation tree that was responsible for displaying the data on the content pane. Use this option to reorient the navigation tree with the window that is currently displayed in the content pane.

*Connection menu:*

Use the option in the Connection menu to end the current session and establish a new connection to the same IBM Tivoli Storage Productivity Center server or to a different server.

<b>Menu Option</b>	<b>Description</b>
<b>New Connection</b>	Initiate a new connection to a server from the current GUI session. For example, use this option to connect to the same server using a different user ID, or to a completely different server.
	All the current changes that are unsaved in the open windows will be lost when you establish a new connection.

*Preferences menu:*

Use the options in the Preferences menu to change the appearance of the user interface, edit the way the product manages open panels, determine what alerts are shown upon login, select what tab appears first when generating reports, and specify what unit of measurement to use when displaying storage sizes in reports.

Menu Option		Description
Look and Feel	Windows	Set the look and feel of the GUI to appear like Microsoft Windows GUI.
	CDE/Motif	Set the look and feel of the GUI to appear like the UNIX Motif interface.
	Metal	Set the look and feel of the GUI to appear like Metal, the cross-platform Java look and feel.
Edit General	Panel Retention	The <b>Panel recall depth</b> value specifies the number of windows that are linked in the content pane for access via the
		
		and
		
		buttons on the toolbar. The default is 20.
		The <b>Panels kept in memory field</b> specifies the number of windows to store in memory, which helps to optimize the system performance. The default is 2.
		<b>Note:</b> Any open views in the topology viewer (for example, an L2:Storage Subsystem view, an L0:Computers view) are considered part of the topology viewer panel and are listed as tabs on the topology viewer panel. If the value in this field is a low number, such as the default of 2, then opening additional non-topology panels can exceed the number of panels that are kept in memory. This can result in the topology viewer panel refreshing and any tabbed views being closed. To avoid this situation, change the value in this field to a higher number, such as 10.
		<b>On login, show</b>
		Control which alerts you will view upon logging in to a user interface session.
		You can select:
		<ul style="list-style-type: none"> <li>• No Alerts</li> <li>• Alerts Directed to &lt;Userid&gt;</li> <li>• All Active Alerts</li> </ul>
		<b>Initial Reporting Tab to Display</b>
		Control what tab will be displayed when you first generate and view a report. You can select:
		<ul style="list-style-type: none"> <li>• Selection tab</li> <li>• Report tab</li> <li>• Chart tab (if Available)</li> </ul>

Menu Option	Description
<b>Advanced Options</b>	<p>Select the unit of measurement that should be used to reflect the storage sizes included in IBM Tivoli Storage Productivity Center reports. This setting affects the results in online, exported, and Batch reports. You can choose from the following options:</p> <ul style="list-style-type: none"> <li>• <b>As Appropriate:</b> Choose this option to automatically determine the unit measurement (KB, MB, GB, TB) to display for storage sizes in a report.</li> <li>• <b>Kilobytes (KB):</b> Choose this option to display storage sizes in reports using the kilobyte unit of measurement. For example, if the storage capacity for a computer is 100 megabytes, it is shown as 102400.00 KB in a capacity report.</li> <li>• <b>Megabytes (MB):</b> Choose this option to display storage sizes in reports using the megabyte unit of measurement. For example, if the storage capacity for a computer is 1 gigabyte, it is shown as 1024 MB in a capacity report.</li> <li>• <b>Gigabytes (GB):</b> Choose this option to display storage sizes in reports using the gigabyte unit of measurement. For example, if the free space on a computer is 500 megabytes, it is shown as 0.49 GB in a free space report.</li> <li>• <b>Terabytes (TB):</b> Choose this option to display storage sizes in reports using the terabyte unit of measurement. For example, if the free space on a computer is 350 gigabytes, it would be shown as 0.34 TB in a free space report.</li> </ul>

*Window menu:*

Use the options in the Windows menu to close all the open windows that do not have any changes, display the dashboard, and list all the open windows.

Menu Option	Description
<b>Close all Windows Without Changes</b>	Close all of the open windows that do not contain any modifications. Any windows that contain active changes to editable objects will not be closed.
<b>Show Dashboard</b>	Display the IBM Tivoli Storage Productivity Center dashboard.
<b>Show Window List</b>	<p>Lists names of all open windows active in the content pane. Select one of these options to view the corresponding window.</p> <p>Beside each window name is an icon that indicates the status of the window:</p> <ul style="list-style-type: none"> <li>• <b>no icon</b> - No changes were made to the window</li> <li>• <b>solid red circle</b> - Changes were made, but have not been saved</li> <li>• <b>black arrow (&gt;)</b> - Current window displayed. No changes were made</li> <li>• <b>solid red arrow (&gt;)</b> - Current window displayed. Changes were made, but have not been saved</li> </ul>

### Help menu:

Use the options in the Help menu to access online help for the product, launch the information center Web page, launch the Supported Products Web pages, launch the demonstrations Web page, and display product information (such as the version number).

Menu Option	Description
<b>Help Topics</b>	Select this menu item to launch IBM Tivoli Storage Productivity Center's online Help system. The Help system will appear in its own window and display a table of contents from which you can access information about how to use the product.
<b>Help for Displayed Panel</b>	Select this menu item to launch the online Help system and display help information for the product window that is currently displayed. You can also press F1 to launch the help topic for the product window that you are viewing.
<b>Launch Information Center</b>	<p>Select this menu item to launch the information center for IBM Tivoli Storage Productivity Center Information Center in a Web browser. The IBM Tivoli Storage Productivity Center Information Center contains detailed instructions that explain how to install, upgrade, configure, maintain, and use the Tivoli Storage Productivity Center product.</p> <p>See "Web browser support" on page 40 for information about Web browser support for launching the IBM Tivoli Storage Productivity Center Information Center.</p>
<b>Supported Products Data</b>	<p>Select the links under this menu item to launch Web pages that contain additional documentation for Disk Manager, Fabric Manager, and Data Manager. This documentation includes matrixes that show the devices supported by each of the managers.</p> <ul style="list-style-type: none"><li>• <b>IBM Tivoli Storage Productivity Center for Disk Supported Products.</b> Click this item to view the Support for Tivoli Storage Productivity Center for Disk Web page. To view the devices supported by Disk Manager, scroll to the <b>Integration/Operation</b> section and click the link that matches your version of Tivoli Storage Productivity Center.</li><li>• <b>IBM Tivoli Storage Productivity Center for Fabric Supported Products.</b> Click this item to view the Support for Tivoli Storage Productivity Center for Fabric Web page. To view the devices supported by Fabric Manager, scroll to the <b>Integration/Operation</b> section and click the link that matches your version of Tivoli Storage Productivity Center.</li><li>• <b>IBM Tivoli Storage Productivity Center for Data Supported Products.</b> Click this item to view the Support for Tivoli Storage Productivity Center for Data Web page. To view the devices supported by Disk Manager, scroll to the <b>Integration/Operation</b> section and click the link that matches your version of Tivoli Storage Productivity Center.</li></ul> <p>See "Web browser support" on page 40 for information about Web browser support for launching the supported products data Web pages.</p>

Menu Option	Description
<b>Tivoli Storage Productivity Center Demos</b>	Select this menu item to launch a Web page that contains Flash demos of Tivoli Storage Productivity Center. These demos provide an introduction to the product, the business and storage administrator challenges that are met by the product, and detailed information about the features and functions that the product provides.  See "Web browser support" for information about Web browser support for launching the product demos Web page.
<b>Launch IBM Tivoli Storage Productivity Center Information Center</b>	Select this menu item to display product information including: <ul style="list-style-type: none"> <li>• version information</li> <li>• copyright information</li> <li>• trademark information</li> </ul>

*Web browser support:*

IBM Tivoli Storage Productivity Center starts a web browser when you access web pages from items in the Help menu, start another application using its launch-in-context feature, or start IBM Tivoli Storage Productivity Center for Replication from its user interface.

**Note:** The Tivoli Storage Productivity Center software is bundled with its own IBM Java™ JRE. When you use the Java Web Start method of remotely accessing the stand-alone GUI, you must use the IBM Java.

Before you start Tivoli Storage Productivity Center, ensure that you are using a supported web browser. For a list of web browsers that you can use with Tivoli Storage Productivity Center, see the support matrix at <http://www.ibm.com/support/docview.wss?uid=swg21386446>. In the **Agents, Servers and GUI** column, click the version of Tivoli Storage Productivity Center that you are installing. On the next page, click **Web Browsers** to find the web browsers that you can use.

If you do not have a web browser configured for use with Tivoli Storage Productivity Center when you access a web page from its user interface, the Configure Element Launcher window is displayed. Use this window to configure a web browser for use with the product.

**Tip:** For information about the web browsers that you can use with the DS8000, see the DS8000 Information Center at <http://publib.boulder.ibm.com/infocenter/dsichelp/ds8000ic/index.jsp>. Search for **Internet browser support**.

**Browser-specific information:** To download Firefox 3 for Linux or Windows, go to <ftp://ftp.mozilla.org/pub/mozilla.org/firefox/releases/>.

The software to block pop-up windows must be turned off in Windows Internet Explorer for any application to start the graphical user interface (GUI) for the following storage systems:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified
- IBM SONAS

For example, if you are in Tivoli Storage Productivity Center and you want to start the Element Manager of the SAN Volume Controller GUI, you must configure Internet Explorer with the following settings.

1. Open Internet Explorer.
2. From the Internet Explorer toolbar, click **Tools > Pop-up Blocker > Turn Off Pop-up Blocker**.

If the Internet Explorer Information Bar displays a message that content is blocked because it was not signed by a valid security certificate, click the Information Bar and select **Show blocked content**.

### **Web browser support for Tivoli Storage Productivity Center for Replication**

When you start Tivoli Storage Productivity Center for Replication from within the Tivoli Storage Productivity Center, its user interface is displayed in a web browser. Depending on the configuration settings for the web browser on your computer, Tivoli Storage Productivity Center for Replication is displayed within a tab of an existing browser session or it is displayed within a new browser session.

In Firefox, you can configure how Tivoli Storage Productivity Center for Replication is displayed when started from Tivoli Storage Productivity Center. To configure Firefox, complete the following steps:

1. Start Firefox.
2. Select **Tools > Options** from the menu bar.
3. Select **Tabs**.
4. Select **a new window** to indicate that you want start Tivoli Storage Productivity Center for Replication in a new web browser session. Select **a new tab** to indicate that you want to start Tivoli Storage Productivity Center for Replication in a new tab of an existing web browser session.

**Note:** For Internet Explorer, Tivoli Storage Productivity Center for Replication is always started in a new web browser session.

**Note:** If you start Tivoli Storage Productivity Center for Replication from within Tivoli Storage Productivity Center, you might be logged out of the Tivoli Storage Productivity Center for Replication user interface unexpectedly. This action occurs when you use Tivoli Storage Productivity Center to start a session of Tivoli Storage Productivity Center for Replication in an Internet Explorer web browser and then open and close a wizard or secondary window in that Tivoli Storage Productivity Center for Replication session.

To work around this problem, use one of these solutions:

- Start Tivoli Storage Productivity Center for Replication from Tivoli Storage Productivity Center using Firefox
- Start Tivoli Storage Productivity Center for Replication from Tivoli Integrated Portal
- Start Tivoli Storage Productivity Center for Replication by entering its web address directly in a Firefox or Internet Explorer web browser.

### **Web browser support for Help menu items**

Tivoli Storage Productivity Center provides a number of items in its **Help** menu that you can click to learn more about how to use the product. When you click one of these items, Tivoli Storage Productivity Center starts a web browser and

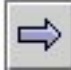

displays the appropriate web page. You must have an internet connection on the system where you are running the Tivoli Storage Productivity Center user interface. You must also have a default browser configured to successfully access these web pages.

### Toolbar:

The toolbar on the Tivoli Storage Productivity Center main window provides one-click access to key commands.

Click the following buttons on the toolbar to access key commands in the product:

Button	Description
<b>Element Management</b>	Click this button to open the Element Manager page in the Configuration Utility. Use the Element Manager page to configure and start the element managers that are visible to Tivoli Storage Productivity Center. Element managers are programs that enable you to configure and maintain your storage devices. An example of an element manager is DS8000 Storage Manager, which is the default element manager that is provided with IBM System Storage DS8000.
<b>Back</b> 	Click this button to move backward through the active panels in the content pane.
<b>Forward</b> 	Click this button to move forward through the active panels in the content pane.
<b>Save</b> 	Click this button to save the current object that you are editing. The object changes are saved to the database repository.
<b>Print</b> 	Click this button to print the current data or report chart that is displayed in the content pane.
<b>Cancel edit session</b> 	Click this button to discard the contents of the content pane. If content pane is in an edit session and changes have been made, a prompt notifying you that a change has been made is displayed.
<b>Configure devices</b> 	<p>Access the Configure Devices wizard. Use the wizard to configure the following storage devices for monitoring by Tivoli Storage Productivity Center.</p> <ul style="list-style-type: none"> <li>• Storage systems</li> <li>• Fabrics and switches</li> <li>• Computers</li> <li>• Tape libraries</li> </ul> <p>The wizard guides you through the process of adding a storage device as a data source, running a discovery, applying alert conditions, and including the device in data collection schedules.</p>

Button	Description
<b>Manage jobs, schedules, and runs</b> 	Access the Job Management panel. Use this panel to view and manage the schedules, runs, and jobs related to the storage devices that are monitored by Tivoli Storage Productivity Center.
<b>Stop current server request</b> 	<p>Click this button to stop the current server request. This button becomes active when a request is made to the server and the user interface is waiting for a response.</p> <p>During the server request wait time, the cursor arrow is displayed as an hourglass. If you decide the current request is taking too long or you do not want to wait any longer, click this button to cancel that request and regain control of the GUI.</p> <p><b>Note:</b> If you click this button, the current request continues to run, and the resources that are used by it on the server are not released until it completes. Frequent use of this button during a session might exhaust the resources on the server and cause the user interface to stop responding.</p>

### Schedules, runs, and jobs:

Use schedules, run, and jobs to manage and monitor the storage entities in your environment. These objects form the framework of job management within Tivoli Storage Productivity Center. Use the Job Management panel to view and manage the schedules, runs, and jobs related to the storage entities that are monitored by the product.

In previous versions of Tivoli Storage Productivity Center, a schedule and its related runs and jobs were displayed as nodes in different parts of the navigation tree. In v4.2 and later, all schedules, runs, and jobs are displayed in the Job Management panel. Use this panel to perform the following tasks:

- View information about all schedules, runs, and jobs in one central location.
- Identify all the schedules, runs, and jobs that are encountering problems when executing.
- Ensure that a storage entity is fully monitored by Tivoli Storage Productivity Center.
- Edit, rename, delete, and run schedules.

#### Schedules

A schedule is a definition of a monitoring task that collects data about storage devices. Monitoring tasks include scans, probes, pings, quotas, discovery, and performance monitors. For example, define a probe schedule to collect data about storage subsystems; define a scan schedule to collect file-level information about hosts.

Schedule definitions are displayed in the navigation tree under their corresponding type. For example, probe schedules are displayed under the **IBM Tivoli Storage Productivity Center > Monitoring > Probes** node; scans are displayed under the **Data Manager > Monitoring > Scans** node. You can click a schedule in the navigation tree to view or edit its definition at any time.

**Runs** A run is a single invocation of a schedule. For example, if a probe schedule is set to collect data once per day, there is one run of that schedule per day. Runs for a schedule are displayed on the Job Management panel.

**Jobs** A job is a unit of work within a run for a schedule. One run might have

multiple jobs. For example, a subsystem probe schedule has one job created for each subsystem for which it collects data. Jobs for a run are displayed on the Job Management panel.

## Data Manager

Data Manager is a comprehensive file and capacity management solution for heterogeneous storage environments. Data Manager includes enterprise-wide reporting and monitoring, policy-based management and automated capacity provisioning for Direct Attached Storage (DAS), network attached storage (NAS), and SAN environments.

Data Manager helps you improve storage utilization, plan for future capacity, and ensure availability by providing storage on demand for file systems. Use Data Manager to perform the following functions:

- Discover and monitor disks, partitions, shared directories, and servers.
- Monitor and report on capacity and utilization across platforms to help you to identify trends and prevent problems.
- Provides a wide variety of standardized reports about filesystems and storage infrastructure to track usage and availability.
- Provide file analysis across platforms to help you to identify and reclaim space used by non-essential files.
- Provide policy-based management and automated capacity provisioning for filesystems when user-defined thresholds are reached.

Using these functions, Data Manager helps you reduce storage costs by:

- Improving storage utilization
- Enabling intelligent capacity planning
- Helping you manage more storage with the same staff
- Supporting application availability through computer uptime reporting and application database monitoring.

Information collected by Data Manager helps you understand what is really going on with data on your servers and in your storage environment. View when files are created, accessed, and modified, and by what group or user. This type of information helps system administrators map storage resources to the consumers of the resource. The ability to map storage consumption to storage hardware has become increasingly important as the size of open systems environments has increased.

In addition to understanding the current consumption and usage of data within the enterprise, Data Manager tracks the information over time. Not only does this historical view of storage consumption and utilization show usage trends over time, the system administrator can also see a projected use of storage in the future. System administrators can prepare for the need to purchase additional capacity in a planned proactive manner rather than reacting to out-of-space emergencies.

Use Data Manager policy functions to help you evaluate and control the usage and status of your enterprise storage management assets. Because Data Manager is policy-based, it has autonomic self-healing capabilities that can detect potential problems and automatically make adjustments based on the policies and actions you have established. Use the capability to provision storage based upon storage policies to expand a file system, and to allocate storage to a volume.

For example, Data Manager can notify you when your system is running out of disk space or warn you of impending storage hardware failure. By alerting you to these and other issues related to your stored data, Data Manager enables you to prevent unnecessary system and application downtime.

## Data Manager for Databases

Data Manager for Databases provides a set of policy-driven automated tools for managing storage capacity, availability, events, performance and assets in your relational databases. It can help you identify, evaluate, control and predict the storage needs of Relational Database Management Systems (RDBMSs), which include Oracle, Sybase SQL Server, Microsoft SQL Server, and UDB/DB2.

Data Manager for Databases is policy-based and through its autonomic self-healing capabilities it can detect potential problems and automatically make adjustments based on the policies and actions you have established. For example, it can notify you when your database tables are running out of storage space or warn you of a dropped tablespace. By alerting you to these and other issues related to your stored data, it enables you to prevent unnecessary system and application downtime.

The following table lists the RDBMS objects whose storage usage is monitored by Data Manager for Databases.

Oracle	SQL Server	Sybase	DB2/UDB
Instances	Instances	Instances	Instances
Databases	Databases	Devices	Databases
Tablespaces	Datafiles	Databases	Tablespaces
Datafiles	Tables	Fragments	Containers
Tables	Indexes	Tables	Tables
Indexes	Log Files	Indexes	Indexes
Extents			
Segments			
Redo Log files			
Control Files			
Archive Log			
Directories			

**Note:** Data Manager for Databases does not currently support the monitoring of clustered database applications.

Data Manager for Databases collects information about RDBMS storage assets and performs tasks against the RDBMS storage assets. Methods for managing and automating capacity utilization of your databases help you:

- Monitor storage assets associated with enterprise-wide databases and notification of potential problems before they occur
- Make intelligent capacity management decisions based on current and trended historical data
- See how much storage is being consumed by users, groups of users and OS's within the database
- Create policy-based management for databases when user-defined threshold is reached
- View storage utilization management from a database and application perspective

## Data Manager for Chargeback

Data Manager for Chargeback uses the storage usage information gathered by Data Manager and Data Manager for Databases to generate invoices that chargeback for storage usage.

With Data Manager for Chargeback you can collect usage information on a departmental, group, or user level. You can allocate costs by storage usage by user, disk capacity by computer, tablespace, or file system/physical device. You can create cost centers by creating user, computer, or tablespace groups, allowing organization to chargeback individuals or business units for their storage usage. By understanding the costs associated with existing and future storage usage, you can improve the use of that storage and reduce the costs associated with its maintenances and upgrades.

Using Data Manager, you can run monitoring jobs that gather detailed statistics about the usage and trending of the storage consumed by the users and user groups within your organization. Using Data Manager for Databases, you can run monitoring jobs that gather detailed statistics about the usage and trending of the storage consumed within RDBMS Instances by the users and user groups within your organization.

In addition to providing invoicing for storage usage, Data Manager for Chargeback also integrates with the chargeback systems already implemented in your environment. It provides you with a higher level, application-specific CIMS output format which can be imported into CIMS applications. With Data Manager for Chargeback, you can export chargeback data for direct import into CIMS, giving you the ability to integrate your storage usage data with other enterprise chargeback information and processes.

## Disk Manager

Disk Manager helps you manage SANs and heterogeneous storage from a single console.

With Disk Manager you can manage network storage components such as:

- IBM System Storage SAN Volume Controller
- IBM Storwize V7000
- Storwize V7000 Unified
- IBM TotalStorage Enterprise Storage Server (TotalStorage Enterprise Storage Server)
- Tivoli Storage Productivity Center disk systems (DS4000, DS5000, DS6000, and DS8000 series)
- IBM XIV Storage System
- IBM SONAS
- Other storage subsystems that support the SMI-S standards

For those devices that use the native interfaces (DS8000, SAN Volume Controller, Storwize V7000, IBM SONAS, and XIV) device discovery is performed when the device is added to Tivoli Storage Productivity Center.

For those devices that use the SMI-S standards, device discovery is done using the Service Location Protocol (SLP), as specified by SMI-S. Configuration of the discovered devices is possible in conjunction with CIM agents associated with

those devices, using the standard mechanisms defined in SMI-S. Disk Manager also gathers events, and can launch an element manager specific to each device.

Disk Manager can:

- Collect and store performance data and provides alerts
- Provide graphical performance reports
- Help optimize storage allocation
- Provide volume contention analysis

Through the use of data collection, setting of thresholds and use of performance reports, performance can be monitored for the TotalStorage Enterprise Storage Server, DS4000, DS5000, DS6000, DS8000, SAN Volume Controller, Storwize V7000, XIV, and any other storage subsystem that supports the SMI-S block server performance subprofile. The performance function starts with the data collection task, which captures performance statistics for the devices and stores the data in the database.

After data collection is done, you can set thresholds to identify exceptions for certain performance metrics, depending on the type of device. Threshold checking is performed during data collection, and when performance is outside the specified bounds, alerts can be generated.

After performance data has been collected, you can configure Disk Manager to present graphical or text reports on the historical performance behavior of specified devices, or of specific internal components of those devices. The performance reports provide information about past period performance metrics or current performance in graphical form.

**Note:** Tivoli Storage Productivity Center supports discovery of and reporting on both FB and CKD volumes (and pools and arrays), but can create only FB volumes. Tivoli Storage Productivity Center does not support the creation of CKD volumes.

## Managing TagmaStore CIM agents

The TagmaStore CIM agents are provided by Hitachi Data Systems for the TagmaStore storage subsystem. The TagmaStore CIM agent collects information from the TagmaStore storage system.

IBM Tivoli Storage Productivity Center supports the Hitachi Data Systems TagmaStore CIM Agent. For information about the CIM agent level supported, see [http://www.ibm.com/support/docview.wss?rs=40&q1=support+matrix&uid=swg21386446&loc=en\\_US&cs=utf-8&lang=en](http://www.ibm.com/support/docview.wss?rs=40&q1=support+matrix&uid=swg21386446&loc=en_US&cs=utf-8&lang=en). Click the appropriate version under **Storage**. Tivoli Storage Productivity Center also supports the TagmaStore as a Storage Virtualizer. Tivoli Storage Productivity Center can display information for virtual disks and local disks.

Tivoli Storage Productivity Center cannot provide correlation information between the virtual storage used by TagmaStore and the volumes created on the storage due to an existing limitation of the CIM agent 5.8 from Hitachi Data Systems. However, Tivoli Storage Productivity Center reports correctly display the correlation between volumes created on the local storage and the local disks. This limitation has no impact on the topology but it does affect several reports that show the correlation:

- **Data Manager > Reporting > Asset > By Storage Subsystem > <HDS\_device> > Disks > Volumes** (does not show the relation between the disk and Volume or volume in the tree)

- **Disk Manager > Reporting > Storage Subsystem > Volume to Backend Volume Assignment**
- **Disk Manager > Reporting > Storage Subsystem > Computer Views** (because Tivoli Storage Productivity Center cannot populate the information for volumes created on the virtual disks)

All volumes are created from a storage pool that is allocated from a primordial storage pool and an imported primordial pool. A volume cannot be created over both local and virtual extents.

For volume correlation, the host computer must have the Storage Resource agent deployed and the TagmaStore device must be in the same SAN fabric. There must also be a zone configured in the active zoneset between the ports of the host computer and the ports of the TagmaStore device. The Storage Resource agent must be configured for the fabric to which the host is connected.

For back-end correlation, the TagmaStore device ports and back-end subsystem ports must be in the same zone and the back-end subsystem has assigned storage volumes to all ports of the TagmaStore device.

## Tape Manager

IBM Tivoli Storage Productivity Center Tape Manager helps you manage your SMI-S compliant tape libraries.

Tape Manager lets you manage those tape libraries which are based on SMI-S 1.1 profile for tape libraries.

You must have at least Tape Operator authority to access the functions in the Tape Manager node. To view your authority level, open the "Role to Group Mappings" window in the **Administrative Services > Configuration** node in the navigation tree.

With Tape Manager you can:

- Discover SMI-S compliant tape libraries attached to your SAN fabrics
- View tape library information
- Monitor tape libraries by probing for data and viewing alerts
- Create and view asset and capacity reports using data collected from your tape libraries
- Use the topology viewer to view information about tape libraries

## Fabric Manager

Fabric Manager helps you manage the SAN fabric that connects the host systems and applications to the storage devices. It is a comprehensive management solution for multi-vendor SANs and includes automatic resource and topology discovery, monitoring and alerts, and zone control.

Fabric Manager is an enterprise scalable solution architected to ANSI SAN standards, allowing you to choose the appropriate products for your environment. It helps you:

- Simplify the task of SAN management and configuration
- Ensure SAN availability
- Improve SAN return on investment

Fabric Manager is able to do SAN fabric performance and capacity management reporting and monitoring. Zoning is one of many SAN security options. Zoning is the only configuration supported for this release. Along with subsystem based volume masking, it is almost universally employed to ensure that only systems that are authorized can access selected data. Zoning is provided by the switch at the port level, so that, for example, a host on port X can access the subsystem connected by port Y. When business needs change, often zones must change also.

Zone control is enabled from a centralized location. Existing zones can be discovered and the members that make up the zone can be viewed and modified by adding or deleting them. New zones can be created and existing zones can be deleted. Fabric Manager makes working with zones easy by providing a GUI that discovers SAN devices and makes them available to add or remove from zones as individual devices.

The ability to do switch performance and capacity management reporting and monitoring can help you to determine if more bandwidth is needed. Wide-area and local-area IP networks, and storage area networks (SANs) move data from one place to another. The management of the bandwidth is needed to continually monitor for link utilization and errors. Data needs to be gathered to tune resources, balance workloads, and do capacity planning.

With Fabric Manager, the comprehensive management of multi-vendor SANs can help simplify the IT infrastructure by providing automatic resource and topology discovery, monitoring, and alerts, and zone control. It brings all the sources of information about SAN topology and configuration into a single place, and creates topology mapping of the SANs. This topology offers both host-centric and device-centric views that can be displayed graphically. The SAN topology display tracks all topology and configuration changes through in-band, out-of-band, and SMI-S monitoring. Without this type of centralized topology, information from a number of sources, such as Element Management tools, device logs, and SNMP traps would have to be continually monitored and manually correlated to determine the current SAN configuration and topology.

Fabric Manager provides you with the ability to view events happening in your SAN environment and records state changes. The events are displayed in a color-coded fashion and can be further customized to reflect organizational priorities. It will forward events signaling topology changes or updates to the IBM Tivoli Enterprise Console, another SNMP manager, or both. Source side filtering by the Fabric Manager enables you to control what events get sent to your centralized console. Filtering helps ensure that the administrators get the information they need and are not overwhelmed by extraneous information.

---

## Tivoli Storage Productivity Center for Replication

Tivoli Storage Productivity Center includes Tivoli Storage Productivity Center for Replication. Tivoli Storage Productivity Center for Replication manages copy services in storage environments. *Copy services* are features that are used by storage systems such as System Storage DS8000 to configure, manage, and monitor data-copy functions. Copy services include IBM FlashCopy, Metro Mirror, Global Mirror, and Metro Global Mirror.

Tivoli Storage Productivity Center for Replication provides copy services management for the storage systems and session types that are listed in the following table:

Storage system	Session type
System Storage DS8000	<ul style="list-style-type: none"> <li>• Basic HyperSwap</li> <li>• FlashCopy</li> <li>• Metro Mirror Single Direction</li> <li>• Metro Mirror Failover/Failback</li> <li>• Metro Mirror Failover/Failback with Practice</li> <li>• Global Mirror Single Direction</li> <li>• Global Mirror Either Direction with Two-Site Practice</li> <li>• Global Mirror Failover/Failback</li> <li>• Global Mirror Failover/Failback with Practice</li> <li>• Metro Global Mirror</li> <li>• Metro Global Mirror with Practice</li> </ul>
System Storage DS6000	<ul style="list-style-type: none"> <li>• Basic HyperSwap</li> <li>• FlashCopy</li> <li>• Metro Mirror Single Direction</li> <li>• Metro Mirror Failover/Failback</li> <li>• Metro Mirror Failover/Failback with Practice</li> <li>• Global Mirror Single Direction</li> <li>• Global Mirror Either Direction with Two-Site Practice</li> <li>• Global Mirror Failover/Failback</li> <li>• Global Mirror Failover/Failback with Practice</li> </ul>
TotalStorage Enterprise Storage Server Model 800	<ul style="list-style-type: none"> <li>• Basic HyperSwap</li> <li>• FlashCopy</li> <li>• Metro Mirror Single Direction</li> <li>• Metro Mirror Failover/Failback</li> <li>• Metro Mirror Failover/Failback with Practice</li> <li>• Global Mirror Single Direction</li> <li>• Global Mirror Either Direction with Two-Site Practice</li> <li>• Global Mirror Failover/Failback</li> <li>• Global Mirror Failover/Failback with Practice</li> <li>• Metro Global Mirror (only H1 site)</li> <li>• Metro Global Mirror with Practice (only H1 site)</li> </ul>
SAN Volume Controller	<ul style="list-style-type: none"> <li>• FlashCopy</li> <li>• Metro Mirror Single Direction</li> <li>• Metro Mirror Failover/Failback</li> <li>• Metro Mirror Failover/Failback with Practice</li> <li>• Global Mirror Single Direction</li> <li>• Global Mirror Failover/Failback</li> <li>• Global Mirror Failover/Failback with Practice</li> </ul>

Storage system	Session type
Storwize V7000	<ul style="list-style-type: none"> <li>• FlashCopy</li> <li>• Metro Mirror Single Direction</li> <li>• Metro Mirror Failover/Failback</li> <li>• Metro Mirror Failover/Failback with Practice</li> <li>• Global Mirror Single Direction</li> <li>• Global Mirror Failover/Failback</li> <li>• Global Mirror Failover/Failback with Practice</li> </ul>
Storwize V7000 Unified	<ul style="list-style-type: none"> <li>• FlashCopy</li> <li>• Metro Mirror Single Direction</li> <li>• Metro Mirror Failover/Failback</li> <li>• Metro Mirror Failover/Failback with Practice</li> <li>• Global Mirror Single Direction</li> <li>• Global Mirror Failover/Failback</li> <li>• Global Mirror Failover/Failback with Practice</li> </ul>
The XIV system	<ul style="list-style-type: none"> <li>• Snapshot</li> <li>• Metro Mirror Failover/Failback</li> <li>• Global Mirror Failover/Failback</li> </ul>

## Architecture

Tivoli Storage Productivity Center for Replication consists of several key components.

### Tivoli Storage Productivity Center for Replication server

The Tivoli Storage Productivity Center for Replication server is the control point for the sessions, storage systems, hosts, and other components that are managed by Tivoli Storage Productivity Center for Replication.

### Database

A single database instance serves as the repository for all Tivoli Storage Productivity Center for Replication data.

An embedded database is provided with Tivoli Storage Productivity Center for Replication.

**GUI** The graphical user interface (GUI) is used to manage all Tivoli Storage Productivity Center for Replication functions.

**CLI** The command-line interface (CLI) is used to issue commands for key Tivoli Storage Productivity Center for Replication functions.

## Interfaces for Tivoli Storage Productivity Center for Replication

Tivoli Storage Productivity Center for Replication provides a graphical user interface (GUI) and a command-line interface (CLI) for managing data replication and disaster recovery.

### Graphical user interface

The Tivoli Storage Productivity Center for Replication GUI contains the following features:

### Navigation tree

The navigation tree provides categories of tasks that you can complete in Tivoli Storage Productivity Center for Replication. Clicking a task opens a main page in the content panel.

### Health Overview

The **Health Overview** area is under the navigation tree and shows a status summary for all sessions, storage systems, host systems, and management servers that Tivoli Storage Productivity Center for Replication is managing.

### Content area

The content panel displays content based on the item that you selected in the navigation tree.

You can view help for the currently displayed panel by clicking the ? icon.

You can view the information center by clicking the ⓘ icon. You must have Internet access to view the information center.

When you log on to the GUI, the **Health Overview** panel is displayed in the content area.

## Command-line interface

You can use the Tivoli Storage Productivity Center for Replication CLI by using the **csmcli** utilities. You can use the CLI directly or as a script for automating functions.

For security, the CLI runs only on the Tivoli Storage Productivity Center for Replication management server. You can run the CLI remotely using a remote-access utility, such as Secure Shell (SSH) or Telnet.

For Tivoli Storage Productivity Center for Replication on Windows, you can specify remote access to Linux or AIX® terminals if you enabled Telnet on your Windows server.

## Tivoli Storage Productivity Center for Replication integration with Tivoli System Automation Application Manager

IBM Tivoli System Automation Application Manager includes a Distributed Disaster Recovery (DDR) feature that uses IBM Tivoli Storage Productivity Center for Replication to provide a data replication and disaster recovery solution for distributed systems. The DDR feature is available in Tivoli System Automation Application Manager version 3.2 or later and requires Tivoli Storage Productivity Center for Replication version 3.4.1.8 or version 4.1.1.1 or later.

Tivoli System Automation Application Manager automates the availability of information technology resources. The DDR feature and Tivoli Storage Productivity Center for Replication provide a full end-to-end solution for site switching on distributed systems at the application level.

For more information about the integration of Tivoli Storage Productivity Center for Replication with Tivoli System Automation Application Manager, including the steps required to perform the integration, see the *Tivoli System Automation Application Manager Administrator's and User's Guide*. The administrator's guide is provided in the Tivoli System Automation Application Manager information centers by version at <http://www.ibm.com/developerworks/wikis/display/tivolidoccentral/Tivoli+System+Automation+Application+Manager>.

---

## Tivoli Integrated Portal

The IBM Tivoli Storage Productivity Center installation program includes IBM Tivoli Integrated Portal. Tivoli Integrated Portal is a standards-based architecture for Web administration. Tivoli Integrated Portal enables developers to build administrative interfaces for IBM and independent software products as individual plug-ins to a common console network. The installation of Tivoli Integrated Portal is required to enable single sign-on for Tivoli Storage Productivity Center and to access the web-based GUI.

### Tivoli Integrated Portal and single sign-on

*Single sign-on* is an authentication process that you can use to enter one user ID and password to access multiple applications. For example, you can access Tivoli Integrated Portal and then access Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication from Tivoli Integrated Portal using a single user ID and password. Single sign-on integrates with the launch and launch in context features to enable you to move smoothly from one application to another application.

#### **Related concepts:**

“Single sign-on”

*Single sign-on* is an authentication process that enables you to enter one user ID and password to access multiple applications. For example, you can access IBM Tivoli Integrated Portal and then access IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication from Tivoli Integrated Portal using a single user ID and password. Single sign-on integrates with the launch and launch in context features to enable you to move smoothly from one application to another application.

“Launch and launch in context” on page 56

The launch and launch in context features are used to start IBM Tivoli Storage Productivity Center and to start other applications from Tivoli Storage Productivity Center. The terms inbound and outbound are used to differentiate starting Tivoli Storage Productivity Center (inbound) and starting another application from Tivoli Storage Productivity Center (outbound).

Chapter 6, “Managing resources in the web-based GUI,” on page 623

You can use the web-based GUI to monitor the condition, capacity, and relationships of the monitored resources within your storage environment.

---

## Key concepts

This section contains a technical overview that will help you understand how IBM Tivoli Storage Productivity Center works. An understanding of the concepts in this section will help you use Tivoli Storage Productivity Center effectively.

### Single sign-on

*Single sign-on* is an authentication process that enables you to enter one user ID and password to access multiple applications. For example, you can access IBM Tivoli Integrated Portal and then access IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication from Tivoli Integrated Portal using a single user ID and password. Single sign-on integrates with the launch and launch in context features to enable you to move smoothly from one application to another application.

For the current version of Tivoli Storage Productivity Center, single sign-on is available for the following applications:

- Tivoli Storage Productivity Center for Replication
- IBM System Storage DS8000
- IBM System Storage SAN Volume Controller
- IBM Storwize V7000

For Tivoli Storage Productivity Center for Replication Storage Manager, single sign-on is enabled by default.

For DS8000 Storage Manager, SAN Volume Controller, and Storwize V7000, single sign-on must be enabled.

To enable single sign-on, see the following topics in the Tivoli Storage Productivity Center information center:

- Configuring Tivoli Storage Productivity Center for DS8000 LDAP authentication
- Configuring Tivoli Storage Productivity Center for SAN Volume Controller and Storwize V7000 single sign-on

## How single sign-on works

A single sign-on environment requires a centralized authentication repository that is accessed by all applications within the environment. When you log on to either Tivoli Integrated Portal or Tivoli Storage Productivity Center, a Lightweight Third-Party Authentication (LTPA) token is created and used for single sign-on authentication when you start other applications from within the Tivoli Storage Productivity Center GUI. LTPA is the security technology that is used in the IBM WebSphere Application Server for passing the user authentication information between applications. To use the LTPA tokens, each application must have the same set of public keys to encrypt the user's information. The authenticating service uses the corresponding private keys to decrypt the user's information for authentication. As an additional security mechanism, LTPA tokens expire after a determined amount of time. By default, the tokens expire after 24 hours. You can change the LTPA token expiration time using the Tivoli Integrated Portal user interface.

During the period between when you log on to Tivoli Storage Productivity Center and when you start other applications, such as element managers, from the Tivoli Storage Productivity Center GUI, the following conditions might occur:

Condition	Explanation
The user password that was used to log on to Tivoli Integrated Portal or Tivoli Storage Productivity Center is changed in the user repository.	Under this condition, the original user credentials that were used to log into Tivoli Integrated Portal or Tivoli Storage Productivity Center are used to access other applications until the timeout period for the LTPA token that is used for single sign-on expires. When the LTPA token expires, you are prompted to reenter your user ID and password when you attempt to start another application using single sign-on.

Condition	Explanation
The user ID that was used to access Tivoli Integrated Portal is changed in the repository or removed from the user repository.	Under this condition, the single sign-on feature does not work. You are always prompted to re-enter your user ID and password when you attempt to start another application through single sign-on.
The user repository is not accessible.	Under this condition, the single sign-on feature does not work. You are always prompted to re-enter your user ID and password when you attempt to start another application through single sign-on.

Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication use their respective IBM WebSphere Application Server instances to authenticate LTPA tokens. However, other applications, such as the IBM System Storage DS8000 element manager and other element managers that do not run within an IBM WebSphere Application Server instance use the authentication service that is provided with Tivoli Integrated Portal. The authentication service client is typically embedded in these other applications and the client communicates with the authentication service server in Tivoli Integrated Portal for all authentication requests.

The single sign-on feature is not supported by the Tivoli Storage Productivity Center command-line interface (CLI).

## Selecting the user authentication method to use with single sign-on

During the installation of Tivoli Storage Productivity Center, you can specify whether to use LDAP or the operating system as the authentication and authorization repository (see the following description of each authentication type). If you do not specify LDAP, then Tivoli Storage Productivity Center uses the operating system (OS) users and groups on the server where Tivoli Storage Productivity Center is installed for authentication and authorization.

### OS Authentication

This method authenticates the user against the users defined for the local operating system (OS).

### LDAP/Active Directory

This method authenticates the user against a Lightweight Directory Access Protocol (LDAP) or Microsoft Active Directory repository.

If OS authentication is selected, the use of the single sign-on feature is limited. OS authentication does not support single sign-on for element managers, even when the element manager is installed on the same computer as Tivoli Storage Productivity Center. LDAP or Microsoft Active Directory authentication supports single sign-on for element managers regardless of where they are installed.

You can change the user authentication method using the Tivoli Integrated Portal graphical user interface (GUI).

During installation, you can specify that Tivoli Storage Productivity Center use an existing Tivoli Integrated Portal instance rather than the instance that is installed with Tivoli Storage Productivity Center. In this case, Tivoli Storage Productivity Center uses the authentication repository that is used by Tivoli Integrated Portal

(LDAP or the operating system). However, if the existing Tivoli Integrated Portal instance uses a file-based authentication repository, you cannot use the existing Tivoli Integrated Portal instance. You must install a new Tivoli Integrated Portal instance when you install Tivoli Storage Productivity Center.

**Related concepts:**

“Changing the user authentication configuration” on page 231

The Tivoli Storage Productivity Center installation program establishes a default authentication configuration using the federated repositories feature of the WebSphere Application Server. If you want to change the user authentication configuration, follow these procedures.

**Related tasks:**

“Changing the LTPA token expiration for single sign-on” on page 248

For single sign-on, the user authentication information is passed between applications using Lightweight Third-Party Authentication (LTPA) tokens. By default, the tokens expire after eight hours. You can change the LTPA token expiration time using the Tivoli Integrated Portal user interface.

## Launch and launch in context

The launch and launch in context features are used to start IBM Tivoli Storage Productivity Center and to start other applications from Tivoli Storage Productivity Center. The terms inbound and outbound are used to differentiate starting Tivoli Storage Productivity Center (inbound) and starting another application from Tivoli Storage Productivity Center (outbound).

Inbound launch in context refers to starting Tivoli Storage Productivity Center at a specific point in the graphical user interface (GUI). You can use inbound launch in context in either of the following ways:

- Configure an application such as Tivoli Enterprise Portal to start Tivoli Storage Productivity Center at functionally related locations in the Tivoli Storage Productivity Center GUI.
- Start Tivoli Storage Productivity Center from Java Web Start, the command line, or the Windows Start menu using parameters to specify the starting location in the Tivoli Storage Productivity Center GUI.

Outbound launch in context refers to starting other applications, such as administrative applications for storage systems and switches, from functionally related points in the Tivoli Storage Productivity Center GUI.

Launch refers to starting an application at the starting point for that application. Launch primarily refers to starting applications from the Tivoli Storage Productivity Center GUI. Starting applications from Tivoli Storage Productivity Center is referred to as an outbound launch.

### Related concepts:

“Inbound launch in context feature”

With the inbound launch in context feature you can start IBM Tivoli Storage Productivity Center at a specified point in the graphical user interface (GUI).

“**Outbound launch and launch in context features**” on page 64

With the outbound launch and launch in context features, you can start the administrative applications for devices such as storage systems and switches from various points in the graphical user interface (GUI).

### Inbound launch in context feature

With the inbound launch in context feature you can start IBM Tivoli Storage Productivity Center at a specified point in the graphical user interface (GUI).

**Prerequisite:** You must have View and Modify permissions to use the launch in context feature.

You can use the launch in context feature to perform the following tasks in Tivoli Storage Productivity Center:

- Create a volume or VDisk
- Open the storage area network SAN Planner
- Create a capacity report
- Create a wasted space report

You can run the launch in context feature in the following ways:

- **Use Java Web Start** from a Web browser. See “Launch with Java Web Start.”
- **Use the command line on Windows, AIX, Linux, or UNIX** to enter the command and arguments on the command line. See “Launch from the command line” on page 59.
- **Use the Windows Start menu.** See “Launch from Start menu” on page 60.
- **Use the Tivoli Enterprise Portal GUI** to define, edit, and launch commands. See “Launch from Tivoli Enterprise Portal” on page 61.

The launch in context feature has a number of parameters. See “Launch in context parameters” on page 1432, “Launch in context task parameters” on page 1434, and “Available windows” on page 1435.

### Launch with Java Web Start:

Using Java Web Start, you can use the launch in context feature from a Uniform Resource Locator (URL).

The launch in context feature requires Java Web Start 6 on the computer that is running the Web browser. If the correct release of Java Web Start is not present, you receive an error message when you enter the URL. The message states that you must download the Java Runtime Environment, which includes Java Web Start. Follow the link provided in the message to install the required software.

If you are using Internet Protocol Version 6 (IPv6) and are using Java Web Start to start IBM Tivoli Storage Productivity Center on a Windows system, use a system host name such as **tpc332.storage.newyork.xyz.com:9549** in the Web browser address field rather than an IPv6 address such as **[2001:DB8:0000:1234:0000:0000:5678:ABCD]:9549**.

To use the launch in context feature to perform a task or display a window on a remote server from your browser, complete the following steps:

1. Open your browser and type the launch in context command.

URLs cannot include spaces. In the command, a parameter and its value are separated by an equal sign (=). Parameter=value pairs are separated by an ampersand (&).

The format of a command to create a volume is:

```
https://device_server:device_port/ITSRM/jsp/jnlp/tpcgui.jsp?consoleClass=com.ibm.usmi.console.lic.tpc.LICConsole&-server=server:port&-function=disk.create_volume&-subsystem_id=ESS-2105-17844-IBM&-name=myvol&-number=2&-size=10&-unit=MB
```

The format of a command to view a window on a remote server is:

```
http://device_server:device_port/ITSRM/jsp/jnlp/tpcgui.jsp?consoleClass=com.ibm.usmi.console.lic.tpc.LICConsole&-server=server:port&-function=window_name
```

**Tip:** The Data server port value is 9549. The port value for the Device server is 9551 for https and 9550 for http. If the wrong the Device server port value is used, the return page cannot be interpreted by the browser. If the wrong Data server port value is used, the following error message is returned.

Unable to connect to the server

2. The first time a window or task is started, you receive a security warning informing you that the downloaded jar files have been digitally signed using a certificate from a trusted company. To prevent this message from being displayed in the future, select **Always trust content from this publisher** and click **Run**. If the Tivoli Storage Productivity Center graphical user interface (GUI) has not been downloaded on the local computer using Java Web Start, or the local computer does not have the latest version of the Tivoli Storage Productivity Center GUI, the GUI is downloaded.
3. If you included the user ID and password in the command, the sign-in dialog is bypassed, otherwise log on to the Tivoli Storage Productivity Center GUI. The Tivoli Storage Productivity Center GUI navigates to the tree node corresponding to the window name that you specified. You are connected using the user name and password that you entered. Depending on the value you specified for the -function parameter, the following actions might occur:
  - The specified window opens
  - For disk.create\_volume, depending on the parameters, the Create Volume wizard or Create VDisk wizard opens.
  - For disk.san\_planner, the SAN Planner panel opens with the given SAN plan ID.
  - For data.filesystem\_capacity\_by\_computer, the Capacity Report opens.
  - For TPC.reports\_data\_wasted\_space, the Wasted Space Report opens.

#### Restrictions:

- When you open a plan in the SAN Planner using launch in context, you must enter the exact name of the plan. The value for the **-plan\_id** parameter is case-sensitive and must match the name of the plan when it was created. For example, if you created a plan named **UserPlan1**, you must specify **-plan\_id UserPlan1** in the launch in context command.
- There is a known limitation when you launch the Filesystem Capacity > By Computer report using launch in context, you must specify the ID for the computer upon which you want to report. For example:

```
http://tpcserver14:9550/ITSRM/jsp/jnlp/
tpcgui.jsp?consoleClass=com.ibm.usmi.console.lic.tpc.LICConsole&-
server=tpcserver14.storage.xyz.com:9549&-
function=data.filesystem_capacity_by_computer&-computer_id=tpcserver14
```

The value you enter for the **computer\_id** parameter might not match the ID for that computer that is stored in the Tivoli Storage Productivity Center database repository. You receive a warning message if the ID for the computer that you enter in the URL does not match the ID that is stored in the data repository. To ensure that this report is displayed properly when you run from the launch in context facility, enter an ID for the computer that matches the ID that is displayed for it through the Topology Viewer or appropriate report in the product user interface.

Use the information in the following links to enter parameters. If any of the parameters are spelled incorrectly, an error message indicates the incorrect parameter.

“Launch in context parameters” on page 1432

You can use the launch in context parameters, definitions, and examples.

“Launch in context task parameters” on page 1434

Use the launch in context feature task parameters to perform tasks.

“Available windows” on page 1435

You can use windows with the inbound launch in context feature to start IBM Tivoli Storage Productivity Center. These windows are called with the `-function window name` argument.

### Launch from the command line:

This topic describes how to start windows and tasks from the Windows AIX, Linux, or UNIX command line.

The bat file `tpc.bat` is used for Windows operating systems. The `.sh` file `TPCD.sh` is used for AIX, Linux, or UNIX systems. The parameters follow the file name. Parameters are separated by spaces. Parameters are optional and can appear in any order. See “Launch in context parameters” on page 1432, “Launch in context task parameters” on page 1434, and “Available windows” on page 1435 for the parameters.

Frequently used commands can be saved as unique command files and rerun as needed.

1. In the Command Prompt window, type the command for the action that you want to take, and press Enter.  
The action occurs on the remote Data server. The graphical user interface (GUI) window for that action opens on the local computer.
2. Enter parameters if you previously did not enter any parameters. If you do not provide a user name, password, or server name, the IBM Tivoli Storage Productivity Center GUI opens the connection dialog box. If you do not provide these values, the GUI presents an error message box and requests the values. If you specify incorrect parameters, you receive an error message.

The following example launches a task from the Windows command line:

```
tpc.bat -user admin -passwd password1 -server
tivoli122.storage.usca.ibm.com:9549 -function
data.filesystem_capacity_by_computer -computer_id <computerID>
```

The following example uses the launch in context feature to view a window on the remote machine:

```
tpc.bat -user admin -passwd password1 -server  
tivoli122.storage.usca.ibm.com:9549 -function disk.storage_subsystem
```

#### Restrictions:

- When you open a plan in the SAN Planner using the command line or a Web browser for launch in context, you must enter the exact name of the plan. The value for **-plan\_id** in the command line is case-sensitive and must match the name of the plan when it was created. For example, if you created a plan named **UserPlan1**, you might enter the following command on the command line:

```
./TPCD.sh -user administrator -passwd passw0rd -server  
tpcserver14.storage.xyz.com:9549 -function disk.san_Planner -plan_id  
UserPlan1
```

- There is a known limitation when you start the Filesystem Capacity > By Computer report using launch in context. To start this report, you must specify the ID for the computer upon which you want to report. For example:

```
./TPCD.sh -user root -passwd "passw0rd" -server  
tpcserver14.storage.xyz.com:9549 -function  
data.filesystem_capacity_by_computer -computer_id tpcserver14
```

The value you enter for "computer\_id" might not match the ID for that computer that is stored in the Tivoli Storage Productivity Center database repository. You will receive a warning message if the ID for the computer you enter in the command line does not match the ID stored in the data repository. To ensure that this report is displayed properly when run from the launch in context command line or through Java Web Start, make sure to enter an ID for the computer that matches the ID that is displayed for it through the Topology Viewer or appropriate report in the product's user interface.

#### Launch from Start menu:

This topic describes how to start windows and actions from the Windows Start menu.

The bat file, `tpc.bat`, is used for Windows operating systems. The parameters follow the bat file name. Parameters are optional and can appear in any order. To use the launch in context feature from the Windows Start menu, complete the following steps:

1. Click **Start > Programs > IBM Tivoli Storage Productivity Center**, right-click **Productivity Center** and select **Properties**. The Productivity Center Properties window opens.
2. Enter the command-line arguments in the **Target** text field and click **Enter**.  
If the Data server is remote, the action occurs on the Data server and the graphical user interface (GUI) window the action opens is on the local computer.
3. Enter the parameters if you did not previously enter the necessary parameters. If you do not provide the user name, password, or server name, the Tivoli Storage Productivity Center GUI opens the connection dialog box. If you do not provide these values, the GUI presents an error message box and requests the values.

The following example starts a task from the Windows Start menu:

```
"C:\Program Files\IBM\TPC\gui\tpc.bat" -user admin -passwd password1  
-server tivoli122.storage.usca.ibm.com:9549 -function  
data.filesystem_capacity_by_computer -computer_id computerID
```

The following example uses the Windows Start menu to view a window on the remote server:

```
"C:\Program Files\IBM\TPC\gui\tpc.bat" -user admin -passwd password1  
-server tivoli122.storage.usca.ibm.com:9549 -function  
disk.storage_subsystem
```

**For more information see:**

“Launch in context parameters” on page 1432

You can use the launch in context parameters, definitions, and examples.

“Launch in context task parameters” on page 1434

Use the launch in context feature task parameters to perform tasks.

“Available windows” on page 1435

You can use windows with the inbound launch in context feature to start IBM Tivoli Storage Productivity Center. These windows are called with the

-function *window name* argument.

**Launch from Tivoli Enterprise Portal:**

This topic shows you how to start an existing launch definition from the Tivoli Enterprise Portal graphical user interface (GUI).

You must configure Tivoli Enterprise Portal before you can use the launch in context feature. For information on prerequisites and details on how to configure the launch in context feature with Tivoli Enterprise Portal, see “Configuring Tivoli Enterprise Portal” on page 62. After Tivoli Enterprise Portal has been configured, you can start the application from the configuration window or use **Launch** from the Tivoli Enterprise Portal navigation tree.

If you use the Tivoli Enterprise Portal navigation tree, **Launch** will open the Tivoli Enterprise Portal graphical user interface with your predefined launch in context commands. To use one of these commands, complete the following steps:

1. In the Tivoli Enterprise Portal window, expand **Enterprise > Windows Systems *your\_server\_name* > Windows OS**. Right-click **Disk** and select **Launch**. Disk is one of several values you can select. Values include Disk, Network, Enterprise Services, Memory, Printer, Process, Processor, and System.
2. The Create or Edit Launch Definitions window opens showing a list of defined launch definitions in the **Existing Launch Definitions** area.
3. Select the launch definition you want to use from the list and click **Launch**. The window or task that is defined by that launch definition opens.

For information on editing the launch in context command with the Tivoli Enterprise Portal GUI, see:

### Related tasks:

“Editing launch definitions” on page 63

You can edit an existing launch definition with the Tivoli Enterprise Portal graphical user interface (GUI).

### *Configuring Tivoli Enterprise Portal:*

You can configure Tivoli Enterprise Portal so that you can use the launch in context feature.

To configure Tivoli Enterprise Portal complete the following steps:

1. The initial steps depend on whether you are going to open a window or perform a task.
  - a. If you are opening a window, in the Tivoli Enterprise Portal navigation window on the local computer, select where you want the launch definition to originate from. This opens the corresponding view on the target computer. Right-click one of the following locations.
    - The navigator item
    - A row in a table or situation event console view
    - A slice of a pie chart
    - A bar of a bar chartIf the launch definition originates from a table, chart, or situation event console view, open the workspace containing the view. If you think you might edit the argument later, create the launch definition from a table or chart view.
  - b. If you are going to perform a task, create a launch definition for one of the following tasks:
    - Create a volume or VDisk
    - Open the SAN Planner
    - Create a capacity report
    - Create a wasted space report
2. In the Tivoli Enterprise Portal window, expand **Enterprise > Windows Systems > your\_server\_name > Windows OS**. Right-click **Disk** and select **Launch**. Disk is one of several values you can select. Values include Disk, Network, Enterprise Services, Memory, Printer, Process, Processor, and System.
3. The Create or Edit Launch Definitions window opens. Click **Create New**.
4. In the **Name** text field, type a descriptive name for this launch definition. This name is used in the definition list.
5. In the **Target** text box click **Browse** to locate the tpc.bat file. The Select files for directories for Launch Definitions window opens. A typical location for Windows systems is C:\Program Files\IBM\TPC\gui\tpc.bat. Select the correct directory and click **OK**.

When you start a launch definition from the command line, if any part of the path contains spaces, enclose the entire entry in quotation marks.
6. In the **Arguments** text field, enter any parameters that will be added when the application is started. Arguments are entered as *-parameter value*. In the Create or Edit Launch Definitions window, click **Browse** next to **Arguments** to locate the parameters that you want to use. The Select Browser Options window opens. Click **Substitutable Items** and then click **OK**. Select parameters from the **Selected Context** and **Extended Context** lists.

The **help** argument lists the available **function** values. You must type the help parameter by itself into the **Arguments** text field or into the form `tpc.bat -help functions` on the command line for Windows or `TPCD.sh -help functions` for UNIX. The **-help functions** parameter provides a window that lists the nodes in the navigation tree that are available to start. If you type **-help** without the **functions** parameter, it results in an error message.

When all parameters have been selected, click **OK** to return to the Create or Edit Launch Definitions window.

7. If the parameters can be changed at launch time (for example, you want to change the system ID), check the **Edit arguments before execution** box.
8. Specify a value for the **Start in** location. Click **Browse** to locate the IBM Tivoli Storage Productivity Center installation and select the folder **gui** where `tpc.bat` is located.
9. Click **Evaluate** to see how the command resolves when the application starts. Correct any of the parameters that are incorrect and reevaluate the command.
10. When you are satisfied with the launch definition, click **Apply** to save your changes. This keeps the window open so that you can start the current launch definition or create a new one. Click **OK** to save the launch definition and close the window.
11. To start the current definition, select **Launch**. The Tivoli Storage Productivity Center graphical user interface (GUI) with the function parameter that you have provided is opened.

**Related reference:**

“Launch in context parameters” on page 1432

You can use the launch in context parameters, definitions, and examples.

“Launch in context task parameters” on page 1434

Use the launch in context feature task parameters to perform tasks.

“Available windows” on page 1435

You can use windows with the inbound launch in context feature to start IBM Tivoli Storage Productivity Center. These windows are called with the `-function window name` argument.

*Editing launch definitions:*

You can edit an existing launch definition with the Tivoli Enterprise Portal graphical user interface (GUI).

If the **Edit arguments before execution** box was checked when a launch definition was configured, you can edit the launch definition by changing the attribute values. To edit a launch definition, complete the following steps:

1. In the Tivoli Enterprise Portal window, expand **Enterprise > Windows Systems > your\_server\_name > Windows OS**. Right-click **Disk** and select **Launch**. Disk is one of several nodes you can select. Nodes include Disk, Network, Enterprise Services, Memory, Printer, Process, Processor, and System.
2. The Create or Edit Launch Definitions window opens showing a list of launch definitions in the **Existing Launch Definitions** area.
3. Select the launch definition that you want to edit. The values are displayed.
4. Make the necessary changes in the text fields.
5. Click **Evaluate** to see how the arguments will resolve when the application starts. Correct any incorrect arguments and re-evaluate the command.
6. Click **Apply** to save the changes and keep the window open. Click **OK** to save the launch definition and close the window.

If you do not want to overwrite the existing launch definition, save the new launch definition with a unique name.

## Outbound launch and launch in context features

With the outbound launch and launch in context features, you can start the administrative applications for devices such as storage systems and switches from various points in the graphical user interface (GUI).

There are two options for starting an application from Tivoli Storage Productivity Center. The option that is available depends on the device that you want to start.

The launch feature starts an application at the starting point for that application.

The launch in context feature starts an application at a functionally related location in that application. Launch in context is available for the following applications:

- Tivoli Storage Productivity Center for Replication
- SAN Volume Controller 6.1 or later
- Storwize V7000
- Storwize V7000 Unified
- IBM SONAS

## Launch menu

When you right-click one of the following entities in Tivoli Storage Productivity Center GUI, you see a launch menu for that entity. The content of the launch menu varies as described in “Launch menu items” on page 65.

- Alert Log Viewer. Each row of the alert log is enabled for a launch in context menu. The context is determined by the type of the alert. Alert types include:
  - Replication
  - Storage Subsystem
  - Computer
  - Fabric
  - Switch
  - Port
  - Tape Library
- Disk Manager Storage Subsystems table
- Fabric Manager Fabrics table
- Tape Manager Tape Libraries table
- Element Manager page (of the Configuration Utility)
- Topology Viewer objects. To see the icons that are associated with each Topology Viewer object, refer to the following list.

## Topology Viewer objects

Topology Object	Icon
Fabric	

Topology Object	Icon
Switch	
Switch port	
Tape library	
Storage subsystem	
Storage subsystem port	
File system volume	
Storage disk	
Storage pool	

## Launch menu items

The following are the possible menu items that can be displayed in the launch menu:

### Launch in context defined application

This menu item is displayed for each application that is defined by a launch descriptor file. Tivoli Storage Productivity Center provides launch descriptor files for the following applications:

- DS8000 Storage Manager
- The management console for the storage systems that are listed under **Management GUI**.
- Tivoli Storage Productivity Center for Replication

If the corresponding launch descriptor files are found for the applications, the following menu items are displayed:

### DS8000 Storage Manager

Click this menu item to start DS8000 Storage Manager.

### Management GUI

Click this menu item to start the management console for the following storage systems:

- SAN Volume Controller 6.1 or later
- Storwize V7000
- Storwize V7000 Unified
- IBM SONAS

### Replication Storage Systems Overview

Click this menu item to start Tivoli Storage Productivity Center for Replication. The window that is opened in the Tivoli Storage Productivity Center for Replication GUI depends on the context for the entity that you selected. For example, if you right-click a storage device on the **Element Manager** tab of the Configuration Utility and click **Replication Storage Systems Overview**, the Tivoli Storage Productivity Center for Replication Storage Systems window opens.

If the launch descriptor file cannot be found, the **Launch file items error** menu item is displayed. Click this item to view a description of the problem. The **Launch file items error** menu item is also displayed in situations such as the IBM Tivoli Integrated Portal server is not installed or is not accessible, the Tivoli Storage Productivity Center Data server is not accessible, or another system error occurred.

### External Tools

This menu item shows any external tools that are defined in the Configuration Utility. Examples of external tools include web-based user interfaces and local executable files. For example, you might add the address of a website that you frequently access or an application that you often use such as a text editor or a spreadsheet.

### Element Manager

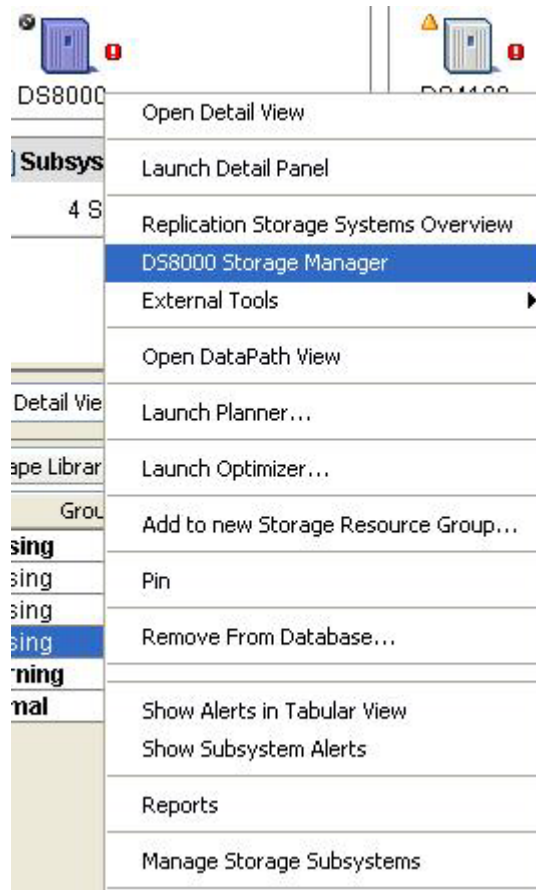

This menu item shows any element managers that were discovered for the device by a Storage Management Initiative Specification (SMI-S) query. To avoid menu item duplication, this item is not displayed when the associated element manager is defined by a launch descriptor file. In this situation, the element manager is displayed as a separate menu item.

### User Defined Tools

This menu item shows any user-defined element managers that are defined in the Configuration Utility. These element managers differ from the element managers in the **Element Manager** menu because they are user-defined and are not discovered by an SMI-S query.

### Example launch menu

The following figure shows an example launch menu for a storage system in the **L0:Storage** topology view. In this example, the menu items **Replication Storage Systems Overview**, **DS8000 Storage Manager**, and **External Tools** are displayed. The **Element Manager** menu item is not displayed because no element managers other than **DS8000 Storage Manager** were discovered. The **User Defined Tools** menu item is not displayed because there are no user-defined element managers that are defined in the Configuration Utility.

## Using the single sign-on feature with launch or launch in context

*Single sign-on* is an authentication process in which you can access more than one system or application by entering a single user ID and password. Single sign-on enables you to start applications from Tivoli Storage Productivity Center without providing logon credentials for the application. Single sign-on is available only for Tivoli Storage Productivity Center for Replication, DS8000, SAN Volume Controller 6.1 and later, and Storwize V7000.

For Tivoli Storage Productivity Center for Replication Storage Manager, single sign-on is enabled by default. For DS8000 Storage Manager, SAN Volume Controller, and Storwize V7000, single sign-on must be enabled.

To enable single sign-on, see the following topics in the Tivoli Storage Productivity Center information center:

- Configuring Tivoli Storage Productivity Center for DS8000 LDAP authentication
- Configuring Tivoli Storage Productivity Center for SAN Volume Controller and Storwize V7000 single sign-on

### Related concepts:

“Single sign-on” on page 53

*Single sign-on* is an authentication process that enables you to enter one user ID and password to access multiple applications. For example, you can access IBM Tivoli Integrated Portal and then access IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication from Tivoli Integrated Portal using a single user ID and password. Single sign-on integrates with the launch and launch in context features to enable you to move smoothly from one application to another application.

## User roles

IBM Tivoli Storage Productivity Center provides user roles that can be mapped to user groups contained in the authentication repository, which is either the local operating system or an LDAP-compliant directory, depending on the choice of authentication mechanism made during the Tivoli Storage Productivity Center installation. The roles determine the user's ability to see and act upon specific nodes in the navigation tree of the GUI. Other factors that affect the user's capability are the components that are licensed, installed, and running.

The superuser is the highest level role and can be used to install IBM Tivoli Storage Productivity Center and to initially set up the product. The superuser has authority over all the other roles in Tivoli Storage Productivity Center:

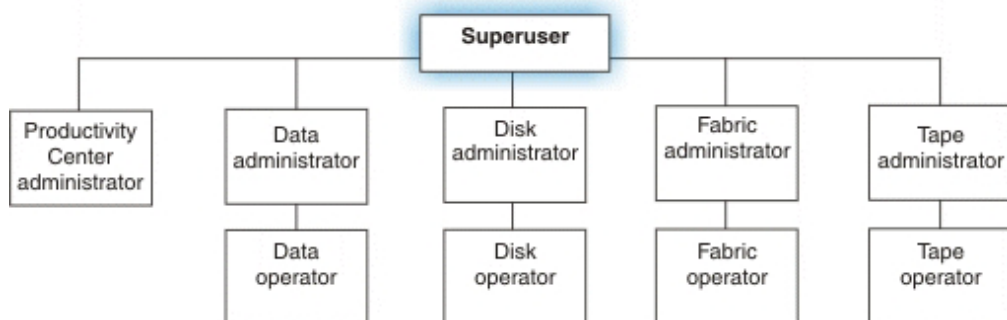

Figure 4. User roles in Tivoli Storage Productivity Center

The functions that are visible for the user roles require that the following components be licensed and installed as shown in Table 11.

Table 11. Functions that require components to be licensed and installed

Function	Component
Data Manager	IBM Tivoli Storage Productivity Center for Data
Disk Manager (requires Device server installation)	IBM Tivoli Storage Productivity Center for Data or Tivoli Storage Productivity Center for Disk or IBM Tivoli Storage Productivity Center for Fabric
Disk performance function (requires Device server installation)	Tivoli Storage Productivity Center for Disk
Fabric Manager (requires Device server installation)	IBM Tivoli Storage Productivity Center for Fabric or IBM Tivoli Storage Productivity Center for Data or Tivoli Storage Productivity Center for Disk

Table 11. Functions that require components to be licensed and installed (continued)

Function	Component
Fabric performance function (requires Device server installation)	IBM Tivoli Storage Productivity Center for Fabric
Tape Manager (requires Device server installation)	IBM Tivoli Storage Productivity Center for Fabric or IBM Tivoli Storage Productivity Center for Data or Tivoli Storage Productivity Center for Disk
Element Manager	IBM Tivoli Storage Productivity Center or IBM Storage Productivity Center Select or IBM Tivoli Storage Productivity Center Advanced Edition

Table 12 shows the GUI nodes that require special roles to view, edit, and act upon the services. The Productivity Center administrator or superuser is required for viewing configurations.

Table 12. GUI nodes that require special roles or licenses

GUI node	Special roles
Administrative Services	All roles can see this node but the user must be a Productivity Center administrator or superuser to edit and act upon the services (for example enable or disable tracing, shut down services, delete services, and so forth).
Administrative Services - Configuration - Role-to-Group Mappings	Only the Productivity Center administrator or superuser can see this node.
Administrative Services - Configuration - License Keys	Only the Productivity Center administrator or superuser can see this node.
Tivoli Storage Productivity Center - My Reports - System Reports - Data	Requires the data administrator role to create or edit objects, or to run jobs, (for example, pings and scans). Requires the data operator role to view reports.
Tivoli Storage Productivity Center - My Reports - System Reports - Disk	Requires that the disk performance function be installed and the disk operator role.
Tivoli Storage Productivity Center - My Reports - System Reports - Fabric	Requires the fabric administrator role to create or edit objects, or to run jobs (for example, pings and scans). Requires the fabric operator role to view reports. This includes being able to view the fabric assets, port connections, SAN switch report, switch port errors, and switch ports (packet rate and data rate).
Tivoli Storage Productivity Center - My Reports - Batch Reports	Requires any administrator role to create the batch reports.
Tivoli Storage Productivity Center - Monitoring - Probes	Requires any administrator role to create or edit probes.

Table 12. GUI nodes that require special roles or licenses (continued)

GUI node	Special roles
Tivoli Storage Productivity Center - Alerting - Alert log	Requires any administrator role to delete or clear alerts. The Storage subsystems node appears if any disk array is installed.
Data Manager	Requires the data administrator role to create or edit objects, or to run jobs (for example, pings and scans). Requires the data operator role to view reports.
Data Manager for Databases	Requires the data administrator role to create or edit objects, or to run jobs (for example, pings and scans). Requires the data operator role to view reports.
Data Manager for Chargeback	Requires the data administrator or data operator role.
Disk Manager	Requires the disk administrator role to create or edit objects, or to run jobs (for example, pings and scans). Requires the disk operator role to view reports. The Storage Subsystem Performance Monitors node requires that the Disk performance function is available.
Disk Manager - Monitoring - Subsystem Performance Monitors - Profile Management - Reporting - Storage Subsystem Performance	Disk performance function must be available.
Fabric Manager	Requires the fabric administrator role to create or edit objects, or to run jobs (for example, pings and scans). Requires the fabric operator role to view reports.
Fabric Manager - Monitoring - Switch Performance Monitors - Reporting - Switch Performance - Constraint Violations	Fabric performance function must be available.
Tape Manager	Requires the tape administrator role to create or edit objects, or to run jobs (for example, pings and scans). Requires the tape operator role to view reports.
Element Manager	All roles can view and edit objects and run jobs.

## User tasks

This section provides an overview of the key IBM Tivoli Storage Productivity Center tasks that you can perform. It includes tasks that are common to all configurations and tasks that require that specific components be installed and licensed.

## Common tasks

Perform common tasks on any Tivoli Storage Productivity Center configuration. These tasks are available under the **Administrative Services** and **IBM Tivoli Storage Productivity Center** nodes in the navigation tree.

- View and manage the services for the Data server, Device server, and Replication server.
- Configure devices for monitoring by Tivoli Storage Productivity Center.
- Manage agents and data sources, including CIM agents, Storage Resource agents, Data agents, Fabric agents, storage systems, Tivoli Storage Productivity Center servers, and VMware VI.
- Discover storage devices that are visible to Tivoli Storage Productivity Center.
- Configure and customize Tivoli Storage Productivity Center for your environment using the functions available under the **Administrative Services > Configuration** node in the navigation tree.
- Authorize users by associating user groups with roles (requires superuser role).
- Deploy Storage Resource agents on hosts that you want to monitor.
- Manage all the schedules, runs, and jobs that are related to the monitoring of storage devices by Tivoli Storage Productivity Center.
- Define probe schedules to collect information about storage devices and other Tivoli Storage Productivity Center servers.
- Create batch reports for information that you want to view on a regular basis in an output file.
- View System Reports that contain key information about the devices that are monitored by Tivoli Storage Productivity Center. These reports are automatically generated when data collection schedules are run.
- Generate Rollup Reports to view information that has been collected by Tivoli Storage Productivity Center servers if you have multiple servers installed in your environment.
- Create and manage groups of related storage entities. Use storage resource groups as input into the SAN Planner.
- Analyze storage subsystems, identify performance bottlenecks, and recommend changes to improve performance (Storage Optimizer).
- Create end-to-end planning for fabrics, hosts, storage controllers, storage pools, volumes, paths, ports, zones, zone sets, and replication (SAN Planner).
- Determine whether existing SAN configurations violate defined best practices or policies (Configuration Analysis).
- Check the alert log to see detailed information about alerts.
- Access a topology view of your storage infrastructure.
- Use Tape Manager to view tape libraries, create tape library groups and run probes against those groups, and view tape library alerts.

## Data Manager tasks

Data Manager tasks are tasks that are specific to the Data Manager, Data Manager for Databases, and Data Manager for Chargeback components.

The following tasks are available under the **Data Manager**, **Data Manager for Databases**, and **Data Manager for Chargeback** nodes in the navigation tree:

- Create monitoring groups that contain related storage devices. Use groups when you want to perform the same action against multiple devices, such as collecting

data with a scan or probe. In Data Manager, you can create groups of computers, file systems, directories, users, OS user groups, databases, tablespaces, and tables.

- Define ping schedules to collect availability information about computers and clusters.
- Define scan schedules to collect detailed information about storage usage and trending for computers, file systems, directories, and clusters.
- Create profiles to define the files that are scanned during a file systems scan and the statistics that are gathered.
- Create and manage alerts for computers, file systems, directories, database instances, tablespaces, and tables. Use alerts to be notified of conditions that are detected on storage devices.
- Establish quotas and constraints to define storage use limits for users and user groups.
- Automatically extend local file systems of managed hosts.
- Generate and view data system reports.
- Use Data Manager for Chargeback to generate invoices that charge back for storage usage.

### **Disk Manager tasks**

The Disk Manager tasks are tasks that are specific to the Disk Manager component.

The following tasks are available under the **Disk Manager** node in the navigation tree:

- Configure storage systems for monitoring by Tivoli Storage Productivity Center.
- Create and manage virtual disks and volumes.
- Define and launch element managers for storage systems.
- Use the Storage Optimizer to identify performance bottlenecks and recommend changes to improve performance for storage systems.
- Use the SAN Planner to perform end-to-end planning for fabrics, hosts, storage controllers, storage pools, volumes, paths, ports, zones, zone sets, and replication.
- Create monitoring groups that contain related storage systems. Use these groups when you want to perform the same action against multiple storage systems, such as collecting data with a probe.
- Define performance monitors to collect performance data related to storage systems.
- Create and manage alerts for storage systems. Use alerts to be notified of conditions that are detected on storage systems.
- Create workload profiles to be used by the SAN Planner to describe characteristics of the volumes to be created.
- Create provisioning profiles to be used by the SAN Planner to define the actual capacity (and security - zoning) characteristics of whatever the profile happens to be associated with.
- Create thin provisioning profiles to specify the parameters for thin provisioned volumes to be created through SAN Planner.
- Generate and view detailed reports about the storage systems that are monitored by Tivoli Storage Productivity Center.

### **Fabric Manager tasks**

Fabric Manager tasks are tasks that are specific to the Fabric Manager component.

The following tasks are available under the **Fabric Manager** node in the navigation tree:

- Configure fabrics and switches for monitoring by Tivoli Storage Productivity Center.
- Create and work with fabric zones, zone aliases, and zone sets
- Create monitoring groups that contain related fabrics. Use these groups when you want to perform the same action against multiple fabrics, such as collecting data with a probe.
- Define switch performance monitors to collect performance data related to switches.
- Create and manage alerts for fabrics, switches, and endpoint devices. Use alerts to be notified of conditions that are detected on these storage devices.
- Generate and view fabric system reports and switch performance reports.

### **Tivoli Storage Productivity Center for Replication tasks**

You can use Tivoli Storage Productivity Center for Replication to obtain continuous availability and disaster recovery solutions by using point-in-time replication, which includes FlashCopy, and Snapshot, and continuous replication, which includes Metro Mirror and Global Mirror.

You can set up Metro Mirror and Global Mirror sessions to replicate data in both the forward and reverse directions.

Use Tivoli Storage Productivity Center for Replication for the following tasks:

- Manage Tivoli Storage Productivity Center for Replication servers
- Create and monitor storage system connections
- Create and monitor logical paths
- Create and manage sessions for performing these types of data replication.
  - FlashCopy (ESS, DS6000, DS8000, and SAN Volume Controller)
  - Snapshot (the XIV system)
  - Global Mirror Single Direction (ESS, DS6000, DS8000, and SAN Volume Controller)
  - Global Mirror Either Direction with Two-Site Practice (ESS, DS6000, and DS8000)
  - Global Mirror Failover/Failback (ESS, DS6000, DS8000, SAN Volume Controller, and the XIV system)
  - Global Mirror Failover/Failback with Practice (ESS, DS6000, DS8000, and SAN Volume Controller)
  - Metro Mirror Single Direction (SAN Volume Controller)
  - Metro Mirror Failover/Failback (SAN Volume Controller, and the XIV system)
  - Metro Mirror Failover/Failback with Practice (SAN Volume Controller)
  - Metro Mirror or Global Copy (ESS, DS6000, and DS8000)
  - Metro Mirror Failover/Failback or Global Copy (ESS, DS6000, and DS8000)
  - Metro Mirror Failover/Failback with HyperSwap® (ESS, DS6000, and DS8000)
  - Metro Global Mirror Failover/Failback (DS8000)
  - Metro Global Mirror Failover/Failback (ESS and DS8000)
  - Metro Global Mirror Failover/Failback with Practice (ESS and DS8000)
  - Metro Global Mirror with HyperSwap (ESS and DS8000)

**Note:** Metro Global Mirror is available only with the IBM Tivoli Storage Productivity Center license, and requires a license key.

- Practicing recovery procedures while maintaining disaster recover capability

## Data collection

Determining what information you want to gather about the storage resources within your enterprise is critical to helping you implement a storage management strategy. Create data collection schedules to gather information about the storage resources in your environment. There are different data collection schedules within Tivoli Storage Productivity Center depending on the type of information that you want to gather and from which types of resources the information is retrieved: discovery, probes, scans, pings, and performance monitors.

You must run discovery schedules or use the Configure Devices wizard before you can collect more detailed information about storage resources. After a storage resource is discovered by Tivoli Storage Productivity Center, use probes, scans, pings, and performance monitors to collect detailed information about those resources. You do not need to run discovery schedules for devices that use native API connection.

The data and statistics gathered by data collection schedules are stored in the database repository. You must define and run schedules before you can perform the other tasks within Tivoli Storage Productivity Center, such as viewing reports, enforcing storage policies, setting alerts, using the topology viewer, and managing storage subsystems.

The following types of data collection schedules are available in Tivoli Storage Productivity Center:

### **Availability Monitoring**

Use pings to collect information about the availability of the storage assets in your enterprise. You can run pings against servers and computers only. Pings are unavailable for storage subsystems and other devices.

### **Asset Collection**

Use probes to collect statistics about the storage assets in your enterprise, such as computers, disk controllers, hard disks, file systems, storage subsystems, fabrics, switches, hypervisors, and RDBMS objects.

### **Usage Monitoring**

Use scans to collect statistics about the usage and trends of your actual storage consumption. Scans provide all the data for usage reporting, quota analysis, and constraint analysis. They gather information at the file and directory level. You can run scans against servers and computers only. Scans are unavailable for storage subsystems, switches, fabrics, and other devices.

### **Switch Performance Monitoring**

Use fabric probes and switch performance monitors to collect information about switches and their performance.

### **Storage Subsystems Performance Monitoring**

Use storage subsystem probes and subsystem performance monitors to collect information about storage subsystems and their performance.

### **Tivoli Storage Productivity Center Server Monitoring**

Use TPC Server probes to collect the storage asset and capacity information that has been gathered by other Tivoli Storage Productivity Center servers

in your environment. Create master and subordinate relationships among servers to use a single interface to generate reports based on data and metrics collected by multiple servers.

You can create groups and profiles to use with data collection schedules to more efficiently monitor storage resources.

### **Monitoring Groups**

Use monitoring groups to ping, probe, or scan multiple storage resources using the same schedule. You can create named groups of computers, storage subsystems, file systems, directories, fabrics, databases, table spaces, tables, users, and OS user groups.

For example, to gather information about all of the computers in a payroll department, create a computer monitoring group named Payroll and populate that group with the computers from the payroll department. Then, to collect information about those computers, select the computer monitoring group named Payroll when defining a data collection schedule. As computers are added or removed from the payroll department, update the Payroll computer monitoring group with those changes. Any data collection schedule that uses Payroll automatically collects information about the new computers in the group during its next run.

### **Profiles**

Use profiles to fine-tune and control the files to be scanned during a file system scan and to specify the statistical information to be gathered.

Default profiles are supplied with Data Manager with Data Manager for Databases. With the default profiles, you can select a specific statistic that you want to gather. If you want to scan a computer or file system and gather all the available statistical information, select all of the default profiles when you create your scan.

You can also use profiles with **Reporting > Usage** reports to determine what information is displayed in those reports.

## **Data replication**

With Tivoli Storage Productivity Center for Replication, you can use several methods to replicate data. The type of data replication that is associated with a session is known as the *session type*.

The following sections describe the session types that are supported by Tivoli Storage Productivity Center for Replication. Depending on the edition of Tivoli Storage Productivity Center for Replication that you are using, some of these session types might not be available.

### **Basic HyperSwap**

Basic HyperSwap sessions are available for the following license types and storage systems.

Table 13. Basic HyperSwap

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication Basic Edition for System z</li> <li>• Tivoli Storage Productivity Center for Replication for System z</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> </ul>	<p>Basic HyperSwap replication is a Metro Mirror replication method that provides high availability if a disk storage system failure occurs. Using Basic HyperSwap with Metro Mirror, you can configure and manage your synchronous Peer-to-Peer Remote Copy (PPRC) pairs.</p>

## FlashCopy

FlashCopy sessions are available for the following license types and storage systems.

Table 14. FlashCopy

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication Basic Edition for System z</li> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> </ul>	<p>FlashCopy replication creates a point-in-time copy in which the target volume contains a copy of the data that was on the source volume when the FlashCopy was established. Using FlashCopy, the data exists on the second set of volumes in the same storage system, and you can restore the data to the first set of volumes.</p> <p>SAN Volume Controller or Storwize V7000 FlashCopy sessions are managed by using FlashCopy consistency groups. Sessions for IBM TotalStorage Enterprise Storage Server (ESS) and IBM DS6000 and DS8000 are not managed by using FlashCopy consistency groups.</p>

## Snapshot

Snapshot sessions are available for the following license types and storage systems.

Table 15. Snapshot

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"><li>• Tivoli Storage Productivity Center for Replication Basic Edition for System z</li><li>• Tivoli Storage Productivity Center for Replication for System z</li><li>• All editions of Tivoli Storage Productivity Center</li></ul>	The XIV system	Snapshot is a session type that creates a point-in-time copy of a volume or set of volumes without having to define a specific target volume. The target volumes of a Snapshot session are automatically created when the snapshot is created.

## Metro Mirror Single Direction

Metro Mirror Single Direction sessions are available for the following license types and storage systems.

Table 16. Metro Mirror Single Direction

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"><li>• Tivoli Storage Productivity Center for Replication for System z</li><li>• All editions of Tivoli Storage Productivity Center</li></ul>	<ul style="list-style-type: none"><li>• TotalStorage Enterprise Storage Server Model 800</li><li>• System Storage DS8000</li><li>• System Storage DS6000</li><li>• SAN Volume Controller</li><li>• Storwize V7000</li><li>• Storwize V7000 Unified</li></ul>	Metro Mirror is a method of synchronous, remote data replication that operates between two sites that are up to 300 KM apart. The source is located in one storage system and the target is located in another storage system. Using Metro Mirror, the data exists on the second site that is less than 300 KM away, and you can restore the data to the first site.

## Metro Mirror Failover/Failback

Metro Mirror Failover/Failback sessions are available for the following license types and storage systems.

Table 17. Metro Mirror Failover/Failback

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> <li>• The XIV system</li> </ul>	<p>Metro Mirror is a method of synchronous, remote data replication that operates between two sites that are up to 300 KM apart. Using Metro Mirror Failover/Failback, the data exists on the second site that is less than 300 KM away. You can use failover and failback to switch the direction of the data flow. Using this method, you can run your business from the secondary site.</p> <p>Using Metro Mirror with HyperSwap, the data exists on the second site that is less than 300 KM away. You can restore the data to the first site. You can also use failover for a backup copy of the data if your primary volumes encounter a permanent I/O error.</p>

## Metro Mirror Failover/Failback with Practice

Metro Mirror Failover/Failback with Practice sessions are available for the following license types and storage systems.

Table 18. Metro Mirror Failover/Failback with Practice

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> </ul>	<p>Metro Mirror is a method of synchronous, remote data replication that operates between two sites that are up to 300 KM apart. The source is located in one storage system and the target is located in another storage system. Metro Mirror Failover/Failback with Practice combines Metro Mirror and FlashCopy to provide a point-in-time copy of the data on the remote site.</p>

## Global Mirror Single Direction

Global Mirror Single Direction sessions are available for the following license types and storage systems.

Table 19. Global Mirror Single Direction

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> </ul>	<p>Global Mirror is a method of asynchronous, remote data replication between two sites that are over 300 KM apart. It maintains identical data in both the source and target, where the source is located in one storage system and the target is located in another storage system. Using Global Mirror, the data exists on the second site that is more than 300 KM away, and you can restore the data to the first site.</p>

## Global Mirror Either Direction with Two-Site Practice

Global Mirror Either Direction with Two-Site Practice sessions are available for the following license types and storage systems.

Table 20. Global Mirror Either Direction with Two-Site Practice

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> </ul>	<p>Global Mirror is a method of asynchronous, remote data replication between two sites that are over 300 KM apart. It maintains identical data in both the source and target, where the source is located in one storage system and the target is located in another storage system. Global Mirror Either Direction with Two-Site Practice combines Global Mirror and FlashCopy to provide a point-in-time copy of the data on either the primary or secondary sites that are over 300 KM apart.</p>

## Global Mirror Failover/Failback

Global Mirror Failover/Failback sessions are available for the following license types and storage systems.

Table 21. Global Mirror Failover/Failback

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> <li>• The XIV system</li> </ul>	<p>Global Mirror is a method of asynchronous, remote data replication between two sites that are over 300 KM apart. It maintains identical data in both the source and target, where the source is located in one storage system and the target is located in another storage system. Using Global Mirror Failover/Failback, the data exists on the second site that is more than 300 KM away, and you can use failover and failback to switch the direction of the data flow. This ability enables you to run your business from the secondary site.</p>

## Global Mirror Failover/Failback with Practice

Global Mirror Failover/Failback with Practice sessions are available for the following license types and storage systems.

Table 22. Global Mirror Failover/Failback with Practice

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> </ul>	<p>Global Mirror is a method of asynchronous, remote data replication between two sites that are over 300 KM apart. It maintains identical data in both the source and target, where the source is located in one storage system and the target is located in another storage system. Global Mirror Failover/Failback with Practice combines Global Mirror and FlashCopy to provide a point-in-time copy of the data on a remote site at a distance over 300 KM away from your first site.</p>

## Metro Global Mirror

Metro Global Mirror sessions are available for the following license types and storage systems.

Table 23. Metro Global Mirror

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800 (only H1 site)</li> <li>• System Storage DS8000</li> </ul>	<p>Metro Global Mirror is a method of continuous, remote data replication that operates between three sites that varying distances apart. Metro Global Mirror combines Metro Mirror synchronous copy and Global Mirror asynchronous copy into a single session, where the Metro Mirror target is the Global Mirror source. Using Metro Global Mirror and Metro Global Mirror with HyperSwap, the data exists on a second site that is less than 300 KM away, and a third site that is more than 300 KM away. Metro Global Mirror uses both Metro Mirror and Global Mirror Failover/Failback to switch the direction of the data flow. This ability enables you to run your business from the secondary or tertiary sites.</p> <p>Using Basic HyperSwap with Metro Global Mirror, you can configure and manage three-site continuous replication that is needed in a disaster recovery event.</p>

## Metro Global Mirror with Practice

Metro Global Mirror with Practice sessions are available for the following license types and storage systems.

Table 24. Metro Global Mirror with Practice

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800 (only H1 site)</li> <li>• System Storage DS8000</li> </ul>	<p>Using Metro Global Mirror with Practice, you can practice your disaster recovery actions while maintaining disaster recovery capabilities. The data exists on a second site that is less than 300 KM away, and a third site that is more than 300 KM away. Metro Global Mirror uses both Metro Mirror and Global Mirror Failover/Failback to switch the direction of the data flow. You can run your business from the secondary or tertiary sites, and simulate a disaster.</p>

## Basic HyperSwap (ESS, DS6000, and DS8000)

Basic HyperSwap is a copy services solution for z/OS® version 1.9 and later. It provides high availability of data if a disk storage system failure occurs. Basic HyperSwap does not replace a disaster recovery solution. If a session is suspended but the suspend operation was not caused by a HyperSwap trigger, the session is not frozen to ensure that it is consistent.

When HyperSwap is combined with Metro Mirror and Metro Global Mirror replication, you can prepare your system for disaster recovery and ensure high availability of data. If a session is suspended but the suspend operation was not caused by a HyperSwap trigger, the session is frozen to ensure that it is consistent.

**Restriction:** This replication method is only available on ESS, DS6000, and DS8000 storage systems, and on management servers that run IBM Tivoli Storage Productivity Center for Replication Basic Edition for System z or IBM Tivoli Storage Productivity Center for Replication for System z.

Basic HyperSwap replication performs the following actions:

- Manages CKD volumes in Metro Mirror to manage synchronous peer-to-peer remote copy (PPRC) relationships.
- Permits only CKD volumes to be added to the HyperSwap session. The graphical user interface (GUI) shows only CKD volumes when you add a copy set. The command-line interface (CLI) does not add a copy set if a fixed block volume is specified.
- Monitors events that indicate a storage device failed.
- Determines whether the failing storage device is part of a Metro Mirror synchronous PPRC pair.
- Determines the action to be taken from policy.
- Ensures that data remains consistent.
- Swaps the I/O between the primary logical devices in the consistency group with the secondary logical devices in the consistency group. A swap can occur from the preferred logical devices to the alternate logical devices or from the alternate logical devices to the preferred logical devices.

## Metro Mirror Failover/Failback with HyperSwap

Metro Mirror Failover/Failback uses HyperSwap to configure and manage synchronous PPRC pairs.

## Metro Global Mirror with HyperSwap

Metro Global Mirror with HyperSwap is a z/OS replication feature that provides the three-site continuous replication that you can use if a disaster occurs.

**Restriction:** If a HyperSwap event occurs when you run a Metro Global Mirror operation with a HyperSwap session, a full copy operation of the data occurs to return the system to a full three-site configuration. If you issue a HyperSwap command when you run a Metro Global Mirror operation with a HyperSwap session, a full copy operation does not occur. A full copy is required only for an unplanned HyperSwap session or a HyperSwap-initiated session by using the z/OS **SETHS SWAP** command.

## Example

Jane is using multiple DS8000 storage systems. The host applications run on a z/OS operating system and the z/OS environment is connected to the DS8000 storage systems. She has a site in Manhattan and a secondary DS8000 in Hoboken. While it is not required that she has a disaster recovery solution in effect, she does need to have a high-availability solution to keep her applications running all the time. Jane is worried that if a volume fails on the DS8000 in Manhattan, her database application might fail. Even a small downtime can be costly to Jane.

Jane uses a Basic HyperSwap session to mirror the data on the DS8000 in Manhattan to the secondary DS8000 in Hoboken. If a volume at the Manhattan site fails, Basic HyperSwap automatically directs application I/O to the mirrored volumes in Hoboken.

## FlashCopy

FlashCopy replication creates a point-in-time copy in which the target volume contains a copy of the data that was on the source volume when the FlashCopy was established.

The ESS, DS6000, and DS8000 provide multiple logical subsystems (LSSs) within a single physical subsystem, while the following platforms provide multiple I/O groups:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

All platforms can use local replication in which the source volume is located in one LSS or I/O group and the target volume is located in the same or another LSS or I/O group. Using the FlashCopy feature, you can reference and update the source volume and target volume independently.

The following figure illustrates how a FlashCopy session works.

## Example

Jane works for a bank. Jane uses a FlashCopy session to make a point-in-time copy of the customer data in existing international accounts. Every night, the bank's servers start batch processing. Jane uses the FlashCopy session to create checkpoint restarts for the batch processing if the batch processing fails. In the batch processing, the first step is to balance all international accounts and to make a

FlashCopy point-in-time copy of the resulting data. The second step in the batch processing is to complete the international disbursements.

If the second step in the batch process fails, Jane can use the data from the FlashCopy session that was taken of the first step to repeat the second step. In this way, Jane does not have to begin the entire process again. Jane also uses a CLI script that performs a FlashCopy operation every night at 11:59 PM, and another script that quiesces the database. She backs up the data to tape on the target storage system, and then sends the tape to the bank's data facility for storage.

## Snapshot

Snapshot is a session type that creates a point-in-time copy of a volume or set of volumes. You do not have to define a specific target volume. The target volumes of a Snapshot session are automatically created when the snapshot is created.

The XIV system uses a snapshot session to create a large number of volume copies without affecting system performance. By using the snapshot function to create a point-in-time copy, and to manage the copy, you can save storage. With the XIV system snapshots, no storage capacity is used by the snapshot until the source volume or the snapshot is changed.

The following figure illustrates how a Snapshot session works.

## Example

Jane's host applications are using an XIV system for their back-end storage. With the XIV system, Jane can create a large number of point-in-time copies of the data. The snapshot function ensures that if data becomes corrupted, she can restore the data to any point in time.

Jane sets up a Snapshot session by using Tivoli Storage Productivity Center for Replication and specifies the volumes on the XIV system that are used by the host applications. Jane does not have to provision target volumes for all the snapshots she intends to make. She can quickly configure a single Snapshot session.

When the session is configured, Jane uses a CLI script that runs a **Create Snapshot** command to the session every two hours. If a problem occurs, such as data becoming corrupted, Jane can find a snapshot of the data from a time before the problem occurred. She can restore the data to that point.

By creating a set of snapshots of the data, Jane can also schedule batch processing against that data every day. She can use the batch processing to analyze certain trends in the market without affecting the host applications.

## Metro Mirror

Metro Mirror is a method of synchronous, remote data replication that operates between two sites that are up to 300 KM apart. The source is located in one storage system and the target is located in another storage system.

**Attention:** If you have Tivoli Storage Productivity Center for Replication for System z sessions that contain Metro Mirror relationships, ensure that the session does not contain system volumes (such as paging volumes) unless you select the **Manage H1-H2 with HyperSwap** or the **Enable Hardened Freeze** option for the session. By using these options, z/OS Input/Output Supervisor (IOS) manages freeze operations for the volumes in the session, which prevents Tivoli Storage Productivity Center for Replication from freezing the volumes and possibly freezing itself.

Metro Mirror replication maintains identical data in both the source and target. When a write operation is issued to the source copy, the changes made to the source data are propagated to the target before the write operation finishes processing. If the storage system ends, no data is lost when you use Metro Mirror if data must be used from the recovery site.

A Metro Mirror session in Global Copy mode creates an asynchronous relationship to accommodate the high volume of data that is migrated. As a result, the data on the target system might no longer be consistent with the source system. The Metro Mirror session switches back to a synchronous relationship when Metro Mirror reissues a **Start** command. In addition, you can start a Metro Mirror session in Global Copy mode and toggle between Metro Mirror and Global Copy modes to accommodate periods in which you require host I/O response time over data consistency.

**Tip:** To determine whether there is any out-of-sync data that must be copied before the session is consistent, check the percent that is complete in the session details page.

### Metro Mirror Single Direction

The following figure illustrates how a Metro Mirror Single Direction session works.

### Metro Mirror Failover/Failback

Using Metro Mirror Failover/Failback, the data exists on the second site, which is less than 300 KM away, and you can switch the direction of the data flow. You can use this session type to run your business from the secondary site, and to copy changes made at the second site back to the primary site when you want to resume production at the primary site.

The following figure illustrates how a Metro Mirror with Failover/Failback session works.

## Metro Mirror Failover/Failback with Practice

A Metro Mirror Failover/Failback with Practice session combines Metro Mirror and FlashCopy features to provide a point-in-time copy of the data on the remote site. You can use this session type to practice what you might do if a disaster occurs, without losing your disaster recovery capability.

This solution consists of two host volumes and an intermediate volume.

The following figure illustrates how a Metro Mirror Failover/Failback with Practice session works.

## Metro Mirror Failover/Failback with HyperSwap

You can enable a Metro Mirror Failover/Failback session to have HyperSwap capabilities. To enable the HyperSwap feature, the following conditions must apply:

- The session is running on an Tivoli Storage Productivity Center for Replication server that runs on IBM z/OS.
- The volumes are only for TotalStorage Enterprise Storage Server, DS6000, and System Storage DS8000 systems.
- The volumes are count key data (CKD) volumes that are attached to the z/OS system.

Metro Mirror Failover/Failback with HyperSwap combines the high availability of Basic HyperSwap with the redundancy of a two-site Metro Mirror Failover/Failback solution when managing count key data (CKD) volumes on z/OS. If the primary volumes encounter a permanent I/O error, the I/O is automatically swapped to the secondary site with minimal effect on the application.

A swap can be planned or unplanned. A planned swap occurs when you issue a HyperSwap command from the **Select Action** list in the graphical user interface (GUI) or when you issue a **cmdsess -action hyperswap** command.

The following figure illustrates how a Metro Mirror Failover/Failback session that is enabled for HyperSwap works.

## Metro Mirror Failover/Failback

For more information about enabling HyperSwap, see “Managing a session with HyperSwap and Open HyperSwap replication” on page 99.

## Metro Mirror Failover/Failback with Open HyperSwap

You can enable a Metro Mirror Failover/Failback session to have Open HyperSwap capabilities. To enable Open HyperSwap processing, the following conditions must apply:

- The volumes in the session are System Storage DS8000 5.1 or later volumes.
- The volumes in the session are fixed block and are mounted to IBM AIX 5.3 or AIX 6.1 hosts with the following modules installed:
  - Subsystem Device Driver Path Control Module (SDDPCM) version 3.0.0.0 or later
  - Multi-Path Input/Output (MPIO) module (the version that is provided with AIX version 5.3 or 6.1)
- The connections between the AIX host systems and the Tivoli Storage Productivity Center for Replication server are established.

Metro Mirror Failover/Failback with Open HyperSwap combines the high availability of Basic HyperSwap on z/OS for fixed-block AIX volumes with the redundancy of a two-site Metro Mirror Failover/Failback solution. If the primary volumes encounter a permanent I/O error, the I/O is automatically swapped to the secondary site with minimal effect on the application.

A swap can be planned or unplanned. A planned swap occurs when you issue a HyperSwap command from the **Select Action** list in the GUI or when you issue a **cmdsess -action hyperswap** command.

The following figure illustrates how a Metro Mirror Failover/Failback session that is enabled for Open HyperSwap works.

## Metro Mirror Failover/Failback

For more information about enabling Open HyperSwap, see “Managing a session with HyperSwap and Open HyperSwap replication” on page 99.

## Examples

Read the following scenarios for information on using Metro Mirror for synchronous, remote data replication between two sites.

### Metro Mirror Single Direction

At the beginning of a work week, Jane is notified that between 10:00 AM and 11:00 AM on the next Friday, power in her building is going to be shut off. Jane does not want to lose any transactions during the power outage, so she decides to transfer operations to the backup site during the outage. She wants a synchronous copy method with no data loss for the critical business functions, so she chooses Metro Mirror, which can be used between locations that are less than 300 KM apart.

In a synchronous copy method, when a write is issued to change the source, the change is propagated to the target before the write is posted. This method of replication maintains identical data in both the source and target. The advantage of this method is when a disaster occurs, there is no data loss at the recovery site because both writes must complete before signaling completion of a write to the source application. Because the data must be copied to both System Storage DS8000 devices before the write is completed, Jane can be sure that the data is safe.

The night before the planned outage, Jane quiesces the database and servers in San Francisco and starts the database and servers in Oakland. To accomplish this task, Jane issues the **Suspend** and **Recover** commands, and then issues the **Start** command on the secondary site. She shuts down the equipment in San Francisco to avoid any power spikes when she restarts the system after the power is turned on.

### Metro Mirror in Global Copy mode

At the beginning of a work week, Jane is notified that between 10:00 AM and 11:00 AM on the next Friday, power in her building is going to be shut off. Jane does not want to lose any transactions during the power outage, so she decides to transfer operations to the backup site during the outage. She wants a synchronous copy method with no data loss for the critical business functions, so she chooses Metro Mirror, which can be used between locations that are less than 300 KM apart.

Jane wants to limit the effect on any applications while completing the initial Metro Mirror synchronization, so she begins the session in Global Copy mode. After she sees that approximately 70% of the data is copied, Jane decides to switch the session to Metro Mirror mode, assuring data consistency.

### Metro Mirror with Practice

Jane wants to run a Metro Mirror with Practice from San Francisco to Oakland. She wants to verify the recovery procedure for the Oakland site, but she cannot stop running the Metro Mirror session while she takes time to practice a recovery. By using a Metro Mirror with Practice session, Jane can practice the disaster recovery scenario in Oakland while the Metro Mirror session runs uninterrupted. By practicing running the applications at the Oakland site, Jane is better prepared to recover data if a disaster occurs at the San Francisco site.

While her session is running in Prepared state, Jane practices a recovery at the Oakland site by issuing the **Flash** command. This command momentarily pauses the session and starts a FlashCopy to the H2 volumes.

As soon as the FlashCopy is started, the session is restarted. These FlashCopy files create a consistent version of the data on the H2 volume that she can use for recovery testing, while the session continues to replicate data from San Francisco to Oakland. As a result, she can carry out the recovery testing without stopping the replication for any extended duration of time.

If, at some point, the Metro Mirror session is suspended because of a failure, Jane can use the practice session to restart the data replication process. She maintains a consistent copy of the data at the Oakland site, in case of a failure during the resynchronization process. When the session is suspended, she can issue a **Recover** command to create a consistent version of the data on the H2 volumes. After the **Recover** command completes, she can issue the **Start H1->H2** command to resynchronize the data from the San Francisco site to the Oakland site.

If a failure occurs before the restarted session is in Prepared state, she has a consistent version of the data on the H2 volumes. She only has to issue the **Recover** command to put the session into Target Available state and make the H2 volumes accessible from the servers. If the session was not in Prepared state when it was suspended, the subsequent **Recover** command does not issue the FlashCopy files to put the data on the H2 volumes. This means that the consistent data on the H2 volumes is not overwritten if the data to be copied to them is not consistent.

### **Metro Mirror Failover/Failback enabled for Open HyperSwap**

Jane wants to run a Metro Mirror with Practice from San Francisco to Oakland. She wants to verify the recovery procedure for the Oakland site, but she cannot stop running the Metro Mirror session while she takes time to practice a recovery. By using a Metro Mirror with Practice session, Jane can practice the disaster recovery scenario in Oakland while the Metro Mirror session runs uninterrupted. By practicing running the applications at the Oakland site, Jane is better prepared to recover data if a disaster occurs at the San Francisco site.

While the session is running in a Prepared state, Jane practices a recovery at the Oakland site by issuing the **Flash** command. This command momentarily pauses the session and starts a FlashCopy to the H2 volumes. As soon as the FlashCopy is started, the session is restarted. These FlashCopy files create a consistent version of the data on the H2 volume that she can use for recovery testing, while the session continues to replicate data from San Francisco to Oakland. As a result, she can carry out the recovery testing without stopping the replication for any extended duration of time.

If the Metro Mirror session is suspended because of a failure, Jane can use the practice session to restart the data replication process while she maintains a consistent copy of the data at the Oakland site, in case of a failure during the resynchronization process. When the session is suspended, she can issue a **Recover** command to create a consistent version of the data on the H2 volumes. After the **Recover** command completes, she can issue the **Start H1->H2** command to resynchronize the data from the San Francisco site to the Oakland site.

If a failure occurs before the restarted session is in Prepared state, she has a consistent version of the data on the H2 volumes. She only has to issue the **Recover** command to put the session into Target Available state and make the H2 volumes accessible from the servers. If the session was not in

Prepared state when it was suspended, the subsequent **Recover** command does not issue the FlashCopy files to put the data on the H2 volumes. This means that the consistent data on the H2 volumes is not overwritten if the data to be copied to the volumes is not consistent.

### Selecting a HyperSwap session

A global insurance company decided to use Tivoli Storage Productivity Center for Replication to manage its disaster recovery environment. Jane wants minimal data exposure, both for planned outages such as routine maintenance, and for unplanned disasters. They have CKD volumes on System Storage DS8000 devices, and use z/OS operating systems. They have two data centers in New York.

Jane chooses a Metro Mirror recovery solution, because her priority is to protect the system from regional disasters. Jane decides to use Metro Mirror solution, because her company has two data centers located near each other. Jane realizes that because she uses a z/OS operating system, CKD, and System Storage DS8000 hardware, she can also use a HyperSwap solution. Using Metro Mirror Failover/Failback with HyperSwap, Jane can minimize the effects on any applications, while she maintains the failover process to the secondary site. Jane decides Metro Mirror Failover/Failback with HyperSwap is the best solution.

After installing and configuring Tivoli Storage Productivity Center for Replication on z/OS, Jane starts the Tivoli Storage Productivity Center for Replication GUI. She adds the Tivoli Storage Productivity Center for Replication storage devices that she intends to use on all sites. From the Session Overview page, Jane uses the Create Session wizard, and selects the **Metro Mirror Failover/Failback** session type. She selects the **Manage H1H2 with HyperSwap** option. After finishing the wizard, Jane clicks **Launch Add Copy Sets Wizard**. She completes this wizard, and issues a **Start H1->H2** command. After the initial copy is completed, Jane can safely replicate the data between both sites. She can also issue the **HyperSwap** command between sites 1 and 2 to switch sites with minimal effect on the application during either a disaster or maintenance period.

### Performing a planned HyperSwap

Jane's company used Metro Mirror Failover/Failback with HyperSwap sessions for the past three months. However, Jane needs to perform maintenance on an H1 volume. During this time, Jane does not want the applications or replication to be interrupted. To prevent this interruption, before the maintenance is scheduled to begin, Jane uses the Tivoli Storage Productivity Center for Replication GUI to perform a HyperSwap operation to the H2 volumes. This process transitions the applications so that the data is written to H2. To perform a planned HyperSwap operation, Jane issues a **HyperSwap** command.

### Understanding what happens when an unplanned HyperSwap occurs

Several weeks after the planned maintenance at Jane's company is completed, an incident occurs at the H1 site. A disk controller fails, causing one of the H1 volumes to encounter a permanent I/O error. Jane's data is safe because she used Metro Mirror Failover/Failback with HyperSwap, and the H2 volume is an exact duplicate of the H1 volume. When the permanent I/O error is detected, a HyperSwap is triggered. The application transitions to write data to the H2 volumes. The applications are not interrupted.

Jane configured a Simple Network Management Protocol (SNMP) listener to alert her to any events, so she receives the SNMP event that indicates

that a HyperSwap occurred. Jane investigates the cause of the HyperSwap process and uses the z/OS console to identify the volume that triggered the HyperSwap process. Jane replaces the faulty disk controller. Then, to recover from the unplanned HyperSwap process, Jane issues the **Start H2->H1** command.

## Global Mirror

Global Mirror is a method of asynchronous, remote data replication between two sites that are over 300 kilometers (km) apart. It maintains identical data in both the source and target, where the source is located in one storage system and the target is located in another storage system.

The data on the target is typically written a few seconds after the data is written to the source volumes. When a write is issued to the source copy, the change is propagated to the target copy, but subsequent changes are allowed to the source before the target verifies that it received the change. Because consistent copies of data are formed on the secondary site at set intervals, data loss is determined by the amount of time since the last consistency group was formed. If the system fails, Global Mirror might lose some data that was being transmitted when the failure occurs. Using Global Mirror, you can ensure that data is recoverable and consistent if a disaster occurs.

## Global Mirror Single Direction

You can use a Global Mirror Single Direction session to run a Global Mirror replication process from only the primary site.

For ESS, DS6000, and DS8000 storage systems, each copy set in the single direction session consists of two host volumes and a journal volume. The following figure illustrates how a Global Mirror Single Direction session works on an ESS, DS6000, or DS8000 storage system.

For the following storage systems, each copy set in the Global Mirror Single Direction session consists of two host volumes:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

The following figure illustrates how a Global Mirror Single Direction session works on these storage systems.

**Global Mirror Either Direction with Two-Site Practice (ESS, DS6000, and DS8000)**

By using a Global Mirror Either Direction with Two-Site Practice session, you can run Global Mirror replication from either the primary or secondary site. It combines Global Mirror and FlashCopy to provide a point-in-time copy of the data on a remote site at a distance over 300 km away from your first site. By using this practice session, you can create volumes on both the primary and secondary site to practice what you might do if a disaster occurred, without affecting the disaster recovery capability.

**Restriction:** This replication method is available on only ESS, DS6000, and DS8000 storage systems.

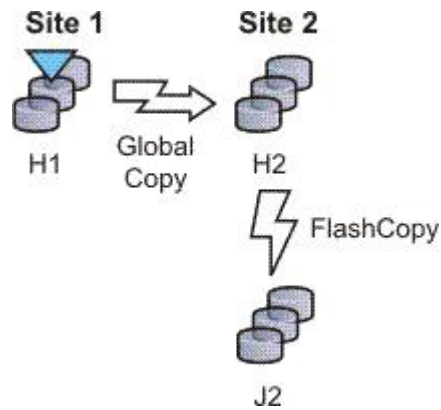

The session consists of two host volumes, two intermediate volumes, and two journal volumes. The following figure illustrates how a Global Mirror Either Direction with Two-Site Practice session works.

**Global Mirror Failover/Failback**

Using Global Mirror Failover/Failback, your data exists on the second site that is more than 300 km away, and you can use failover or failback processing to switch the direction of the data flow. You can run your business from the secondary site.

For ESS, DS6000, and DS8000 storage systems, each copy set in the Global Mirror Failover/Failback session consists of two host volumes and a journal volume. The following figure illustrates how a Global Mirror Failover/Failback session works on an ESS, DS6000, or DS8000 storage system.

For the following storage systems, each copy set in the Global Mirror Failover/Failback session consists of two host volumes:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified
- The XIV system

The following figure illustrates how a Global Mirror Failover/Failback session works on these storage systems.

### Global Mirror Failover/Failback with Practice

A Global Mirror Failover/Failback with Practice session combines Global Mirror and FlashCopy features to provide a point-in-time copy of the data on a remote site at a distance over 300 KM away from your primary site. You can use this to practice what you might do if a disaster occurred, without affecting the disaster recovery capability.

For ESS, DS6000, and DS8000 storage systems, each copy set in the Global Mirror Failover/Failback with Practice session consists of two host volumes, an intermediate volume, and a journal volume. The following figure illustrates how a Global Mirror Failover/Failback with Practice session works on an ESS, DS6000, or DS8000 storage system.

For the following storage systems, each copy set in the Global Mirror failover/failback with Practice session consists of two host volumes and an intermediate volume:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

The following figure illustrates how a Global Mirror Failover/Failback with Practice session works on these storage systems.

### Examples

Read the following scenarios for information on using Global Mirror for asynchronous, remote data replication between two sites.

#### Global Mirror Single Direction

Although Jane's FlashCopy and Metro Mirror copies were both planned, Jane realizes that sometimes a failure can occur, and she wants to ensure that the data is safe. Because Jane works in San Francisco, she wants her other site to be far away if a disaster occurs locally. Her other site is based in Houston. A minor earthquake occurs in San Francisco and power and

communications both fails. Jane arranged for the data on customer accounts that recently opened or closed to be asynchronously copied in Houston, using Global Mirror. Jane risks losing the bytes of data that were being processed when the tremor disrupted the processing in San Francisco. However, she understands that it is a minor inconvenience when weighed next to the value of backing up her data to an area that is not prone to earthquakes.

### **Global Mirror with Practice**

Jane wants to run a Global Mirror with practice from San Francisco to Houston. She plans to verify her recovery procedure for the Houston site, but she cannot stop running the Global Mirror session while she takes time to practice a recovery. By using a Global Mirror with Practice session, Jane can practice her disaster recovery scenario in Houston while the Global Mirror session runs uninterrupted. When she practices running the applications at the Houston site, Jane is better prepared to recover the data if a disaster ever strikes the San Francisco site.

### **Global Mirror Either Direction with Two-Site Practice**

Jane wants to run a Global Mirror with Practice from San Francisco to Houston. She plans to verify her recovery procedure for the Houston site, but she cannot stop running the Global Mirror session while she takes time to practice a recovery. By using a Global Mirror Either Direction with Two-Site Practice session, Jane can practice her disaster recovery scenario in Houston while the Global Mirror session runs uninterrupted. When she practices running the applications at the Houston site, Jane is better prepared to recover the data if a disaster ever strikes the San Francisco site.

Jane can use the Global Mirror Either Direction with Two-Site Practice session to run asynchronous consistent data replication from either the San Francisco site or the Houston site. She can practice the disaster-recovery tasks at the target site, regardless of the location of the current production site. Jane's business can run a consistent Global Mirror session from its Houston site back to San Francisco while it runs a production site at Houston.

## **Setting up Global Mirror for Resource Groups on System Storage DS8000**

If resource groups are defined on a System Storage DS8000, Global Mirror session IDs might be defined for some users. To determine which session IDs are valid, you must modify the `rmserver.properties` file and add the following property:

```
gm.master.sessionid.gm_role,session_name = xx
```

where `gm_role` is the role that has the master volume (for example, H1 in a Global Mirror failover/failback session), `session_name` is the name of the session that uses the session ID, and `xx` is the decimal number for the session ID.

**Tip:** System Storage DS8000 represents session IDs as a two-digit hexadecimal number. Use the decimal version of that number. For example, if you want a Global Mirror Failover/Failback session to use a session ID of 0F, the decimal number is 15, as shown in the following example:

```
gm.master.sessionid.H2.11194_wprac=15
```

### **Metro Global Mirror (ESS and DS8000)**

Metro Global Mirror is a method of continuous, remote data replication that operates between three sites that are varying distances apart. Metro Global Mirror

combines Metro Mirror synchronous copy and Global Mirror asynchronous copy into a single session, where the Metro Mirror target is the Global Mirror source.

This replication method is available on only TotalStorage Enterprise Storage Server Model 800 and System Storage DS8000 storage systems. You can select ESS storage systems in only the H1 volume role. All other volume roles must use DS8000 volumes.

You can use both ESS and DS8000 volumes in the H1 volume role. If ESS and DS8000 storage systems are both used in the H1 role, the DS8000 storage system performs Incremental Resync processing, and the ESS storage system performs a full copy operation. Because you cannot use the Incremental Resync function with ESS, a full copy is required when you change from H1->H2->H3 to H1>H3 and from H2->H1->H3 to H2->H3.

**Attention:** If you have Tivoli Storage Productivity Center for Replication for System z sessions that contain Metro Global Mirror relationships, ensure that the session does not contain system volumes (such as paging volumes) unless you select the **Manage H1-H2 with HyperSwap** or the **Enable Hardened Freeze** option for the session. By using these options, z/OS Input/Output Supervisor (IOS) manages freeze operations for the volumes in the session, which prevents Tivoli Storage Productivity Center for Replication from freezing the volumes and possibly freezing itself.

Metro Global Mirror maintains a consistent copy of data at the remote site, with minimal effect on applications at the local site. This remote mirroring function works in combination with FlashCopy to provide a disaster-recovery solution that includes the following features:

- Fast failover and failback
- Rapid reestablishment of three-site mirroring, without production outages
- Data currency at the remote site with minimal time lag at the local site, an average of only 3 - 5 seconds for many environments
- Quick resynchronization of mirrored sites using only incremental changes

If Tivoli Storage Productivity Center for Replication runs on a z/OS operating system, you can configure a Metro Global Mirror session to control the Metro Mirror relationship between the primary and secondary site by using the HyperSwap feature. With HyperSwap enabled, a failure on the primary storage system causes an automatic HyperSwap operation, which transparently redirects application I/O to the auxiliary storage system. The Global Mirror relationship continues to run uninterrupted throughout this process. With this configuration, you can achieve almost a zero data loss at larger distances.

Using synchronous mirroring, you can switch from local site H1 to remote site H2 during a planned or unplanned outage. It also provides continuous disaster recovery protection of the H2 and H3 sites. You do not have to configure H2, if a switch from site H1 occurs. With this configuration, you can reestablish H2->H1->H3 recoverability while production continues to run at site H2. Additionally, this setup can reduce the workload on site H1.

**Important:**

- If HyperSwap occurs by event when running a Metro Global Mirror with a HyperSwap session, a full copy of the data occurs to return to a full three-site configuration. If you issue a HyperSwap command when running a Metro

Global Mirror with a HyperSwap session, a full copy does not occur. A full copy is required only for an unplanned HyperSwap or a HyperSwap initiated using the z/OS SETHS SWAP command.

- In Metro Global Mirror and Metro Global Mirror with Practice sessions, when the H1 is on an ESS storage system, you might risk filling up the space efficient journal volumes. Because incremental resynchronization is not available on the ESS storage system, full copies are performed in many of the transitions.

### Metro Global Mirror

A Metro Global Mirror session with Practice combines Metro Mirror, Global Mirror, and FlashCopy across three sites to provide a point-in-time copy of the data on the third site.

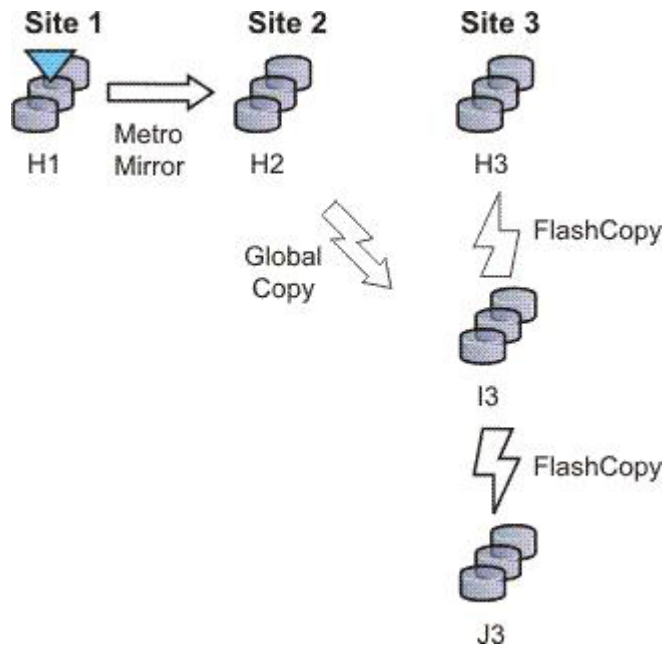

The following figure illustrates how a Metro Global Mirror session works.

### Metro Global Mirror with Practice

A Metro Global Mirror session with Practice combines Metro Mirror, Global Mirror, and FlashCopy across three sites to provide a point-in-time copy of the data on the third site. You can use this session to practice what you might do if a disaster occurred without losing your disaster recovery capability.

The session consists of three host volumes, an intermediate volume, and a journal volume. The following figure illustrates how a Metro Global Mirror with Practice session works.

**Note:** In Metro Global Mirror and Metro Global Mirror with Practice sessions, when the H1 is on an ESS storage system, you might risk filling up the space efficient journal volumes. Because incremental resynchronization is not available on the ESS storage system, full copies are performed in many of the transitions.

## Examples

Read the following scenarios for information on using Metro Global Mirror for continuous, remote data replication between three sites.

### Metro Global Mirror

Although Jane works in San Francisco, she wants to run the business from either Oakland, the secondary site, or Houston, the tertiary site. Jane can use Metro Global Mirror with Failover/Failback to switch the direction of the data flow, so that she can run the business from either Oakland or Houston. Using Metro Global Mirror, Jane has zero data loss at the secondary site and minimal data loss at the tertiary site.

### Metro Global Mirror with Practice

Jane wants to run a Metro Global Mirror with Practice from San Francisco to Houston. She plans to verify her recovery procedure for the Houston site. However, she cannot stop running the Metro Global Mirror session while she takes time to practice a recovery. By using a Metro Global Mirror with Practice session, Jane can practice her disaster recovery scenario in Houston while the Metro Global Mirror session runs uninterrupted. When she practices running the applications at the Houston site and is prepared to run the applications at the Oakland site, if necessary, Jane is prepared to recover data if a disaster occurs at the San Francisco site.

Jane can use Metro Global Mirror with Practice to switch the direction of the data flow, so that she can run the business from either Oakland or Houston. Using Metro Global Mirror, Jane has zero data loss at the secondary site and minimal data loss at the tertiary site.

## Managing a session with HyperSwap and Open HyperSwap replication

HyperSwap and Open HyperSwap provide high availability of data if a primary disk storage system failure occurs. When a failure occurs in writing I/O to the primary storage system, the failure is detected by IOS, and IOS automatically swaps the I/O to the secondary site with no user interaction and minimal application effect.

### Sessions that can be enabled for HyperSwap or Open HyperSwap:

You can create sessions that enable swapping, which provides a session with a highly available business continuity solution.

### Sessions that can enable HyperSwap

The following session types can enable HyperSwap processing:

- Basic HyperSwap
- Metro Mirror with Failover/Failback
- Metro Global Mirror

To enable HyperSwap processing, the following conditions must apply:

- The session is running on a Tivoli Storage Productivity Center for Replication server that is running on IBM z/OS.
- The volumes are only for TotalStorage Enterprise Storage Server, System Storage DS8000, and DS6000 systems.
- The volumes are count key data (CKD) volumes that are attached to the z/OS system.

### Sessions that can enable Open HyperSwap

Only Metro Mirror with Failover/Failback session type can enable Open HyperSwap processing.

To enable Open HyperSwap processing, the following conditions must apply:

- The volumes in the session are System Storage DS8000 5.1 or later volumes.
- The volumes in the session are fixed block and mounted to IBM AIX 5.3 or AIX 6.1 hosts with the following modules installed:
  - Subsystem Device Driver Path Control Module (SDDPCM) version 3.0.0.0 or later
  - Multi-Path Input/Output (MPIO) module (the version that is provided with AIX version 5.3 or 6.1)
- The connections between the AIX host systems and the Tivoli Storage Productivity Center for Replication server are established.

### Setting up the environment for HyperSwap:

You must set up an environment in which you can run HyperSwap processing before you can enable HyperSwap for a IBM Tivoli Storage Productivity Center for Replication session.

Complete the following steps before you enable HyperSwap. For more information about these steps, see the IBM Tivoli Storage Productivity Center for Replication for System z Installation and Configuration Guide.

1. Install IBM Tivoli Storage Productivity Center for Replication for System z.

2. Set up the data store and configure other necessary system settings.
3. Ensure that all RESERVEs are converted to global enqueues (ENQs).
4. Ensure that all volumes in the session that you are enabling for HyperSwap are attached to the IBM z/OS system that runs Tivoli Storage Productivity Center for Replication.
5. Set up and start the IOSHSAPI and HSIB tasks.

### Setting up the environment for Open HyperSwap:

You must set up an environment in which you can run Open HyperSwap processing before you can enable Open HyperSwap for a IBM Tivoli Storage Productivity Center for Replication session.

Complete the following steps before you enable Open HyperSwap.

1. Ensure that the IBM AIX hosts and IBM System Storage DS8000 meet the following hardware and software requirements:

#### AIX requirements

You can find the supported AIX version for each Tivoli Storage Productivity Center for Replication release in the support matrix at <http://www.ibm.com/support/docview.wss?uid=swg21386446>. Click the link for the applicable release under Agents, Servers, and GUI.

You must have the following AIX modules installed:

- Subsystem Device Driver Path Control Module (SDDPCM) version 3.0.0.0 or later
- Multi-Path Input/Output (MPIO) module (the version that is provided with AIX)

#### System Storage DS8000 hardware requirements

The Open HyperSwap function requires System Storage DS8000 5.1 or later.

You cannot use Open HyperSwap with High Availability Cluster Multi-Processing (HACMP™).

2. Create connections from Tivoli Storage Productivity Center for Replication to the AIX hosts by following the instructions at “Adding a host system connection” on page 685.
3. Assign copy set volumes from the storage device to the host by using the System Storage DS8000 command-line interface (CLI) or the graphical user interface (GUI).
4. Run the AIX **cfgmgr** command to discover the volumes that are assigned to the host.

### Considerations for Open HyperSwap and the AIX host:

- A single session that has the Open HyperSwap function enabled can manage multiple hosts; however, each host can be associated with only one session. Multiple hosts can share the session.
- For AIX 5.3, a single host can manage a maximum of 1024 devices that are enabled for Open HyperSwap processing on the host, with eight logical paths configured for each copy set in the session. For AIX 6.1, a single host can manage a maximum of 1024 devices that are enabled for Open HyperSwap processing on the host, with 16 logical paths that are configured for each copy set in the session.

- If an application on the host opened a device, a Tivoli Storage Productivity Center for Replication session for that device cannot be ended. The **Terminate** command fails. To end the session, you must either close the application or remove the copy sets from the session. If you remove copy sets from the session, you must ensure that the application writes the data to the correct volume when the copy set relationship is restored.
- Open HyperSwap processing can fail on a subset of hosts for the session and continue to run on the remaining hosts for the same session. In this situation, you must determine the best action to take if the application is writing data to volumes on the source system and to volumes on the target system.
- To enable Open HyperSwap processing on the host, see the *IBM System Storage Multipath Subsystem Device Driver User's Guide*.

*Configuring timers to support Open HyperSwap:*

You can configure timeout values for the storage system, Tivoli Storage Productivity Center for Replication, and AIX hosts systems. These values can affect the operation of Open HyperSwap.

The following various timeout values can affect Open HyperSwap:

**Storage system quiesce timeout value**

This value is the time when the storage system starts a quiesce operation. When the timer value expires, I/O is resumed on the primary device. The default timeout value is 2 minutes, but the value can be set from 30 to 600 seconds. To set the quiesce timeout value, use the **chdev** command in the *IBM System Storage Multipath Subsystem Device Driver User's Guide*.

**Storage system long busy timeout value**

This value is the time in seconds that the logical subsystem (LSS) consistency group volume stays in the long busy state after a remote mirror and copy error is reported.

**Timeout values for the applications that are on the host**

The various applications that are running on the host have timeout values. The timeout values vary depending on the application.

**Considerations for setting timers**

Consider the following information for setting timers:

- If the host quiesce timer is set to a shorter value than the Tivoli Storage Productivity Center for Replication response timer, an I/O swap failure can occur. If a storage system triggers an unplanned failover and if the storage system quiesce timer expires before Tivoli Storage Productivity Center for Replication responds, the host attempts to write I/O to the primary volume where the loss of access occurred. If the hardware condition that caused the loss of access continues, the write I/O operation fails again and an unplanned Open HyperSwap is not performed.
- If the host quiesce timer is set to a longer value than the Tivoli Storage Productivity Center for Replication response timer, an application timeout might occur if Open HyperSwap takes too long to complete.

**Enabling a session for HyperSwap or Open HyperSwap:**

Enabling HyperSwap or Open HyperSwap for a session provides business recovery and business continuity.

Ensure that you can use the HyperSwap or Open HyperSwap functions in your environment. See “Setting up the environment for HyperSwap” on page 99 or “Setting up the environment for Open HyperSwap” on page 100.

Enable a HyperSwap or Open HyperSwap session by completing the following steps:

1. In the Tivoli Storage Productivity Center for Replication navigation tree, select **Sessions**. Click the button next to the session that you want to enable.
2. From the **Select Action** menu, select **View/Modify Properties** and click **Go**. If you did not create the session, click **Create Session**. You can enable the HyperSwap or Open HyperSwap function on the Properties page
3. In **ESS / DS Metro Mirror Options**, select the appropriate HyperSwap or Open HyperSwap options:
  - **Manage H1-H2 with HyperSwap**. This option enables a session to manage the H1-H2 sequence using HyperSwap. If you select this option, select from the following additional options.
    - **Disable HyperSwap**. Select this option to prevent a HyperSwap from occurring by command or event.
    - **On Configuration Error**. Choose one of the following options:
      - **Partition the system(s) out of the sysplex**. Select this option to partition out of the sysplex when a new system is added to the sysplex and encounters an error in loading the configuration. A restart of your system is required if you select this option.
      - **Disable HyperSwap**. Select this option to prevent a HyperSwap from occurring by command or event.
    - **On Planned HyperSwap Error**. Choose one of the following options:
      - **Partition out the failing system(s) and continue swap processing on the remaining system(s)**. Select this option to partition out the failing system and continues the swap processing on any remaining systems.
      - **Disable HyperSwap after attempting backout**. Select this option to stop the HyperSwap action, and disable the HyperSwap commands or events.
    - **On Unplanned HyperSwap**. Choose one of the following options:
      - **Partition out the failing system(s) and continue swap processing on the remaining system(s)**. Select this option to partition out the failing systems and continues the HyperSwap processing on the remaining systems when a new system is added to the sysplex and HyperSwap does not complete. A restart of your system is required if you select this option.
      - **Disable HyperSwap after attempting backout**. Select this option to stop the HyperSwap action, and disable the HyperSwap commands or events.
  - **Manage H1-H2 with Open HyperSwap**. If volumes are attached to an IBM AIX host, Tivoli Storage Productivity Center for Replication can manage the H1-H2 sequence of a Metro Mirror session using Open HyperSwap. If this option is selected, a failure on the host accessible volumes triggers a swap, which redirects application I/O to the secondary volumes. Only volumes that are currently attached to the host systems that are defined on the Tivoli Storage Productivity Center for Replication Host Systems panel are eligible for Open HyperSwap.

- **Disable Open HyperSwap.** Select this option to prevent a swap from occurring by a command or event while keeping the configuration on the host system and all primary and secondary volumes coupled.
4. Click **OK** to apply the selected options.

#### **Restarting an AIX Host System that is enabled for Open HyperSwap:**

When an AIX host system is restarted, the host automatically opens any volumes for I/O that were open before the system was restarted. If Open HyperSwap was enabled for a set of volumes on the host system, the host must determine which storage system is the primary system before the host can allow the volumes to be opened.

If the Metro Mirror relationship for the set of volumes is in Prepared or Suspended state and the host has connectivity to both the primary and secondary storage systems, the host can determine through the hardware which storage system is the primary system. In this situation, the host automatically opens the volumes.

If the Metro Mirror relationship for the set of volumes is in Prepared state and the host has connectivity to only the secondary storage system, all I/O to the volumes might be blocked on the host system. The I/O might be blocked until the host can verify the primary volume in the relationship. The AIX varyonvg command fails to open the volumes for I/O to prevent the application from writing to an incorrect volume. If the host can determine which volume is the primary volume in the relationship and connectivity to the primary storage system is still lost, a Hyperswap event is triggered. This event causes all I/O to be automatically opened and directed to the secondary storage system.

If the Metro Mirror relationship for the set of volumes is in Target Available state or the host system does not have connectivity and is unable to determine which site is the primary site, all I/O to the volumes are blocked on the host system. The Target Available state occurs after a Hyperswap or a Recover command is issued for the session. The varyonvg command fails to open the volumes for I/O to prevent the application from writing to an incorrect volume.

#### **Unblocking I/O on the host system after a host system restart**

When any of the previous scenarios cause I/O to be blocked, manual actions might be necessary to remove the block.

If the relationships are in Target Available state on the hardware, issue the **Start** command to the session in the required direction of the relationship. This action defines the primary storage system for the host. The host system can allow the volumes to be opened for I/O processing.

If the relationships cannot be restarted, or the host cannot determine the primary storage system, it might be necessary to manually decouple the volumes on the host system.

To decouple the volumes, complete one of the following tasks:

- Stop the session or remove the copy set. This action requires a full copy when the relationships are restarted.
- Remove Object Data Manager (ODM) entries by using the following command:  
`odmdelete -o Volume_Equivalency`

**Restriction:** This command deletes copy set information; use it only for this scenario.

### Planned and unplanned swaps:

After a session is enabled for HyperSwap or Open HyperSwap processing and reaches Prepared state, Tivoli Storage Productivity Center for Replication loads the configuration of volumes that can be swapped to a z/OS or AIX operating system.

When the load is complete, the session can start a planned or unplanned swap. The H1-H2 role pair of the session shows a type of HS. An "H" is displayed over the connection in the dynamic image for that role pair, as shown in the following figure.

Metro Mirror Failover/Failback

### Completing a Planned Swap

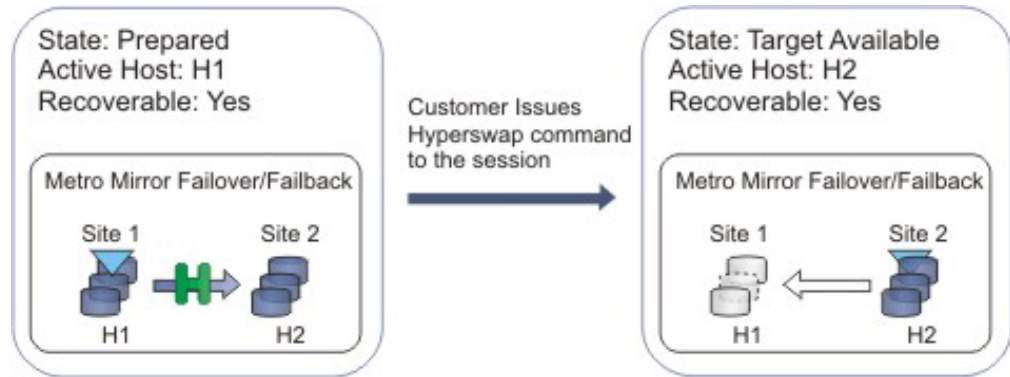

When the session configuration is loaded on z/OS for HyperSwap or AIX for Open HyperSwap, the session is considered swap capable. There may be cases such as a planned maintenance or a migration from the primary storage, in which a planned swap might be required. When the session is in swap capable state, a planned swap can be completed by issuing the **HyperSwap** command for the session.

After you run a planned swap for z/OS HyperSwap and Open HyperSwap, the session transitions to Target Available state and all the H1-H2 pairs are in Target Available state. If the H1-H2 role pair was consistent at the time of the swap, the session has a status of Normal, which indicates that H1-H2 is consistent. If the H1-H2 role pair was not consistent at the time of the swap, the session has a status of SEVERE. The active host on the session is shown as H2.

All I/O is redirected to the H2 volumes. After a successful swap to site 2, you cannot enable the copy function to site 2. The only way to restart the copy processing is by issuing the **Start H2->H1** command. To have the volumes protected with high availability and disaster recovery again, correct the error that caused the swap to occur, and manually restart the session to begin copying data to the other site.

The following figure illustrates a planned swap operation.

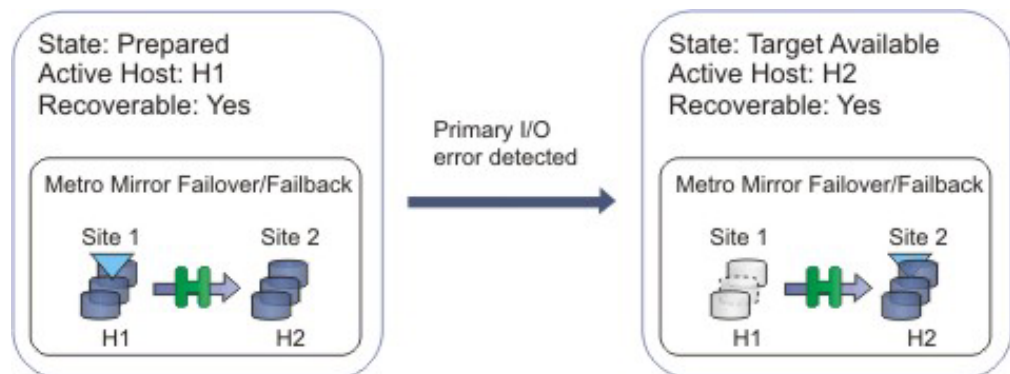

### Unplanned swaps

When the session configuration is loaded on z/OS for HyperSwap processing or on AIX for Open HyperSwap processing, the session is considered swap capable. If a primary I/O error occurs, a swap occurs automatically. For HyperSwap, z/OS completes the swap and then alerts Tivoli Storage Productivity Center for Replication that a swap occurred. For Open HyperSwap, Tivoli Storage Productivity Center for Replication and the AIX host work together to complete the swap.

When an unplanned swap occurs for HyperSwap and Open HyperSwap, the session transitions to Target Available state and all the H1-H2 pairs are in Target Available state. If the H1-H2 role pair was consistent at the time of the swap, the session has a status of Normal and indicates that H1-H2 is consistent. If the H1-H2 role pair was not consistent at the time of the swap, the session might show a status of SEVERE. The active host on the session is shown as H2.

All I/O is redirected to the H2 volumes. After a successful swap to site 2, you cannot enable the copy function to site 2. Therefore, it is not possible to issue a **Start H1->H2** command. The only way to restart the copy processing is by issuing a **Start H2->H1** command. To have the volumes protected with high availability and disaster recovery again, correct the error that caused the swap to occur, and manually restart the session to begin copying data to the other site.

The following figure illustrates an unplanned swap.

## Scenarios that require a full copy in Metro Global Mirror with HyperSwap sessions

You must run a full copy to return to the three-site configuration after a swap when the following conditions occur:

- If you run a Metro Global Mirror session with the HyperSwap function and you issue the **HyperSwap** command by using the z/OS HyperSwap API.
- If you run a Metro Global Mirror session with the HyperSwap function and an unplanned swap occurs.

*Verifying a session for a planned or unplanned swap:*

You can verify whether a session is capable of a planned or unplanned swap from the z/OS console on HyperSwap or the AIX host on Open HyperSwap.

Verify the status of HyperSwap from the z/OS console:

1. View the overall status of the HyperSwap session. Issue the `ds hs,status` command. For example:

```
15.03.06 SYSTEM1 d hs,status
15.03.06 SYSTEM1 STC00063 IOSHM0303I HyperSwap Status 531
Replication Session: SR_HS
HyperSwap enabled
New member configuration load failed: Disable
Planned swap recovery: Disable
Unplanned swap recovery: Disable
FreezeAll: No
Stop: No
```

2. Verify all the volumes in the configuration. Issue the `ds hs,config(detail,all)` command. For example:

```
15.03.51 SYSTEM1 d hs,config(detail,all)
15.03.51 SYSTEM1 STC00063 IOSHM0304I HyperSwap Configuration 534
Replication Session: SR_HS
Prim. SSID UA DEV# VOLSER Sec. SSID UA DEV# Status
06 02 00F42 8K3602 06 04 00FA2
06 01 00F41 8K3601 06 03 00FA1
06 00 00F40 8K3600 06 02 00FA0
```

Verify the status of Open HyperSwap from the AIX host:

1. View the session association and the path that the I/O is being routed to. The path is indicated by an asterisk. Issue the `pcmpath query device` command. For example:

```
host1> pcmpath query device 14

DEV#: 14 DEVICE NAME: hdisk14 TYPE: 2107900 ALGORITHM: Load Balance
SESSION NAME: session1
OS Direction: H1<-H2
=====
PRIMARY SERIAL: 25252520000
-----
Path# Adapter/Path Name State Mode Select Errors
0 fscsi0/path0 CLOSE NORMAL 6091 0
1 fscsi0/path2 CLOSE NORMAL 6300 0
2 fscsi1/path4 CLOSE NORMAL 6294 0
3 fscsi1/path5 CLOSE NORMAL 6187 0

SECONDARY SERIAL: 34343430000 *
-----
Path# Adapter/Path Name State Mode Select Errors
4 fscsi0/path1 CLOSE NORMAL 59463 0
```

5	fscsi0/path3	CLOSE	NORMAL	59250	0
6	fscsi1/path6	CLOSE	NORMAL	59258	0
7	fscsi1/path7	CLOSE	NORMAL	59364	0

### Temporarily disabling HyperSwap or Open HyperSwap:

In some situations, it might be necessary to temporarily disable the HyperSwap or Open HyperSwap function for a session.

You might want to disable HyperSwap or Open HyperSwap in the following circumstances:

- If you are performing maintenance on the system
- If one sysplex member cannot communicate with one or more volumes

Complete these steps to disable Open HyperSwap for a specific session:

1. In the Tivoli Storage Productivity Center for Replication navigation tree, select **Sessions**.
2. Select the sessions for which you want to disable the HyperSwap or Open HyperSwap function.
3. Select **View/Modify Properties** from the **Select Actions** list, and click **Go**.
4. Select **Disable HyperSwap** or **Disable Open HyperSwap**, and click **OK**.

**Tip:** On management servers that run on a z/OS operating system, you can disable the HyperSwap function from an MVS command prompt window by entering the **SETHS DISABLE** command.

### Using active and standby Tivoli Storage Productivity Center for Replication servers with HyperSwap or Open HyperSwap:

You can set up an active and standby management server configuration with HyperSwap or Open HyperSwap.

#### Active and standby servers with HyperSwap

When the storage system is set up to connect through the z/OS interface, the connection information is sent to the standby server and a connection is attempted. The connection might fail if the standby server does not run on a z/OS operating system or does not have access to the same volumes. If the connection fails and the standby server resumes the processing, the standby server cannot manage the HyperSwap processing.

On the z/OS system, if the session configuration was successfully loaded before the HyperSwap processing, the z/OS system can manage the HyperSwap processing. If the z/OS system swaps the volumes but cannot communicate with the Tivoli Storage Productivity Center for Replication server, the session is set to Suspended or Severe state. To set the session to Target Available state, clear the **Manage H1-H2 with Hyperswap** option, and issue the **Recover** command for the session.

#### Active and standby servers with Open HyperSwap

When there is an active and standby management server configuration and a host system connection is added to the active server, a connection is attempted between the host system and the standby server. After AIX loads the session configuration, Open HyperSwap processing is possible only if there is communication between

AIX and the Tivoli Storage Productivity Center for Replication server. If a standby server resumes the processing and is unable to connect to the host system that manages the swap, the session cannot run Open HyperSwap processing. You must activate communication to the host system before the session can run Open HyperSwap processing.

**Related tasks:**

“Managing management servers” on page 664

This section provides information about how to set up active and standby management servers, restore a lost connection between the management servers, or perform a takeover on the standby management server.

## Alerts

You can set up Tivoli Storage Productivity Center so that it examines the data that it collects about your storage infrastructure and writes an alert to a log when an event occurs. You also can specify that an action is initiated, such as sending an SNMP trap, sending an e-mail, or running a script when the event occurs.

Alerts that are triggered based on the data collected by monitoring jobs (for example, pings, scans, and probes) must be defined before the monitoring jobs are run. Alerts that are triggered based on an external source, such as an SNMP trap, must be defined after the SNMP server is configured properly.

You can define an alert in the following ways:

- As part of a data collection schedule
- As part of an alert definition

When an event occurs and triggers an alert, the alert is written to a log. You can also select one or more other ways to be notified of the event. These alert notifications include SNMP traps, IBM Tivoli Enterprise Console events, Tivoli Storage Productivity Center login notifications, operating-system event logs, or email.

**Note:** Alerts are not generated in a Tivoli Storage Productivity Center instance for actions that you perform from that instance. For example, if you start Tivoli Storage Productivity Center and use Disk Manager to assign or unassign volumes for a subsystem, you do not receive alerts for those volume changes in that instance. However, if you assign and unassign volumes outside of that Tivoli Storage Productivity Center instance, an alert is generated.

### Triggering conditions for alerts

In general, the following types of conditions can trigger alerts:

- A data collection schedule failed to complete.
- A change occurred in the storage infrastructure.
- A performance threshold was violated.

The specific conditions that can trigger events vary, depending on the type of storage resource that is being monitored. See “Triggering conditions for alerts” on page 1439 for more information about triggering conditions.

### Alert notifications and triggered actions

Notification methods, or triggered actions, define the method by which you are notified of an alert: SNMP Trap, Tivoli Enterprise Console Event, Login

Notification, Windows Event Log, UNIX Syslog, and email. Alerts are always written to the error log. Additionally, if a Data agent or Storage Resource agent is deployed on a monitored computer, you can run a script or start an IBM Tivoli Storage Manager job in response to the alert. See “Triggered actions for alerts” on page 1453 for more information about triggered actions.

## Prerequisites for successfully using alerts

The following conditions must be met in order to successfully use alerts:

- Data collection schedules are configured and scheduled to run on a regular basis.
- If you want to be notified about an alert in some way other than an entry in the log file, such as using SNMP traps, Tivoli Enterprise Console events, or email, alert notification instructions must be configured before using the alert. See “Configuring alert destinations” on page 395).
- If an alert is triggered based on an SNMP trap from the monitored resource, you must properly configure the SNMP server of the monitor resource to enable Tivoli Storage Productivity Center to listen to SNMP traps. The default port number is 162, and the default community is public.

## Default alerts

The following types of alerts are set for your system by default:

- New entity found
- Job failed

You can change the triggered actions and enable or disable these alerts, but you cannot delete them.

## Provisioning planner

Use the IBM Tivoli Storage Productivity Center *host planner*, the *storage planner*, and the *security planner* to provide guidance when you provision your storage system. The collective term for all three individual planners working together is the *provisioning planner*.

For example, to add more storage to a host, the three planners work together to create the storage, zone the new storage to the host, and configure the multipath settings on the host. After using the planners to do these tasks, you can continue to do typical Tivoli Storage Productivity Center jobs with the storage on the host, such as creating the file system.

You can call each planner individually. For example, you might modify an existing multipath or zone setting or create volumes on the subsystem for later use with the host planner.

Use the planners to plan an integrated set of high-level policies for performance, availability, and security, based on the current resource utilization. The set of selected policies determines the best action responses to performance, availability, and security events and constitutes the output plan, which is the record of the output of the planners. You can either accept plan advice to trigger an associated action (like creating a volume or performing zoning), or reject the advice and change the plan.

## Modes of use

You can use the planners in the following ways:

### Planning mode (Host planning advice)

Planning mode uses each of the planners: storage planner, provisioning planner, and security planner, to configure an end-to-end plan for storage connectivity. This results in a recommendation for zoning, volume assignment, and multipath software configuration.

### Assist mode

Assist mode provides zoning recommendation that meet the connectivity requirements, as established in current policies.

### Validate mode

Validate mode evaluates the current configuration against the connectivity requirements, using the configuration checker utility.

## Host planner

Use the IBM Tivoli Storage Productivity Center *host planner* to provide guidance when you configure host to subsystem connectivity. The host planner accesses default requirements or requirements that you set, and helps identify configurations that do not meet those requirements.

You can perform common network and storage provisioning tasks all at once by using the host planner with the other two planners, which are the *security planner* and the *storage planner*. The collective term for the three individual planners working together is *provisioning planner*.

For example, to add more storage to a host, the three planners work together to create the storage, zone the new storage to the host, and configure the multipath settings on the host. After using the planners to do these tasks, you can continue to do typical Tivoli Storage Productivity Center jobs with the storage on the host, such as creating the file system.

Host planning is the task of determining the connectivity between a host and the storage subsystems to obtain pathing and performance requirements. Inputs to the planning process are:

- The host
- Host ports and storage controller ports (and port performance utilization)
- Existing multipathing and zoning information
- The subsystem and identifiers
- The application profile (I/O, performance, and availability requirements)
- Pathing requirements (whether to use multipathing if it is available)

The planning process uses storage planning, configuration checking, and security planning for portions of the overall process.

### Collection of information

The planner retrieves information from the Tivoli Storage Productivity Center database as its default input. You can provide explicit values to override default input. If you explicitly specify the number of paths, for example, the host planner verifies whether the value satisfies performance requirements. If not, the host planner calculates the number of paths, and which storage controller and host ports satisfy the requirements. The fabric, disk, and data discovery and probe operations must run to collect the information needed for the planner. If the information is not collected,

the planner output identifies the limitation and presents a recommendation based on the subset of information that is available.

### **Required components**

The host planner also uses the following components:

#### **Data agent or Storage Resource Agent**

The Tivoli Storage Productivity Center data agent is enhanced to deal with an SD multipathing driver on the host. The enhanced data agent also collects SDD information, including SDD present, version, HBAs and ports, HBA info, vdisk and vpath configuration, and multipathing settings per vpath.

#### **Multipathing control action application programming interfaces (APIs)**

Unlike the storage planner or the security planner, control action APIs for multipathing do not exist.

## **Overview of the planning process**

Host planning requires the following steps:

1. Validating that the host and subsystem are compatible by type and level of the host, the operating system, the subsystem, and the SDD software, for example
2. Determining the number of paths needed for the pathing policy and the expected I/O performance
3. Determining the connectivity required between the host and the subsystem
4. Determining the configuration for multipathing software
5. Configuring the zoning and SDD multipathing configuration

### **Policies related to the host planner**

The host planner uses the following policies that you configure with the configuration checker utility:

#### **Multipath**

Specifies the multipath policy requirement (multiple or single path)

#### **Preferred number of paths**

Specifies required number of paths between host and subsystems

#### **Multipath driver mode**

Specifies multipath driver mode (failover, load balancing, round robin)

#### **Redundant fabric**

Specifies routing through isolated fabrics (must have at least two routes in separate fabrics, only one route required)

### **Planning guidance outputs**

The host planner provides guidance that is based on the pathing and performance requirement inputs that it accesses. Outputs from the planning process are:

- Validation that a plan is possible
- Zoning
- Subsystem assignment
- Multipathing (SDD) configuration information
- Configuration of zoning and SDD

### **Indication of violations**

The planner notifies you of current policy violations before running a new plan that compensates for the violations. Violations are logged in the job log.

### **Command-line interface**

You cannot invoke the planning wizard by using the command-line interface..

## **Storage planner**

Use the IBM Tivoli Storage Productivity Center *storage planner* to perform storage administration tasks, such as creating storage.

You can complete common network and storage provisioning tasks at the same time by using the storage planner with the other two planners, which are the *host planner* and the *security planner*. The collective term for the three individual planners working together is *provisioning planner*.

For example, to add more storage to a host, the three planners work together to create the storage, zone the new storage to the host, and configure the multipath settings on the host. After using the planners to do these tasks, you can continue to do typical Tivoli Storage Productivity Center jobs with the storage on the host, such as creating the file system.

### **Collection of information**

The storage planner collects and evaluates capacity, storage controller preferences, storage controller types, the number of volumes and volume size, performance requirements, the use of unassigned volumes, the RAID level and performance utilization and capacity utilization input from the Tivoli Storage Productivity Center database and from explicit values that you define.

### **Planning guidance outputs**

The storage planner generates a plan that presents optimal storage controller and storage pool configurations.

### **Control action application programming interfaces (APIs)**

The control action APIs are not implemented by the storage planner but are implemented by the device manager (DM).

### **Overview of the planning process**

If you explicitly specify the storage pool and controller information, the storage planner checks to see whether the input performance and capacity requirements can be satisfied.

### **Supported devices**

The storage planner provides support for IBM System Storage DS8000, IBM System Storage DS6000, and IBM Enterprise Storage (ES800 controllers). The storage planner is capable of working with any combination of these specific controllers.

## **Security planner**

Use the IBM Tivoli Storage Productivity Center *security planner* to perform security administration tasks.

You can perform common network and storage provisioning tasks all at once by using the security planner with the other two planners, which are the *host planner* and the *storage planner*. The collective term for the three individual planners working together is *provisioning planner*.

For example, to add more storage to a host, the three planners work together to create the storage, zone the new storage to the host, and configure the multipath settings on the host. After using the planners to do these tasks, you can continue to do typical Tivoli Storage Productivity Center jobs with the storage on the host, such as creating the file system.

#### **Collection of information**

The security planner collects and evaluates existing host port information, storage controller ports, zones, zone sets, and switches from the Tivoli Storage Productivity Center database and from explicit values that you define as zoning input and volume masking input.

#### **Planning guidance outputs**

The security planner generates a plan that presents optimal zoning and volume masking.

#### **Control action application programming interfaces (APIs)**

The security planner control APIs are currently already implemented by the fabric and DM APIs.

#### **Overview of the planning process**

If you specify exact zoning and volume masking information details, the planner informs you whether your input is different than the existing configuration, or different than the optimal configuration that the planner calculates based on policies and the existing security parameters. If the optimal configuration differs from your selections, the planner proposes zoning and volume masking settings.

## **Reporting**

This section contains conceptual information about reporting.

Use the Reporting facilities in the different managers of IBM Tivoli Storage Productivity Center to view both overview and detailed information about your storage. The over 500 available reports are constructed from the statistical information accumulated in the repository and enable you to select exactly the computers, storage systems, switches, clusters, disks, file systems, hypervisors, users and even other Tivoli Storage Productivity Center servers upon which you want to report. You can view reports as tables of data or as graphical charts, which provides you with the flexibility to get a very detailed look at your information or a very high level overview.

You must collect information about your environment before you can use reports to view details about the storage resources in it. You can use monitoring jobs in Tivoli Storage Productivity Center such as probes, scans, pings, and Tivoli Storage Productivity Center server probes, and discovery jobs to gather comprehensive information and statistics about your storage resources.

## **Fabric and zones**

Use the IBM Tivoli Storage Productivity Center to learn more about fabrics and zones.

#### **Zones, zone aliases, and zone sets**

Zones, zone aliases, and zone sets allow logical grouping of ports and storage devices within a storage area network. This section describes zoning concepts and elements.

In a storage area network a *zone* is a logical grouping of ports to form a virtual private storage network. Zones that belong to a single SAN can be grouped into a *zone set*, which can be activated or deactivated as a single entity across all switches in the fabric. A zone set can contain one or more zones, and a zone can be a member of more than one zone set. Using zoning, you can automatically or dynamically arrange fabric-connected devices into logical groups across a physical fabric.

Ports and devices in a zone are called *zone members*. A zone can contain one or more zone members. Ports that are members of a zone can communicate with each other, but they are isolated from ports in other zones. Devices, however, can belong to more than one zone. A *zone alias* is a collection of zone members. A zone alias can be added to one or more zones.

**Note:** In some cases, inactive zones might not have any zone members. Activating an inactive zone set that contains empty zones will fail if a switch does not support empty zones in active zone definitions.

Zone membership can be specified by:

- The N\_Port\_Name of the N\_Port connected to the switch (also known as WWN zoning or port name zoning)
- The N\_Port address identifier assigned during fabric login (also known as PortId or FCID zoning)
- The Node\_Name associated with the N\_Port
- The Domain identification (Domain\_ID) and physical port ID of the Switch Port to which the N\_Port is attached (also known as domain port zoning)
- An alias name

Zoning supports the use of aliases, which are meaningful names assigned to devices. An alias can also be a group of devices that are managed together to make zoning easier.

There are two types of zoning:

**Hardware zoning (port zoning)**

In hardware zoning (also called *port zoning*), the members of a zone are the physical ports on a fabric switch.

**Software zoning (WWN zoning)**

Software zoning uses the Simple Name Server (SNS) that runs inside a fabric switch. It is based on the node WWN or port WWN of the zone members to be included. Software zoning lets you create symbolic names for the zones and zone members.

A *default zone* is a group of devices that are not members of the active zone set. These can communicate with each other but not with members of any other zone. Default zoning is enabled by default. You can use a switch element manager to configure the Default Zone option to enable or disable the default zone independently of the active zone set.

**Note:**

1. If the default zone is disabled, devices that are not members of the active zone set cannot communicate.
2. If the default zone is disabled and no zone set is active, no devices can communicate.

3. If default zoning is enabled, deactivating the active zone set makes all devices members of the default zone. If default zoning is disabled, all communication stops.
4. If you activate one zone set while another zone set is active, the currently active zone set is deactivated.
5. If your EFC Manager manages multiple fabrics, ensure that you have the correct zone set for the fabric you are currently updating.

You can view zones in SANs using the topology viewer console. Fabric Manager lets you create, update, and delete zones, zone aliases, and zone sets in a SAN. In addition, you can do the following:

- Assign zones to zone sets
- Activate and deactivate zone sets
- View zone membership
- Add and remove zone members to and from a zone
- Add and remove zone members to and from a zone alias
- Assign zone aliases to zones

**Note:** Certain types of switches and the types of agents configured can affect the zoning operations that you can perform.

## Zone configuration

When you configure zones, you can use Fabric Manager or the management application for the devices. The advantages of using Fabric Manager rather than the management applications of the devices are that Fabric Manager lets you perform zoning from a single interface, and you can use consistent, familiar methods to work with devices from multiple vendors.

Consider the following guidelines if you use Fabric Manager with zones:

- For Brocade fabrics, topology information is collected through CIM agents. If no CIM agents are configured, or if the fabric is a QLogic or Cisco fabric, have at least one Storage Resource agent attached to each fabric and as a member of an active zone for the complete topology display. In this way, you can manage your switches and a string is returned, provided by the vendor, that can be the worldwide name (WWN) or a vendor, model, and level type designation.
- For zone discovery and zone control for any fabrics with Brocade switches or vendor Brocade switches, you must have a SMI-S agent configured for the fabric.
- A zone set can be deleted while it contains zones. With QLogic switches, those zones are put into an orphan zone set. The zones can later be moved from an orphan set into other zone sets. The Fabric Manager zone configuration panels cannot display zones in an orphan zone set. However, the zones exist on the switch, and they can be configured using the tool from the switch vendor.
- You cannot add empty zones to inactive zone sets for switches. Activating an inactive zone set that contains empty zones can fail if a switch does not support empty zones in active zone definitions.

**Note:** Fabric probes through the Storage Resource agents do not detect orphan zones. These zones are not listed in the Zone Configuration window. However, the zones exist on the switch, and they can be configured using the tool from the switch vendor. However, Brocade orphan zones, which are discovered through Storage Management Initiative (SMI) agents, are listed in the Zone Configuration

window and can be configured by the Fabric Manager. Brocade orphan zone aliases are listed in the Zone Configuration window and can be configured by the Fabric Manager.

### **Switch zoning capabilities**

When you select a fabric in which to perform zoning operations, Fabric Manager determines the capabilities of the switches in the SAN and limits the zoning operations based on that information.

To see a list of supported switches and their capabilities, default values, ranges, and possible effects, go to <http://www.ibm.com/support/docview.wss?&uid=swg21156206>.

### **Zoning for Cisco MDS 9000 devices:**

Cisco switches support virtual SANs (VSANs), which is the logical partitioning of a fabric into multiple fabrics. The overall network is referred to as the physical infrastructure, and the logical fabrics are the VSANs. Fabric Manager provides basic zone discovery and zone control for the Cisco MDS 9000 series of devices using the FC-GS-3 protocol. This allows in-band zone control and defaults to the Cisco VSANs.

The following tasks are supported:

- Creating, deleting, and updating zones
- Creating, deleting, updating, activating, and deactivating zone sets

Fabric Manager supports these zone member types:

- N\_Port WWN
- FC ID (the fibre channel ID of an N\_port attached to the switch)

Unsupported zone and zone member types are displayed as non-standard on the topology display. Fabric Manager does not allow zone management of zones and zone sets that contain unsupported members.

### **Brocade switches in zones:**

Brocade switches support some non-standard zones such as quick loop zones, fabric assist zones, and protocol zones. If the switch configurations have these zones already defined, Fabric Manager preserves them and does not modify them in any way. They are not displayed on the zone control interface. However, if they are part of a zone set that is active at some time, the devices that are part of such zones that are also online are displayed in the topology Zone View.

You can create, change, and delete non-standard zones by using the Brocade switch management application.

### **Note:**

- A zone set displayed on the zone control interface might have no zones. This could mean that the zone set contains a non-standard zone on a Brocade switch.
- A zone set might have non-standard zones on a Brocade switch that are not displayed on the zone control interface.
- When creating a new zone using the same zone name as that of a non-standard zone that already exists on a Brocade switch, you might get a error that the zone

already exists. Because the non-standard zone is not displayed on the zone control interface, you must verify this by using the switch management application.

- Tivoli Storage Productivity Center allows you to add empty zones to an inactive zone definition. Activation of a zone set containing empty zones may still fail if the switch does not support empty zones in active zone definitions.

## Agents

The IBM Tivoli Storage Productivity Center uses agents to gather data: Common Information Model (CIM) agents, Storage Resource agents, Data agents, Fabric agents, and out-of-band Fabric agents.

### Common Information Model agents

Common Information Model (CIM) agents enable communication between the storage device (storage subsystem, fabric switch, or tape library) and IBM Tivoli Storage Productivity Center. Each storage device that you want to manage must have a CIM agent either installed or embedded unless it is a device that uses Native API connection.

CIM agents are provided by the vendor of the storage subsystem, fabric switch, or tape library. Each vendor provides unique agent code for their family of storage devices. This code implements a Common Information Model Object Manager (CIMOM) that conforms to the Storage Management Initiative Specification (SMI-S) of the Storage Networking Industry Association (SNIA).

The CIM agent enables communication between the storage device and Tivoli Storage Productivity Center. Commands and responses are transmitted between Tivoli Storage Productivity Center and the CIM agent using an XML transport layer. The CIM agent to storage device layer uses a vendor-specific proprietary interface.

The CIM agent usually must be installed and configured, so that it can identify the storage devices with which it communicates. Some storage devices, such as Cisco fabric switches, contain embedded CIM agents and so do not require that CIM agents be installed, although Tivoli Storage Productivity Center must be configured to point directly to the storage devices that contain the embedded CIM agents.

CIM agents can be referred to as SMI-S providers, CIM proxy agents, and CIMOM agents. CIM agents can be embedded in the device or installed on a separate computer.

#### Note:

- Do not install multiple CIM agents on a single computer because of port conflicts.
- Do not install a CIM agent on the system where a Tivoli Storage Productivity Center server component is installed.

### Storage Resource agents and Data agents

Use Storage Resource agents and Data agents to collect information about the storage resources (for example, servers, computers, workstations, HBAs, and so on) in your environment. You must deploy an agent on systems that you want Tivoli Storage Productivity Center to monitor.

**Note:** In Tivoli Storage Productivity Center v4.2 and later, you can deploy Storage Resource agents only. If you want to install a Data agent, you must own a previous

version of the product. See the documentation for the previous version of the product for information about how to install a Data agent.

Agents gather the following information about storage resources:

- Asset information
- File and file system attributes
- Database application information
- Novell Directory Services (NDS) tree information (only supported by Data agents)
- Network attached storage (NAS) device information
- Topology information
- Zoning information

Agents also discover fabrics and perform zone control for Cisco and Qlogic fabrics.

### **Deployment guidelines and limitations for Storage Resource agents:**

There are a number of guidelines and limitations that you must consider when managing the Storage Resource agents in your environment.

Use the following information when you deploy Storage Resource agents and migrate existing Data agents:

- Multiple Storage Resource agents that are probing or scanning the same storage resources
- Platforms that support Storage Resource agents deployments
- Product functions that are not available for storage devices monitored by Storage Resource agents
- Required authority for deploying Storage Resource agents
- Orphan zones
- Firewalls and Storage Resource agent deployments
- Multiple computers in a deployment
- Communication between the Tivoli Storage Productivity Center server and a Storage Resource agent
- Daemon and non-daemon services
- Authentication between the Tivoli Storage Productivity Center server and a Storage Resource agent
- Storage Resource agents on the same computer
- Time zones for computers monitored by Storage Resource agents
- UNIX systems using RSH protocol
- Deployments on Windows - NetBIOS setting
- Deployments on Windows - User Account Control (UAC) remote restrictions
- Additional information about Storage Resource agents

#### **Multiple Storage Resource agents that are probing or scanning the same storage resources**

If multiple Storage Resource agents are set up to probe or scan the same storage resources, the Storage Resource agent that was added to Tivoli Storage Productivity Center first is used for the probe or scan. Therefore, only data that is gathered by the first Storage Resource agent is shown.

#### **Platforms that support Storage Resource agents for the same**

For a list of platforms on which you can deploy Storage Resource agents,

go to the Tivoli Storage Productivity Center support site at [http://www.ibm.com/support/entry/portal/Overview/Software/Tivoli/Tivoli\\_Storage\\_Productivity\\_Center\\_Standard\\_Edition](http://www.ibm.com/support/entry/portal/Overview/Software/Tivoli/Tivoli_Storage_Productivity_Center_Standard_Edition), click the **Documentation** link, and enter **Platform Support: Agents, Servers and GUI** in the **Search** box. Click the link to the document for the appropriate release.

### **Product functions that are not available for storage devices monitored by Storage Resource agents**

Before you migrate an existing Data agent to a Storage Resource agent or deploy a new Storage Resource agent, make sure that the product functions you want to use on the monitored devices are available for those agents. The following functions are not available for storage devices that are monitored by Storage Resource agents:

- Certain relational database monitoring. For list of relational databases that can be monitored by Storage Resource agents, go to the Tivoli Storage Productivity Center support site at [http://www.ibm.com/support/entry/portal/Overview/Software/Tivoli/Tivoli\\_Storage\\_Productivity\\_Center\\_Standard\\_Edition](http://www.ibm.com/support/entry/portal/Overview/Software/Tivoli/Tivoli_Storage_Productivity_Center_Standard_Edition), click the **Documentation** link, and enter **Platform Support: Agents, Servers and GUI** in the **Search** box. Click the link to the document for the appropriate release.
- The changing of zone configurations and the reporting of HBA, fabric topology, or zoning information for fabrics connected to hosts running Linux on IBM System z hardware. These limitations also apply to Storage Resource agents on all guest operating systems for VMware configurations.

### **Required authorities for deploying and running Storage Resource agents**

Before you can create deployment schedules and deploy Storage Resource agents on target computers, you must meet the following requirements:

- To create deployment schedules, you must be logged in to Tivoli Storage Productivity Center with a user ID that has the **Productivity Center Administrator** role. See the *IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication Installation and Configuration Guide* for more information about user roles.
- To deploy Storage Resource agents on target computers, you must provide a user ID that has administrative rights on those computers. You enter this ID when creating a deployment schedule. Tivoli Storage Productivity Center uses this ID to log on to the target computers and install and configure the necessary runtime files for the agents.

The user under which a Storage Resource agent (daemon or non-daemon) runs must have the following authorities on the target computers:

- On Linux or UNIX, the user must have root authority. By default, an agent runs under the user 'root'.
- On Windows, the user must have Administrator authority and be a member of the Administrators group. By default, a Storage Resource agent runs under the 'Local System' account.

### **Orphan zones**

Storage Resource agents do not collect information about orphan zones. An orphan zone is a zone that does not belong to at least one zoneset.

### **Firewalls and Storage Resource agent deployments**

Before you can deploy a Storage Resource agent on a computer, you must

turn off the firewall on that computer. If you do not turn off the firewall, the deployment fails. To turn off the firewall on a Windows 2008 computer, complete the following steps:

1. On the desktop of the Windows 2008 computer, click **Start > Administrative Tools**.
2. Click **Windows Firewall with Advanced Security**.
3. Click **Windows Firewall Properties**.
4. Change the **Firewall state** field to **Off** on the following tabs: **Domain Profile, Private Profile, Public Profile**.
5. Click **OK** to accept the changes and exit.
6. Deploy a Storage Resource agent to the Windows 2008 computer.

### **Multiple computers in a deployment**

You can define a deployment schedule to include multiple computers on which to install Storage Resource agents. The computers you include in a deployment schedule must share the same administrative user ID and password. IBM Tivoli Storage Productivity Center uses these user credentials to log on to the computers when installing Storage Resource agents. If the computers in a deployment schedule do not share the same administrative user credentials, you must create separate deployment jobs for them.

**Note:** When you deploy a Storage Resource agent to multiple computers, a globally unique identifier (GUID) is created for each computer (if one does not exist).

### **Communication between the Tivoli Storage Productivity Center server and a Storage Resource agent**

The Tivoli Storage Productivity Center server connects to a monitored computer when a Storage Resource agent is deployed and whenever a data collection schedule runs against that agent.

During deployment, the server communicates with the target computer using one of the following protocols:

- Windows server message block protocol (SMB)
- Secure Shell protocol (SSH)
- Remote execution protocol (REXEC)
- Remote shell protocol (RSH)

After deployment, the type of communication between the server and agent on that computer depends on whether you deployed the agent as daemon service or non-daemon service. See the *IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication Installation and Configuration Guide* for more information about these protocols.

### **Daemon and non-daemon services**

You can deploy a Storage Resource agent as a daemon or non-daemon service:

- A Storage Resource agent that is deployed as a daemon service runs in the background on the monitored computer and listens for requests from the Tivoli Storage Productivity Center server. Connectivity between the server and agent is established using SSL. The server and agent have their respective certificates and no additional information is required besides those certificates and the security that is provided by the SSL protocol.

- A Storage Resource agent deployed as a service on demand (non-daemon service) runs as a stand-alone executable file on the monitored computer. Communication from the server to the agent uses the same protocol that was used during the deployment of the agent. Communication from the agent to the server uses SSL.

### **Authentication between the Tivoli Storage Productivity Center server and a Storage Resource agent**

Tivoli Storage Productivity Center requires the correct authentication information (user ID, password, port, certificate location, or passphrase) for monitored computers each time it communicates with Storage Resource agents on those computers. If the authentication information changes for a host computer on which a Storage Resource agent is deployed, the authentication information for that agent must be updated using the **Change Authentication** or **Update Storage Resource agent List** functions on the Data/Storage Resource agents panel located under the **Administrative Services > Data Sources** node in the navigation tree.

### **Storage Resource agents on the same computer**

You cannot deploy a Storage Resource agent on a computer where a Storage Resource agent is already installed *and* pointing to the same Data server. You can deploy a Storage Resource agent on the same computer as another Storage Resource agent if those agents communicate with different Data servers and use different ports when listening for requests.

### **Time zones for computers monitored by Storage Resource agents**

The time zones of computers that are monitored by Storage Resource agents are shown as Greenwich Mean Time (GMT) offsets in Tivoli Storage Productivity Center reports. For example, a computer in Los Angeles shows the following time zones in the By Computer report in Asset reporting:

(GMT-8:00) GMT-8:00

### **UNIX operating systems using Remote Shell protocol (RSH)**

If RSH is configured to use a user ID and password, the connection fails. To successfully connect to a system using RSH, you must set up the `.rhosts` file (in the home directory of the account). RSH must be configured to accept a login from the system that is running your application.

### **Deployments on Windows operating systems - NetBIOS setting**

If you want to install a Storage Resource agent on Windows targets, the **Enable NetBIOS over TCP/IP** option must be selected in the Control Panel settings for the computer's network connections properties. To set this option, click **Start > Settings > Control Panel > Network and Dial-Up Connections > <some\_connection> > Properties > Internet Protocol (TCP/IP) > Advanced > WINS > Enable NetBIOS over TCP/IP**.

See the documentation for your firewall to determine if these ports are not blocked for inbound requests.

To determine if security policies are blocking the connection ports, click **Start > Settings > Control Panel > Administrative Tools**.

Depending on whether your policies are stored locally or in Active Directory, follow these directions:

#### **Locally stored policies**

For locally stored policies, click **Start > Settings > Control Panel > Administrative Tools > Local Security Policy > IP Security Policies on Local Computer**.

### Policies stored in Active Directory

For policies stored in Active Directory, examine the IP security policies and edit or remove filters that block the ports:

- Click **Administrative Tools > Default Domain Security Settings > IP Security Policies on Active Directory**.
- Click **Administrative Tools > Default Domain Controller Security Settings > IP Security Policies on Active Directory**.

For all Windows systems, the Server service must be running to connect to a Windows system using the Windows protocol.

The following table lists the ports reserved for NetBIOS. Ensure that these ports are not blocked.

Port	Description
135	NetBIOS Remote procedure call. (Not currently used.)
137	NetBIOS name service.
138	NetBIOS datagram. (Not currently used.)
139	NetBIOS session (for file and print sharing).
445	CIFS (on Windows XP).

For Windows Server 2008, shares must be shared for the Guest or Everyone accounts, and password protected sharing must be disabled. To disable password protected sharing, follow these steps:

1. Click **Control Panel > Networking and Sharing Center**.
2. Click the down arrow next to **Password protected sharing**.
3. Click **Turn off password protected sharing**.
4. Click **Apply**. Exit from the Control Panel.

### Deployments on Windows 2008 - User Account Control (UAC) remote restrictions

If you are planning to install Storage Resource agents remotely on a Windows 2008 operating system, you must disable the User Account Control (UAC) remote restrictions on the Windows operating system. User Account Control is a security component on Windows operating systems.

**Note:** This task contains steps that tell you how to modify the registry. Serious problems might occur if you modify the registry incorrectly. Therefore, make sure that you follow these steps carefully. For added protection, back up the registry before you modify it. Then you can restore the registry if problems occur. For information about how to back up and restore the registry, see <http://support.microsoft.com/kb/322756/>.

To disable UAC remote restrictions, follow these steps:

1. Click **Start > Run**. Enter **regedit** and click **OK**.
2. Locate and click the following registry subkey:  
HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\  
Policies\System
3. If the LocalAccountTokenFilterPolicy registry entry does not exist, follow these steps:
  - a. On the **Edit** menu, click **New > DWORD Value**.
  - b. Enter **LocalAccountTokenFilterPolicy** as the name for the DWORD value in the content pane. Click **Enter**.

- c. Right-click **LocalAccountTokenFilterPolicy**, then click **Modify**.
- d. In the Edit DWORD Value window, enter **1**, then click **OK**.

This value can be 0 or 1:

- 0** This value builds a filtered token. This value is the default value. The administrator credentials are removed.
  - 1** This value builds an elevated token.
- e. Exit the registry editor.

#### **Additional information about Storage Resource agents**

See *Planning for Storage Resource agents* in the *IBM Tivoli Storage Productivity Center Installation and Configuration Guide* for more information about Storage Resource agents.

### **Storage Resource agents**

Storage Resource agents collect information about the Storage Attached Network (SAN) fabrics. You must deploy agents on systems with host bus adapters (HBAs) that are connected to the SAN fabrics that you want to manage.

Agents communicate through the HBA and collect the following information:

- Attribute and topology information
- Host-level information, such as file system and volume mappings
- HBA information, including make, model, and driver versions
- Port state information
- Zoning information (for QLogic and Cisco fabrics)

You can deploy Storage Resource agents locally or remotely from the Tivoli Storage Productivity Center server. Deploy a Storage Resource agent on *at least* one system that has an HBA that is connected to each switch that you want to manage; consider installing two Storage Resource agents for each switch to ensure redundancy.

### **Out-of-band fabric agents**

Out-of-band fabric agents issue SNMP queries to the fabric switches and collect topology information.

Be sure that your out-of-band fabric agents point to each switch in the Storage Area Network (SAN) that you want to manage.

Out-of-band fabric agents are necessary for Virtual storage area network (VSAN) information for Cisco switches. For Brocade fabrics, if no SMI-S agent is configured, Out-of-band fabric agents are necessary for Zoning information for Brocade switches.

IBM Tivoli Storage Productivity Center only supports SNMP V1.

See the Planning > Planning for Fabric Manager > *Configuring Cisco switches* topic in the *Installation and Configuration Guide* for more information about using Out-of-band fabric agents and Cisco switches.

### **Tivoli Storage Productivity Center Monitoring Agent**

The IBM Tivoli Storage Productivity Center Monitoring Agent can be used by the IBM Tivoli Enterprise Monitoring Server to monitor systems in your enterprise. This agent is an optional program you can install and use in your enterprise.

IBM Tivoli Monitoring monitors and manages system and network applications on a variety of operating systems, tracks the availability and performance of your enterprise system, and provides reports to track trends and troubleshoot problems. The Tivoli Storage Productivity Center Monitoring Agent participates in that environment.

For performance reasons, install the Tivoli Storage Productivity Center server on a separate system from the IBM Tivoli Monitoring server. You can install the Tivoli Storage Productivity Center Monitoring agent on any system you want to monitor.

Before using the Tivoli Storage Productivity Center Monitoring Agent, you must have IBM Tivoli Enterprise Monitoring Server installed. For information about the IBM Tivoli Enterprise Monitoring Server, see [http://publib.boulder.ibm.com/infocenter/tivihelp/v15r1/index.jsp?topic=/com.ibm.itm.doc\\_6.2.1/welcome.htm](http://publib.boulder.ibm.com/infocenter/tivihelp/v15r1/index.jsp?topic=/com.ibm.itm.doc_6.2.1/welcome.htm).

For information about installing IBM Tivoli Monitoring, see the Quick Start Guide at <http://publib.boulder.ibm.com/infocenter/tivihelp/v15r1/index.jsp?topic=/com.ibm.itm.doc/GI11-8058-00.htm>.

To use the Tivoli Storage Productivity Center Monitoring Agent, install this agent on the system you want to monitor.

To see the type of reports displayed by the Tivoli Storage Productivity Center Monitoring Agent, see “Tivoli Storage Productivity Center Monitoring Agent reports” on page 1137.

## Security

The IBM Tivoli Storage Productivity Center environment supports role-based security. Tivoli Storage Productivity Center also has several applications that use certificates to ensure server to server security.

For role-based authorization, user groups contained in the authentication repository, which is either the local operating system or an LDAP-compliant directory depending on the choice of authentication mechanism made during the Tivoli Storage Productivity Center installation, are associated with predefined roles. When a user ID is authenticated to Tivoli Storage Productivity Center through the GUI, CLI, or APIs, membership in a user group determines the authorization level.

If you are using a previous version of Tivoli Storage Productivity Center (before v4.2) or are still using Data agents in v4.2, Agent Manager includes demonstration certificates that you use for a test environment, but you can also create new generated certificates during the installation of the Agent Manager. These generated certificates are used when the Tivoli Storage Productivity Center server or agent registers with the Agent Manager.

### Role-based authorization

Operating system groups or LDAP groups (for example, groups contained in your LDAP-compliant repository) are associated with predefined roles. When a user ID is authenticated to Tivoli Storage Productivity Center through the GUI, CLI, or APIs, membership in an operating system or LDAP group determines the authorization level of the user.

Table 25 on page 125 shows the association between roles and authorization level.

If you select OS authentication for your Tivoli Storage Productivity Center installation, then you do not have to create any of the groups before installation.

The Tivoli Storage Productivity Center superuser role automatically gets mapped to the Administrators group on the Windows operating system, to the system group on the AIX operating system, or to the root group on the Linux operating system.

*Table 25. Roles and authorization levels*

<b>Role</b>	<b>Authorization level</b>
Superuser	Has full access to all Tivoli Storage Productivity Center functions.
Productivity Center administrator	Has full access to operations in the Administration section of the GUI.
Disk administrator	Has full access to Tivoli Storage Productivity Center disk functions.
Disk operator	Has access to reports only for Tivoli Storage Productivity Center disk functions. These reports include information about tape devices.
Fabric administrator	Has full access to Tivoli Storage Productivity Center Fabric Manager functions.
Fabric operator	Has access to reports only for Tivoli Storage Productivity Center Fabric Manager functions.
Data administrator	Has full access to Tivoli Storage Productivity Center Data Manager functions.
Data operator	Has access to reports only Tivoli Storage Productivity Center Data Manager functions.
Tape administrator	Has full access to Tivoli Storage Productivity Center tape functions.
Tape operator	Has access to reports only for tape functions.

**Notes:**

1. If a user has multiple roles, the authorization level is a combination of the levels for each of the roles.
2. If a user is not a member of any of the roles listed, no access is granted to that user.
3. For enterprise-rollup reports, you need superuser or Tivoli Storage Productivity Center administrator authority to do the following actions:
  - Add, remove, or modify the Tivoli Storage Productivity Center subordinate server that the master server is monitoring.
  - Create or run probe jobs that include Tivoli Storage Productivity Center subordinate servers.

Any Tivoli Storage Productivity Center user can generate enterprise-rollup reports.

4. You need to assign the appropriate Tivoli Integrated Portal roles to other Tivoli Storage Productivity Center users and groups who are added later to the system.

**Agent Manager certificates**

Agent Manager provides a demonstration certificate to facilitate the rapid deployment of a test environment or demonstration environment.

The demonstration certificate and its password are publicly available. Anyone who has a demonstration certificate can participate in your deployment. Using the

demonstration certificate does not provide the level of security required by a typical production environment. In a production environment, let the Agent Manager installation program generate a certificate that is unique to Agent Manager installation. When you install Agent Manager, you can specify to use the demonstration certificates or create a new certificate on the *Specify Certificates* page.

**Note:** You cannot install Agent Manager in Tivoli Storage Productivity Center v4.2 or later. If you want to install Agent Manager, you must use a previous version of the product.

## SAN Volume Controller topics

This section contains information about the following SAN Volume Controller topics: managed disks (MDisks), managed-disk states, managed-disk groups, and virtual disks (VDisks).

### IBM Tivoli Storage Productivity Center SAN Volume Controller

The IBM Tivoli Storage Productivity Center SAN Volume Controller is a SAN appliance that attaches open-systems storage devices to supported open-systems hosts.

The SAN Volume Controller provides symmetric virtualization by creating a pool of managed disks from the attached storage subsystems, which are then mapped to a set of virtual disks for use by attached host computer systems. System administrators can view and access a common pool of storage on the SAN, which enables them to use storage resources more efficiently and provides a common base for advanced functions. The SAN Volume Controller performs the following functions for the SAN storage that it controls:

- Creates a single pool of storage
- Manages logical volumes
- Provides advanced functions for the SAN, such as large scalable cache, copy services, and space management

A *node* is a single storage engine. The storage engines are always installed in pairs with one or as many as four pairs of nodes constituting a *cluster*. Each node in a pair is configured to back up the other.

Each pair of nodes is known as an *I/O group*. All I/O operations are cached on both nodes for resilience. To eliminate any single point of failure, each of the two nodes are protected by different uninterruptible power supplies. A node can be in only one I/O group.

Figure 5. A SAN Volume Controller node

The SAN Volume Controller I/O groups see the storage presented to the SAN by the back-end controllers as a number of disks, known as *managed disks*. The application services do not see these managed disks. Instead, they see a number of logical disks, known as *virtual disks*, that are presented to the SAN by the SAN Volume Controller. Each node must only be in one I/O group and provides access to the virtual disks in the I/O group.

The fabric contains two distinct zones: a host zone and a disk zone. In the host zone, the host systems can identify and address the nodes. You can have more than one host zone. Generally, you create one host zone per operating system type. In the disk zone, the nodes can identify the disk drives (storage subsystems). Host systems cannot operate on the disk drives directly; all data transfer occurs through the nodes. As shown in Figure 6 on page 128, several host systems can be connected to a SAN fabric. A cluster of SAN Volume Controllers is connected to the same fabric and presents virtual disks to the host systems. You configure these virtual disks using the disks located on the RAID controllers.

Figure 6. Example of a SAN Volume Controller in a fabric

### Managed disks

A managed disk (MDisk) is a logical disk that a SAN Volume Controller has exported to the SAN fabric to which the nodes in the cluster are attached.

A managed disk might consist of multiple physical disks that are presented to the SAN as a single logical disk. A managed disk always provides usable blocks of physical storage to the cluster, even if it does not have a one-to-one correspondence with a physical disk.

Figure 7 shows physical disks and managed disks.

Figure 7. Physical disks and managed disks (MDisks)

### Extents

Each MDisk is divided into chunks of equal size called *extents*. Extents are numbered sequentially (beginning at 0) from the start to the end of the managed disk. Extents are a unit of mapping the data between MDisks and virtual disks (VDisks).

The extent size is a property of managed-disk groups (MDisk groups). When a managed disk is added to a managed-disk group, the size of the extents that the MDisk will be broken into depends on the attribute of the managed-disk group to which it has been added.

## **Access modes**

The access mode determines how the SAN Volume Controller cluster uses the MDisk. The possible modes are the following:

### **Unmanaged**

The MDisk is not used by the cluster.

### **Managed**

The MDisk is assigned to an MDisk group and provides extents that virtual disks (VDisks) can use.

**Image** The MDisk is assigned directly to a VDisk with a one-to-one mapping of extents between the MDisk and the VDisk.

## **Managed disk states**

This topic describes the operational states of managed disks (MDisks).

Managed disks can be in the following states:

### **Online**

The MDisk can be accessed by all online nodes. That is, all the nodes that are currently working members of the cluster can access this MDisk. The MDisk is online when the following conditions are met:

- All timeout error recovery procedures complete and report the disk as online.
- Volume inventory of the target ports correctly reported the MDisk.
- Discovery of this volume completed successfully.
- All of the managed disk target ports report this volume as available with no fault conditions.

### **Degraded**

The MDisk cannot be accessed by all the online nodes. That is, one or more (but not all) of the nodes that are currently working members of the cluster cannot access this MDisk. The MDisk might be partially excluded; that is, some of the paths to the MDisk (but not all) have been excluded.

### **Excluded**

The MDisk has been excluded from use by the cluster after repeated access errors.

### **Offline**

The MDisk cannot be accessed by any of the online nodes. That is, all of the nodes that are currently working members of the cluster cannot access this MDisk. This state can be caused by a failure in the SAN, the storage subsystem, or one or more physical disks connected to the storage subsystem. The MDisk will only be reported as offline if all paths to the disk fail.

**Attention:** If your fabric is undergoing transient link breaks or you have been replacing cables or connections in your fabric, you might see one or more MDisks change to the degraded status. If an I/O operation was attempted during the link breaks and the same I/O failed several times, the MDisk will be partially excluded and change to a status of degraded. You must include the MDisk to resolve the problem.

**Managed disk path** Each managed disk will have an online path count, which is the number of nodes that have access to that managed disk; this represents a summary of the I/O path status between the cluster nodes and the particular storage device. The maximum path count is the maximum number of paths that have been detected by the cluster at any point in the past. Thus if the current path count is not equal to the maximum path count then the particular managed disk may be degraded. That is, one or more nodes may not see the managed disk on the fabric.

### Managed disk groups

A SAN Volume Controller *MDisk group* is a collection of MDisks that jointly contain all the data for a specified set of virtual disks (VDisks).

All MDisks in a group are split into extents of the same size. VDisks are created from the extents that are available in the group. You can add MDisks to an MDisk group at any time in order to increase the number of extents that are available for new VDisks or to expand existing VDisks. You can add only MDisks that are in unmanaged mode. When MDisks are added to a group, their mode changes from unmanaged to managed.

Figure 8 shows an MDisk group containing four MDisks.

Figure 8. MDisk group

You can delete MDisks from a group under the following conditions:

- VDisks are not using any of the extents that are on the MDisk.
- Enough free extents are available elsewhere in the group to move any extents that are in use from this MDisk.

**Attention:** If you delete an MDisk group, you destroy all the VDisks that are made from the extents that are in the group. If the group is deleted, you cannot recover the mapping that existed between extents that are in the group and the extents that VDisks use. The MDisks that were in the group are returned to unmanaged mode and can be added to other groups. Because the deletion of a group can cause a loss of data, you must force the deletion if VDisks are associated with it.

Table 26 on page 131 describes the operational states of an MDisk group.

Table 26. Managed disk group states

Status	Description
Online	The MDisk group is online and available. All the MDisks in the group are available.
Degraded	The MDisk group is available; however, one or more nodes cannot access all the MDisks in the group.
Offline	The MDisk group is offline and unavailable. No nodes in the cluster can access the MDisks. The most likely cause is that one or more MDisks are offline or excluded.

**Attention:** If a single MDisk in an MDisk group is offline and therefore cannot be seen by any of the online nodes in the cluster, then the MDisk group of which this MDisk is a member goes offline. This causes *all* the VDIs that are being presented by this MDisk group to go offline. Care should be taken when creating MDisk groups to ensure an optimal configuration.

Consider the following guidelines when you create MDisk groups:

- If you are creating image-mode VDIs, do not put all of these VDIs into one MDisk group because a single MDisk failure results in all of these VDIs going offline. Allocate your image-mode VDIs between your MDisk groups.
- Ensure that all MDisks that are allocated to a single MDisk group are the same RAID type. This ensures that a single failure of a physical disk in the storage subsystem does not take the entire group offline. For example, if you have three RAID-5 arrays in one group and add a non-RAID disk to this group, then you lose access to all the data striped across the group if the non-RAID disk fails. Similarly, for performance reasons you should not mix RAID types. The performance of all VDIs will be reduced to the lowest performer in the group.
- If you intend to keep the virtual disk allocation within the storage exported by a storage subsystem, ensure that the MDisk group that corresponds with a single subsystem is presented by that subsystem. This also enables nondisruptive migration of data from one subsystem to another subsystem and simplifies the decommissioning process if you want to decommission a controller at a later time.

## Extents

To track the space that is available, the SAN Volume Controller divides each MDisk in an MDisk group into chunks of equal size. These chunks are called *extents*, and are indexed internally. Extent sizes can be 16, 32, 64, 128, 256, or 512 MB.

You must specify the extent size when you create a new MDisk group. You cannot change the extent size later; it must remain constant throughout the lifetime of the MDisk group. MDisk groups can have different extent sizes. However, different extent sizes can place restrictions on the use of data migration. The choice of extent size affects the total amount of storage that can be managed by a cluster. Table 27 on page 132 shows the maximum amount of storage that can be managed by a cluster for each extent size. Because the SAN Volume Controller allocates a whole number of extents to each virtual disk that is created, using a larger extent size can increase the amount of wasted storage at the end of each virtual disk. Larger extent sizes also reduce the ability of the SAN Volume Controller to distribute

sequential I/O workloads across many managed disks. Therefore, larger extent sizes might reduce the performance benefits of virtualization.

Table 27. Capacities of the cluster given extent size

Extent size	Maximum storage capacity of cluster
16 MB	64 TB
32 MB	128 TB
64 MB	256 TB
128 MB	512 TB
256 MB	1 PB
512 MB	2 PB

## Virtual disks

An SAN Volume Controller *VDisk* is a logical disk that the cluster presents to the storage area network (SAN).

Application servers on the SAN access *VDisks*, not managed disks (*MDisks*). *VDisks* are created from a set of extents in an *MDisk* group. There are three types of *VDisks*: striped, sequential, and image.

## Types

You can create the following types of *VDisks*:

### Striped

The striping is at extent level. One extent is allocated, in turn, from each managed disk that is in the group. For example, a managed disk group that has 10 *MDisks* takes one extent from each managed disk. The 11th extent is taken from the first managed disk, and so on. This procedure, known as a round-robin, is similar to RAID-0 striping.

You can also supply a list of *MDisks* to use as the stripe set. This list can contain two or more *MDisks* from the managed disk group. The round-robin procedure is used across the specified stripe set.

**Attention:** Care should be taken when specifying a stripe set if your *MDisk* group contains *MDisks* of unequal size. By default striped *VDisks* are striped across all *MDisks* in the group. If some of the *MDisks* are smaller than others, the extents on the smaller *MDisks* will be used up before the larger *MDisks* run out of extents. Manually specifying the stripe set in this case might result in the *VDisk* not being created.

Figure 9 on page 133 shows an example of a managed disk group containing three *MDisks*. This figure also shows a striped virtual disk created from the extents available in the group.

Figure 9. Managed disk groups and VDisks

### Sequential

When selected, extents are allocated sequentially on one managed disk to create the virtual disk if enough consecutive free extents are available on the chosen managed disk.

**Image** Image-mode VDisks are special VDisks that have a direct relationship with one managed disk. If you have a managed disk that contains data that you want to merge into the cluster, you can create an image-mode virtual disk. When you create an image-mode virtual disk, a direct mapping is made between extents that are on the managed disk and extents that are on the virtual disk. The managed disk is not virtualized. In other words, the logical block address (LBA)  $x$  on the managed disk is the same as LBA  $x$  on the virtual disk.

When you create an image-mode VDisk, you must assign it to a managed disk group. An image-mode VDisk must be at least one extent in size. In other words, the minimum size of an image-mode VDisk is the extent size of the MDisk group to which it is assigned.

The extents are managed in the same way as other VDisks. When the extents have been created, you can move the data onto other MDisks that are in the group without losing access to the data. After you move one or more extents, the virtual disk becomes a real virtualized disk, and the mode of the managed disk changes from image to managed.

**Attention:** If you add an MDisk to an MDisk group as a managed disk, any data on the MDisk will be lost. Ensure that you create image-mode VDisks from the MDisks that contain data before you start adding any MDisks to groups.

MDisks that contain existing data have an initial mode of unmanaged, and the cluster cannot determine whether it contains partitions or data.

A virtual disk can have one of three states. The following list describes the different states of a virtual disk:

#### Online

The virtual disk is online and available if both nodes in the I/O group can access the virtual disk. A single node will only be able to access a VDisk if it can access all the MDisks in the MDisk group associated with the VDisk.

#### Offline

The VDisk is offline and unavailable if both nodes in the I/O group are missing or none of the nodes in the I/O group that are present can access the VDisk.

**Degraded**

The status of the virtual disk is degraded if one node in the I/O group is online and the other node is either missing or cannot access the virtual disk.

If you delete a virtual disk, you destroy access to the data that is on the virtual disk. The extents that were used in the virtual disk are returned to the pool of free extents that is in the managed disk group. The deletion might fail if the virtual disk is still mapped to hosts. The deletion might also fail if the virtual disk is still part of a FlashCopy or a Metro Mirror mapping. If the deletion fails, you can specify the force-delete flag to delete both the virtual disk and the associated mappings to hosts. Forcing the deletion will also delete the copy services relationship and mappings.

---

## Chapter 3. Scenarios

This section contains scenarios which illustrate how to perform specific tasks using IBM Tivoli Storage Productivity Center.

The provided scenarios set out situations that can be solved using Tivoli Storage Productivity Center. When using these scenarios you should remember the following:

- The scenarios are intended to be step-by-step instructions that you follow to complete a specific job. Each scenario contains multiple tasks that must be followed in the order given.
- Specific values are given in the scenarios, such as user name, IP Address, probe name, and so forth. These are for illustration purposes only and you must replace them with values appropriate for your system.
- The scenarios do not provide in-depth conceptual information about the tasks. See the appropriate topics in the IBM Tivoli Storage Productivity Center Information Center for more information about the concepts behind the tasks.
- You will complete a scenario successfully if you follow the instructions correctly and your system performs as expected.

---

### Monitoring and reporting on I/O utilization

This scenario involves monitoring a DS8000 and a DS4000 to determine what data can be moved to the less expensive storage media. Monitoring over time collects the necessary information for analysis. Trending reports, produced with IBM Tivoli Storage Productivity Center Reporter, display utilization information and can be used by management to make decisions about future storage needs.

You have a DS8000 and a DS4000. The DS8000 is nearly full but the DS4000 is only half full. You need to move workload onto the DS4000 as the demand for the DS8000 grows. You will monitor the utilization of volumes on each system to identify potential migration candidates. You will also gather this information over time to indicate trends. This trending information, in report format, will be used for future planning and will be presented to management who will make decisions based on the report.

To perform this scenario, complete the following steps:

#### Perform performance monitoring

1. **Configure the storage systems for monitoring by Tivoli Storage Productivity Center** This process is in two parts as Tivoli Storage Productivity Center uses native interfaces to connect to DS8000 storage systems while the DS4000 must be connected using a CIM object manager (CIMOM) connection. Use the Configure Devices wizard to configure the DS8000 system. For the DS4000 system, you can configure it manually by running a first discovery to locate the CIMOMs that are visible to the Device server with SLP. After configuring the CIMOM login information, run a second discovery to gather information about the DS4000 system. Run a CIMOM discovery every four hours. See “Discover storage subsystem, tape library, and fabric information with CIM agents” on page 333 for more information. Alternatively, you can configure the DS4000 system by using the Configure Devices wizard.

### Configure the DS8000 system

- a. Use the Configure Devices wizard to enter connection information for the native interface of the DS8000 system. See “Configuring storage subsystems” on page 308 for details of how to use the Configure Devices wizard. You can use the wizard to include the DS8000 system automatically in a probe. If you want to monitor SAN Volume Controller systems or the XIV systems, you can also use the Configure Devices wizard to enter connection information for their native interfaces.

### Configure the DS4000 system manually

- a. Expand **Administrative Services > Data Sources > CIMOM Agents** .
- b. For each CIMOM you use, click the magnifying glass to open the View and Edit window. Enter the name and password information. Check the **Test CIMOM connectivity before editing**.
- c. Click the **Save** icon. This action saves your information and performs a connectivity check. You must use this process for each SLP-discovered CIMOM you choose to use.
- d. Expand **Administrative Services > Discovery**, right-click on **CIMOM**, and click **Run Now**.
- e. In the **CIMOM Discovery job submitted** window, click OK.
- f. When the job has finished, you can view the list of discovered storage systems by expanding **Disk Manager > Storage Subsystems**.

### Configure the DS4000 system using the Configure Devices wizard

- a. Use the Configure Devices wizard to enter connection information for the native interface of the DS8000 system. See “Configuring storage subsystems” on page 308 for details of how to use the Configure Devices wizard.
2. **Create a probe** Create the probe to run during off-hours.
    - a. Expand **Tivoli Storage Productivity Center > Monitoring > Probes**. Right-click **Probes** and select **Create Probe**.
    - b. In the **What to Probe** tab, move the DS6000 and the DS4000 from the **Available** list box to the **Current Selections** box.
    - c. In the **When to run** tab you will schedule when you want the probe to run. We strongly recommend that you run probes when nothing else is running.
      - 1) Choose to run the job repeatedly according to a schedule you specify.
      - 2) Select the current day, month, and year as the date when you want data collection to begin. Select 1:00 AM as the time the job should begin running.
      - 3) Select the days the job should run. Select all of them. A check mark will appear next to each day you have chosen.
    - d. In the **Alerts** tab accept the default (error log) as the means of notification if the job fails.
    - e. Click **Save**. The probe will run daily at 1:00 AM.
  3. **Create a storage-system performance monitor** Create a storage-system performance monitor to gather performance data and view the results in the log file.
    - a. Expand **Disk Manager > Monitoring**, right-click **Subsystem Performance Monitor** and select **Create Performance Monitor**.
    - b. In the Create Storage Subsystem Performance Monitor window, click the Storage Subsystems tab. Select the DS8000 and DS4000 you want to report

on and move them to the Current Selections field. Make sure these storage systems have been probed. If they have not been, data collection will fail.

- c. Click the Sampling and Scheduling tab. In the Sampling area, specify the length of the sampling window and how frequently the performance data is to be gathered, using the following values:
  - Interval length = 5 minutes
  - Duration = Indefinite
  - Scheduling = Begin immediately
- d. In the Alert tab, **Monitor Failed** is the only triggering condition. In the Triggered Actions area accept the default (error log) means of notification.
- e. Click **Save**. When prompted, type a name for the threshold and click **OK**. The name of the storage system performance monitor is displayed under the Subsystem Performance Monitors node. The performance monitor will take 3 hours to run, as set in step c. The status icon will indicate when the job has completed successfully.
- f. When the job has completed, a table is displayed listing the storage systems. To view the log file for each storage system, select the magnifying glass.

#### 4. Tivoli Storage Productivity Center Reporter for Disk

This scenario uses Tivoli Storage Productivity Center Reporter for Disk to prepare a finished report automatically. Tivoli Storage Productivity Center Reporter is a free Java 2 Platform application that extracts storage system information and hourly performance statistics. The statistics are transcribed into a paper-style PDF file containing your storage server utilization, which is saved on the local machine.

If you do not have Tivoli Storage Productivity Center Reporter for Disk, complete the following steps. If you have installed Tivoli Storage Productivity Center Reporter for Disk, go to step 5.

- a. Go to the Tivoli Storage Productivity Center Reporter for Disk web page, <http://www-03.ibm.com/support/techdocs/atmastr.nsf/WebIndex/PRS2618>.
- b. Select **Download Tivoli Storage Productivity Center Reporter for Disk for Windows (60MB)**
- c. Follow steps to download Tivoli Storage Productivity Center Reporter.
- d. Run the Installer

#### 5. Create your report with Tivoli Storage Productivity Center Reporter

- a. To start the program go to **Start > Programs > Tivoli Storage Productivity Center Reporter for Disk > Tivoli Storage Productivity Center Reporter for Disk**. Select **Start**. The Confirmation window will open.
- b. Enter the Hostname (or IP address), Port, UserID, and Password of the system that you want the report on. Click **Continue**. The Select Serial Number window will open. Tivoli Storage Productivity Center Reporter for Disk saves a list of the commands and the status of the commands you are using in the GUI. The commands and status of the commands are displayed in the Status window.
- c. If the probe of the selected systems was successful, the DS8000 and DS4000 storage systems will be listed in the Select Serial Number window. Select the DS8000 storage system. Click **Select**. You can only create a report for one storage system at a time.
- d. The Select Date Range window opens. Select the **Last 7 days** radio button. Click **Select**,

- e. The Customer Information window opens. This information will be included in the title information of the finished report. The first text field, **Company**, is required. This is the company name that will appear on the title page of the report. All other fields are optional. When finished, click **Continue**.
  - f. The IBM/Partner Information window opens. All fields are optional. Click **Continue**.
  - g. Select a file name and directory in which to save the generated report. The default directory is "My Documents" and the default file name is TPCReport.pdf. It is strongly recommended that you save the PDF file under a different name. Click **Save**.
  - h. The steps Tivoli Storage Productivity Center Reporter takes to create the report are shown in the status window. Once the report has been generated, the **Exit** button becomes available. Click **Exit**.
  - i. Go to "My Documents", find and double-click the PDF report.  
The report includes the following information for storage systems, ports, arrays, and volumes:
    - General information
    - Performance summary
    - Statistics
    - Definitions
6. Using the DS8000 report, look at the Volume Performance Summary for volumes with low levels of I/O and throughput in Megabytes. These might be candidates for moving to the DS4000.

### Printing

The report will have been saved as a PDF file using the latest Acrobat Reader on your system. If you only have the Reader of that version of Acrobat, you will be able to view the report, but you will be unable to print it. In this case take the following steps to print the report:

1. Open your complete version of Adobe Acrobat.
2. Select **File > Open** and navigate to the report.
3. Select **File > Print** to print the report.
4. Close the report. You will not be able to save the report as an earlier version of an Acrobat PDF file.

The following documents were referenced for this scenario:

- *IBM Tivoli Storage Productivity Center User's Guide GC32-1775*
- *Tivoli Storage Productivity Center Reporter for Disk Version 1.01 - Process and Report Overview*

---

## Storage provisioning by using workflows

IBM Tivoli Storage Productivity Center and Tivoli Provisioning Manager Workflow automation can reduce provisioning time from hours to minutes and significantly simplify the task of provisioning new storage capacity. This automation is especially valuable when adding storage provisioning to existing automated server provisioning tasks, such as deploying operating systems, software, and network resources. This scenario shows you how to use Tivoli Provisioning Manager and Tivoli Storage Productivity Center Workflows to automate provisioning of SAN attached storage capacity to a server in a Microsoft Windows environment.

Tivoli Storage Productivity Center and Tivoli Provisioning Manager work together to provide automated storage provisioning for the data center.

Tivoli Provisioning Manager provides the means to automate common tasks in the data center that surround each of the four major pillars of provisioning:

- OS provisioning (Windows, Linux, AIX, Solaris, HP-UX, and so on)
- Software provisioning (DB2, WebSphere, Oracle, and many more)
- Network provisioning (provisioning VLANs, ACLs, IP addresses, activating, and deactivating switch ports, and so on)
- Storage provisioning (attaching SAN disks for use by the server)

Tivoli Provisioning Manager Workflows automate tasks, especially the tasks that are complex, repetitive, and prone to error by applying best practices for zoning, device configuration, and path selection automatically.

Tivoli Storage Productivity Center provides heterogeneous management functions for the SAN storage environment. Tivoli Storage Productivity Center Workflows provide status information about its SAN storage environment to Tivoli Provisioning Manager. They also allow Tivoli Provisioning Manager to modify the SAN through Tivoli Storage Productivity Center.

The following illustration shows the movement of workflow information between Tivoli Provisioning Manager and Tivoli Storage Productivity Center.

**Restriction:** You must ensure that each Tivoli Provisioning Manager manages only one Tivoli Storage Productivity Center server. If multiple Tivoli Storage Productivity Center servers are managed, and you run a probe on the second server, information on the first server is deleted.

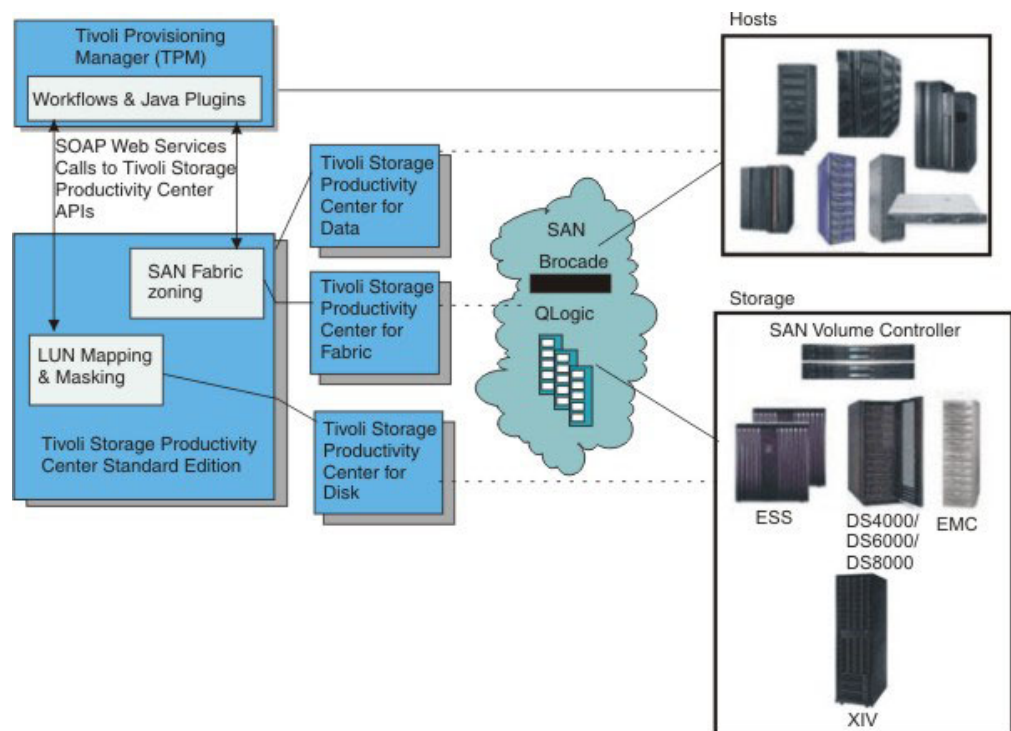

Figure 10. High-level architecture

End-to-end provisioning of SAN storage is difficult due to the complexity of modern environments and inputs that must be considered. This scenario creates a Tivoli Provisioning Manager storage template used for end-to-end storage provisioning that can automate the process. After the storage template is created, it can be reused to automate end-to-end provisioning of SAN storage with a few mouse clicks.

Without workflows, you would need to complete the following individual steps in Tivoli Storage Productivity Center to provision storage:

- Add a volume (storage subsystem)
  - Select storage subsystem
  - Select or create new volume
  - Select host HBA ports (WWNs)
  - Select subsystem controller ports (WWNs)
  - Map volume to controller ports
  - Map volume to host HBA ports
- Set paths (SAN fabric switches)
  - Determine whether multiple paths are required
  - Create or update zones
  - Get active zone set
  - Add zone to zone set
  - Activate zone set
- Map the HBA Volumes to the operating system and file system (Host server)
  - Rediscover attached volumes
  - Configure multipathing drivers
  - Map volumes to OS devices
- Create volume and file system (Host server)
  - Create Windows volume
  - Create or extend NTFS file system

With workflows, after the template is created, these tasks are automated and condensed to the following tasks:

- Select the host that needs additional storage
  - Select the template name from the template list
  - Click OK.

To use workflows, the following prerequisites must be met:

- Tivoli Provisioning Manager v5.1 is installed and configured.
- Tivoli Storage Productivity Center v4.1 or later is installed and configured.
- The following two automation packages is downloaded, installed, and configured from the Open Process Automation Library (OPAL):
  - IBMTPC.tcdriver
  - WindowsNTFS.tcdriver

For more information about the prerequisites needed to use workflows, see the IBM white paper, *Tivoli Provisioning Manager and IBM Tivoli Storage Productivity Center-Storage Provisioning Configuration and Exercises*.

To create and use a storage template, complete the following steps:

1. To create the Tivoli Provisioning Manager workflow template, complete the following steps:
  - a. Select **Inventory > Manage Templates > Storage Templates** from the Tivoli Provisioning Manager navigation tree.

- b. Select **Edit** and click **Add Storage Template**. The **Create Storage Template** window opens.
- c. Enter **NTFS\_SVC** as the name for the storage template. Click **Next**.
- d. Define the volume container settings. In the **Configure Volume Container Settings** window, enter the following information:
  - Type **NTFS** for the **Volume Container Name**.
  - Select **NTFS** as the **Storage Manager**.
  - Click **Add Volume Container Settings**.
  - Click **Next**.
- e. Define the physical volume settings
  - Scroll down to the **SAN Physical Volume Settings** and specify a SAN volume.
  - Type **SAN** in the **Name** field.
  - In the **Volume Container Settings** field, select **NTFS**.
  - Select **mdiskgrp0** as the appropriate storage pool from **Storage Pool/Storage Subsystem**.
  - Type **5G** as the value for **Consumable Size**.
  - Set the **Function Type** to **Generic**.
  - For the **RAID Level**, select **UNKNOWN**.
  - Click **Add SAN Setting** and click **Next**.
- f. Define the data path settings:
  - In the **Configure Data Path Settings** window, select **SAN** from the **SAN Physical Volume Setting** list box.
  - Click **Add Data Path Settings** and click **Next**.
- g. Define the logical volume settings:
  - In the **Configure Logical Volume Settings** window, type **TPMVolume** in the **Name** field.
  - Select **Simple** as the **Logical Volume Type**.
  - Select **NTFS** for the **Volume Container Settings**.
  - Specify **5G** for **Consumable Size**.
  - Set the **Function Type** to **Generic**.
  - Set the **RAID Level** to **UNKNOWN**.
  - Click **Add Logical Volume Settings** and click **Next**.
- h. Define file system settings:
  - In the **Configure File System Settings** window, select **TPMVolume** from the **Logical Volume Settings** list.
  - Type **H:** as the **Label**.
  - For the **File System Type**, select **NTFS** from the list.
  - Specify **5G** for **File System Size**.
  - Click **Add File System Settings** and click **Next**.
- i. File system mount settings are not used. In the **Configure Filesystem Mount Settings** window, click **Next**.
- j. Define disk partition settings:
  - In the **Configure Disk Partition Settings** window, set the **Partition Size** to **5G**.
  - From the **Physical Volume Settings** list, select **SAN**.
  - From the **Logical Volume Settings** list, select **TPMVolume**.

- Click **Add Disk Partition Settings** and click **Next**.
- k. Verify the summary information. When you are done, click **Finish**.
- l. Verify that the **NTFS\_SVC** template is displayed in the Tivoli Provisioning Manager GUI at **Inventory > Manage Templates > Storage Templates**.

This template allows any system administrator to complete end to end provisioning.

2. To provision, complete the following steps
  - a. From the **General** tab of a Windows computer in Tivoli Provisioning Manager, click **Edit** and select **Add Storage to Host**.
  - b. Select **NTFS\_SVC** from the **Storage Template** list
  - c. Click **OK**.
  - d. Navigate to **Automation > Workflow Status** and track the status of the deployment request in the workflow status log until it completes successfully. It takes approximately 10 - 15 minutes to complete.

A new 5G volume is created on the SAN Volume Controller storage pool **mdiskgrp0**. This storage pool is assigned to your windows host and mounted and formatted as the drive letter **H** within a few minutes with consistent results and no user errors.

For more information about workflows, see the following publications:

- *IBM Tivoli Storage Productivity Center Workflow User's Guide*
- Redpapers:
  - *Automated Storage Provisioning for Windows by using Tivoli Storage Productivity Center and Tivoli Provisioning Manager*
  - *An Introduction to Storage Provisioning with Tivoli Provisioning Manager and Tivoli Storage Productivity Center*

---

## Archive and delete files

This scenario shows you how to reclaim storage space by archiving and deleting files that meet criteria you define.

You are running out of available storage capacity and need to find stale data which can be archived and deleted in order to reclaim space and make it available to more pertinent data. Specifically, you are **TPCUser** and you want to find files on the **C:\** file system of **computer1** that are larger than **5MB**, and have not been accessed in **365** days.

Steps include the following tasks:

- Running a probe (if needed)
- Defining the constraint
- Running a scan
- Generating a constraint violation report
- Running an archive/backup on selected files in the report

Before you can use the IBM Tivoli Storage Manager archive or backup functionality you must ensure the prerequisites listed in "Requesting an archive or backup" on page 476 have been met.

To create an archive job, complete the following steps:

### 1. Run a Probe

You may not need to complete this step if a successful probe has been recently completed. Check the most recent day and time a probe was run successfully at **IBM Tivoli Storage Productivity Center > Monitoring > Probes**. To do this, expand the probe name to see the date the last successful probe was run. In most cases the default probe is sufficient.

If you do need to run a probe, complete the following steps:

- a. Expand **IBM Tivoli Storage Productivity Center > Monitoring > Probes**, and select **Create Probe**. The **Create Probe** window opens.
- b. Enter a description for the probe.
- c. In the **What to Probe** tab, select the resources you want to probe, in this case **Computer Groups > TPCUser.Default Computer Group > computer1**.
- d. In the **When to Run** tab, accept the defaults: **Run Now** and **Local time in each time zone**.
- e. In the **Alerts** tab, accept the default. If the probe fails, a notification will be sent to the error log automatically.
- f. Click **Save** to save the probe. Enter **Archive Backup Probe** as the probe name and click **OK**. An entry for the probe appears under **IBM Tivoli Storage Productivity Center > Monitoring > Probes > TPCUser.Archive Backup Probe**.
- g. The probe will begin running immediately. The number of times this job has been run and the date and time will be listed under the probe name. To see the status of the job, right-click on the probe name and select **Update Job Status**.

### 2. Define Constraints

Define the criteria you are looking for with a constraint.

- a. Expand **Data Manager > Policy Management > Constraints**, right-click and select **Create Constraint**.
- b. In the **Description** field, enter a description of this constraint.
- c. In the **Filesystems** tab **Available** column, select **Filesystems > computer1 > C:\** and move it to **Current Selections**.
- d. In the **File Types** tab, check **Forbid files matching these patterns**. All file types should be in the **Choose a file type** column. This will apply the constraint to all file types.
- e. In the **Users** tab, Check the **Forbid files owned by selected users**. All users should be listed in the **Available Users** column. This will apply the constraint to all users.
- f. In the **Options** tab, leave the default, **200**, in the text box in the **Violating File Limits** section. In the **Alerts on Files** section, select **number of days since last access greater than** and type **365**. Select **bigger than** and enter **5 MB**. Below the **Alerts on Files** section, **File Filter Text:** will list the values you picked in the **File Types**, **Users**, and **Options** tabs.
- g. In the **Alert** tab under **Triggering Conditions**, the only triggering condition is **Violating files consume more than**. Type **5** in the **Value** field. Select **Megabytes** from the **Value Units:** pull-down. Accept the default in **Triggered Actions**, which will send a message to the error log if the constraints you have defined are violated.
- h. Click the **Save** icon. Name the constraint **Archive File Constraint**. The constraint will be saved as **Data Manager > Policy Management > Constraints > TPCUser.Archive File Constraint**.

### 3. Run a Scan

Scan with the constraint violation you have created.

- a. Expand **Data Manager > Monitoring**, right-click **Scans** and select **Create Scan**. The **Create Scan** window opens.
- b. In the **Filesystems** tab, select **Filesystems > computer1 > C:/** from the **Available** column and move it to the **Current Selections** column.
- c. Do not select anything in the **Directory Groups** tab.
- d. In the **Profiles** tab, select all the profiles listed in the Available Profiles column and move them to both **Profiles to Apply to Filesystems** and **Profiles to Apply to Directories**.
- e. In the **When to Run** tab, select **Run Now** and **Local Time in each time zone**.
- f. In the **Alert** tab, **Scan Failed** is the only **Triggering Condition**. In the **Triggered Actions** area, select nothing to accept the default. If the job fails, a message will be sent to the log file automatically.
- g. Click the **Save** icon. Save the scan as **Archive Scan**. The scan is saved under **Data Manager > Monitoring > Scans > TPCUser.Archive Scan**. The scan starts to run immediately. Scans can take some time to complete depending on the number of storage assets scanned and the profiles used.

### 4. Generate a Constraint Violation Report

Generate a report listing files that met your constraint violation criteria.

- a. Expand **Data Manager > Reporting > Usage Violations > Constraint Violations** and click **By Constraint**. The **Constraint Violations: By Constraint** window opens to the **Selection** tab.
- b. In the **Report Filter Specifications** area, type **100** in the **Return maximum of text field**.
- c. In the **Report Filter Specifications** area, click **Selection**. The **Select Resources** pop-up opens listing the available constraints.
- d. Select **Archive File Constraint**. (You may have to de-select the other constraints.) Click **OK**.
- e. Select the columns you want to appear in the report. By default, all columns will be listed in **Included Columns**. If you want to remove columns from the report, select them and move them to **Available Columns**.
- f. Click **Generate Report**. The Constraint Violation Report is displayed on the monitor.
- g. The page will stay the same with the addition of a **Constraints** tab which shows the **Constraint Violations: By Constraint** report. Click the magnifying glass to drill down to the **Constraint Violations: By Filesystem** report. Click the magnifying glass again and the **Largest Files: By Filesystem** report opens. This report, the **Constraint Violation Report**, will be used to create an Archive/Backup job.

### 5. Run Archive/Backup on selected files in the report

Archive and backup files are automatically sent to the Tivoli Storage Manager server and are stored on that machine. Files are put into storage groups that are controlled through a Tivoli Storage Manager policy that the Tivoli Storage Manager server administrator usually creates.

- a. Select the files in the **Constraint Violation Report** that you want to archive or backup.
- b. Right-click on the selected files and select **Create a new archive\backup job**. The **Create New Archive/Backup Job** window opens.

- c. In the **Options** tab, choose **Archive**. In this scenario the purpose is to archive and delete files that violate the constraints, so select **Delete After Successful Archival**. If, for some reason, you did **not** want to delete the files after they have been archived, do not select **Delete After Successful Archival**. If the archive is not successful, the files will not be deleted.
- d. The files you have selected for archive/backup are shown in the **Files** tab.
- e. In the **When to Run** tab select **Run Now**. In the **How to handle time zones** section, select **Local time in each time zone**.
- f. In the **Alert** tab, in the **Triggering-Condition** area, the only triggering condition is **File Archive/Backup Failed**. Do not select anything in the **Triggered Actions** area to accept the default (a message sent to the error log).
- g. Click the **Save** icon. Enter the name **Archive Log** and click **OK**. The job log is saved at **Data Manager > Monitoring > Policy Management > Archive/Backup > TPCUser.Archive Log**.
- h. A notice telling you that the job has been submitted appears. Click **OK**.
- i. Expand the job name to see the status of this particular job. You can judge the status by the color coding. When the job has finished, click on the date and time to view the job log file.

### Setting an archive/backup from the constraint

You can call archive backup when you set the constraint. However, if you set the delete option, it will automatically archive and delete **all** files that match the constraint criteria, which you probably do not want to do. At the very least you should not set archive/backup in the constraint the first time you run it.

To call for an archive/backup within a constraint, select **Archive/Backup** in the **Triggered Actions** area of the **Alert** tab in the **Create Constraint** window. Click **Define**. An **Archive/Backup Options** pop-up opens. Select **Delete After Successful Archival**. Go to the next tab and continue defining your constraint.

**Related concepts:**

“Requesting an archive or backup” on page 476

Request an IBM Tivoli Storage Manager archive and backup of the largest violating files identified by a constraint. Tivoli Storage Manager protects your data from hardware failures and other errors by storing backup and archive copies of data on auxiliary storage.

**Related tasks:**

“Creating probes” on page 338

Create and schedule a probe to job to gather information about your storage resources. You can define any number of probes to gather information about different storage resources at different times.

“Creating a file constraint” on page 470

Learn how to create a constraint that defines the acceptable and unacceptable file types, file sizes, and file owners for a computer or a set of computers in your environment.

“Defining an archive or backup in a constraint” on page 476

Learn how to request an IBM Tivoli Storage Manager archive and backup of the largest violating files identified by a constraint. Request a Tivoli Storage Manager archive and backup on the alert page of a constraint definition.

“Creating scans” on page 346

Create and schedule a scan to gather usage information about your storage resources. You can specify which file systems, computers, clusters, directories, databases, and other storage resources that you want to scan. You can define any number of scans to gather information about different storage resources at different times.

---

## Create a profile with a filter

This scenario scans storage on a selected drive looking for the 100 largest media files, and summarizes space used by filesystem or directory and by owner.

There are a number of media files on computer1 that you suspect are taking up space that could be used for other purposes. You would like to search C:\ drive file systems and directories for the 100 largest files and create a report you can use to decide what action to take (contact the owner, archive and delete the files, and so forth). You will also publish this report to the web, where other people with permission levels greater to or equal to yours (TPCUser) can access it.

With this scenario, you perform the following tasks:

1. Create a profile to look for the largest media files
2. Create a filter within the profile
3. Create a new scan schedule using the profile
4. Create and run a batch report using the information gathered from the scan schedule
5. Save this report as an HTML file

For this scenario, complete the following steps:

1. **Create a new profile**
  - a. Expand **Data Manager > Monitoring**, right-click **Profiles** and select **Create Profile**.
  - b. The **Create Profiles** window opens. Enter a description for the profile.
  - c. In the **Statistics** tab, do the following:

- 1) Under **Summarize space usage by**, select **filesystem** or **directory** and **owner**.
  - 2) Under **Accumulate History**, select **Per Scan** and type **10** as the number of days to keep.
  - 3) Under **Gather statistics by length of time since**, select **creation**.
  - 4) Under **Gather the information on the**, select **largest files** and type **100** in the text field.
- d. In the **File Filters** tab, create the filter by doing the following:
- 1) Highlight **(All Files Selected)** and click **New Condition**. The **Create Condition** window opens.
  - 2) Select **NAME** and **Matches any of** from the pull-down lists.
  - 3) Select **In any Directory**.
  - 4) In the **match** field, enter the types of files you are looking for in either a comma-separated list or by pressing return after each entry. As you press return, the file type will be listed in the box underneath the text field. For this scenario the file types are **\*.avi**, **\*.au**, **\*.mpeg3**, and **\*.gif**. Click **OK**. The **Create Profile** window re-opens, reflecting your choices.
- e. Click the **Save** icon. Name the profile **Media Files Profile** and click **OK**. The profile will be saved as **Data Manager > Monitoring > Profiles > TPCUser.Media Files Profile**.
2. **Create the scan**
- a. Expand **Data Manager > Monitoring**, right-click **Scans** and select **Create Scan**.
  - b. The **Create Scans** window opens. Type a description of the scan.
  - c. In the **Filesystems** tab, select **C:/** as the file system to scan.
  - d. Do not select anything in the **Directory Groups** tab.
  - e. In the **Profiles** tab, select **TPCUser.Media Files Profile** from Available Profiles and move it to **Profiles to apply to Filesystems**.
  - f. In the **When to run** tab, choose **Run Now** and select **Local time in each time zone**.
  - g. In the **Alerts** tab, the only **Triggering Condition** is **Scan Fails**. In the **Triggered Actions** area, select nothing to accept the default. If the job fails, a notification will be sent to the error log automatically.
  - h. Click the **Save** icon. Name the scan **Media Files Scan** and click **OK**. The scan will be saved as **Data Manager > Monitoring > Scans > TPCUser.Media Files Scan** and the job will begin running immediately. This scan could take approximately 20 minutes to complete.
3. **Create the batch schedule**
- Once you have run a scan with the new profile, the data is in the database but you have to go get it with a custom-designed report or batch schedule.
- a. Expand **IBM Tivoli Storage Productivity Center > My Reports**, right-click **Batch Reports** and select **Create Batch Report**.
  - b. The **Create Batch Report** window opens. Enter a description for the report.
  - c. In the **Available** column in the **Report** tab, select **Usage > Files > Largest Files > by Computer** and move that to **Current Selections**.
  - d. In the **Selection** tab, select **TPCUser.Media Files Profile** from the available profiles. By default, all columns are included in **Included Columns**. If you do not want a column in your report, select it and move it to **Available Columns**.
  - e. In the **Options** tab, make the following selections:

- Under **Agent Computer Specification**, select **computer1**. This is the computer where the report will be run and the data stored. In most cases this is the Agent running on the Tivoli Storage Productivity Center server. If **computer1** is a Data Agent computer, you must accept the default report-destination path. If **computer1** is a V4.2 Storage Resource Agent or the Tivoli Storage Productivity Center server, you can accept the default path or you can specify a different path in the **Report destination** field. The default destination path varies depending on whether the computer is a Storage Resource Agent or the server.
  - Under **Report Type Specification**, select **HTML File**.
  - Select nothing under **Script**.
  - Under **Output File Specification**, enter the mask that will determine the output file name. It is recommended that you name the report something other than the default so that it can be easily identified by you and others. **{Report name}.{Report run date}** is recommended.
- f. In the **When to run** tab, choose **Run Now** and select **Local time in each time zone**.
  - g. In the **Alerts** tab, the only **Triggering Condition** is **Report Failed**. In the **Triggered Actions** area, select nothing to accept the default. If the job fails, a notification will be sent to the error log automatically.
  - h. Click the **Save** icon. Name the batch report **Largest Media Files** and click **OK**. The batch report criteria will be saved under **IBM Tivoli Storage Productivity Center > Reports > Batch Reports > TPCUser.Largest Media Files**. The job will begin running immediately. The job number, date, and time will be listed under **TPCUser.Largest Media Files**.
4. Batch reports can be saved to any computer running Tivoli Storage Productivity Center. Reports are saved to a default location for Data Agents. If the computer is a V4.2 Storage Resource Agent or the Tivoli Storage Productivity Center server, you can accept the default path or you can specify a different path when you select batch report options.

**Related tasks:**

“Creating a profile” on page 356

Create a profile for use within a scan.

“Creating scans” on page 346

Create and schedule a scan to gather usage information about your storage resources. You can specify which file systems, computers, clusters, directories, databases, and other storage resources that you want to scan. You can define any number of scans to gather information about different storage resources at different times.

“Creating batch reports” on page 1062

Create a batch report.

“Selecting batch report options” on page 1063

Define the agent computer that you want to run the batch report on and specify the format of the file to be saved.

---

## Creating a performance threshold within an alert

You can monitor the performance of your enterprise by creating alerts with performance thresholds for storage subsystems and SAN switches. By defining alerts that are triggered by performance thresholds, you can get timely information about performance issues in your enterprise.

To properly monitor the performance of your storage subsystem you will need to create the appropriate data collection jobs and alert definitions. The performance monitors collect data from the devices they are monitoring and at each sample interval the data is compared to the performance thresholds you have set. If the thresholds are exceeded, a notification is generated and the actions you defined in an alert are performed.

**Note:** The term Alert can be used one of three ways. An IBM Tivoli Storage Productivity Center *Alert definition* is defined at **[Data | Disk | Tape] Manager > Alerting > [Type of Alert]**. Within the Alert definition there is an *Alert tab*. Within the Alert tab there is a *Triggering Condition* area which gives the condition that will result in an *Alert message*. Most Triggering Condition areas in the Alert tab have only one Triggering Condition, such as **Probe Failed**. However, in Disk Manager some of the triggering conditions have thresholds, which are condition boundaries you set. For example, **Total I/O Rate Threshold** requires two upper-threshold and two lower-threshold boundaries or values. Only if these boundaries are matched or exceeded will an Alert message be generated and sent by the method you chose in *Triggered Actions*.

In this scenario, you are defining a performance threshold alert to monitor a disk subsystem (**DS8000-21-7-1300271-IBM**), for the **Total I/O Rate Threshold** condition, and generating, viewing, and printing the results.

To complete this scenario, you need to perform the following tasks:

1. Create a storage subsystem performance monitor
2. Create a storage subsystem alert definition
3. Generate and view a report showing the collected storage subsystem data

**Note:** You must run probes against storage subsystems prior to successful performance monitoring of those subsystems.

**1. Create a subsystem performance monitor**

- a. Expand **Disk Manager > Monitoring**, right-click **Subsystem Performance Monitor** and select **Create Subsystem Performance Monitor**. The **Create Storage Subsystem Monitor** page opens to the **Storage Subsystem** tab.
- b. Select the disk you want to monitor from the **Available subsystems** column and move it to the **Selected subsystems** column. Although we do not do it here, you can select more than one subsystem at a time.
- c. Click the **Sampling and Scheduling** tab. In the **Sampling** area, set the interval for gathering data to **1 hour**. Select **Continuing gathering data for** and select a value of **1 month**. In the **Scheduling** area, select **Begin immediately**.

**Note:** You do not want to sample too frequently as it increases the size of the database repository significantly. Monitors should be set to run for long periods, such as weeks or indefinitely.

- d. Click the **Alert** tab. **Monitor Failed** is the only **Triggering Condition** available. In **Triggered Actions**, select nothing to accept the default. If the job fails, a message will be sent to the log file automatically.
  - e. Click the **Save** icon. Name the monitor **SS Monitor**. It will be listed at **Disk Manager > Monitoring > Subsystem Performance Monitors > TPCUser.SS Monitor**. The job will begin running immediately.
- 2. Create a storage subsystem performance alert**

- a. Expand **Disk Manager > Alerting**, right-click **Storage Subsystem Alerts** and select **Create Storage Subsystem Alert**. The **Create Storage Subsystem Alert** page opens.
- b. Click the **Alert** tab. Select **Total IO Rate Threshold** from the **Condition** drop down list in the **Triggering-Condition** area. Text fields will open for **Critical Stress**, **Warning Stress**, **Warning Idle**, and **Critical Idle**.

**Note:** The threshold values given in this scenario are examples and are **not** recommended values. They are for the purpose of illustration only. Your values will undoubtedly be different. Performance behavior varies tremendously between different devices and even different applications for different devices. We recommend monitoring your performance for several weeks and use this historical data to determine reasonable values for each threshold.

- In the **Critical Stress** field, type **3000** as the upper-threshold boundary for critical stress.
  - In the **Warning Stress** field, type **2200** as the upper-threshold boundary for warning stress.
  - Leave the **Warning Idle** field, the lower-threshold boundary for warning idle, blank.
  - Leave the **Critical Idle** field, the lower-threshold boundary for critical idle, blank.
- c. In the **Triggered-Actions** area, select **Email** to send an e-mail to a mail address you specify.
    - 1) When you select **Email** the **Email Recipients** text box becomes active.
    - 2) Click **Add** and type an e-mail address in the text box. You can type multiple e-mail addresses.
    - 3) Click **Edit e-mail** to customize the e-mail message. Note that errors sent to the error log are very generic, so you might want to be more descriptive in the text of the e-mail.
  - d. In the **Storage Subsystems** tab, select **Storage Subsystems > DS8000-21-7-1300271-IBM** in the **Available** column and move it to the **Current Selections** column.
  - e. To save the alert, click the **Save** icon. Name the alert **SS Alert**. It will be listed at **Disk Manager > Alerting > Storage Subsystem Alerts > TPCUser.SS Alert**. The conditions defined in the alert will be checked when the next probe runs against the subsystem.
3. **Generate and view a report**
- a. Expand **Disk Manager > Reporting > Storage Subsystem Performance**, and click **By Storage Subsystem**. The **Storage Subsystem Performance: By Storage Subsystem** window opens.
  - b. In the **Selection** tab, all performance metrics fields are selected by default. To remove a field from the report, click on the metric name in **Included Columns** and move it to **Available Columns**. In the **Report Filter Specifications** area enter the number of storage subsystems upon which you want a report in the **Return maximum of** text field.
  - c. Click the **Generate Report** button. A **Storage Subsystem** tab will open containing the report. There will be one line in the report for each storage subsystem.

- d. To save the report definition, click the **Save** icon. The **Save As** window opens. Name the report **SS Report** and click **OK**. The report will be saved at **IBM Tivoli Storage Productivity Center > My Reports > TPCUser's Reports > TPCUser.SS Report**.
- e. Click the **Print** icon to print the current page on the local machine. You can only print one screen at a time.

**Note:** You might want to monitor the **Total IO Rate Threshold** condition for the storage subsystem by using constraints instead of thresholds. The Triggering Condition for a constraint would be **Violating Files Consume More Than**. This will alert you if any file goes over the condition value you set. In the **Value** field, type **2200**, which is the value of Warning Stress. In **Value Units**, select **Megabytes** from the pull-down list. See “Archive and delete files” on page 142 for more information on creating constraints.

You can use the preceding steps, with some minor changes, to create performance monitors and alerts for certain types of switches that have been discovered by Tivoli Storage Productivity Center. Switch performance monitors, for example, are created in the Fabric Manager node:

- To create a switch performance monitor, expand **Fabric Manager > Monitoring > Switch Performance Monitors**
- To create a switch performance alert, expand **Fabric Manager > Alerting > Switch Performance Alerts**.

**Related tasks:**

“Creating storage subsystem performance monitor” on page 379

Create a subsystem performance monitor to gather performance data for storage systems.

“Creating storage system alerts” on page 392

You can use storage systems alerts to monitor systems for changes in configuration or status. When the condition is detected during a probe, an alert is generated. These alerts can be applied to storage subsystem groups and storage subsystems.

**Related reference:**

“Disk Manager reports” on page 990

Use Disk Manager reports to view the relationships among the components of a storage subsystem and the storage capacity for a computer, filesystem, storage subsystem, volume, Array Sites, Ranks, and disk.

---

## Determine application performance problems

This scenario provides a method for finding out why an application has stopped performing as expected.

A previously normal application has stopped performing well. You must find out what is impacting the application so that you can take steps to correct the situation. You suspect a storage system problem.

In this scenario, you perform the following tasks:

- Probe Storage Resource agents and Data agents
- Probe the Storage Systems and start the Performance Monitor running
- Create a **Storage Subsystem: By Filesystem/Logical Volume** report
- Create a **Storage Subsystem Performance: By Volume** report
- Create a **Storage Subsystem Performance: By Array** report

**Tip:** Ordinarily, you run probes and performance monitors on both storage systems and switches, because the problem might be in either place. However, in this scenario you are only gathering information about storage systems.

**Prerequisites:**

- The Storage Resource agents and Data agents must be installed on the monitored computers before you can complete the tasks in this scenario. These are usually installed as part of the IBM Tivoli Storage Productivity Center installation process.
- Storage Resource agents, Data agents, and Arrays must have already been probed.
- Storage systems such as IBM System Storage DS8000 Storage Manager, IBM System Storage SAN Volume Controller, and the XIV systems must be connected through native interfaces. For other storage systems, CIM object manager (CIMOM) connections must be added and discovered.

Substitutable values that are used in this scenario:

- Device path = M:\ (from application owner or server administrator)
- Computer = ODCCL163.odcclass.ibm.com (from Filesystem/Logical Volume report)
- Volume name = testvol-100 (id.1000)(from Filesystem/Logical Volume report)
- Storage system name = DS6000-1750-13AB44A-IBM (from Filesystem/Logical Volume report)
- Array = 1750.13AB24A-1 and A-2 (from the By Volume report, drill down to By Array report)

To track down application performance problems, collect information by running probes, performance monitors, and reports. Then use that information to determine actual performance and use values.

To perform this scenario, complete the following steps:

1. When the problem is reported, get computer information, device path information, and the application name from the application owner or the server administrator.
2. Probe the Storage Resource agents and Data agents.
  - a. Expand **IBM Tivoli Storage Productivity Center > Monitoring**. Right-click **Probes** and select **Create Probes**.
  - b. In the description field, type Probe for agents.
  - c. In the **What to Probe** page, expand 'Computers' in the **Available** box, select All Computers, and move that to **Current Selections**. This includes all Storage Resource agents and Data agents in the probe.
  - d. Click the **When to Run** tab and select **Run Repeatedly**, and set a regular time the probe is run. The following settings are up data collection for 2:00 AM every morning.
    - 1) Set the day in **Beginning at** a day ahead of the current day. If the day is February 21st, 2008, enter February 22, 2008, at 2:00 AM.
    - 2) Select **Repeat Every** and set **23 Hour(s)** to specify how often the probe is run. This setting allows time for the probe to shut down and start again.  
In the **How to handle time zones** area, select **Use the timezone that the server runs in**, which uses the time zone where the Data server resides.
  - e. On the **Alert** page, **Probe Failed** is the only triggering condition that triggers an alert. In the **Triggered Actions** area, select **Windows Event Log** and set the **Event Type** to **Warning**.

- f. Click the **Save** icon. Type `AgentsProbe_1` as the probe name and click the **Save** button. The probe is listed in the navigation tree as **IBM Tivoli Storage Productivity Center > Monitoring > Probes > Administrator.AgentsProbe\_1**.
  - g. To begin collecting data immediately, expand **IBM Tivoli Storage Productivity Center > Monitoring > Probes**, right-click **Administrator.AgentsProbe\_1** and select **Run Now**. The status line for the probe is listed under **Administrator.AgentsProbe\_1** by date and time.  
A probe of the agents typically takes under a minute.
3. **Probe the Storage Systems.** Creating the Storage System probe is similar to creating the probe for the Storage Resource agents and Data Agents.
    - a. Expand **IBM Tivoli Storage Productivity Center > Monitoring**, right-click **Probes** and select **Create Probe**. In the **Description** field, type Probe for Storage Systems.
    - b. In the **What to Probe** tab Available area, expand **Storage Subsystems**. Select **All Storage Subsystems** and move it to Current Selections.
    - c. In the **When to Run** page, select **Run Repeatedly** beginning a day later than the current day at 3:00 AM.
    - d. Click the **Save** icon. Type `StorageSystemsProbe_1` as the probe name and click the **Save** button. The listing for the probe is displayed in the navigation tree as **IBM Tivoli Storage Productivity Center > Monitoring > Probes > Administrator.StorageSubsystemProbe\_1**.
    - e. To collect initial data, right-click **Administrator.StorageSubsystemProbe\_1** and select **Run Now**. Depending on the number and size of the storage systems to be probed, this probe might take up to 15 minutes.
  4. **Begin running the storage system Performance Manager.** If you have a current Performance Monitor running and you have added another storage system, you must start a new Performance Monitor.
    - a. Expand **Disk Manager > Monitoring**, right-click **Subsystem Performance Monitor** and select **Create Performance Monitor**. In the **Description** field, type System performance monitor.
    - b. Click the **Storage Subsystems** tab. All storage systems that have had probes created and completed are listed under **Available subsystems**. Select all the available systems and move them to **Selected subsystems**.
    - c. Click the **Sampling and Scheduling** tab. In the Sampling area specify how frequently data is to be gathered and the length of the sampling window.
      - 1) For the Interval Length, type 5 in the minutes field.
      - 2) For Duration, select **Continue indefinitely**.
      - 3) Select **Begin Immediately** in the **Scheduling** area.
    - d. Click the **Alert** tab.
      - 1) In the **Condition** area, **Monitor Failed** is the only triggering condition.
      - 2) In the **Triggered Actions** area, select **Windows Event Log** with a **Warning** event type.
    - e. Click the **Save** icon and enter `SSPerformanceMonitor_1` as the performance monitor name. Click **OK**. The name of the storage system performance monitor is displayed at **Disk Manager > Monitoring > Subsystem Performance Monitor > Administrator.SSPerformanceMonitor\_1**.

**Tip:** Setting performance alerts is not necessary for this scenario, but at this point you can review the historical performance data for your environment. Then you can define performance alerts with values that you consider out

of the ordinary for your environment. You can set performance alerts for both storage systems and switches. After a performance alert is defined, future deviations will generate an alert and create an entry in the Performance Manager Constraint Violation report.

5. Gather information for at least two cycles (in this case, gather the information for at least 10 minutes). When information has been gathered, run the following reports to collect the data you can use to check performance.
  - **Disk Manager > Reporting > Storage Subsystems > Computer Views > By Filesystem/Logical Volume**
  - **Disk Manager > Reporting > Storage Subsystem Performance > By Volume**
  - **Disk Manager > Reporting > Storage Subsystem Performance > By Array**

The data from the reports is saved by date and time, but you might want to print copies of the reports for easier comparison.

- a. The **Storage Subsystem: By Filesystem/Logical Volume** report identifies the backend storage volumes associated with the file system. Variable values that are gathered from this report include values for computer, storage subsystem, and volume name.
  - 1) Run the report by expanding **Disk Manager > Reporting > Storage Subsystems > Computer Views** and click **By Filesystem/Logical Volume**.
  - 2) Click the **Selection** tab, and in the **Report Filter Specifications** area, select **Volumes to Relate Filesystems/Logical Volumes to** in the list.
  - 3) Click the **Selection** button, clear the listed computers, and select your Device Path (M:\). Click **OK** to return to the **Selection** tab. When you run the report, the information is limited to your device path.
  - 4) By default all columns are listed as **Included Columns**. If there are columns you do not want in the report, select them and move them to **Available Columns**. Do **not** to move the "volume name" columns to **Available Columns**.
  - 5) Click **Generate Report**.
- b. The **Storage Subsystem Performance: By Volume** report shows you the actual performance metrics that are associated with the volumes the problem file system resides on.
  - 1) Expand **Disk Manager > Reporting > Storage subsystem Performance** and click **By Volume**. By default all columns are listed as **Included Columns**. Do not move any of them to **Available Columns**.
  - 2) Click the **Selection** button. Click **Deselect All**, then find your system name (DS6000-1750-13AB24A-IBM) and component (the Volume Name - testvol-1000 (ID.1000)), and select that line. The information in the report is limited to that system and volume.
  - 3) Click **OK**. Click **Generate Report**.
- c. The **Storage Subsystem Performance: By Array** report shows the other volumes on the same array as the problem volume. It indicates whether the problem is specific to that one volume or if all of the volumes on the same array have a similar problem.

**Note:** Arrays are only supported on IBM TotalStorage Enterprise Storage Server, DS8000, and IBM System Storage DS6000systems.

- 1) Expand **Disk Manager > Reporting > Storage subsystem Performance** and click **By Array**.

- 2) In the **Report Filter Specifications** area, select **Display latest performance data (by sample)**.
  - 3) Click the Selection button. Click **Deselect All** then find your arrays (Component) (1750.13AB45A-1 and A-2) and select those lines. The information in the report is limited to those arrays.
  - 4) By default all columns are listed as **Included Columns**. Do not move any of them to **Available Columns**.
  - 5) Click **Generate Report**.
6. Parts of the information that you use to determine the problem is in all of the reports. Look for the following things:
- Look at the I/O rate and the response time together for a complete picture of the performance. Ideally, you want a high I/O rate and low response time.
  - If the I/O rate is high but the response time is slowing over time, look at the cache hits to see how well cache is performing and, therefore, how often the I/O must go to disk.
  - If the I/O rate is low, look at the data rate. When there is a large number of I/O requests with high transfer sizes, the data rates become more important than I/O rates. In this case, look at the data rates and transfer sizes together.
  - Look at all the volumes in the same array to determine the I/O rate and response times. To determine these values, drill up from a selected volume in the 'By Volume' report to view the arrays that the volume is a part of. Then drill down from the array to get a filtered 'By Volume' report of just the volumes on that array. Now compare the performance metrics against all the volumes in the same array. If all of them show the same performance problem, the performance bottleneck is the array. If only one volume has a performance problem, the performance bottleneck is somewhere else.
7. In this scenario, based on the I/O rates and the response times for the array over a time period, you determine that the array is being saturated with I/O and I/O should be off-loaded to other storage to improve performance.

**Tip:** You can also use Tivoli Storage Productivity Center to determine and project when more storage space is needed by monitoring I/O rates and response times over a time period.

## Identifying performance hot spots

This scenario uses the Storage Optimizer to analyze storage systems to determine whether there are performance hot spots. This scenario also illustrates how to use the Storage Optimizer to get recommendations for improving storage system performance.

You want to analyze your two IBM System Storage DS8000 Storage Manager storage systems to determine whether there are performance hot spots. You want to identify the hot spots and get recommendations on how to improve storage system performance.

### Prerequisites for using Storage Optimizer

- IBM Tivoli Storage Productivity Center Advanced Edition license
- One or more of these systems:
  - System Storage DS8000
  - System Storage DS6000
  - System Storage DS5000
  - System Storage DS4000
  - TotalStorage Enterprise Storage Server
  - SAN Volume Controller
  - Storwize V7000
- Performance monitoring data gathered for at least one week in advance of using Storage Optimizer. Providing a longer time interval for data collection increases the accuracy of the analysis and recommendations.

### Monitoring the performance of your DS8000 systems

At least one week in advance, start performance monitoring for the DS8000 storage systems.

1. Use the Configure Devices wizard to enter connection information for the native interfaces of your DS8000 systems. For systems that connect through CIM object manager (CIMOM) connections, run a discovery for storage system CIMOMs.
2. Create a probe. See “Creating probes” on page 338.
3. Create a storage system performance monitor and allow it run for at least one week. See “Creating storage subsystem performance monitor” on page 379.

To identify performance hot spots, complete the following steps:

#### Part 1: Creating an analysis report that includes both DS8000 storage systems.

1. At least one week in advance, run a storage system performance monitor to collect performance data for both DS8000 systems.
2. Navigate to **IBM Tivoli Storage Productivity Center > Analytics**.
3. Right-click **Storage Optimizer** and select **Create Analysis**. The Create Analysis panel allows you to specify the storage systems that you want to analyze.
4. Under Create Analysis, enter "Analyze DS8000 systems" in the Description field.
5. Click **Add** in the Select Storage pane. The Optimizer Selection panel opens. This panel provides a topology view of the current storage network.
6. Select both of your DS8000 storage systems.

7. Click **OK** to return to the Storage Optimizer Create Analysis panel with the DS8000 systems displayed in the Select Storage pane.
8. Set the Performance Time Interval to start one week before the current date.
9. For How often to run, select **Run Now**.
10. Choose **File > Save** to save and submit the analysis report job.
11. When prompted to enter a name for the report job, enter "Analyze DS8000 systems" and click **OK**.
12. View the analysis report job status for "Analyze DS8000 systems" under the **Storage Optimizer** node in the navigation tree.

## Part 2: Viewing the analysis report and identify hot spots

When the analysis report job "Analyze DS8000 systems" is complete (status is green), select it to view the analysis report for your DS8000 systems. The heat maps display color-coded cells that represent the projected utilization of both DS8000 systems, as measured against the required performance threshold of 80%. Each cell represents a storage pool.

1. From the list of components for **Heat Map based on**, choose Hard Disk to update the heat maps to display the analysis data for that component.
2. Move the performance threshold slider to see its affect on the heat maps.
3. Click the **Performance Tables** tab to display a tabular view of the data, if wanted.
4. In the Hard Disk heat map for one of your DS8000 systems, you notice a red cell, or "hot spot". Move your cursor over that cell to display the details for the storage pool named Pool 1. The details for Pool 1 indicate that it is exceeding the required performance threshold of 80%.

A green cell displays for Pool 2. The green color indicates that Pool 2 is performing at less than or equal to 25% of the established performance threshold.

You think that you might be able to improve the performance of Pool 1 by moving some of its volumes to Pool 2. You know that Pool 2 has some amount of available capacity.

## Part 3: Creating an optimization report that includes recommendations on how to improve the performance of Pool 1.

1. In the analysis report, select the red cell which represents Pool 1.
2. Click >> next to **Source Entities** to move Pool 1 into the list of source entities.
3. Select the green cell which represents Pool 2.
4. Click >> next to **Target Entities** to move Pool 2 into the list of target entities.
5. Choose **File > Save** to save and submit the optimization report job.
6. When prompted to enter a name for the optimization report job, enter "Optimize DS8000 systems" and click **OK**.
7. Under **View Previously Run Optimization Reports**, click **Refresh Job Status** to update the report job status.

## Part 4: Viewing the optimization report and recommendations.

When the optimization report job "Optimize DS8000 systems" is complete (job status is "Success"), click  to display the optimization report. The report includes a recommendation for how to improve the performance of Pool 1.

The heat maps in the optimization report display the performance utilization of Pool 1 and Pool 2 before and after implementing the recommendation. The heat maps show you that the red cell representing Pool 1 changes to green after implementing the recommendation. The heat maps also show you that the green cell representing Pool 2 changes to yellow after implementing the recommendation. This means that Pool 2 will still be performing at less than or equal to 75% of the performance threshold after you implement the recommendation.

To view the effects on the before and after heat maps of implementing only some of the recommendations:

- Remove the check mark next to **Select all recommendations** and select a subset of the recommendations from the recommendations table.

To print the optimization report:

- Click the Print button in the optimization report.

The printed report includes additional information such as SVC sample scripts to help you implement the recommendations using the SAN Volume Controller command-line interface.

**Related information:**

See "Configuring storage subsystems" on page 308 for details of how to use the Configure Devices wizard to enter connection information for any of the storage systems that connect to Tivoli Storage Productivity Center using native interfaces. For more information, see "Discover storage subsystem, tape library, and fabric information with CIM agents" on page 333.

---

## Retiring underutilized storage systems

This scenario illustrates how you can use the Storage Optimizer to create recommendations about retiring underutilized storage systems and migrating their data to other systems in your data center.

Your data center has seven IBM System Storage DS8000 Storage Manager storage systems in use. Using various IBM Tivoli Storage Productivity Center capacity reports, you determine that two of the systems are underutilized. You want to create a report that provides recommendations to help guide you in retiring the underutilized systems and migrating the data into your remaining five systems.

**Prerequisites for using Storage Optimizer**

- One or more of these supported systems:
  - System Storage DS8000
  - System Storage DS6000
  - System Storage DS5000
  - System Storage DS4000
  - TotalStorage Enterprise Storage Server
  - SAN Volume Controller
  - Storwize V7000

- Performance monitoring data gathered for at least one week in advance of using Storage Optimizer. Providing a longer time interval for data collection increases the accuracy of the analysis and recommendations.

### Monitoring the performance of your DS8000 systems

At least one week in advance, start performance monitoring for the DS8000 storage systems.

1. Use the Configure Devices wizard to enter connection information for the native interfaces of your DS8000 systems. For systems that connect through CIM object manager (CIMOM) connections, run a discovery for storage system CIMOMs.
2. Create a probe. See “Creating probes” on page 338.
3. Create a storage system performance monitor and allow it run for at least one week. See “Creating storage subsystem performance monitor” on page 379.

To perform this scenario, complete the following steps:

#### Part 1: Creating an analysis report for the seven DS8000 storage systems in your data center.

1. At least one week in advance, run a storage system performance monitor to collect performance data for all DS8000 systems.
2. Navigate to **IBM Tivoli Storage Productivity Center > Analytics**.
3. Right-click **Storage Optimizer** and select **Create Analysis**. The Create Analysis panel allows you to specify the storage systems that you want to analyze.
4. Under Create Analysis, enter “Analyze DS8000 systems” in the Description field.
5. Click **Add** in the Select Storage pane. The Optimizer Selection panel opens. This panel provides a topology view of the current storage network.
6. Select all your DS8000 storage systems.
7. Click **OK** to return to the Storage Optimizer Create Analysis panel with the DS8000 systems displayed in the Select Storage pane.
8. Set the Performance Time Interval to start one week before the current date.
9. For How often to run, select **Run Now**.
10. Choose **File > Save** to save and submit the analysis report job.
11. When prompted to enter a name for the report job, enter “Analyze DS8000 systems” and click **OK**.
12. View the analysis report job status for “Analyze DS8000 systems” under the Storage Optimizer node in the navigation tree.

#### Part 2: Viewing the analysis report.

When the analysis report job “Analyze DS8000 systems” is complete (status is green), select it to view the analysis report for your DS8000 systems.

- For **Heat Map based on**, choose the **Space** option to view the heat maps in the analysis report based on disk space utilization. The heat maps confirm that most pools in systems 6 and 7 are performing at less than 75% of capacity.

#### Part 3: Creating an optimization report that includes recommendations on how to retire the underutilized systems 6 and 7 and migrate the data to your remaining five systems.

1. In the heat maps, select all pools for storage systems 6 and 7 using the **Select all pools for storage subsystem** check box.
2. Click >> next to **Source Entities** to move systems 6 and 7 into the list of source entities.
3. Click **Make retirement recommendations for the selected entity**.
4. In the heat maps, select all pools for storage systems 1 through 5 using the **Select all pools for storage subsystem** check box.
5. Click >> next to **Target Entities** to move systems 1 through 5 into the list of target entities.
6. Choose **File > Save** to save and submit the optimization report job.
7. When prompted to enter a name for the report job, enter "Retire DS8K" and click **OK**.
8. Under **View Previously Run Optimization Reports**, click **Refresh Job Status** to update the report job status.

#### Part 4: Viewing the optimization report and recommendations.

When the optimization report job "Retire DS8K" is complete (job status is

"Success"), click  to display the optimization report. If it is possible to retire systems 6 and 7, the report will include recommendations for retiring systems 6 and 7 and migrating the data into systems 1 through 5.

- For **Heat Map based on**, choose **Space** to view the before and after optimization heat maps based on disk space utilization.
- To view the effects on the before and after heat maps of implementing only some of the recommendations, remove the check mark next to **Select all recommendations** and select a subset of the recommendations from the recommendations table.

The before and after heat maps illustrate the effects of retiring systems 6 and 7 and migrating the data into systems 1 through 5. The heat maps also confirm that even after retiring systems 6 and 7, the remaining systems will still perform within the limits of the required performance threshold.

To print the optimization report:

- Click the Print button in the optimization report.

The printed report includes additional information such as SVC sample scripts to help you implement the recommendations using the SAN Volume Controller command-line interface.

#### Related information:

See "Configuring storage subsystems" on page 308 for details of how to use the Configure Devices wizard to enter connection information for any of the storage systems that connect to Tivoli Storage Productivity Center using native interfaces. For more information, see "Discover storage subsystem, tape library, and fabric information with CIM agents" on page 333.

---

## Tivoli Storage Productivity Center for Replication scenarios

These scenarios illustrate how to perform specific replication tasks using IBM Tivoli Storage Productivity Center for Replication.

The provided scenarios set out situations that can be solved using IBM Tivoli Storage Productivity Center. When using these scenarios you should remember the following:

- The scenarios are intended to be step-by-step instructions that you follow to complete a specific task. Each scenario contains multiple steps that must be followed in the order given.
- Specific values such as user names, passwords, and IP Address are given in the scenarios only for illustration purposes. You must replace them with values appropriate for your environment.
- The scenarios do not provide in-depth conceptual information about the tasks.

## Identifying and investigating a suspended Metro Mirror session

IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication work together to help meet your storage management needs and automate your replication management tasks. This scenario shows you how to use IBM Tivoli Storage Productivity Center to view and investigate a suspended Metro Mirror between two IBM DS8000 storage systems that was detected by IBM Tivoli Storage Productivity Center for Replication.

You want to use IBM Tivoli Storage Productivity Center to analyze alerts generated by events detected by IBM Tivoli Storage Productivity Center for Replication. You want to open a page in IBM Tivoli Storage Productivity Center for Replication from the IBM Tivoli Storage Productivity Center user interface.

### Prerequisites:

- Two DS8000 storage systems.
- Use IBM Tivoli Storage Productivity Center for Replication to mirror a database application between the DS8000 storage systems.
- Set up IBM Tivoli Storage Productivity Center to monitor DS8000 storage systems. The general steps are as follows:
  1. Run a CIMOM discovery to identify the storage systems managed by CIMOMs in your environment. See information about discovering storage resources in the *IBM Tivoli Storage Productivity Center for Replication for System z User's Guide* for more information about how to discover storage systems.
  2. Create and schedule a probe to run against the storage systems. See information about collecting storage statistics (probes) in the *IBM Tivoli Storage Productivity Center for Replication for System z User's Guide* for more information about how to define probes.

IBM Tivoli Storage Productivity Center includes a predefined set of alerts that correspond to events detected by IBM Tivoli Storage Productivity Center for Replication. In this scenario, IBM Tivoli Storage Productivity Center for Replication detects that a Metro Mirror session just went into a suspended state. That event is communicated to IBM Tivoli Storage Productivity Center and recorded in the alert log. Use the alert log to view information about that alert and start the IBM Tivoli Storage Productivity Center for Replication user interface. Use IBM Tivoli Storage Productivity Center for Replication to determine that the paths between your DS8000 devices in a Metro Mirror session were removed and resolve the problem.

The following tasks are described in this scenario:

1. IBM Tivoli Storage Productivity Center: Set up notification methods for replication alerts.
2. IBM Tivoli Storage Productivity Center: Use the alert log to view information about a suspended Metro Mirror session that was detected by IBM Tivoli Storage Productivity Center for Replication.
3. IBM Tivoli Storage Productivity Center for Replication: Start IBM Tivoli Storage Productivity Center for Replication from the IBM Tivoli Storage Productivity Center user interface to access the Session Details panel for the alert and resolve the problem.

To use IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication to analyze storage events, complete the following steps:

1. IBM Tivoli Storage Productivity Center: Set up notification methods for replication alerts.
  - a. Start IBM Tivoli Storage Productivity Center.
  - b. In the navigation tree, expand **Replication Manager > Alerting** and select **Replication Alerts**.
  - c. Click **TPCUser.Replication Suspending Event**. The Edit Replication Alerts panel is displayed. Use this panel to determine how you are notified if IBM Tivoli Storage Productivity Center for Replication detects a suspending event in your storage environment.
  - d. In the **Triggered Actions** section, select the notification methods for the alert.

By default, all suspending events that are detected by IBM Tivoli Storage Productivity Center for Replication are recorded as entries in the Alert Log panel under **IBM Tivoli Storage Productivity Center > Alerting** . If you want to be notified using additional methods when the alert log is updated for a suspending event, select any of the following options:

- Select **SNMP Trap** to generate an SNMP trap message to any NMS, console, or terminal to indicate the triggering of a suspending alert.
- Select **TEC/OMNIBus Event** to send an alert to the Tivoli Event Console or OMNIBus.
- Select **Login Notification** to be notified of a suspending event when you log in to Tivoli Storage Productivity Center.
- Select **Windows Event Log** or **UNIX SYSLOG** to write the suspending alert to the operating system log file.
- Select **Run Script** to run a script when a suspending alert is triggered.
- Select **Email** to indicate the email addresses that receive notification when a suspending alert is triggered.

You are not required to select any of these options. Triggered alerts from IBM Tivoli Storage Productivity Center for Replication are automatically recorded in the alert log. These options are meant to provide you with additional methods for receiving alerts.

- e. Click the **Save** icon to save the alert definition. When IBM Tivoli Storage Productivity Center for Replication detects that a session has suspended, this alert is triggered, an entry is added to the IBM Tivoli Storage Productivity Center alert log, and any additional triggered actions are run.
2. IBM Tivoli Storage Productivity Center: Use the alert log to view information about a suspended Metro Mirror session.

This step occurs after IBM Tivoli Storage Productivity Center for Replication has detected a suspended session and triggered an alert in the IBM Tivoli Storage Productivity Center user interface.

- a. In the navigation tree, expand **IBM Tivoli Storage Productivity Center > Alerting** and select **Alerting Log**. A visual indicator is displayed next to each alert type under this node. In this scenario, a red, filled-in circle is displayed next to the **Replication** node to indicate that IBM Tivoli Storage Productivity Center has received an alert from IBM Tivoli Storage Productivity Center for Replication that is unresolved.
  - b. Click the **Replication** node. The content pane displays a table that contains a row for each alert received from IBM Tivoli Storage Productivity Center for Replication. The **Alert Type** column in this table indicates the type of alert that was triggered.
  - c. Click the magnifying glass icon next to the alert that displays **Suspending Event** in the **Alert Type** column. The Detail for Alert panel displays a description of the event that triggered the alert:  

```
IWNR1958W [2009/03/04 15:11:49.250 EST] Session session_name has  
changed to the SEVERE status due to an unexpected error.
```
  - d. Click the back arrow in the tool bar to return to the Alert Log panel.
3. Start IBM Tivoli Storage Productivity Center for Replication from a suspended event alert in the alert log.

The Session Details page indicates that the session went suspended because the paths between the devices were dropped.

- a. On the **IBM Tivoli Storage Productivity Center > Alerting > Alerting Log** page, right-click the row for that represents the **Suspending Event** alert type. The menu that is displayed contains the actions that you can perform against the alert log entry. One of the actions is to start the IBM Tivoli Storage Productivity Center for Replication user interface.
- b. Click **Launch Replication Session Details** on the menu. The IBM Tivoli Storage Productivity Center for Replication user interface starts in a Web browser and displays the Session Details page. Use this page to view detailed information about the suspended event.

Single sign-on is an authentication process that enables you to enter one user ID and password to access multiple applications. Single sign-on integrates with the launch in context feature to enable you to move smoothly from the IBM Tivoli Storage Productivity Center user interface to a specific location in the IBM Tivoli Storage Productivity Center for Replication user interface without re-entering a user ID and password.

For example, this scenario shows how you can use single sign-on and launch in context to open a page in the IBM Tivoli Storage Productivity Center for Replication user interface based on a triggered alert in IBM Tivoli Storage Productivity Center.

- c. Use IBM Tivoli Storage Productivity Center for Replication to resolve the problem that triggered the alert.

You can use steps similar to the preceding ones to use IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication together to investigate and resolve different conditions and events that occur within your storage environment.

## Performing planned maintenance scenarios

Scenarios for a planned outage consist of the removal of a unit from service to perform scheduled work on specific components for a predetermined duration.

### Planned outage of local (H1), moving production to site 2 (H2) and optional return

In this scenario, your goal is to shut down the H1 box for maintenance, or for a planned power outage. As a result, you must move production to the H2 site, with the option of switching back to the H1 site after it is restored.

Follow these steps to carry out this scenario.

1. **Start H1->H2->H3**

Issue this command to begin Metro Global Mirror on your system when the production I/O is running on H1. The session will reach a Prepared state so there is a consistent point on Sites 2 and 3.

**Note:** Since the outage is a planned outage, stop production I/O to H1.

2. **Suspend**

This command creates the planned outage by suspending the Metro Mirror relationship between H1 and H2. When this step is complete, the session state should be suspended and recoverable.

3. **Recover H2**

This command makes H2 target-available. When the session state is Target Available, the production I/O can then be moved to write to the H2 volumes.

4. **Start H2->H3**

This command starts a Global Mirror session during the outage of H1. Production I/O can continue on H2. After the session reaches the Prepared state, a consistent copy of the data resides on Site 3, and can be used in the event of a disaster.

5. **Start H2->H1->H3**

Issue this command when H1 is available and ready to be brought back into the configuration. This command starts a Metro Global Mirror session with H1 and H2 roles reversed from the original configuration. Production I/O can continue on H2. After the session reaches the Prepared state, both Site 1 and Site 3 will have a consistent copy of the data.

**Note:** The following steps are the steps you must follow after you decide to switch production I/O to write on Site 1 again. Stop production I/O on H2 before continuing to the next step.

6. **Suspend**

This command suspends the Metro Mirror relationship between H2 and H1. When this step is complete, the session state should be suspended and recoverable.

7. **Recover H1**

This command makes H1 target-available. When the session state is target-available at H1, run production I/O to H1.

8. **Start H1->H2->H3**

This command returns the session to its original configuration, copying data from Site 1, to Site 2, to Site 3.

## Planned outage on site 2 (H2) and return to three-site configuration

In this scenario, there is a planned outage expected on site 2. Disaster recovery capability is still needed so the copy will be setup between site 1 and site 3. After site 2 is brought back up, the session can then be brought back up to its original configuration.

Follow these steps to carry out this scenario:

### 1. Start H1->H2->H3

Run this command to begin Metro Global Mirror on your system when the production I/O is running on H1. After the session is in a Prepared state, both sites 2 and 3 will have a consistent copy of the data.

**Note:** Production I/O does not stop running to site 1 to perform the following steps.

### 2. Start H1->H3

This command starts a Global Mirror session between site 1 and site 3, during the outage of H2. Production I/O can continue on H1. After the session has reached a Prepared state, a consistent copy of the data will reside on Site 3.

**Note:**

- If running DS8000 devices on H1 with the correct level of microcode, and enough time has passed since the initial start of the session, the creation of the H1 to H3 pairs will *not* require a full copy.
- Data on Site 2 is no longer consistent at this point.
- After Site 2 is brought back up and is ready to hold a consistent copy of the data, go to the next step to return to the full three-site configuration. Production I/O never has to stop writing to H1 in this scenario.

### 3. Start H1->H2->H3

After the session reaches a Prepared state, site 2 and 3 will have a consistent copy of the data again.

## Planned outage of local (H1) with production move to remote (H3)

In this scenario, there is a planned outage for Site 1 (H1). Site 2, however, does not have the resources to run production, so production will be moved to Site 3 during the outage at Site 1. When the outage is complete, production can then be moved back to Site 1 and resume the full three-site configuration.

Complete the following steps to carry out this scenario.

### 1. Start H1->H2->H3

Issue this command to begin Metro Global Mirror on your system when the production I/O is running on H1. Once the session is in a Prepared state, both sites 2 and 3 will have a consistent copy of the data.

**Note:** Because this is a planned outage at Site 1, stop production I/O to Site 1 (H1) before continuing to the next step.

### 2. Suspend

This command creates the planned outage by suspending the Metro Mirror relationship between H1->H2. When this step is complete, the session state should be suspended and recoverable.

### 3. Recover H3

This command makes H3 Target Available. When the session state is Target Available at H3, production I/O can be moved to H3.

**Note:** When Site 1 is ready to resume production, continue with the following steps. Production I/O can continue to be written to H3 through the following step.

4. **Start H3->H1->H2**

Issue this command when H1 and H2 are available and ready to be brought back into the configuration. Changes from production at the remote site (H3) flow from the local site (H1) to the intermediate site (H2). The H3-H1 and H1-H2 pairs are Global Copy. The session will remain in a preparing state.

**Note:** While the session is Preparing, you can decrease the amount of time that production I/O has to be stopped by waiting for progress on the H3-H1 role pair to be at or near 100%. The next step will drive H3-H1 to sync, which depending on the percentage of the copy that is complete, can take a significant amount of time. When you are ready to switch back to Site 1, stop production I/O on H3 before continuing to the next step.

5. **Suspend**

This command suspends Global Copy relationship between H3->H1 and H1->H2. When this step is complete, the session state should be suspended and recoverable.

6. **Recover H1**

This command makes H1 Target Available. When the session state is Target Available at H1, production can be switched back to H1.

7. **Start H1->H2->H3**

This command will resume copy from Site 1 back to sites 2 and 3. Once the session reaches a Prepared state, there will be a consistent copy on Site 2 and Site 3.

## **Planned outage of remote (H3) and returning**

In this scenario, the remote site H3 has a planned outage, or consistency groups from the Global Mirror session need to be temporarily paused.

Complete the following steps to carry out this scenario.

1. **Start H1->H2->H3**

Issue this command to begin Metro Global Mirror on your system when the production I/O is running on H1. After the session is in a Prepared state, both sites 2 and 3 will have a consistent copy of the data.

**Note:** Production I/O to H1 can continue during the following steps.

2. **Suspend H2->H3**

Issue this command to suspend only the Global Mirror portion of the session. The Metro Mirror continues between H1 and H2. This causes the session state to be put into a SuspendedH2H3 state.

3. **Start H1->H2->H3**

This command restores the original configuration by restarting the Global Mirror portion of the session.

## Recovering from a disaster scenarios

Scenarios for disaster recovery (or unplanned outages) describe the steps to recover from the loss of a complete site and restart operations after a disaster or disruption.

### Unplanned outage of local (H1), production move to intermediate (H2)

In this scenario, there was an unplanned outage of the local site (H1), and production must be moved to Site 2 (H2) until Site 1 can be brought back up.

Complete the following steps to carry out this scenario.

**Note:** To ensure consistency in the event of a rolling disaster where the IBM Tivoli Storage Productivity Center for Replication server is lost on Site 1 before freezing all the copies in the session, enable the Metro Mirror heartbeat function.

#### 1. Start H1->H2->H3

Issue this command to begin Metro Global Mirror on your system when the production I/O is running on H1. Once the session is in a Prepared state, both sites 2 and 3 will have a consistent copy of the data.

#### 2. Unplanned outage of H1

This event causes an unplanned outage of H1, which causes the session to go suspended. It is recoverable if the session was in a Prepared state when the outage occurred. If the state was Preparing when the outage occurred, the session might be recoverable at Site 2 but will not be recoverable at Site 3.

#### 3. RecoverH2

This command makes H2 Target Available. When the session state is Target Available at H2, production can be switched to H2.

#### 4. Start H2->H3

This command starts a Global Mirror session from Site 2 to Site 3 during the outage of H1. Once the session reaches a Prepared state, consistent data should reside on Site 3.

**Note:** Do not perform the following step until Site 1 is back up and ready to receive a copy of the data that has been written to Site 2 during the outage.

#### 5. Start H2->H1->H3

This command starts an MGM session with the H1 and H2 roles reversed from the original configuration. Production I/O can continue on H2. Wait for the session to go to the Prepared state, at which point there will be a consistent copy of the data on Site 1 and Site 3.

**Note:** The following steps can be used to return to the original configuration so that production I/O can be switched back to Site 1. Stop production I/O on H2 before continuing to the next step.

#### 6. Suspend

This command suspends the Metro Mirror relationship between H2 and H1. When this step is complete, the session state should be suspended and recoverable.

#### 7. RecoverH1

This command makes H1 Target Available. When the session state is Target Available at H1, production I/O can be switched back to H1.

#### 8. Start H1->H2->H3

This command restores the original configuration. Once the session reaches a Prepared state, a consistent copy of the data will reside on Site 2 and Site 3.

## Unplanned outage of Site 2 (H2)

In this scenario, an unplanned outage of Site 2 (H2) occurs. Disaster Recovery capability is still required, so a Global Mirror session must be set up between Site 1 (H1) and Site 3 (H3) while Site 2 is down.

Complete the following steps to carry out this scenario.

### 1. Start H1->H2->H3

Issue this command to begin Metro Global Mirror on your system when the production I/O is running on H1. Once the session is in a Prepared state, both sites 2 and 3 will have a consistent copy of the data

**Note:** Production I/O to H1 can continue during the following steps.

### 2. Unplanned outage of H2

This event causes an unplanned outage of H2, which causes the session to go suspended. It is recoverable if the session was in a Prepared state when the outage occurred. If the session state was Preparing, the session might be recoverable at Site 2 but would not be recoverable at Site 3.

### 3. Start H1->H3

This command starts a Global Mirror session between Site 1 and Site 3 during the outage of H2. Production I/O can continue on H1.

**Note:** If you are running DS8000 devices on H1 with the proper level of microcode, and enough time has passed since the initial start of the session, the creation of the H1 to H3 pairs will NOT require a full copy.

Once the session has reached a Prepared state, a consistent copy of the data will reside on Site 3.

**Note:** Data on Site 2 is no longer consistent at this point.

**Note:** After Site 2 has been successfully brought back up, perform the next step to return to the three-site configuration.

### 4. Start H1->H2->H3

Issue this command when H2 is ready to be brought back into the configuration. This command restores the original configuration. Production I/O can continue on H1. Once the session reaches a Prepared state, a consistent copy will reside on Site 2 and Site 3.

## Unplanned outage of remote (H3)

In this scenario, an unplanned outage occurs on Site 3 (H3).

Complete the follow these steps to carry out this scenario.

### 1. Start H1->H2->H3

Issue this command to begin Metro Global Mirror on your system when the production I/O is running on H1. Once the session is in a Prepared state, both sites 2 and 3 will have a consistent copy of the data.

A failure of the remote site (H3) causes the session state to go from Prepared to SuspendedH2H3, with an error message that the connection to the H3 box has been lost.

**Note:** When the remote site (H3) is repaired and ready to return to the configuration, the session will remain SuspendedH2H3 and recoverable until step 2 is completed.

2. **Start H1->H2->H3**

Issue this command only when the remote site (H3) is repaired and ready to return to the configuration. With this command, your session returns to the original configuration by starting the Global Mirror portion back up.

**Unplanned outage of local (H1) with production move to remote (H3)**

In this scenario, there is an unplanned outage for Site 1 (H1). Site 2, however, does not have the resources to run production, so production will be moved to Site 3 during the outage at Site 1. When the outage is complete, production can then be moved back to Site 1 and resume the full three-site configuration.

Complete the following steps to carry out this scenario.

**Note:** To ensure consistency in the event of a rolling disaster where the IBM Tivoli Storage Productivity Center for Replication server might be lost on Site 1 before freezing all the copies in the session, enable the Metro Mirror heartbeat function.

1. **Start H1->H2->H3**

Issue this command to begin Metro Global Mirror on your system when the production I/O is running on H1. When the session is in a Prepared state, both sites 2 and 3 have a consistent copy of the data.

2. **Unplanned outage of H1 and H2**

This event causes an unplanned outage of H1 and H2 which causes the session to go suspended. It is recoverable if the session was in a Prepared state when the outage occurred. If the state was Preparing, the session might be recoverable at Site 2, but will not be recoverable at Site 3.

3. **Recover H3**

This command makes H3 Target Available. The session will be severe/Target Available. When the session state is Target Available at H3, production I/O can be moved to H3.

**Note:** Once Site 1 is brought back up, perform the following step to begin the process of returning production to Site 1.

4. **Start H3->H1->H2**

Issue this command when H1 and H2 are available and ready to be brought back into the configuration. Changes from production at the remote site (H3) flow from the local site (H1) to the intermediate site (H2). The H3-H1 and H1-H2 pairs are Global Copy. The session will in the preparing state.

**Note:** While the session is Preparing, you can decrease the amount of time that production I/O has to be stopped by waiting for the progress on the H3-H1 role pair to be at or near 100%. The next step will drive H3-H1 to sync, which depending on the percentage of the copy that is complete, can take a significant amount of time. When you are ready to switch back to Site 1, stop production I/O on H3 before continuing to next step.

5. **Suspend**

This command suspends the Global Copy relationship between H3>H1 and H1>H2. When this step is complete, the session state should be suspended and recoverable.

6. **Recover H1**

This command makes H1 Target Available. When the session state is Target Available at H1, run production I/O to H1.

7. **Start H1->H2->H3**

This command restores the original three-site configuration. Once the session reaches a Prepared state, a consistent copy of the data will reside on Site 2 and Site 3.

## Practicing disaster recovery scenarios

This section provides scenarios for how to practice disaster recovery using a regular Metro Global Mirror session. You can follow these scenarios to practice disaster recovery while continuing to be disaster recovery-capable using only the Metro Mirror portion of the session. The Metro Global Mirror with Practice session is also available, which allows for practicing disaster recovery while maintaining full three-site disaster recovery capability.

### Practice a recovery to H2 with production that is continuing on H1 in a normal configuration

In this scenario, your goal is to practice a recovery to H2 with production that is continuing on H1 in a normal configuration.

Follow these steps to carry out this scenario.

1. **Start H1->H2->H3**

Issue this command to begin a Metro Global Mirror session on your system when the production I/O is running on H1. Wait for the session to go to the prepared state.

You can continue to run production I/O to H1 during the following steps.

2. **Suspend**

This command creates the planned outage by suspending the Metro Mirror relationship between H1 and H2. When this step is complete, the session state should be suspended and recoverable.

**Note:** Stop running production I/O to H2 prior to issuing the Suspend command.

3. **Recover H2**

This command makes H2 target-available. When the session is target-available at H2, run practice I/O to H2.

4. **Start H1->H3**

Issue this command to ensure that any I/O that is written to site 1 is copied to site 3.

You can also use the Start H1->H3 command to practice for a disaster at the H2 site while still maintaining disaster recovery capability. When the H1->H3 role pair is in Global Mirror mode, you can recover the session at site 3 if a disaster occurs.

When you complete testing on H2, you can issue the Start H1->H2->H3 command to return to a three-site configuration without completing a full copy.

5. **Start H1->H2->H3**

Issue this command to restart the Metro Global Mirror session in the H1-H2-H3 configuration. Any changes from production at the local site (H1) flow from the remote site (H3) to the intermediate site (H2), which overwrites the test data on H2.

Table 28. Role-pair states at the completion of each step (participating and nonparticipating role pairs)

Steps	Role-pair states					
	H1-H2	H2-H3	H2-J3	H3-J3	H1-H3	H1-J3
1	Prepared	Preparing	Prepared	Target available	Non-participating	Non-participating
2	Suspended					
3						
4		Non-participating	Non-participating		Participating	Prepared
5	Prepared	Preparing	Prepared		Non-participating	Non-participating

## Practice recovery to H1 with production that is continuing on H2

In this scenario, your goal is to practice a recovery to H1 with production that is continuing on H2.

Follow these steps to carry out this scenario.

### 1. Start H1->H2->H3

Issue this command to begin a Metro Global Mirror session on your system when the production I/O is running on H1. Wait for the session to go to the prepared state.

### 2. Suspend

This command creates the planned outage by suspending the Metro Mirror relationship between H1 and H2. When this step is complete, the session state should be suspended and recoverable.

**Note:** Stop running production I/O to H1 prior to issuing the Suspend command.

### 3. Recover H2

This command makes H2 target-available.

**Note:** Start running production I/O to H2.

### 4. Start H2->H1->H3

This command starts a Metro Global Mirror session with H1 and H2 roles reversed from the original configuration.

You can continue to run production I/O to H2 for the next two steps.

### 5. Suspend

This command creates the planned outage by suspending the Metro Mirror relationship between H1 and H2. When this step is complete, the session should be suspended and recoverable.

### 6. Recover H1

This command makes H1 target-available. When the session state is target-available at H1, run practice I/O to H1.

### 7. Start H2->H3

Issue this command to ensure that any I/O that is written to site 2 is copied to site 3.

You can also use the Start H2->H3 command to practice for a disaster at the H1 site while still maintaining disaster recovery capability. When the H2->H3 role pair is in Global Mirror mode, you can recover the session at site 3 if a disaster occurs.

When you complete testing on H1, you can issue the **Start H2->H1->H3** command to return to a three-site configuration without completing a full copy.

### 8. **Start H2->H1->H3**

Issue this command to restart the Metro Global Mirror session in the H2-H1-H3 configuration. Any changes from production at the local site (H2) flow from the remote site (H3) to the intermediate site (H1), which overwrites the test data on H1.

Table 29. Role-pair states at the completion of each step (participating and nonparticipating role pairs)

Steps	Role-pair states					
	H1-H2	H2-H3	H2-J3	H3-J3	H1-H3	H1-J3
1	Prepared	Preparing	Prepared	Target available	Non-participating	Non-participating
2	Suspended					
3						
4	Prepared	Non-participating	Non-participating		Preparing	Prepared
5	Suspended					
6						
7		Preparing	Prepared		Non-participating	Non-participating
8	Prepared	Non-participating	Non-participating		Preparing	Prepared

### Practice at H3 for Metro Global Mirror

This topic describes how to practice at the remote site (H3) while running a Metro Global Mirror session.

To practice on the remote site, you first need to suspend the back-end. For example, if running in an H1->H2->H3 configuration, issue a **Suspend H2H3** command to pause the Global Mirror portion of the session while leaving the Metro Mirror portion of the session active. When the session is in a suspended state (that is, H2H3 is suspended while in an H1->H2->H3 configuration), you have the option to issue a **Recover H3** command.

The **Recover H3** command acts differently than other recover commands. In this case, the command acts only to make the remote site (H3) target-available and does not switch the application site to H3. The application site remains the original host site and the session acts as it does in a normal Metro Mirror Failover/Failback session.

While the session is in this mode, it remains capable of disaster recovery at Site 2 and will freeze all pairs to maintain consistency during an error. You can also suspend the session by command and recover to Site 2 if necessary. However, if recovering to Site 2 in this mode, it will not be possible to restart a full three-site solution. To get three sites back up and running, you need to copy back to H1 using the **Start H2->H1** command and then suspend and recover to H1. Once H1 is the application host again, you can issue the **Start H1->H2->H3** command to restart three-site support. If this is done, all data written to H3 during the practice is overwritten with the data that is on H1.

## Overview of scenarios for practicing at H3 for Metro Global Mirror:

This topic provides an overview of the scenarios for practicing at H3 for Metro Global Mirror.

**Note:** For simplicity, the following scenarios are geared toward the configuration where the session is running H1->H2->H3. The same options apply when in the configuration is running H2->H1->H3.

There are two methods to set up a practice mode at the remote site, H3.

In the first method, you issue the following commands:

1. **Start H1->H2->H3**
2. **SuspendH2H3**
3. **RecoverH3**

When the session state is Target Available at H3, you can practice you disaster recovery steps on H3 while continuing to run the real production I/O to H1.

In the second method of setting up a practice mode, issue the following commands:

1. **Start H1->H2->H3**
2. **Suspend**
3. **RecoverH3**
4. **Start H1->H2**

When the session state is Target Available at H3, run practice I/O to H3. Continue running production I/O to H1.

The difference between the second method and the first method is that a **Suspend** command is issued instead of a **SuspendH2H3** command. When the session is in suspended mode (as opposed to suspended H2H3 mode), the session does not automatically go into practice mode. The application site switches to H3 and you must issue a **Start H1->H2** to enable the practice mode.

### Practice scenario 1: While practicing, disaster occurs at Site 1, recover to Site 2:

This topic describes what to do in the event that a disaster occurs on Site 1 while practicing at Site 3.

If a disaster occurs at Site 1, the session immediately suspends itself. You then must complete the following steps:

1. Issue **RecoverH2**.
2. Move the production I/O to Site 2.
3. Issue **Start H2->H1** to make the session capable of disaster recovery again once Site 1 has been brought back up.

### Practice scenario 2: While practicing, planned outage at Site 1, recover to Site 2:

This topic describes what to do if there is a planned outage on Site 1 while practicing at Site 3.

While practicing, if you want a planned outage with a switch to Site 2, complete the following steps:

1. Issue **Suspend**.

2. Issue **RecoverH2**.
3. Move the production I/O to Site 2.
4. Issue **Start H2->H1** to make the session capable of disaster recovery again once Site 1 has been brought back up.

**Practice scenario 3: while practicing with production at site 2, move production back to site 1:**

This topic describes an H3 practice scenario, with production running at site 2, followed by a move of production to site 1.

While practicing, if you moved the production to site 2, you need to move it back to site 1 before you can start three-site support. To move production back to site 1, do the following steps (assume the session is running H2->H1):

1. Issue **Suspend**.
2. Issue **Recover H1**.
3. Move the production I/O to site 1.
4. Issue **Start H1->H2** to make the session capable of disaster recovery again and move the production I/O to H3.
5. Issue **Start H1->H2->H3** when H3 is ready to receive a copy of the data at site 1. When this command completes, all writes that were done to H3 are overwritten by the data on site 1.

The following table shows the changing states of the role pairs after each step.

*Table 30. Role-pair states at the completion of each step (participating and nonparticipating role pairs)*

Steps	Role-pair states					
	H1-H2	H2-H3	H2-J3	H3-J3	H1-H3	H1-J3
1	Suspended	Nonparticipating				
2	Target Available					
4	Prepared	target-available			nonparticipating	
5		Preparing	Prepared	Target Available		

---

## Chapter 4. Administering

Administer DB2 to back up the database and to start and stop the control center. Administer IBM Tivoli Storage Productivity Center to authorize users, start and use the console, which is the graphical user interface (GUI), start and stop services, and many other administrative tasks.

---

### Starting Tivoli Storage Productivity Center

IBM Tivoli Storage Productivity Center provides two graphical user interface (GUI) applications for managing and monitoring the resources in a storage environment: a stand-alone GUI and a web-based GUI. You can start these GUIs on the Tivoli Storage Productivity Center server or on a remote system.

The stand-alone GUI and the web-based GUI provide different functions and offer different advantages. Start the one that is best suited to your current needs.

- The stand-alone GUI contains functions for monitoring the condition of storage resources, and all the tools for managing data, disk, fabric, tape, and replication. Start the stand-alone GUI if you must have the full administrative capabilities of Tivoli Storage Productivity Center. How you start the stand-alone GUI depends on whether the stand-alone GUI component is installed on your system.
- The web-based GUI provides quick access to pages that you can use to monitor the condition, capacity, and relationships of the resources within your storage environment. Start the web-based GUI if you are interested in monitoring your storage environment but do not require the full set of administrative tools available in the stand-alone GUI.

### Starting the Tivoli Storage Productivity Center stand-alone GUI

The stand-alone GUI contains functions for monitoring the condition of storage resources, and all the tools for managing data, disk, fabric, tape, and replication.

How you start the stand-alone GUI depends on whether the stand-alone GUI component is installed on your system.

- On the Tivoli Storage Productivity Center server, or on a remote system where the stand-alone GUI component is installed, you start the stand-alone GUI by running a batch file or a shell script. For Windows operating systems, you run the batch file `tpc.bat`, which you can run from the Start menu. For AIX or Linux operating systems, you run the shell script `TPCD.sh`.
- If the stand-alone GUI component is not installed on a remote system, you use a Java Web start application to download and start the stand-alone GUI.

### Starting the Tivoli Storage Productivity Center stand-alone GUI by using Java Web Start

Start the stand-alone Tivoli Storage Productivity Center GUI by using Java Web Start to interact remotely with Tivoli Storage Productivity Center running on the server.

Before you start Tivoli Storage Productivity Center, ensure that you are using a supported web browser. For a list of web browsers that you can use with Tivoli Storage Productivity Center, see the support matrix at <http://www.ibm.com/>

support/docview.wss?uid=swg21386446. In the **Agents, Servers and GUI** column, click the version of Tivoli Storage Productivity Center that is installed on your system. On the next page, click **Web Browsers** to find the web browsers that you can use.

On remote systems where the stand-alone GUI component is not installed, you can start the stand-alone Tivoli Storage Productivity Center GUI using Java Web Start. To start the stand-alone GUI by using Java Web Start, you click a web link that downloads a Java Network Launching Protocol (JNLP) file from the server. The JNLP file specifies all the files needed by the application. The Java Web Start Launcher on the remote system opens the JNLP file, downloads and caches all the required files, and starts the stand-alone GUI in a new window.

1. Start a web browser, and type the following address for the Java Web Start page.

```
http://hostname:port/ITSRM/app/welcome.html
```

In the preceding address, specify the following values:

*hostname*

The Tivoli Storage Productivity Center server. You can specify the *hostname* as an IP address or a Domain Name System (DNS) name. To verify your host name, ask your Tivoli Storage Productivity Center administrator.

*port*

The port number for the Device server. The default port number for connecting to the Device server using the HTTP protocol is 9550. However, this port number might be different for your site. For example, the port number might be different if the default port range was not accepted during installation. If the default port number does not work, ask your Tivoli Storage Productivity Center administrator for the correct port number.

2. The Tivoli Storage Productivity Center GUI requires an IBM Java Runtime Environment 1.6.0. Links are provided on the Java Web start page for you to download the IBM Java Runtime Environment 1.6.0 for Windows, Linux, or AIX. If an IBM Java Runtime Environment 1.6.0 is not already installed on the system, click the link to download the IBM Java Runtime Environment 1.6.0 for your operating system. On Windows, download a self-extracting executable. On Linux, download an RPM file. On AIX, download an executable JAR file. Install the JRE from the file that you downloaded before you start the stand-alone GUI. If you are prompted to install the JRE as the system JRE or to overwrite the current system JRE, click **No**.
3. From the Java Web Start page, click **TPC GUI (Java Web Start)**  
The JNLP file is downloaded.

**Important:** Depending on your browser and operating system and their default settings for your browser and operating system) you might need to:

- Verify to your browser that the `tpcgui.jnlp` file is safe to download
- Indicate that JNLP files are to be opened by the Java Web Start Launcher

For more information, go to the Tivoli Storage Productivity Center information center at <http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp> and search for *Cannot start the Tivoli Storage Productivity Center stand-alone GUI remotely*.

4. The stand-alone Tivoli Storage Productivity Center GUI opens in a separate window. To log on to Tivoli Storage Productivity Center, enter the following information and click **OK**.

- a. Enter your user ID and password.

**Important:** If you are logging on immediately after installation and, see “Overview of required user IDs for initial log on to the Tivoli Storage Productivity Center family of products” on page 181 for information on the user ID you must use.

- b. If the server field does not contain the address and port number of for the server, specify the following values for the *hostname* and *port*.

*hostname*

The Tivoli Storage Productivity Center server. You can specify the *hostname* as an IP address or a Domain Name System (DNS) name. To verify your host name, ask your Tivoli Storage Productivity Center administrator.

*port*

The port number for the Data server. The default port number for connecting to the Data server is 9549. However, this port number might be different for your site. For example, the port number might be different if the default port range was not accepted during installation.

### Starting the Tivoli Storage Productivity Center stand-alone GUI on a system where the GUI component is installed

On the Tivoli Storage Productivity Center server, or on a remote system where the stand-alone GUI component is installed, you start the Tivoli Storage Productivity Center stand-alone GUI using the batch file `tpc.bat` on a Windows operating system or the shell script `TPCD.sh` on an AIX and Linux operating system.

A typical installation of Tivoli Storage Productivity Center on the server includes the stand-alone GUI component. A remote system can also have the stand-alone GUI component installed. On a system where the stand-alone GUI component is installed, use the following instructions for starting the stand-alone GUI. If you are on a remote system where the stand-alone GUI component is not installed, start the stand-alone GUI by using Java Web Start instead.

1. Start the Tivoli Storage Productivity Center GUI by using the Start menu or batch file on a Windows operating system or a shell script on an AIX or Linux operating system.

- On Windows, click **Start > Programs > IBM Tivoli Storage Productivity Center > TPC Stand-alone GUI**. This runs the Windows batch file `tpc.bat`. If you are on a remote system, the Start menu item for the stand-alone GUI might not be available. In this case, run the `tpc.bat` directly. The default location for the batch file is `C:\Program Files\IBM\TPC\gui\tpc.bat`.
- On AIX or Linux, type the following path and command at the command line.

```
/opt/IBM/TPC/gui/TPCD.sh
```

2. From the Tivoli Storage Productivity Center GUI logon window, log on to Tivoli Storage Productivity Center.
  - a. Enter your user ID and password.
  - b. If the server field does not contain the address of the server, enter the information in the format *hostname:port*. Specify the following values for the *hostname* and *port*:

*hostname*

The Tivoli Storage Productivity Center server. You can specify the *hostname* as an IP address or a Domain Name System (DNS) name.

*port*

The port number for the Data server. The default port number for connecting to the Data server is 9549. However, this port number might be different for your site. For example, the port number might be different if the default port range was not accepted during installation.

- c. Click **OK**.

## Starting the Tivoli Storage Productivity Center web-based GUI

You can start the web-based Tivoli Storage Productivity Center GUI by opening a web browser and entering a web address for the Tivoli Storage Productivity Center logon page.

Before you start IBM Tivoli Storage Productivity Center, ensure that you are using a supported web browser. For a list of web browsers that you can use with Tivoli Storage Productivity Center, see the support matrix at <http://www.ibm.com/support/docview.wss?uid=swg21386446>. In the **Agents, Servers and GUI** column, click the version of Tivoli Storage Productivity Center that is installed on your system. On the next page, click **Web Browsers** to find the web browsers that you can use.

The web-based GUI provides quick access to pages that you can use to monitor the condition, capacity, and relationships of the resources within your storage environment. Start the web-based GUI if you are interested in monitoring your storage environment, but do not need the full set of administrative tools available in the stand-alone GUI.

1. On a server running the Windows operating system, click **Start > Programs > IBM Tivoli Storage Productivity Center > TPC Web-based GUI** to open a browser to the correct address. If you are not on a server running the Windows operating system, start a web browser and enter the following address in the address field:

`http://hostname:port/srm`

In the preceding address, specify the following values:

*hostname*

The Tivoli Storage Productivity Center server. You can specify the host name as an IP address or a Domain Name System (DNS) name.

*port*

The port number for Tivoli Storage Productivity Center. The default port number for connecting to Tivoli Storage Productivity Center by using the HTTP protocol is 9568. However, this port number might be different for your site. For example, the port number might be different if the default port range was not accepted during installation. If the default port number does not work, ask your Tivoli Storage Productivity Center administrator for the correct port number.

You might be redirected from the address that you enter to another address and port that provides secure access using the HTTPS protocol. This page is the Tivoli Storage Productivity Center logon page.

2. From the Tivoli Storage Productivity Center logon page, type your user name and password and click **Log in**. The web-based Tivoli Storage Productivity Center GUI opens in the browser.

---

## Starting Tivoli Storage Productivity Center for Replication

You can start the IBM Tivoli Storage Productivity Center for Replication GUI by opening a web browser and entering a web address for the Tivoli Storage Productivity Center for Replication logon page.

Before you start Tivoli Storage Productivity Center for Replication, ensure that you are using a supported web browser. For a list of web browsers that you can use with Tivoli Storage Productivity Center, see the support matrix at <http://www.ibm.com/support/docview.wss?uid=swg21386446>. In the **Agents, Servers and GUI** column, click the version of Tivoli Storage Productivity Center that is installed on your system. On the next page, click **Web Browsers** to find the web browsers that you can use.

The Tivoli Storage Productivity Center for Replication GUI provides a single point of control to configure, manage, and monitor copy services. Whether you start it on the server or on a remote system, the GUI is web-based and is displayed in a browser.

1. On a server running the Windows operating system, click **Start > Programs > IBM Tivoli Storage Productivity Center > TPC Replication Manager GUI** to open a browser to the correct address. If you are not on a server running the Windows operating system, start a web browser and enter the following address in the address field. The address is case-sensitive.

`https://hostname:port/CSM`

In the preceding address, specify the following values:

*hostname*

The Tivoli Storage Productivity Center for Replication server. You can specify the host name as an IP address or a Domain Name System (DNS) name.

*port*

The port number for Tivoli Storage Productivity Center for Replication. The default port number for connecting to Tivoli Storage Productivity Center for Replication using the HTTPS protocol is 9559. However, this port number might be different for your site. For example:

- If you upgraded from Tivoli Storage Productivity Center for Replication version 3.3 or earlier, the default HTTPS port is 9443.
- If you upgraded from Tivoli Storage Productivity Center for Replication version 3.4 or later, the default HTTPS port is 3443.
- If you are using IBM WebSphere Application Server for z/OS, the default HTTPS port is 9443.
- If you are using IBM WebSphere Application Server OEM Edition for z/OS, the default HTTPS port is 32209.

You can also find the port number in the `install_root/eWAS/profiles/profile_name/properties/portdef.props` file. The default port for the HTTP protocol is defined by the `WC_defaulthost_secure` property within the file.

2. From the Tivoli Storage Productivity Center for Replication logon page, type your user name and password and click **Login**. The web-based Tivoli Storage Productivity Center for Replication GUI opens in the browser.

---

## Starting the Tivoli Storage Productivity Center family of products through Tivoli Integrated Portal

You can start the Tivoli Storage Productivity Center stand-alone GUI, the Tivoli Storage Productivity Center web-based GUI, and the Tivoli Storage Productivity Center for Replication web-based GUI within IBM Tivoli Integrated Portal. Tivoli Integrated Portal provides the advantages of the single sign-on capability and launch-in-context integration.

Before you start Tivoli Storage Productivity Center, ensure that you are using a supported web browser. For a list of web browsers that you can use with Tivoli Storage Productivity Center, see the support matrix at <http://www.ibm.com/support/docview.wss?uid=swg21386446>. In the Agents, Servers and GUI column, click the version of Tivoli Storage Productivity Center that is installed on your system. On the next page, click Web Browsers to find the web browsers that you can use.

These instructions assume that you have previously started the Tivoli Storage Productivity Center stand-alone GUI, Tivoli Storage Productivity Center web-based GUI, or the Tivoli Storage Productivity Center for Replication web-based GUI outside of Tivoli Integrated Portal and that you already configured your system. For example, to start the stand-alone Tivoli Storage Productivity Center GUI by using Java Web Start, an IBM Java Runtime Environment 1.6.0 is required.

By logging on to Tivoli Integrated Portal, you eliminate the need to log on to Tivoli Storage Productivity Center or any other Tivoli application that uses the common portal framework. In addition to the convenience of single sign-on, Tivoli Integrated Portal provides launch-in-context integration. By using these functions, you can move between Tivoli Storage Productivity Center and another Tivoli application at specific points within the other application interface.

1. Start a web browser and enter the following address in the address field:  
`http://hostname:port/ibm/console`

In the preceding address, specify the following values:

*hostname*

The Tivoli Integrated Portal server. You can specify the host name as an IP address or a Domain Name System (DNS) name.

*port*

The port number for Tivoli Integrated Portal. If you did not upgrade your system from an earlier version of the product, the default port number for connecting to Tivoli Integrated Portal using the HTTP protocol is 9568. However, this port number might be different for your site. For example, the port number might be different if you upgraded your system from an earlier version of the product or if the default port range was not accepted during installation. If the default port number does not work, see “Tivoli Integrated Portal port numbers” on page 229 for alternative default ports.

You might be redirected from the address you enter to another address and port that provides secure access using the HTTPS protocol. This page is the Tivoli Integrated Portal logon page.

2. From the Tivoli Integrated Portal logon page, type your Tivoli Storage Productivity Center ID and password and click **Log in**.
3. From the Tivoli Integrated Portal navigation tree, click **Tivoli Storage Productivity Center**.

4. From the Tivoli Storage Productivity Center portlets page, you can start the Tivoli Storage Productivity Center stand-alone GUI, the Tivoli Storage Productivity Center web-based GUI, or the Tivoli Storage Productivity Center for Replication web-based GUI. Select one of the following options:
  - **Start the stand-alone GUI for Tivoli Storage Productivity Center.**
  - **Start the web-based GUI for Tivoli Storage Productivity Center.**
  - **Start the web-based GUI for Tivoli Storage Productivity Center for Replication.**

**Related tasks:**

“Starting the Tivoli Storage Productivity Center stand-alone GUI by using Java Web Start” on page 175

Start the stand-alone Tivoli Storage Productivity Center GUI by using Java Web Start to interact remotely with Tivoli Storage Productivity Center running on the server.

“Starting the Tivoli Storage Productivity Center web-based GUI” on page 178

You can start the web-based Tivoli Storage Productivity Center GUI by opening a web browser and entering a web address for the Tivoli Storage Productivity Center logon page.

“Starting Tivoli Storage Productivity Center for Replication” on page 179

You can start the IBM Tivoli Storage Productivity Center for Replication GUI by opening a web browser and entering a web address for the Tivoli Storage Productivity Center for Replication logon page.

---

## **Overview of required user IDs for initial log on to the Tivoli Storage Productivity Center family of products**

All the graphical user interfaces (GUIs) in the Tivoli Storage Productivity Center family require a user ID and password. If you are logging on to a GUI immediately after you installed the software, the user ID that you must use differs depending on the type of installation and the GUI interface.

Immediately after you install the software, you must use the user ID as described in the following tables. After you log on, you can assign roles for users in Tivoli Storage Productivity Center and Tivoli Storage Productivity Center for Replication. When users log on, their user roles determine their authorization level and the components that they can view in each GUI.

For example, if a user is in a group that is assigned to the Tivoli Storage Productivity Center Superuser role, the user has full access to all Tivoli Storage Productivity Center functions. However, if a user is in a group that is assigned to the Tape Administrator role, the user has access to only tape-related functions.

### **Required user ID for initial log on after installation on a single server when only the common user is defined**

After you install the software on a single server, if you defined only the common user, and did not define a separate user for Tivoli Integrated Portal and Tivoli Common Reporting, the required user ID for initial log is the common user name that was defined for the installation of Tivoli Storage Productivity Center.

You must use this user ID to log on to Tivoli Storage Productivity Center stand-alone GUI, the Tivoli Storage Productivity Center web-based GUI, the Tivoli Storage Productivity Center for Replication web-based GUI, or the Tivoli Integrated Portal.

## Required user ID for initial log on after installation on a single server when the common user and a separate user for Tivoli Integrated Portal and Tivoli Common Reporting are defined

After you install the software on a single server if you defined a common user and a separate user for Tivoli Integrated Portal and Tivoli Common Reporting, you must use the user ID as described in the following table.

*Table 31. Required user ID for initial log on after installation on a single server when the common user and a separate user for Tivoli Integrated Portal and Tivoli Common Reporting are defined*

To log on to:	Use this user ID:
Tivoli Storage Productivity Center stand-alone GUI	The common user name that was defined for the installation of Tivoli Storage Productivity Center
Tivoli Storage Productivity Center web-based GUI	The common user name that was defined for the installation of Tivoli Storage Productivity Center
Tivoli Storage Productivity Center for Replication web-based GUI	The common user name that was defined for the installation of Tivoli Storage Productivity Center
Tivoli Integrated Portal	The common user name that was defined for the installation of Tivoli Integrated Portal and Tivoli Common Reporting

## Required user ID for initial log on after installation on multiple servers with a remote database schema

After you install the software on multiple servers with a remote database schema, you must use the user ID as described in the following table.

*Table 32. Required user ID for initial log on after installation on multiple servers with a remote database schema*

To log on to:	Use this user ID:
Tivoli Storage Productivity Center stand-alone GUI	The user name that was defined for the installation of Tivoli Storage Productivity Center
Tivoli Storage Productivity Center web-based GUI	The user name that was defined for the installation of Tivoli Storage Productivity Center
Tivoli Storage Productivity Center for Replication web-based GUI	The user name that was defined for the installation of Tivoli Storage Productivity Center
Tivoli Integrated Portal	The user name that was defined for the installation Tivoli Integrated Portal and Tivoli Common Reporting

## Required user ID for initial log on after installation on multiple servers with remote Tivoli Integrated Portal and Tivoli Common Reporting

After you install the software on multiple servers with remote Tivoli Integrated Portal and Tivoli Common Reporting, you must use the user ID as described in the following table.

*Table 33. Required user ID for initial log on after installation on multiple servers with remote Tivoli Integrated Portal and Tivoli Common Reporting*

To log on to:	Use this user ID:
Tivoli Storage Productivity Center stand-alone GUI	The user name that was defined for the installation of Tivoli Storage Productivity Center. Because user authentication is conducted on the server where Tivoli Integrated Portal is installed, the user name and user group must exist in the operating system user and group registry on the Tivoli Integrated Portal server.
Tivoli Storage Productivity Center web-based GUI	The user name that was defined for the installation Tivoli Integrated Portal and Tivoli Common Reporting
Tivoli Storage Productivity Center for Replication web-based GUI	The user name that was defined for the installation of Tivoli Storage Productivity Center. The Tivoli Storage Productivity Center for Replication GUI detects only users and groups that are in the operating system user and group registry on the server where Tivoli Integrated Portal is installed. To provide access to a user or group in the Tivoli Storage Productivity Center for Replication GUI, the user or group must be in the operating system user and group registry on the Tivoli Integrated Portal server.
Tivoli Integrated Portal	The user name that was defined for the installation of Tivoli Integrated Portal and Tivoli Common Reporting

---

## Administering DB2

Administer DB2 by backing up the IBM Tivoli Storage Productivity Center database, starting the control center, and starting and stopping DB2.

### Backing up the Tivoli Storage Productivity Center database

IBM Tivoli Storage Productivity Center uses circular logs for the DB2 database. Therefore, only an offline database backup is supported. When an offline database backup is performed, the database connections are terminated. Therefore, the Tivoli Storage Productivity Center servers need to be stopped and then restarted.

1. Close the Tivoli Storage Productivity Center GUI.
2. Stop the Tivoli Storage Productivity Center servers.
3. Back up your database.
  - a. Open the DB2 Control Center.
  - b. The Control Center View panel is displayed. Select **Basic** and click **OK**.

- c. In the Control Center navigation tree, click **All Databases**.
  - d. Under the **All Databases** node, you see **TPCDB**. **TPCDB** is the IBM Tivoli Storage Productivity Center database. Highlight **TPCDB** and right-click it. Click **Backup**.
  - e. The Confirm the details of your database panel is displayed. Click **Next**.
  - f. The Specify where to store your backup image panel is displayed. For Media Type, enter **File System**. If you want to add a new folder, click **Add**.
  - g. On the Path Browser - LOCALHOST panel, click the **Create New Folder** icon. Enter the name of your new folder (for example, TPCbackup1). Click **OK**.
  - h. On the Specify where to store your backup image panel, you see your new folder listed (TPCbackup1). Click **Finish**. The database backup runs.
  - i. When the database backup is completed, you see a DB2 Message window indicating that the database backup completed successfully.
  - j. Close the DB2 Message window.
4. Restart the Tivoli Storage Productivity Center servers.

If you want to do an online backup of the database, you need to change the use of circular logs to linear logs. The use of linear logs can fill up the file system quickly if the database is not maintained properly. For information about how to change the use of circular logs to linear logs, see the DB2 Information Center. Click **Designing > Backups**.

## Starting the Control Center

This topic describes how to start the DB2 Control Center.

To start the Control Center, perform the following action:

### On Linux operating systems:

From a console window, run the **db2cc** command.

### On UNIX operating systems:

Open the **IBM DB2** folder on the desktop and click **Control Center**.

### On Windows operating systems:

Click **Start > Programs > IBM DB2 > General Administration Tools > Control Center**

## Using the command line on UNIX and Linux

This topic describes how to use a command line to perform actions against a DB2 instance under UNIX or Linux.

If the DB2 control center is unavailable or you do not have access to a graphical user interface, you can use a command line to execute DB2 commands such as starting and stopping an instance. To use a command line to perform actions against an instance of DB2, complete the following steps:

1. Log in with a user ID or name that has **ROOT**, **SYSADM**, **SYSCTRL**, or **SYSMAINT** authority on the instance; or log in as the instance owner.
2. Run the startup script:
  - For Bourne or Korn shell, type: **. HOME/sqllib/db2profile**.
  - For C shell, type: **source HOME/sqllib/db2cshrc**.

where **HOME** is the home directory of the instance you want to use.

3. To start the instance using the command line, type **db2start**.

**Note:** When you run commands to start the database manager instance, the DB2 database manager applies the command to the current instance.

4. To stop the instance using the command line, type **db2stop**.

**Note:** When you run commands to stop the database manager instance, the DB2 database manager applies the command to the current instance.

## Manually starting DB2 on Windows

This topic describes how to manually start DB2 on Windows.

To start DB2 manually, complete the following steps:

1. Start the following Windows services:
  - DB2 - DB2-0
  - DB2DAS - DB2DAS00
  - DB2 JDBC Applet Server
  - DB2 License Server
  - DB2 Security Server
2. To open a DB2 command window, click **Start > Programs > IBM DB2 > Command Line Tools > Command Window**.
3. From the DB2 Command window, run the **db2start** command.

## Manually stopping DB2 on Windows

This topic describes how to manually stop DB2 on Windows.

To stop DB2 manually, complete the following steps:

1. Stop the following Windows services:
    - DB2 Security Server
    - DB2 License Server
    - DB2 JDBC Applet Server
    - DB2DAS - DB2DAS00
    - DB2 - DB2-0
- Note:** When you stop the **DB2 Security Server** service, you are prompted to stop the Warehouse logger and Warehouse Serve; click **Yes**.
2. To open a DB2 command window, click **Start > Programs > IBM DB2 > Command Line Tools > Command Window**.
  3. From the DB2 Command window, run the **db2stop** command.

To restart DB2, enter the **db2start** command from the DB2 Command window. Before you can issue the command, you must first start these services from the Windows Services panel:

```
DB2 - DB2-0
DB2DAS - DB2DAS00
DB2 JDBC Applet Server
DB2 License Server
DB2 Security Server
```

## Monitoring DB2

The minimum user authority level needed for monitoring DB2 instances is a user with DB2 system maintenance authority (SYSMAINT).

To check and set SYSMAINT authority, follow these steps:

1. Run this command in the DB2 command prompt window to check to see if there is an operating system user group defined to have SYSMAINT authority:  
`db2 get dbm cfg`

In the output file, look for this information:

```
SYSADM group name           (SYSADM_GROUP) =  
SYSCTRL group name         (SYSCTRL_GROUP) =  
SYSMAINT group name        (SYSMAINT_GROUP) =  
SYSMON group name          (SYSMON_GROUP) =
```

If the setup for the operating system group has not been done, you do not see a value set.

If the setup has been done, this example shows what you can expect to see:

```
SYSADM group name           (SYSADM_GROUP) =  
SYSCTRL group name         (SYSCTRL_GROUP) =  
SYSMAINT group name        (SYSMAINT_GROUP) = ADMINISTRATORS  
SYSMON group name          (SYSMON_GROUP) =
```

In this example, the "ADMINISTRATORS" group has SYSMAINT\_GROUP authority.

2. If the setup has been done, add the user you want to use to the ADMINISTRATORS group using the operating system utilities or use a user that already belongs to the ADMINISTRATORS group.

If you want to give a user group "SYSMAINT\_GROUP" authority, follow these steps:

- a. If a user (for example userA) belongs to an operating system group called db2monitor, here is an example of setting the db2monitor group with SYSMAINT authority. From the DB2 command prompt window, run the following command:  
`db2 update dbm cfg using SYSMAINT_GROUP db2monitor`
- b. After issuing the **db2 update** command, restart DB2 by running the following command from the DB2 command prompt window or restarting the system:  
`db2 force application all`

This command might need to be issued a few times to stop all the database connections.

- c. Run the following commands from the DB2 command prompt window:  
`db2stop`  
`db2start`
- d. UserA can now monitor the DB2 database.

---

## Adding a Tivoli Storage Productivity Center user group name to Tivoli Storage Productivity Center for Replication

To access Tivoli Storage Productivity Center for Replication using a user ID from the Tivoli Storage Productivity Center user group name, you must add the user group name to the Tivoli Storage Productivity Center for Replication administrative role. If you installed Tivoli Storage Productivity Center with LDAP authentication, you do not have to perform these steps.

Follow these steps:

1. Log in to Tivoli Storage Productivity Center as the Superuser.
2. Expand **Administrative Services > Configuration**. Left-click **Role-to-Group Mappings**. Locate the user group name that has the user ID you want for logging in to Tivoli Storage Productivity Center and Tivoli Storage Productivity Center for Replication.
3. Add the user group name to Tivoli Storage Productivity Center for Replication Administrator role by using the Add Access wizard. Open Tivoli Storage Productivity Center for Replication using a Tivoli Storage Productivity Center for Replication Administrator user ID.
4. Click **Add Access** on the Administration page.
5. Add the user group name to Tivoli Storage Productivity Center for Replication and complete the wizard.

---

## Backing up and recovering all the Tivoli Storage Productivity Center for Replication

There are three backup methods for IBM Tivoli Storage Productivity Center for Replication. This section provides information about these methods.

The backup methods are:

- The first backup option is to use IBM Tivoli Storage Productivity Center for Replication's import and export function to save the configuration of each IBM Tivoli Storage Productivity Center for Replication session. You would export a IBM Tivoli Storage Productivity Center for Replication session to a CSV file. The CSV file can then be used to recover a IBM Tivoli Storage Productivity Center for Replication session.
- The second backup option is to use IBM Tivoli Storage Productivity Center for Replication's high availability function. This option allows IBM Tivoli Storage Productivity Center for Replication to have a real time backup server that can take over in the event of a disaster.
- The third backup option is to use the **mkbackup** command to create a backup copy of the embedded database repository. This option does not work for DB2 databases. Any user on DB2 (z/OS or IBM Tivoli Storage Productivity Center for Replication before version 4.2) will not be able to use the **mkbackup** command.

For information about the high availability function and configuring sessions and copy sets, go to the Information Center at <http://publib.boulder.ibm.com/infocenter/tivihelp/v4r1/index.jsp>.

---

## Administering Tivoli Storage Productivity Center

Administer Tivoli Storage Productivity Center to authorize users, start the graphical user interfaces, manage services, change passwords, and many other administrative tasks.

### Checking the Tivoli Storage Productivity Center version

Check the version of Tivoli Storage Productivity Center that is installed on your system.

To check the version of Tivoli Storage Productivity Center that you have installed, open the `version.txt` file that is in the following directory:

**For Windows operating systems:**

C:\Program Files\IBM\TPC

For UNIX or Linux operating systems:

*usr or opt/IBM/TPC*

This is an example of the information in the version.txt file:

TPC V5.1.0.0 Build 20120501-2311

## Viewing and managing services

This topic describes viewing and managing services for Data server and Device server.

### Data Server services

Data Server directs all monitoring operations. Data Server services include the various services that run in the IBM Tivoli Storage Productivity Center for Data Server component.

The Data Server is the control point for scheduling functions, configuration, event management, reporting, and GUI support. The Data Server directs all of the activities related to the monitoring performed on computers with agents installed and the reporting performed on the client GUI computers.

When you expand the Data Server node, five nodes appear which represent the running services within the server. Select any of the following nodes to display information on the server identification, run time statistics, requests processed, database information, and agent statistics:

**Server** The component that provides the functionality of the Data Server. The Server, sometimes called Data Server, provides monitoring functions for services, data, and facilities to the network.

### Scheduler

The Scheduler is the process that receives requests to schedule operations, such as the running of scheduled pings, probes, and scans. It is a multithread background server process designed to handle the scheduling and launching of jobs, based on a simple timing scheme.

**GUI** The main graphical user interface that enables you to do monitoring operations, such as generate reports, check the status of agents, create and run jobs, setup monitoring for the Data Server, and so forth.

### Device

Converts general commands for peripheral devices and passes them between the Server and the device. Defines I/O devices to the operating system and then controls the operation of these devices.

**Agent** The process on the server that sends and receives requests from agents for information gathering or processing. Agents can perform specific operations, such as scans or probes, on a regular schedule.

With Data Server services you can perform the following tasks:

- View a Data Server service log
- Configure tracing on a service
- Shut down a service
- Restart a service that is inactive

Additionally, through the Server service you can do the following:

- Configure audit logging
- Broadcast name and port information

To view the status of the server and services, expand **Administrative Services > Services > Data Server**. A green box icon next to the name of a service (for example, **Scheduler**) means that the service is active and running normally. If the service is not currently active, a red circle icon is displayed next to the name.

### Refresh the Data Server list

To refresh the Data Server list, complete the following steps:

1. In the Navigation Tree pane, expand **Administrative Services > Services**.
2. Right-click **Data Server**, and click **Refresh**.

### Viewing Data Server information with the Server service:

The Server service directs all Data Server information. You can view information about the Server service, including the name and port, disk space, connections, requests, and agent information.

To view Data Server information, complete the following steps:

1. In the Navigation Tree pane, expand **Administrative Services > Services > Data Server**.
2. Click **Server**. In the content pane, the Server service page opens displaying the following information:

**Server** Displays the name of the server.

**Port** Displays the port number on which the server is listening to agents.

**Start Time**  
Displays the date and time when the server was started.

**Elapsed Time**  
Displays the elapsed time when the server was last updated.

**VM Size**  
Displays the disk space allocated to the virtual memory size of the server.

**Network Connections**  
Displays the number of networks to which the server is connected.

**Maximum Connections**  
Displays the maximum number of networks to which the server can connect.

**Pending Requests**  
Displays the number of outstanding requests waiting for server response.

**Processed Requests**  
Displays the number of requests processed by the server.

**Database**  
The following fields display information about the Data Manager's repository database.

**JDBC URL**  
Displays the location of the JDBC file used to connect to the database.

**JDBC Driver**

Displays the name of the JDBC driver used to connect to the database.

**DB Connections**

Displays the number of connections to the database.

**DB Pool Count**

Displays the database pool count.

**Agents**

The following fields provide information about the status of Data Manager agents.

**Total** The number of agents that are installed.

**Online**

The number of agents that are currently online (communicating with the server).

**Offline**

The number of agents that are currently offline (not communicating with the server, but were shut down normally).

**Unreachable**

The number of agents that are 1) not communicating with the server, and 2) provided no information to the server that they were shutting down.

**Upgrading**

The number of agents that are currently in the process of upgrading to the same version as the server.

**Upgrade Required**

The number of agents that must be upgraded to the same version as the server.

**Viewing information about Data Server services:**

Select any of the Data Server services to display information on that services' identification, run time statistics, requests processed, database information, and agent statistics.

To display information about a service, complete the following steps:

1. In the Navigation Tree pane, expand **Administrative Services > Services > Data Server**.
2. Click one of the following services:

**Scheduler**

Controls the running of scheduled pings, probes, and scans.

**GUI**

Enables you to generate report requests and to create and run jobs.

**Device**

Converts commands for peripheral devices.

**Agent**

Sends and receives requests from agents.

3. In the content pane, the following information about the selected Data server service is displayed:

**Service**

Whether the service is active or down.

**Pending Requests**

Number of requests waiting to be processed by the scheduler for the current session.

**Processed Requests**

Number of requests processed by the scheduler for the current session.

**Idle Threads**

Number of threads waiting for a process request.

**Viewing a Data Server service log:**

Use the content of a service log file to troubleshoot any errors that might occur during startup, processing, or shutdown of the Data Server service.

To display a service log, complete the following steps:

1. In the Navigation Tree pane, expand **Administrative Services > Services > Data Server**.
2. Right-click the name of the service and click **View Log**. The service log will open in the content pane.

Service alerts, if any, are displayed in red.

Logs are searchable by search string. Enter the string in the field provided and click the up or down arrow to search.

**Configuring tracing for Data Server services:**

Configure tracing for the Scheduler, GUI, Device, and Agent services by setting the debug level. Tracing changes can only be made by users with administrator authority.

To configure tracing for the Scheduler, GUI, Device, and Agent services, complete the following steps:

1. In the Navigation Tree pane, expand **Administrative Services > Services > Data Server**.
2. Right-click the name of the service and click **Configure Tracing**.
3. In the Server Tracing Configuration window, check the **Enable Trace** box to enable tracing for the service. If this box is unchecked, tracing will not be performed.
4. Once tracing has been enabled, select the level of debugging you want to perform. You can select one of the following:
  - **DEBUG\_MIN** - Provides minimal information on errors. This is the default value.
  - **DEBUG\_MID** - Provides more information on errors.
  - **DEBUG\_MAX** - Lists all debugging trace information.
5. Click **OK**.

Tracing can be turned off by de-selecting the **Enable Trace** option in the Server Tracing Configuration window.

**Configuring audit logging for the Server:**

Use audit logging to record a history of user actions. This function is available for the Server only.

To configure audit logging, complete the following steps:

1. In the Navigation Tree pane, expand **Administrative Services > Services > Data Server**.
2. Right-click the **Server** node and click **Configure Audit Logging**. The Server Audit Logging Configuration window opens.
3. In the Server Audit Logging Configuration window, check the **Enable Trace** check box to enable tracing for the server component. If this box is unchecked, tracing will not be performed.
4. Specify the audit logging options:

**Maximum Number of Files**

Select the maximum number of trace files that will be created. When the maximum number of files has been reached, tracing will rollover and start writing to the first file. (default is 5)

The value in this field also applies to the other services for which tracing is enabled.

**Maximum File Size (kilobytes)**

Select the maximum size of each log file. When the current trace file has reached its maximum capacity, tracing will continue to the next available trace file as defined in the Maximum Number of Files field. (default is 20 MB).

The value in this field also applies to the other services for which tracing is enabled.

5. Click **OK**.

**Broadcasting the Data Server location:**

Use broadcasting to inform agents of the Data Server location. Broadcasting is available with the Server service only.

Broadcasting informs agents of the server location

To broadcast the Data Server location, complete the following steps:

1. In the Navigation Tree pane, expand **Administrative Services > Services > Data Server**.
2. Right-click the **Server** node and click **Broadcast**.

**Shutting down a Data Server service:**

Shut down the active process or processes associated with a service (for example, processes on the server that receive requests from the scheduler). If you shut down a service, you must restart it before the server will resume receiving requests from it.

To shut down a running service, complete the following steps:

1. In the Navigation Tree pane, expand **Administrative Services > Services > Data Server**.
2. Right-click the name of the service and click **Shutdown**.
3. Select one of the following shutdown methods:

**Normal**

Let all running and scheduled processes complete and then shut down cleanly. During this shutdown process, new jobs are allowed to run if

they were scheduled during the time that the shutdown is taking place. Once all jobs have completed and no more jobs are scheduled to start during the shutdown time, the service will be shut down.

**Immediate**

Let all running processes complete but not allow scheduled jobs to start. During this shutdown process, new jobs are *not* allowed to start if they were scheduled during the time that the shutdown is taking place. Once all running jobs have completed, the service will be shut down.

**Abort** Stops whatever processes are currently running and then shuts down the service.

**Starting a Data Server service:**

Reactivate a service after it has been stopped. The start action is available only for services that are not running.

To start a service, complete the following steps:

1. In the Navigation Tree pane, expand **Administrative Services > Services > Data Server**.
2. Right-click the name of the service and click **Start**.

**Configuring tracing**

Configure tracing for the Data server, agent, scheduler, Device server, and GUI by setting the debug level and log file characteristics. The level of information saved in a log file is determined by the tracing level. Tracing settings can only be changed by users with administrator authority.

To configure tracing for IBM Tivoli Storage Productivity Center, complete the following steps:

1. In the navigation tree pane, expand **Administrative Services > Services > Data Server**.
2. Right-click on one of the following components:
  - Server
  - Agent
  - Scheduler
  - Device
  - GUI

Click **Configure Tracing**.

3. In the Server Tracing Configuration window, check the **Enable Trace** check box. Specify additional tracing options:

**Level** Select the level of debugging you want to perform. Select one of the following debugging level:

**DEBUG\_MIN**

Provides minimal information about errors. This option is the default value.

**DEBUG\_MID**

Provides more information about errors.

**DEBUG\_MAX**

Lists all debugging trace information.

**Maximum number of files**

Select the maximum number of trace files that is created. When the maximum number of files has been reached, tracing rolls over and start writing to the first file. (default is five)

The value in this field also applies to the other services for the Data server for which tracing is enabled.

**Maximum File Size (kilobytes)**

Select the maximum size of each log file. When the current trace file has reached its maximum capacity, tracing continues to the next available trace file as defined in the Maximum Number of Files field. (default is 20 MB).

**4. Click OK.**

Tracing can be turned off by clearing the **Enable Trace** option in the Server Tracing Configuration window.

**Device server services**

A **Device server** node is present in the Navigation Tree pane only if a device server is deployed in IBM Tivoli Storage Productivity Center your environment.

In the Navigation Tree pane, expand **Administrative Services > Services > Device server** to display a list of the services associated with the Device server. The following services are displayed:

**Device server**

Detects all the operations of the Device server.

**SAN Planner**

Monitors the SAN planning tools.

**Event** Service that monitors external events.

**Log** Service for configuring logging and tracing.

**Configuration Analysis and History**

Monitors the SAN configuration tools.

**Control**

Service that provides control functions.

**Fabric Manager**

Service that provides fabric management functions.

**Disk Manager**

Service that provides storage subsystem management functions.

**Inband Agent**

Service that maintains the list of in-band Fabric agents.

**Disk Monitor**

Service that monitors the storage subsystems.

**Out of Band Agent**

Service that maintains the list of out-of-band Fabric agents.

**Element Manager**

Service that provides ability to manage element managers.

**Performance**

Service that monitors device performance.

**Configuration**

Service for configuring Device server properties.

**Discovery**

Service that provides discovery and probe functions.

**Tape Manager**

Service that provides tape management functions.

**Message**

Service that provides internal messaging functions.

**Data Access functions**

Service providing data access and control functions.

**Data Server Monitor**

Service that provides Data server monitoring functions.

**Service Manager**

Service that manages the other services.

**Server Virtualization Management Service**

Service providing server virtualization management functions.

**Device server Monitor**

Service that provides Device server monitoring functions.

A green box icon next to a service name means that the service is active and running normally. If the service is not currently active, a red circle icon displays next to the name.

**Changing the Device server password:**

This section provides information about changing the Device server password.

To change the password, follow this procedure:

1. In the Navigation Tree pane, expand **Administrative Services > Services > Device server**.
2. Right-click the Device server node and select **Change Password**.
3. In the Change Password window, type the name of the new password twice and click **OK**.

**Displaying information about a Device server service**

You can view service information including start time, version, and status.

To display information about a service, follow this procedure:

1. In the Navigation Tree pane, expand **Administrative Services > Services > Device server**.
2. Click the name of the service.

**Viewing a Device server log**

You can use the content of the log file to troubleshoot any errors that might occur during startup, processing or shut down. Service alerts, if any, are displayed in red.

To display the log of a service, follow this procedure:

1. In the Navigation Tree pane, expand **Administrative Services > Services > Device server**.
2. Right-click the name of the service and select **View Log**.

## Starting and stopping the Tivoli Storage Productivity Center services

This section provides information about how to start and stop the IBM Tivoli Storage Productivity Center services.

**Note:** The IBM Tivoli Integrated Portal server starts automatically after you reboot the system or after a temporary power loss on Windows. The IBM Tivoli Integrated Portal server does not start automatically on AIX or Linux; you must manually start the server.

### Stopping the IBM Tivoli Storage Productivity Center services

This topic describes how to stop the IBM Tivoli Storage Productivity Center services.

#### Stopping the services on Windows

To stop the services on Windows, click **Start > Control Panel > Administrative Tools > Services**. Stop the following services:

**IBM WebSphere Application Server V8.0 - TPCDeviceServer**

**IBM Tivoli Storage Productivity Center - Data Server**

**IBM Storage Resource Agent - *directory***

where *directory* is where the Storage Resource agent is installed. The default directory is `c:\Program Files\IBM\TPC\agent`.

**IBM WebSphere Application Server V8.0 - TPCReplicationServer**

**Tivoli Integrated Portal - V2.2\_TIPProfile\_Port\_XXXX**

where *XXXX* indicates the port specified during installation.

**IBM Cognos Content Database**

#### Stopping the services on Linux

To stop the services on Linux, go to a command prompt window and enter the following commands:

##### Data server

```
/TPC_install_directory/data/server/tpcdsrv1 stop
```

The default directory is `/opt/IBM/TPC`.

##### Device server

```
/TPC_install_directory/device/bin/linux/stopTPCF.sh
```

The default directory is `/opt/IBM/TPC`.

##### Storage Resource agent

```
/SRA_install_directory/agent/bin/agent.sh stop
```

The default directory is `/opt/IBM/TPC`.

##### IBM WebSphere Application Server V8.0 - TPCReplicationServer

```
/opt/IBM/TPC/ewas/profiles/ReplicationServerProfile/bin/stopServer.sh  
replicationServer
```

##### Tivoli Integrated Portal

```
/tip_install_directory/profiles/TIPProfile/bin/stopServer.sh server1  
-username user name -password password
```

The `tip_install_directory` default value is `/opt/IBM/tipv2`.

**IBM Cognos Content Database service (Tivoli Common Reporting)**  
`/tcr_install_directory/bin/stopTCRserver.sh server1 username  
password`

The `tcr_install_directory` default value is `/opt/IBM/tipv2Components/TCRComponent`.

**Remember:** When you start the Tivoli Common Reporting server, the Tivoli Integrated Portal server also starts.

## Stopping the services on AIX

To stop the services on AIX, go to the command prompt window and enter the following commands:

**Data server**  
`/TPC_install_directory/data/server/tpcdsrv1 stop`

**Device server**  
`/TPC_install_directory/device/bin/aix/stopTPCF.sh`

The default directory is `/opt/IBM/TPC`.

**Storage Resource agent**  
`/SRA_install_directory/agent/bin/agent.sh stop`

The default directory is `/opt/IBM/TPC`.

**IBM WebSphere Application Server V8.0 - TPCReplicationServer**  
`/usr_or_opt/IBM/TPC/ewas/profiles/ReplicationServerProfile  
/bin/stopServer.sh replicationServer`

**Tivoli Integrated Portal**  
`/tip_install_directory/profiles/TIPProfile/bin/stopServer.sh server1  
-username username -password password`

**IBM Cognos Content Database service (Tivoli Common Reporting)**  
`/tcr_install_directory/bin/stopTCRserver.sh server1 username password`

## Starting the Tivoli Storage Productivity Center services

This topic describes how to start the Tivoli Storage Productivity Center services.

### Starting the services on Windows

To start the services on Windows, click **Start > Control Panel > Administrative Tools > Services**. Start the following services:

**IBM WebSphere Application Server V8.0 - TPCDeviceServer**

**IBM Tivoli Storage Productivity Center - Data Server**

**IBM Storage Resource Agent - *directory***  
where *directory* is where the Storage Resource agent is installed. The default directory is `c:\Program Files\IBM\TPC\agent`.

**IBM WebSphere Application Server V8.0 - TPCReplicationServer**

**Tivoli Integrated Portal - V2.2\_TIPProfile\_Port\_*xxxx***  
where *xxxxx* indicates the port specified during installation.

**IBM Cognos Content Database**

## Starting the services on Linux

To start the services on Linux, go to a command prompt window and enter the following commands:

### Data server

```
/TPC_install_directory/data/server/tpcdsrv1 start
```

The default directory is */opt/IBM/TPC*.

### Device server

```
/TPC_install_directory/device/bin/linux/startTPCF.sh
```

The default directory is */opt/IBM/TPC*.

### Storage Resource agent

```
/SRA_install_directory/agent/bin/agent.sh start
```

The default directory is */opt/IBM/TPC*.

### IBM WebSphere Application Server V8.0 - TPCReplicationServer

```
/opt/IBM/TPC/ewas/profiles/ReplicationServerProfile/bin/startServer.sh  
replicationServer
```

### Tivoli Integrated Portal

```
/tip_install_directory/profiles/TIPProfile/bin/startServer.sh server1
```

The *tip\_install\_directory* default value is */opt/IBM/tipv2*.

### IBM Cognos Content Database service (Tivoli Common Reporting)

```
/tcr_install_directory/bin/startTCRserver.sh server1
```

The *tcr\_install\_directory* default value is */opt/IBM/tipv2Components/TCRComponent*.

**Remember:** When you start the Tivoli Common Reporting server, the Tivoli Integrated Portal server also starts.

## Starting the services on AIX

To start the services on AIX, go to the command prompt window and enter the following commands:

### Data server

```
/TPC_install_directory/data/server/tpcdsrv1 start
```

### Device server

```
/TPC_install_directory/device/bin/aix/startTPCF.sh
```

The default directory is */opt/IBM/TPC*.

### Storage Resource agent

```
/SRA_install_directory/agent/bin/agent.sh start
```

The default directory is */opt/IBM/TPC*.

### IBM WebSphere Application Server V8.0 - TPCReplicationServer

```
/opt/IBM/TPC/ewas/profiles/ReplicationServerProfile/bin/startServer.sh  
replicationServer
```

### Tivoli Integrated Portal

```
/tip_install_directory/profiles/TIPProfile/bin/startServer.sh server1
```

The *tip\_install\_directory* default value is */opt/IBM/tipv2*.

## IBM Cognos Content Database Service (Tivoli Common Reporting)

```
/tcr_install_directory/bin/startTCRserver.sh server1
```

The `tcr_install_directory` default value is `/opt/IBM/tipv2Components/TCRComponent`.

**Remember:** When you start the Tivoli Common Reporting server, the Tivoli Integrated Portal server also starts.

## Starting and stopping the Tivoli Integrated Portal server

The IBM Tivoli Integrated Portal server starts automatically after you reboot the system or after a temporary power loss on Windows. The server does not start automatically on AIX or Linux; you must manually start Tivoli Integrated Portal and Tivoli Common Reporting. You can manually stop and start Tivoli Integrated Portal and Tivoli Common Reporting before beginning certain configuration tasks or as needed.

Perform the following steps at the command prompt:

1. Change to the following directory:

For Windows:

```
cd c:\program files\IBM\tipv2Components\TCRComponent\bin
```

For AIX or Linux:

```
cd /opt/IBM/tipv2Components/TCRComponent/bin
```

2. To stop Tivoli Integrated Portal and Tivoli Common Reporting, enter the following command:

For Windows:

```
stopTCRserver.sh server1 username password
```

For AIX or Linux:

```
stopTCRserver.sh server1 username password
```

Wait for the operation to complete.

3. To start Tivoli Integrated Portal and Tivoli Common Reporting, enter the following command:

For Windows:

```
startTCRserver.cmd server1
```

For AIX or Linux:

```
startTCRserver.sh server1
```

Wait for the operation to complete.

**Tip:** For Windows, you can also stop and start the services by clicking **Start > Control Panel > Administrative Tools > Services**. Stop or start the following services:

- Tivoli Integrated Portal - V2.2\_TIPProfile\_Port\_port\_number, where *port\_number* indicates the port specified during installation
- IBM Cognos Content Database

## Checking Tivoli Storage Productivity Center status

This section provides information on checking the status of Tivoli Storage Productivity Center.

## Checking the status of the Data Server

This topic describes how to check the status of the Data server.

To check the status of the Data Server, complete the following steps:

1. Open the IBM Tivoli Storage Productivity Center graphical user interface (GUI).
2. In the navigation tree, click **Administrative Services > Services > Data Server**.  
A status icon is displayed in the navigation tree for each service.

## Checking the status of the Device server

This topic describes how to check the status of the Device server.

To check the status of the Device server, complete the following steps:

1. Open the IBM Tivoli Storage Productivity Center graphical user interface (GUI).
2. In the navigation tree, click **Administrative Services > Services > Device server**. A status icon is displayed in the navigation tree for each service.

## Checking the status of agents

This topic describes how to check the status of the agents.

In the navigation tree, expand **Administrative Services > Data Sources**. Click on one of the following nodes:

- **CIMOM Agents**
- **Data/Storage Resource Agents**
- **Inband Fabric Agents**
- **Out of Band Fabric Agents**

In the content pane, a list of agents is displayed. If the agents are up and running, there will be a green health status icon in the State column. For CIMOM Agents, there will be a green health status icon in the Connection Status column.

If the status icon is red, you can view the log by selecting an agent and click **View Log** for Data, Native, and Inband Fabric. This action displays the log in the content pane. If the reason that an agent is down is a connectivity problem, you might not be able to get the log files. A given discovered CIMOM appears as a red (critical) icon status until you enter valid credentials.

## Increasing memory allocation

If you run out of memory for the Data server, Device server, or agent, you might want to increase the memory allocated for these components. This section describes how to increase the memory allocated for these components on systems running AIX, Linux, and Windows.

### Increasing the memory allocation for the Data server

If you run out of memory for the Data server, you might want to increase the memory allocated for the Data server. This section describes how to increase the memory allocated for the Data server on systems running AIX, Linux, and Windows.

#### Increasing the memory allocation for the Data server running on AIX:

This section describes how to increase the memory allocation for the Data server running on AIX.

To increase the memory allocated for the Data server running on AIX, complete the following steps:

1. Log in as a user with root authority.
2. To stop the Data Server, from the command prompt, run the following command:

```
/opt/IBM/TPC/data/server/tpcdsrv1 stop
```

3. Using a text editor, open the **tpcdsrv1** file.
4. Locate the following line:

```
exec $JAVAEXE -Dsun.net.inetaddr.ttl=300 -Xrs -Xmx XXXXm  
-cp $CLASSPATH com.tivoli.itsrm.server.Server &
```

where *XXXXm* is the memory allocated for the Data server. By default, this is 1024m (1024 MB).

5. Increase the memory allocated for the Data server. For example, to increase the memory to 1536 MB, change the line to read as follows:

```
exec $JAVAEXE -Dsun.net.inetaddr.ttl=300 -Xrs -Xmx1536m  
-cp $CLASSPATH com.tivoli.itsrm.server.Server &
```

6. Save the modified **tpcdsrv1** file.
7. To restart the Data server, run the following command:

```
/opt/IBM/TPC/data/server/tpcdsrv1 start
```

### **Increasing the memory allocation for the Data server running on UNIX or Linux:**

This section describes how to increase the memory allocation for the Data server running on Linux.

To increase the memory allocated for the Data server running on HP-UX, Linux, or Solaris, complete the following steps:

1. Log in as a user with root authority.
2. To stop the Data Server, from the command prompt, run the following command:

```
/opt/IBM/TPC/data/server/tpcdsrv1 stop
```

3. Using a text editor, open the **tpcdsrv1** file.
4. Locate the following line:

```
exec $JAVAEXE -Dsun.net.inetaddr.ttl=300 -Xrs -Xmx XXXXm  
-cp $CLASSPATH com.tivoli.itsrm.server.Server &
```

where *XXXXm* is the memory allocated for the Data server. By default, this is 1024m (1024 MB).

5. Increase the memory allocated for the Data server. For example, to increase the memory to 1536 MB, change the line to read as follows:

```
exec $JAVAEXE -Dsun.net.inetaddr.ttl=300 -Xrs -Xmx1536m  
-cp $CLASSPATH com.tivoli.itsrm.server.Server &
```

6. Save the modified **tpcdsrv1** file.
7. To restart the Data server, run the following command:

```
/opt/IBM/TPC/data/server/tpcdsrv1 start
```

### **Increasing memory allocation for Data server running on Windows:**

This section describes how to increase the memory allocation for the Data server running on Windows.

To increase the amount of memory available to the server, complete the following steps:

1. Select **Start > Run**. The Run window is displayed.
2. Type **regedit** in the Open: field and click **OK**. The Registry Editor window is displayed.
3. Expand the **HKEY\_LOCAL\_MACHINE > SOFTWARE > IBM > TSRM** folder on the left-hand side of the Registry Editor window.
4. Right-click the 1 folder and select **New > String Value** from the pop-up menu.
5. Type **SRVJPARMS** as the name of the string.
6. Right-click the name of the string and select **Modify** from the pop-up menu.
7. Enter **-Xmx<###>m** in the Value data field, where **###** represents the number of megabytes for the server's maximum heap size. The default size is 256. Click **OK**. The largest possible value for the maximum heap size is 1536 megabytes. If the value is set to something larger than 1536, that value will be ignored and 1536 megabytes will be used as the maximum heap size.
8. Stop and restart the server to have the changes take effect. To stop the server, complete the following steps:
  - a. Go to **Start > Settings > Control Panel > Administrative Tools > Services**. The Services window is displayed.
  - b. Right-click on **IBM Tivoli Storage Productivity Center - Data Server** service and click **Stop** from the pop-up menu. To restart the server, complete the following steps:
    - 1) Go to **Start > Settings > Control Panel > Administrative Tools > Services**. The Services window is displayed.
    - 2) Right-click on **Tivoli Storage Productivity Center - Data Server** service and click **Start** from the pop-up menu.

### Increasing the memory allocation for the Device server

This topic describes how to increase the memory allocated for the Device server.

1. Stop the Device server.
2. Open the `server.xml` file in a text editor. This file is located at  
`directory/ewas/profiles/DeviceServerProfile/config/cells/DeviceServerCell/nodes/DeviceServerNode/servers/deviceServer`  
  
where *directory* is where IBM Tivoli Storage Productivity Center is installed.
3. Search for `JVMArguments` and change the value of the `-Xmx1436m` parameter.
4. Save the modified `server.xml` file.
5. Restart the Device server.

### Setting timeouts values for the Device server

If a probe or discovery of a storage subsystem times out before the operation completes, you can increase the timeout values for the Device server.

If a probe or discovery of a storage subsystem times out before the operation completes, you receive the following error message:

```
HWN021650E Encountered timeout while connecting to CIMOM IP:port.  
Check the CIMOM or increase timeout value.
```

where *IP* is the IP address, and *port* is the port number. If you determine that the Common Information Model Object Manager (CIMOM) is not the cause of the problem, you can use the command-line interface (CLI) to increase the timeout values for the Device server.

For those storage systems that use native interfaces to connect to Tivoli Storage Productivity Center you see this error message:

```
HWN020103E The external process exceeded the timeout limit and was cancelled.
```

The following storage systems use native interfaces to connect to Tivoli Storage Productivity Center:

- System Storage DS8000
- SAN Volume Controller
- The XIV system
- Storwize V7000
- Storwize V7000 Unified
- IBM SONAS

1. Run the **getdscfg** command to determine the current values of the timeout properties. From the command prompt, enter the following command:

```
cli>tpctool getdscfg -user user -pwd password -url host:port  
-property timeout_property timeout_value
```

where:

- *user* is an IBM Tivoli Storage Productivity Center user ID.
- *password* is the password for the Tivoli Storage Productivity Center user ID.
- *host* is the host name or IP address, and *port* is a valid port number for the HTTP service of the Device server. The default value for *port* is typically 9550.
- *timeout\_property* is one of the following strings:
  - http.timeout
  - CIMClientWrapper.Timeout
  - Probe.Timeout.Array
  - Probe.Timeout.InBand
  - Probe.Timeout.LMM
  - Discovery.Timeout
  - CIMOMManager.TestConnectionTimeout

For the storage systems that use the native interface, the *timeout\_property* strings are:

- NAPI.Timeout.TestConnection
- NAPI.Timeout.Probe
- NAPI.Timeout.EventPoll
- *timeout\_value* is the value for the timeout.

2. Run the **setdscfg** command to increase the timeout value. Run the following command:

```
cli>tpctool setdscfg -user user -pwd password -url host:port  
-property timeout_property timeout_value
```

For more information about **tpctool**, see the *Tivoli Storage Productivity Center Command-Line Interface Reference*. You also can view help from the command line by issuing the command with the **-help** option.

## Changing passwords

This section provides information about changing passwords.

If you installed IBM Tivoli Storage Productivity Center using the typical installation and used the same DB2 user ID and password for the items IBM Tivoli Storage Productivity Center requires, then when you change the DB2 password, you must also change the passwords for the items that the DB2 password applies to. For example, the DB2 administrative password might also apply to the following items:

- Database administration user ID and password (for the Data Server or Device server to connect to the database)
- Database user ID and password to create the database schema
- Host authentication password (for the Storage Resource agents to communicate with the Device server)
- Storage Resource agent service login user ID and password (for Windows only, if this user ID does not exist)
- WebSphere administration user ID and password (for the Device server to communicate with embedded WebSphere if the user ID does not exist). This is the case only if you select OS authentication during the IBM Tivoli Storage Productivity Center installation. If you chose LDAP authentication, then the WebSphere administration user ID and password are set to the LDAP TPC Administrator username and password.

### Changing passwords using the password tool

The password tool changes the passwords for DB2, Tivoli Storage Productivity Center, and IBM Tivoli Integrated Portal so that they can continue to authenticate to one another whenever you change a password.

#### Single server installation where components use the same logon credentials:

Use the password tool to change the password for DB2, Tivoli Storage Productivity Center, and IBM Tivoli Integrated Portal when they are installed on the same server, and use the same user name and password.

Before you use the password tool, ensure that you know the existing password or passwords that you want to change.

1. Complete the following steps:

#### For Windows operating systems where Tivoli Storage Productivity Center is configured for OS authentication:

- a. From the desktop, click **Start > Control Panel**.
- b. Double-click **User Accounts**.
- c. Click **Change your password**.
- d. Enter the current password, and then enter and confirm the new password. Click **Change password**. Close the User Accounts window.

#### For AIX or Linux operating systems where Tivoli Storage Productivity Center is configured for OS authentication:

Log in with the DB2 user ID, and run the **passwd** command.

**Tip:** To change other user credentials, run the `passwd username` command.

**Tip:** To find out how to change the LDAP user password, refer to your LDAP server documentation.

2. Open a command prompt window and change the directory to the following default directory:

**On Windows operating systems:**

`C:\Program Files\IBM\TPC\service`

**On Linux or UNIX operating systems:**

`/opt/IBM/TPC/service`

3. Start the password tool by running the following program:

**On Windows operating systems:**

`changepasswords.bat`

**On Linux or AIX operating systems:**

`changepasswords.sh`

4. From the "Choose the password to change" window, click **Change Tivoli Integrated Portal password** and click **OK**.
5. Complete the following steps:
  - a. Enter and confirm the new password, ensuring that it is the same as the new password that you entered in step 1.
  - b. Ensure that the **Restart servers** option is selected. Click **OK**.
  - c. In response to the following message, click **Yes**:  
Are you sure you want to change the password?
  - d. When the process is completed, click **Back to Main**.
6. To change the password for Tivoli Storage Productivity Center, click **Change Tivoli Storage Productivity Center server and DB2 passwords** and click **OK**.
  - a. Enter and confirm the new password, ensuring that it is the same as the new password that you entered in step 1. Click **OK**.
  - b. In response to the following message, click **Yes**:  
Are you sure you want to change the password?

**Tip:** After you click **Yes**, if the DB2 servers are already started, the following errors might be displayed in a command prompt window. Ignore them and continue with the procedure.

```
Changing DB2 User password for Data Server...
Changing DB2 User password for Device Server...
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
```

- c. When the process is completed, click **Back to Main**.

**Tip:** To verify that the password changes were completed successfully, review the `PWTool.log` file that is in the `TPC_installation_directory\service` directory, where `TPC_installation_directory` is the directory where Tivoli Storage Productivity Center is installed.

7. Exit the password tool.

**Related tasks:**

“Single server installation where components use different logon credentials”  
Use the password tool to change the passwords for DB2, Tivoli Storage Productivity Center, and IBM Tivoli Integrated Portal when they are installed on the same server, but use different user names and passwords.

“Multiple server installation where Tivoli Integrated Portal is remote” on page 208  
Change the passwords for DB2, Tivoli Storage Productivity Center, and IBM Tivoli Integrated Portal when they are installed on two servers, with Tivoli Integrated Portal on server *A*, and DB2 and Tivoli Storage Productivity Center on server *B*.

“Multiple server installation where DB2 is remote” on page 210  
Change the passwords for DB2, Tivoli Storage Productivity Center, and IBM Tivoli Integrated Portal when they are installed on two servers, with Tivoli Integrated Portal and Tivoli Storage Productivity Center on server *A*, and DB2 on server *B*.

**Single server installation where components use different logon credentials:**

Use the password tool to change the passwords for DB2, Tivoli Storage Productivity Center, and IBM Tivoli Integrated Portal when they are installed on the same server, but use different user names and passwords.

Before you use the password tool, ensure that you know the existing password or passwords that you want to change.

1. Complete the following steps:

**On Windows operating systems where Tivoli Storage Productivity Center is configured for OS authentication:**

- a. From the desktop, click **Start > Control Panel**.
- b. Double-click **User Accounts**.
- c. Click **Change your password**.
- d. Enter the current password, and then enter and confirm the new password. Click **Change password**. Close the User Accounts window.

**On AIX or Linux operating systems where Tivoli Storage Productivity Center is configured for OS authentication:**

When you are logged in with the DB2 user ID, run the **passwd** command. To change other user credentials, run the **passwd *username*** command.

**Tip:** To find out how to change the LDAP user password, refer to your LDAP server documentation.

2. Open a command prompt window and change the directory to the following default directory:

**On Windows operating systems:**

C:\Program Files\IBM\TPC\service

**On Linux or UNIX operating systems:**

/opt/IBM/TPC/service

3. Start the password tool by running the following program:

**On Windows operating systems:**

changepasswords.bat

**On Linux or AIX operating systems:**

changepasswords.sh

4. From the “Choose the password to change” window, click **Change Tivoli Integrated Portal password** and click **OK**.
5. To change the password, complete the following steps:
  - a. Enter and confirm the new password and click **OK**.
  - b. In response to the following message, click **Yes**:  
Are you sure you want to change the password?
  - c. When the process is completed, click **Back to Main**.
6. To change the password for Tivoli Storage Productivity Center, click **Change Tivoli Storage Productivity Center server passwords** and click **OK**.
7. Complete the following steps:
  - a. Enter and confirm the new password and click **OK**.
  - b. In response to the following message, click **Yes**:  
Are you sure you want to change the password?
  - c. When the process is completed, click **Back to Main**.
8. To change the password for DB2, click **Change DB2 password** and click **OK**.
9. Complete the following steps:
  - a. Enter and confirm the new password. Ensure that the **Restart servers** check box is selected and click **OK**.
  - b. In response to the following message, click **Yes**:  
Are you sure you want to change the password?

**Tip:** After you click **Yes**, if the DB2 servers are already started, the following errors might be displayed in a command prompt window. Ignore them and continue with the procedure.

```
Changing DB2 User password for Data Server...
Changing DB2 User password for Device Server...
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
```

- c. When the process is completed, click **Back to Main**.

**Tip:** To verify that the password changes were completed successfully, review the `PWTool.log` file that is in the `TPC_installation_directory\service directory`, where `TPC_installation_directory` is the directory where Tivoli Storage Productivity Center is installed.

**Important:** For Windows operating systems, if Tivoli Integrated Portal fails to stop and restart, restart your system manually.

**Related tasks:**

“Single server installation where components use the same logon credentials” on page 204

Use the password tool to change the password for DB2, Tivoli Storage Productivity Center, and IBM Tivoli Integrated Portal when they are installed on the same server, and use the same user name and password.

“Multiple server installation where Tivoli Integrated Portal is remote”

Change the passwords for DB2, Tivoli Storage Productivity Center, and IBM Tivoli Integrated Portal when they are installed on two servers, with Tivoli Integrated Portal on server *A*, and DB2 and Tivoli Storage Productivity Center on server *B*.

“Multiple server installation where DB2 is remote” on page 210

**Multiple server installation where Tivoli Integrated Portal is remote:**

Change the passwords for DB2, Tivoli Storage Productivity Center, and IBM Tivoli Integrated Portal when they are installed on two servers, with Tivoli Integrated Portal on server *A*, and DB2 and Tivoli Storage Productivity Center on server *B*.

Before you use the password tool, ensure that you know the existing password or passwords that you want to change.

1. On the server where DB2 and Tivoli Storage Productivity Center are installed, complete the following steps to change the DB2 and Tivoli Storage Productivity Center passwords:

**On Windows operating systems where Tivoli Storage Productivity Center is configured for OS authentication:**

- a. From the desktop, click **Start > Control Panel**.
- b. Double-click **User Accounts**.
- c. Click **Change your password**.
- d. Enter the current password, and then enter and confirm the new password. Click **Change password**. Close the User Accounts window.

**For AIX or Linux operating systems where Tivoli Storage Productivity Center is configured for OS authentication:**

When you are logged in with the DB2 user ID, run the **passwd** command. To change other user credentials, run the **passwd username** command.

**Tip:** To find out how to change the LDAP user password, refer to your LDAP server documentation.

2. On the server where Tivoli Integrated Portal is installed, complete the following tasks:

**On Windows operating systems where Tivoli Storage Productivity Center is configured for OS authentication:**

- a. From the desktop, click **Start > Control Panel**.
- b. Double-click **User Accounts**.
- c. Click **Change your password**.

- d. Enter the current password, and then enter and confirm the new password. The new password can be different from the password that you created in step 1. Click **Change password**. Close the User Accounts window.

**For AIX or Linux operating systems where Tivoli Storage Productivity Center is configured for OS authentication:**

When you are logged in with the DB2 user ID, run the **passwd** command. To change other user credentials, run the **passwd *username*** command.

3. On the same server, open a command prompt window and change the directory to the following default directory:

**On Windows operating systems:**

C:\Program Files\IBM\TPC\service

**On Linux or UNIX operating systems:**

/opt/IBM/TPC/service

4. Start the password tool by running the following program:

**On Windows operating systems:**

changepasswords.bat

**On Linux or AIX operating systems:**

changepasswords.sh

5. From the “Choose the password to change” window, click **Change Tivoli Integrated Portal password** and click **OK**.
6. Complete the following steps:
  - a. Enter and confirm the new password and click **OK**.
  - b. In response to the following message, click **Yes**:  
Are you sure you want to change the password?
  - c. When the process is completed, click **Back to Main**.
7. On the same server, from the “Choose the password to change” window, click **Change DB2 password** and click **OK**.
8. Complete the following steps:
  - a. Enter and confirm the new password, ensuring that it is the same as the new password that you entered in step 1. Ensure that the **Restart servers** check box is selected and click **OK**.
  - b. In response to the following message, click **Yes**:  
Are you sure you want to change the password?

**Tip:** After you click **Yes**, if the DB2 servers are already started, the following errors might be displayed in a command prompt window. Ignore them and continue with the procedure.

```
Changing DB2 User password for Data Server...
Changing DB2 User password for Device Server...
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
```

- c. When the process is completed, click **Back to Main**.
9. On the server where Tivoli Storage Productivity Center and DB2 are installed, from the “Choose the password to change” window, click **Change Tivoli Storage Productivity Center server passwords** and click **OK**.
10. Complete the following steps:

- a. Enter and confirm the new password, ensuring that it is the same as the new password that you entered in step 1. Click **OK**.
  - b. In response to the following message, click **Yes**:  
Are you sure you want to change the password?
  - c. When the process is completed, click **Back to Main**.
11. On the same server, click **Change DB2 password** and click **OK**.
  12. Complete the following steps:
    - a. Enter and confirm the new password, ensuring that it is the same as the new password that you entered in step 1. Click **OK**.
    - b. In response to the following message, click **Yes**:  
Are you sure you want to change the password?

**Tip:** After you click **Yes**, if the DB2 servers are already started, the following errors might be displayed in a command prompt window. Ignore them and continue with the procedure.

```
Changing DB2 User password for Data Server...
Changing DB2 User password for Device Server...
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
```

- c. When the process is completed, click **Back to Main**.
13. Exit the password tool.

**Tip:** To verify that the password changes were completed successfully, review the `PWTool.log` file that is in the `TPC_installation_directory\service` directory, where `TPC_installation_directory` is the directory where Tivoli Storage Productivity Center is installed.

#### Related tasks:

- b. Double-click **User Accounts**.
- c. Click **Change your password**.
- d. Enter the current password, and then enter and confirm the new password. The new password can be different from the password that you created in step 1. Click **Change password**. Close the User Accounts window.

**For AIX or Linux operating systems where Tivoli Storage Productivity Center is configured for OS authentication:**

When you are logged in with the DB2 user ID, run the **passwd** command. To change other user credentials, run the **passwd username** command.

3. On the same server, open a command prompt window and change the directory to the following default directory:

**On Windows operating systems:**

C:\Program Files\IBM\TPC\service

**On Linux or UNIX operating systems:**

/opt/IBM/TPC/service

4. Start the password tool by running the following program:

**On Windows operating systems:**

changepasswords.bat

**On Linux or AIX operating systems:**

changepasswords.sh

5. From the “Choose the password to change” window, click **Change Tivoli Integrated Portal password** and click **OK**.

6. Complete the following steps:

- a. Enter and confirm the new password and click **OK**.
- b. In response to the following message, click **Yes**:  
Are you sure you want to change the password?

- c. When the process is completed, click **Back to Main**.
7. On the same server, from the “Choose the password to change” window, click **Change Tivoli Storage Productivity Center server passwords** and click **OK**.
8. Complete the following steps:
  - a. Enter and confirm the new password, ensuring that it is the same as the new password that you entered in step 2. Click **OK**.
  - b. In response to the following message, click **Yes**:  
Are you sure you want to change the password?
  - c. When the process is completed, click **Back to Main**.
9. On the server where DB2 is installed, from the “Choose the password to change” window, click **Change DB2 password** and click **OK**.
10. Complete the following steps:
  - a. Enter and confirm the new password, ensuring that it is the same as the new password that you entered in step 1. Ensure that the **Restart servers** check box is selected, and click **OK**.
  - b. In response to the following message, click **Yes**:  
Are you sure you want to change the password?

**Tip:** After you click **Yes**, if the DB2 servers are already started, the following errors might be displayed in a command prompt window. Ignore them and continue with the procedure.

```
Changing DB2 User password for Data Server...
Changing DB2 User password for Device Server...
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
```

- c. When the process is completed, click **Back to Main**.
11. Click **Exit program**.
12. On the server where Tivoli Integrated Portal and Tivoli Storage Productivity Center are installed, from the “Choose the password to change” window, click **Change DB2 password**.
13. Complete the following steps:
  - a. Enter and confirm the new password, ensuring that it is the same as the new password that you entered in step 1. Ensure that the **Restart servers** check box is selected, and click **OK**.
  - b. In response to the following message, the following message, click **Yes**:  
Are you sure you want to change the password?

**Tip:** After you click **Yes**, if the DB2 servers are already started, the following errors might be displayed in a command prompt window. Ignore them and continue with the procedure.

```
Changing DB2 User password for Data Server...
Changing DB2 User password for Device Server...
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
OpenServiceW failed, error code = 5
```

- c. When the process is completed, click **Back to Main**.
14. Exit the password tool.

**Important:** For the changes to take effect, you might have to manually restart the Data server, the Device server, or Tivoli Integrated Portal, or all three.

**Tip:** To verify that the password changes were completed successfully, review the `PWTool.log` file that is in the `TPC_installation_directory\service` directory, where `TPC_installation_directory` is the directory where Tivoli Storage Productivity Center is installed.

**Related tasks:**

“Single server installation where components use the same logon credentials” on page 204

Use the password tool to change the password for DB2, Tivoli Storage Productivity Center, and IBM Tivoli Integrated Portal when they are installed on the same server, and use the same user name and password.

“Single server installation where components use different logon credentials” on page 206

Use the password tool to change the passwords for DB2, Tivoli Storage Productivity Center, and IBM Tivoli Integrated Portal when they are installed on the same server, but use different user names and passwords.

“Multiple server installation where Tivoli Integrated Portal is remote” on page 208  
Change the passwords for DB2, Tivoli Storage Productivity Center, and IBM Tivoli Integrated Portal when they are installed on two servers, with Tivoli Integrated Portal on server *A*, and DB2 and Tivoli Storage Productivity Center on server *B*.

## Changing passwords by editing configuration files

### Changing the DB2 user password for the Device server:

This section provides information about changing the DB2 user password for the Device server.

If you change the DB2 user password, follow these steps to change it for the Device server:

1. Go to the `TPC_installation_dir\cli` directory and run the following command:  
`tpctool encrypt password`

This encrypts the password.

2. Copy the encrypted password to the following file: `TPC_installation_dir\device\conf\tsnmdbparms.properties` Replace this password:  
`tivoli.sanmgmt.jdbc.dbPassword=<encrypted_password>`
3. Restart the Device server.

### Changing the DB2 password for the Data Server:

This section provides information about changing the DB2 password for the Data Server.

To change the DB2 password, complete the following steps:

1. From a command prompt, change to the directory where the file `repository.config` resides in the IBM Tivoli Storage Productivity Center installation path. For example:  
`c:\Program Files\IBM\TPC\data\config\` (Windows)  
`/<usr or opt>/IBM/TPC/data/config/` (AIX or Linux)
2. Run the following command for the Data server. This assumes that the Tivoli Storage Productivity Center directory is in `C:\Program Files\IBM\TPC` for Windows.

```
"C:\Program Files\IBM\TPC\data\config>"program files"\
ibm\tpc\jre\bin\java -classpath "\program files\ibm\tpc\data\server\lib\
TSRMsrv.zip" com.tivoli.itsrm.repository.Transform
-p <new_password> repository.config
```

3. Stop and then restart the Data Server.
4. Start the Tivoli Storage Productivity Center GUI.

## Checking for a fully qualified host name

IBM Tivoli Storage Productivity Center requires fully qualified host names. Some machines might be configured to return a short host name, such as **ddunham** instead of a fully qualified host name, such as **ddunham.myorg.mycompany.com**. This topic provides information on how to check for a fully qualified host name.

### Checking for a fully qualified host name for Windows systems

This topic provides information on how to verify a fully qualified host name for Windows systems.

To verify a fully qualified host name, complete the following steps:

1. On the desktop, right-click **My Computer**.
2. Click **Properties**.
3. The System Properties panel is displayed.
4. On the Computer Name tab, click **Change**.
5. The Computer Name Changes panel is displayed. Enter your fully qualified host name in the Computer name field. Click **More**.
6. The DNS Suffix and NetBIOS Computer Name panel is displayed. Verify that the **Primary DNS suffix** field displays a domain name. Click **OK**.
7. Click **OK** on the Computer Name Changes panel.
8. Click **Apply** and close the System Properties panel.

### Checking for a fully qualified host name for AIX systems

This topic provides information on how to verify a fully qualified host name for AIX.

The default domain name search order is as follows:

1. Domain Name System (DNS) server
2. Network Information Service (NIS)
3. Local /etc/hosts file.

If the /etc/resolv.conf file does not exist, the /etc/hosts file is used. If only the /etc/hosts file is used, the fully qualified computer name must be the first one that is listed after the IP address.

Verify that the /etc/resolv.conf file exists and contains the appropriate information, such as:

```
domain mydivision.mycompany.com
nameserver 123.123.123.123
```

If NIS is installed, the /etc/irs.conf file overrides the system default. It contains the following information:

```
hosts = bind,local
```

The /etc/netsvc.conf file, if it exists, overrides the /etc/irs.conf file and the system default. It contains the following information:

```
hosts = bind,local
```

If the NSORDER environment variable is set, it overrides all of the preceding files. It contains the following information:

```
export NSORDER=bind,local
```

## Checking for a fully qualified host name for Linux systems

This topic provides information on how to verify a fully qualified host name for Linux.

Linux uses a resolver library to obtain the IP address corresponding to a host name. The `/etc/host.conf` file specifies how names are resolved. The entries in the `/etc/host.conf` file tell the resolver library what services to use, and in what order, to resolve names. Edit the `host.conf` file using the `vi` editor to add the following lines:

```
# Lookup names through DNS first then fall back to /etc/hosts.
order bind,hosts
# Machines with multiple IP addresses.
multi on
# Check for IP address spoofing.
nospoof on
```

The **order** option indicates the order of services. The sample entry specifies that the resolver library should first consult the name server to resolve a name and then check the `/etc/hosts` file. It is recommended to set the resolver library to first check the name server, `bind` file, and then the `hosts` file (`hosts`) for better performance and security on all your servers. You must have the DNS and BIND software installed for this configuration to work.

The **multi** option determines whether a host in the `/etc/hosts` file can have multiple IP addresses. Hosts that have more than one IP address are said to be multihomed, because the presence of multiple IP addresses implies that the host has several network interfaces.

The **nospoof** option takes care of not permitting spoofing on this machine. IP-Spoofing is a security exploit that works by tricking computers into a trust relationship that you are someone that you really are not. In this type of attack, a machine is set up to look like a legitimate server and then issue connections and other types of network activities to legitimize end systems, other servers, or large data repository systems. This option must be set ON for all types of servers.

## Checking for a fully qualified host name for Oracle Solaris

This topic provides information about how to verify a fully qualified host name for Oracle Solaris systems.

Verify that the `/etc/resolv.conf` file exists and contains the appropriate information, such as:

```
domain mydivision.mycompany.com
nameserver 123.123.123.123
```

A short name is used if the `/etc/nsswitch.conf` file contains a line that begins as follows and if the `/etc/hosts` file contains the short name for the computer:

```
hosts: files
```

To correct this problem, follow these steps:

1. Change the line in the `/etc/nsswitch.conf` file to the following:

```
hosts: dns nis files
```

2. Enter the following command to stop the **inet** service:  

```
/etc/init.d/inetsvc stop
```
3. Enter the following command to restart the **inet** service:  

```
/etc/init.d/inetsvc start
```

## Granting local administrative privileges to a domain account

For Windows users, the user account which the Storage Resource agent runs under requires local administrative rights. Because these rights are not necessarily guaranteed for domain users in a Windows domain environment, this topic provides information about how to grant local administrative rights for domain users. Using this procedure, you do not have to manually process each machine in the domain.

**Note:** These steps are for a Windows system that is a member of a Windows domain and not for the Windows Domain Primary Domain Controller.

To use Group Policy to grant local administrative privileges to a domain account, complete the following steps:

1. On the domain controller, go to **Administrative Tools > Active Directory Users and Computers** (you must be running with Domain Administrator privileges).
2. Right-click on the Organizational Unit (OU) upon which you want to apply the Group Policy. Click **Properties**.
3. The Group Policy Properties panel is displayed. Select the Group Policy tab and click **New** to create a Group Policy.
4. Designate a name for the new Group Policy. Select the new Group Policy and click **Edit**.
5. The Group Policy Object Editor panel is displayed. Go to **New Group Policy Object *your\_policy* > Computer Configuration > Windows Settings > Security Settings > Restricted Groups**. Right-click on **Restricted Groups**. Click **Add Group**.
6. For example, name the new group "Administrators." Under "Properties", add the user "Administrator", and the domain accounts or groups upon which you want the Group Policy in effect for. For example, you can add "TPC\tapeadmin", "TPC\tapegroup", and "TPC\TestGroup". Click **OK**.
7. Add these user rights to the domain account:
  - Act as part of the operating system
  - Log on as a service

In the Group Policy Object Editor, go to **New Group Policy Object *your\_policy* > Computer Configuration > Windows Settings > Security Settings > Local Policies > User Rights Assignments**. In the content pane, select "Log on as a service" and double-click. Add the domain user for whom you are granting user rights and click **OK**. Repeat this step for "Act as part of the operating system."

8. The group policy is now enforced for the Organizational Unit to include the domain accounts and groups specified under the local Administrators group on each computer in the Organizational Unit. In addition, the domain user has been granted the necessary rights. To verify the user rights, log in to a domain computer and open the Computer Management console. Select **Groups**, double-click the Administrators group, and verify the membership of the domain users.

## Importing SSL certificates for VMware

If your VMware uses SSL certificates, you must import the SSL certificates for VMware Virtual Infrastructure Data Source.

If your VMware uses SSL certificates, you must follow these steps before you can get data from the VMware Virtual Infrastructure. Complete the following steps:

1. Open a browser. Point the browser to the following:  
`https://ESX_server_IP_address/host`
2. You will see a list of Configuration files. Right-click on `ssl_cert`. Save the file as `ESX_machine_name.crt`.

**Note:** Depending on your browser, you would save the file using **Save Target as** (for Internet Explorer) or **Save Link as** (for Firefox). Use this file to import the certificate.

3. The VirtualCenter Server uses a self-generated SSL certificate located in the following directory:

```
C:\Documents and Settings\All Users\Application Data\
VMware\VMware VirtualCenter\SSL\rui.crt
```

Install these certificates into a certificate store on the client machine. Copy the certificate file or files from the servers to a directory on the client machine.

Enter the **keytool** command:

```
TPC_installation_directory/jre/bin/keytool -import
-file certificate-filename
-alias server-name
-keystore vmware.jks
```

For example, run this command:

```
TPC_installation_directory/jre/bin/keytool -import
-file vc-server1.crt -alias vc-server1
-keystore vmware.jks
```

Enter a password for the keystore. Enter **yes** to import the certificate.

The truststore will be located in the Device server configuration directory:

```
TPC_installation_directory/device/conf
```

If the truststore was generated in another directory, it must be copied to `TPC_installation_directory/device/conf`. The truststore is called **vmware.jks**. The truststore will automatically be defined at service startup time as this property in the Device server JVM:

```
javax.net.ssl.trustStore System
```

4. Add a VMware data source using the URL, user name, and password for the service console.
5. Run a discovery job for the VMware data source.
6. Run a probe job for the VMware data source.
7. You will now be able to display VMware Virtual Infrastructure in reports and the topology viewer.

**Important:** For Linux: If you install Java when you install the operating system, the operating system version of the **keytool** command is installed. The operating system level of **keytool** might not be the correct version for Tivoli Storage Productivity Center to use. To create the `vmware.jks` file correctly, use the **keytool** located in `/opt/IBM/TPC/jre/bin`.

## SQL access to Tivoli Storage Productivity Center views

IBM Tivoli Storage Productivity Center stores the information collected by data collection jobs in its DB2 database repository. This information is organized into a set of accessible views. You can use Structured Query Language (SQL) to retrieve the information from these views to create custom reports or for use within other applications.

**Prerequisite:** See the *Planning* section in the Tivoli Storage Productivity Center Information Center for information about the requirements when retrieving data from views in the database repository.

A view is a logical table that consists of data that is generated by a query. A view is based on an underlying set of base tables in the database repository, and the data in a view is determined by a SELECT statement that is run on those base tables. The data collected Tivoli Storage Productivity Center is organized into the following sets of views that you can access in the database repository:

### Storage entity views

These views include detailed information about the properties of storage entities. For example, the name, disk space, and available disk space for a storage subsystem. Information about the following storage entities are available in views in the database repository:

- Storage entity views: Hosts, volume groups, disks, virtual disks, external storage volumes, disk paths, virtual disk paths, controllers, logical volumes, file systems, clusters, cluster resource groups, hypervisors, virtual machines, virtual machine disks, hypervisor volumes, host virtual files, hypervisor partitions, MAC addresses, files, file types, directories, exports, OS users, OS user groups, IP addresses, Windows domains, and Storage Resource agents.
- Host relationship views:
  - Logical volume to host disk
  - Logical volume to logical volume (Parent and child logical volume relationships)
  - Computer to storage entity (disk or logical volume)
  - Filesystem to logical volume

(for example, the relationship between a logical volume and a host disk)

- Database views: Database instances, database containers, database archive logs, database control files, database datafiles, database devices, database log files, database log groups, database segments, database tables, database tablespaces
- Storage subsystem views: Storage subsystems, storage virtualizers, storage pools, extents, volumes, disk drives, disk groups, element managers, nodes, backend disks, storage virtualizer I/O groups, volume paths, array sites, ranks
- Storage subsystem relationship views:
  - Disk drive to storage extent
  - Storage volume to storage extent
  - Volume to disk drive
  - Storage volume to backend disk
- NAS Filers
- Tape library views: Tape libraries, tape cartridges, tape drives, tape frames, tape I/O ports, tape media changers, tape media locations

- Fabric views: Fabrics, nodes, peripheral entities, port to port connections, switches, switch blades, zones, zone members, zone sets, zone aliases, FC ports, host bus adapters
- Fabric relationship views:
  - Blade to FC port
  - Node to HBA, Node to port
  - Peripheral entity to node
  - Switch to port
  - Zone to alias, Zone to zone member, Zone to node, Zone to member
  - Zone set to zone
  - Zone alias to node
  - Alias to member
  - Fabric to switch, Fabric to zoneset, Fabric to zone, Fabric to zone alias
- Performance management views (for example, metrics and threshold violations)

### **Entities defined by Tivoli Storage Productivity Center**

These views include information about entities that are defined by Tivoli Storage Productivity Center. These entities include Data agents, Fabric agents, the alert log, the Tivoli Storage Productivity Center servers, scan profiles, external tools, monitoring groups, reporting groups, and storage resource groups.

### **Data sources**

These views include information about the data sources that are associated with Tivoli Storage Productivity Center. These data sources include Data agents, Storage Resource agents, Fabric agents, Tivoli Storage Productivity Center servers, CIMOM agents, Out of Band agents, and VMWare Virtual Infrastructure.

### **Aggregated views**

These views provide summary information for the database history, data in a database instance, and the Data agent file system.

### **Reporting views**

These views combine several different entities into one view, such as aggregate database and file system summary views, file size, time, and age distribution views, enterprise-wide statistics views, directory size views, and historical views of statistics for database summaries, ping jobs, user space usage, and files in user groups.

### **Rollup views**

These views include rollup report information from the master and subordinate Tivoli Storage Productivity Center servers, Data agents, Fabric agents, Storage Resource agents, host cluster data, computer group, host, database computer groups, fabric SAN assets, switch assets, storage subsystem group, storage subsystems, and Data Manager for Databases.

See the Tivoli Storage Productivity Center's support Web site for detailed descriptions of the views provided with Tivoli Storage Productivity Center: <http://www.ibm.com/systems/support/storage/software/tpc>

This Web page contains the following additional documentation:

- Information about the TPCREPORT schema, including:

- A list of the views that exist in the schema and descriptions of the columns with the views.
- A list of the views that contain performance data and descriptions of the performance metrics within those views.
- Diagrams that show the relationships between views.
- A diagram that traces the relationship between a computer and a storage subsystem disk and shows the views that contain information about the storage entities within that relationship.

### Accessing views in the database repository

Use SQL to access the views in Tivoli Storage Productivity Center database repository. You can do this using an SQL command line or an application capable of using SQL to retrieve information from views. This topic provides an example of how to create and view a report based on those views.

To retrieve information from the database repository you must have the proper authority to access the views. You must also collect information about your storage assets to populate those views with information. See the *Planning* section in the Tivoli Storage Productivity Center Information Center for more information.

To perform the steps described in this topic, you must install the correct version BIRT. You can download BIRT v2.2.1 from the following Web page: <http://www-01.ibm.com/software/brandcatalog/portal/opal/details?catalog.label=1TW10OT02>. You must use this version of BIRT when working with Tivoli Storage Productivity Center and Tivoli Common Reporting.

You can use a number of SQL and reporting tools for accessing and viewing the content of IBM Tivoli Storage Productivity Center's exposed views. For example, you can use the DB2 Command Line Processor to run SQL commands against the views.

This topic describes how to use BIRT to create a report package based on the views and how to import that package into Tivoli Common Reporting for viewing. Tivoli Common Reporting is installed with Tivoli Storage Productivity Center.

See the following web sites for more information about BIRT and Tivoli Common Reporting:

- BIRT overview information: <http://www.eclipse.org/birt/phenix/intro/>
- Tivoli Common Reporting overview information: <http://www.ibm.com/developerworks/spaces/tcr>

Complete these steps to use BIRT and Tivoli Common Reporting to work with Tivoli Storage Productivity Center's views:

1. Install BIRT on a computer that has access to Tivoli Storage Productivity Center's database repository. The database repository is located on the computer where the Tivoli Storage Productivity Center server is installed.
2. Start the BIRT Designer tool.
3. Set the connection information for the Tivoli Storage Productivity Center database repository in Data Source section of the user interface.
4. Use the **Data Sets** section of the user interface to create a report based on SQL queries to the exposed views that are in the TPCREPORT schema. See <http://www.eclipse.org/birt/phenix/intro/> for information on how to use

BIRT to create a report. When writing queries against the views make sure to qualify the view names with the TPCREPORT schema (for example, TPCREPORT.STORAGESUBSYSTEM).

**Note:** BIRT limits the amount of views that are displayed to 100 by default. To change this, access the **Preferences** window for the Data Set Editor and enter a value greater than 275 in the **Maximum number of tables in each schema to display** field.

5. Define the layout of the report. Use BIRT to customize the appearance of a report, including customizing column names and creating charts, graphics, and aggregated totals for the data in the report. Use the preview function to view a snapshot of the report that you defined.
6. Create a report package (archive file) for the reports to import into Tivoli Common Reporting.
7. Import the report package into Tivoli Common Reporting.
  - a. Start Tivoli Integrated Portal. For information about starting Tivoli Integrated Portal, go to the Tivoli Storage Productivity Center information center. Search for **Starting the Tivoli Storage Productivity Center GUI from Tivoli Integrated Portal**.
  - b. Expand **Reporting** in the navigation tree and click **Common Reporting**.
  - c. Right-click **Report Sets** and select **Import Report Package**.
  - d. Select the report package you want to import and click **Import**. Click **Overwrite** in the **Advanced Options** section if the report package was previously imported. The name of the report package appears in the **Reports** section of the panel.
  - e. Right-click the report package and select **Views As > output\_type**, where *output\_type* represents the format of the generated report.
  - f. View the report.

## Repocopy tool

You can use the Repocopy tool to export all the tables in the IBM Tivoli Storage Productivity Center repository (Data Manager data) for purposes of debugging problems.

You can send the exported data to the IBM Support Center to help debug problems.

### **Note:**

- You must stop the Device server and Data server before running **repocopy**.
- You cannot import **repocopy** data into the IBM Tivoli Storage Productivity Center database if the migration tool has not been run against the database. When you upgrade the Device server, you must run the migration tool before importing **repocopy** data.

## Exporting repository data

Use the repocopy tool to export data from an existing repository into a comma delimited file.

To export repository data, follow these steps:

1. Go to the following default directory:

### **On Windows operating systems:**

c:\Program Files\IBM\TPC\data\server\tools

**On Linux or UNIX operating systems:**

/opt/IBM/TPC/data/server/tools

2. Run the **repocopy.bat** or **repocopy.sh** command. A window opens prompting you for what you would like to do.
3. Select **Export data from repository tables** and click **Next**. The Options for Import/Export window is displayed.
4. In the Options for Import/Export window, enter information in the following fields:

**Directory for Export**

Enter the directory where the comma delimited file is saved.

**Delimiter**

Enter a delimiter for the delimited file format (comma is the default).

**Quote** Enter the symbol that contains string data (double quotation marks is the default).

IBM Tivoli Storage Productivity Center exports the data into the comma delimited file you specify, and place it in a file named *tablename.txt*. Click **Next**.

5. The Choices for DB2 Export window are displayed. You have the following choices:
  - Export Using DB2 native format
  - Export Using text files

Make a choice and click **Next**.

6. The Table Export Choices window opens. You have the following choices:
  - Export base tables (always)
  - Export Performance Manager tables
  - Export history tables used for IBM Tivoli Storage Productivity Center for Data history reports

Make a choice and click **Next**. The Connection Properties window opens.

Tivoli Storage Productivity Center reads the *server.config* file and determines your current repository and the information for accessing the database. The information detected in the *server.config* file is displayed in the Connection Properties window within the following fields:

- Database Types
- User name
- Password
- Driver Class
- Driver URL
- Database
- DB Creator
- Classpath

**Note:** If you want to export data from a different database from the one listed in the *server.config* file, you can select the database from the **Database Types** list box. Manually enter the database information.

7. Click **Finish**.

8. Tivoli Storage Productivity Center then connects to the database and displays the database and connection information. To begin the export process, click **Run**.

A window opens containing the export progress log. As you progress through the export process, messages are written to this progress log. You can keep track of the steps through the progress log.

**Note:** When you run the repocopy tool on a server that has a remote database, the repocopy tool displays a message. When the repocopy tool is used with a remote database, the DB2 shared library is unavailable for loading `libTSRMinsudb.so`. You can ignore this message. Click **OK** and continue.

### Importing repository data

Use the Repository Copy tool to import data from a comma delimited file. You must have previously exported data from an existing repository.

To import data into repository tables, follow these steps:

1. Stop the Device server and Data server.
2. Go to the following directory:
  - On Windows operating systems:**  
`c:\Program Files\IBM\TPC\data\server\tools`
  - On Linux or UNIX operating systems:**  
`/opt/IBM/TPC/data/server/tools`
3. Run the **repocopy.bat** or **repocopy.sh** command. A window is displayed prompting you for what you would like to do
4. Select **Import data into repository tables**, and then click **Next**. The Options for Import/Export window opens.
5. In the Options for Import/Export window, enter information in the following fields:

#### Directory for Import

Enter the directory where the comma delimited files are stored.

#### Delimiter

Enter a delimiter used for the delimited file format (comma is the default). You must use the same delimiter that was used in the exported file.

**Quote** Enter the symbol used to contain string data (double quotation marks is the default). You must use the same double quotation marks that were used in the exported file.

#### Delete before inserting

Check this option if you want to delete any existing data in the repository tables before importing new data.

IBM Tivoli Storage Productivity Center imports the data from the comma delimited file that you specify. Click **Next**.

6. The Connection Properties window opens.
7. Enter the database and the access information of the database to which you want to import data. The Connection Properties window contains the following fields:
  - Database Types
  - User name

- Password
- Driver Class
- Driver URL
- Database
- DB Creator
- Classpath

Click **Finish**. Tivoli Storage Productivity Center then connects to the database and displays the database and connection information.

8. To begin the import process, click **Run**.

A window containing the import progress log opens. As you progress through the import, messages are written to this progress log. You can use the progress log to track the steps as they happen.

**Note:** When you run the repocopy tool on a server that has a remote database, the repocopy tool displays a message. When the repocopy tool is used with a remote database, the DB2 shared library is unavailable for loading `libTSRMinsudb.so`. You can ignore this message. Click **OK** and continue.

## Service tool: collecting information

The Service tool collects information from all installed IBM Tivoli Storage Productivity Center components. The tool detects system configuration, collects the applicable information, and creates a compressed file that can be sent to the IBM support center.

The Service tool collects the following information:

- Host name
- IP address and configuration information
- Operating system and version
- Java home, version, and class path
- Java Virtual Machine (JVM) implementation name and version
- Protocol statistics and current IBM Tivoli Storage Productivity Center / Internet Protocol network connections, including listening ports
- Diagnostic information regarding the system and its services
- Listing of all library files, for example, server and library, agent and library, and GUI library

When the Service tool is run on the system where the Data server or the Device server is installed, it also collects the following information:

- For the Data server, information about all of the graphical user interfaces (remote and local) that are associated with this Data server
- All applied e-fixes
- Installation logs
- Everything in the `log` directory, including subdirectories
- Everything in the `conf` directory
- Directory listing of the `lib` directory
- Everything in the `log` and `conf` directories underneath the `ewas` directory
- The version of DB2 (information from the `db2level` command)
- Information from the `ipconfig /all` command (Windows operating systems)

- Information from the **ipconfig -a** command (Linux and UNIX operating systems)
- Information from the **netstat -an** command

When the Service tool is run on the system where the database repository is installed, it also collects the following information:

- The DB2 support information (information from the db2support command)

When the Service tool is run on the system where Tivoli Integrated Portal and the TCR component is installed, it also collects the following information:

- Everything in the log and conf directories
- Logs for the deployment engine
- Listing of COI components installed
- InstallAnywhere logs for Tivoli Integrated Portal and TCR
- TCR COI related logs
- Tivoli Integrated Portal ewas configuration files

When the Service tool runs on the Storage Resource Agent computer, it collects the following information:

- All applied e-fixes
- Everything in the log directory (including subdirectories).
- Everything in the conf directory
- Directory listing of the lib directory
- Information from the **ipconfig /all** command (for Windows operating systems).
- Information from the **ifconfig -a** command (for UNIX and Linux operating systems).
- Information from the **netstat -an** command

By default, the service data is collected in the following directory:

**On Windows operating systems:**

*TPC\_installation\_directory\service\data*

**On UNIX and Linux operating systems:**

*TPC\_installation\_directory/service/data*

You can change the default directory. To do this, refer to the following topic: “Customizing the service tool from the command line” on page 227

**Tip:** You can run the Service tool on IBM Tivoli Storage Productivity Center regardless of whether you configured it on a single server or on a split server. The Service tool automatically recognizes the installed components and collects service data about them. To learn how to run the Service tool for servers, see the following topic: “Creating a compressed file about servers for the IBM Support Center” on page 226.

**Restriction:** The Service tool does not collect service logs or other service information for Tivoli Storage Productivity Center for Replication. If you must collect the log and trace files for the Replication server, go to the information center. Go to **IBM Tivoli Storage Productivity Center > Troubleshooting > IBM Tivoli Storage Productivity Center for Replication > Logs**.

## Creating a compressed file about servers for the IBM Support Center

Run the Service tool for the Data server and the Device server to create a compressed file that can be sent to the IBM Support Center.

You must have administrator authority on Windows operating systems or root authority on UNIX and Linux operating systems.

To run the tool for the servers, follow these steps:

1. Log on to the system.
2. If you used the default directory, go to the following directory:
  - On Windows operating systems: C:\Program Files\IBM\TPC\service\.
  - On Linux or UNIX operating systems: /usr\_or\_opt/IBM/TPC/service/.
3. Run the following program:

**On Windows operating systems:**

service.bat

**On Linux or UNIX operating systems:**

service.sh

A compressed file, TPCServiceFiles.zip, is created in the following directory:

**On Windows operating systems**

*TPC\_installation\_directory*\service\data

**On Linux or UNIX operating systems**

*TPC\_installation\_directory*/service/data

**Tip:** You can customize the data that is collected by the Service tool. For more information, see “Customizing the service tool from the command line” on page 227

### Related tasks:

“Creating a compressed file about Storage Resource Agents for the IBM Support Center”

Run the Service tool on Storage Resource Agents that were deployed by using the stand-alone GUI to create a compressed file that can be sent to the IBM Support Center.

## Creating a compressed file about Storage Resource Agents for the IBM Support Center

Run the Service tool on Storage Resource Agents that were deployed by using the stand-alone GUI to create a compressed file that can be sent to the IBM Support Center.

You must have administrator authority on Windows operating systems or root authority on UNIX and Linux operating systems.

To run the Service tool on the Storage Resource agents, do the following steps:

1. Log on to the stand-alone GUI.
2. In the navigation tree, expand **Administrative Services > Data Sources > Data/Storage Resource Agents**.
3. In the content pane, select the agent. From the **Select Action** menu, click **Collect Service Data**.

The following compressed files are created:

**On Windows operating systems:**

C:\Program Files\IBM\TPC\data\log\SRATraces\*SRA\_computer\_name*\TPCServiceInfo.zip

**On UNIX and Linux operating systems:**

/opt/IBM/TPC/data/log/SRATraces/*SRA\_computer\_name*/TPCServiceInfo.zip

where *SRA\_computer\_name* represents the name of the computer on which the Storage Resource agent is located.

If the compressed file cannot be created, a message indicates that the job was unsuccessful.

For more information about the error, see the server log file or the services script information file. The files are in the following default locations:

**Server log file**

This file is on the system where IBM Tivoli Storage Productivity Center is installed:

**For Windows operating systems:**

c:\Program Files\IBM\TPC\data\log

**For UNIX or Linux operating systems**

/opt/IBM/TPC/data/log

**Services script information file**

This file is on the system where the Storage Resource agent is installed:

**For Windows operating systems:**

c:\Program Files\IBM\TPC\*SRA\_computer\_name*\services\TPCServiceInfo.log

**For UNIX or Linux operating systems:**

/opt/IBM/TPC/*SRA\_computer\_name*/services/TPCServiceInfo.log

**Tip:** You can customize the data that is collected by the Service tool. For more information, see “Customizing the service tool from the command line”

**Related tasks:**

“Creating a compressed file about servers for the IBM Support Center” on page 226

Run the Service tool for the Data server and the Device server to create a compressed file that can be sent to the IBM Support Center.

**Customizing the service tool from the command line**

Using various parameters, you can use the service tool to collect data about specific IBM Tivoli Storage Productivity Center components, which you can then send to the IBM Support Center. You can also use the command line parameters to specify a location to place the data that is collected, specify whether the data should be compressed, or both.

**Help and output command-line parameters**

To customize the data that is collected by the service tool, use the following command-line parameters:

**-output** *directory\_path*

Places the files that contain the data that was collected in a directory that you

specify. If you specify a directory that does not exist on your system, that directory is created. If you do not use the `-output directory_path` parameter, the files are placed in the default directory:

**On Windows operating systems:**

`TPC_installation_directory\service\data`

**On Linux or UNIX operating systems:**

`TPC_installation_directory/service/data`

**Restriction:** If you specify a directory, the directory path cannot contain spaces.

**-nozip**

When you use this parameter, separate directories are created for each Tivoli Storage Productivity Center component for which data was collected. You can then create compressed files for the files. In this way, you can control the size and content of each compressed file. To specify a directory other than the default directory, use the `-output directory_path` parameter.

**Tip:** You can specify more than one parameter, for example, `C:\Program Files\IBM\TPC\service>service -install -nozip`.

## Collecting data for specific Tivoli Storage Productivity Center components

You can use the service tool to collect data about specific Tivoli Storage Productivity Center components.

The following list shows the parameters that are used to collect data for each component:

**-all**

Collects data about all Tivoli Storage Productivity Center components.

**-install**

Collects data about the installation component files.

**-data**

Collects data about the data server component files.

**-device**

Collects data about the device server component files.

**-repl**

Collects data about the replication server component files.

**-sra**

Collects data about the Storage Resource Agent component files.

**-db**

Collects data about DB2 files.

**-cli**

Collects data about command-line interface files.

**-gui**

Collects data about Tivoli Integrated Portal and other IBM Tivoli Storage Productivity Center web-based GUI files.

**-tcr**

Collects data about IBM Tivoli Common Reporting.

**Tip:** You can specify more than one parameter, for example, C:\Program Files\IBM\TPC\service>service -tcr -install -gui.

If you collect information about a particular component and you do not specify the **-nozip** parameter, you can identify the contents of a compressed service file from its name. For example, if you specify the **-tcr -install -gui** parameters but did not specify the **-nozip** parameter, a file named TPCServiceFiles\_tcr\_install\_gui.zip is created.

**Attention:** An existing compressed file is overwritten when another file of the same name is created. For example, if you run C:\Program Files\IBM\TPC\service>service -db -gui, a file named TPCServiceFiles\_device\_db.zip is created. If you rerun the tool with the same component options, a new file named TPCServiceFiles\_device\_db.zip is created. This new file overwrites the previously created file unless you specify the **-nozip** parameter, or use the **-output** parameter to specify a different path.

If you specify the **-nozip** parameter, a subdirectory is created for the components that you specified in the parameter. If you did not specify a specific component, data is collected for all installed components, and the data is placed in files in the following directory:

**Windows operating systems:**

*TPC\_installation\_directory\service\data*

**UNIX or Linux operating systems:**

*TPC\_installation\_directory/service/data*

Files for particular components are then placed in a subdirectory that corresponds to that component. Common files, such as license.txt, are placed in the following directory:

**Windows operating systems:**

*TPC\_installation\_directory\service\data*

**UNIX or Linux operating systems:**

*TPC\_installation\_directory/service/data*

---

## Administering Tivoli Integrated Portal

This topic provides information on how to perform administrative tasks in Tivoli Integrated Portal that are reflected in Tivoli Storage Productivity Center.

### Tivoli Integrated Portal port numbers

Depending on how you installed Tivoli Storage Productivity Center, the default port numbers for Tivoli Integrated Portal can vary.

To find the default port numbers that are used in Tivoli Integrated Portal URLs, do the following steps:

**For a new installation of Tivoli Storage Productivity Center Version 5.1:**

1. Go to the following directory:

**On Windows operating systems:**

*C:\Program Files\IBM\tipv2\properties\*

**On Linux or UNIX operating systems:**

*/opt/IBM/tipv2/properties/*

2. Open the TIPPortDef.properties file.
3. Review the following entry:

**For http:// protocols:**  
WC\_defaulthost\_xxxx

**For https:// protocols:**  
WC\_defaulthost\_secure\_xxxx

**For an installation of Tivoli Storage Productivity Center Version 5.1 that was upgraded from an earlier version:**

1. Go to the following directory:

**On Windows operating systems:**  
C:\Program Files\IBM\Tivoli\tipv2\properties\

**On Linux or UNIX operating systems:**  
/opt/IBM/Tivoli/tipv2/properties/

2. Open the TIPPortDef.properties file.
3. Review the following entry:

**For http:// protocols:**  
WC\_defaulthost\_xxxx

**For https:// protocols:**  
WC\_defaulthost\_secure\_xxxx

## **Port numbers for a new installation of Tivoli Storage Productivity Center Version 5.1**

- If you installed Tivoli Storage Productivity Center Version 5.1 and used default Tivoli Integrated Portal port numbers, the port numbers are as follows:

**For http:// protocols:**  
9568

**For example:**  
`http://hostname:9568/ibm/console/logon.jsp`

**For https:// protocols:**  
9569

**For example:**  
`https://hostname:9569/ibm/console/logon.jsp`

- If you installed Tivoli Storage Productivity Center version 5.1 and used customized port numbers for Tivoli Integrated Portal, the URLs for a Tivoli Integrated Portal logon might appear as follows:

**For http:// protocols:**

**For example:**  
`http://hostname:WC_defaulthost/ibm/console/logon.jsp`

**For https:// protocols:**

**For example:**  
`https://hostname:WC_defaulthost_secure/ibm/console/logon.jsp`

## **Port numbers for an upgraded installation of Tivoli Storage Productivity Center Version 4.2.2**

- If you upgraded from Tivoli Storage Productivity Center Version 4.2.2 to Version 5.1, the default Tivoli Integrated Portal port numbers are as follows:

**For http:// protocols:**

16310

**For example:**

`http://hostname:16310/ibm/console/logon.jsp`

**For https:// protocols:**

16311

**For example:**

`https://hostname:16311/ibm/console/logon.jsp`

- If you used customized port numbers when you installed Tivoli Storage Productivity Center Version 4.2.2, upgraded to Version 5.1, and then used customized port numbers for Tivoli Integrated Portal, the URLs for a Tivoli Integrated Portal logon might appear as follows:

**For http:// protocols:**

`http://hostname:12345/ibm/console/logon.jsp`

**For https:// protocols:**

`https://hostname:12346/ibm/console/logon.jsp`

## Changing the user authentication configuration

The Tivoli Storage Productivity Center installation program establishes a default authentication configuration using the federated repositories feature of the WebSphere Application Server. If you want to change the user authentication configuration, follow these procedures.

Within the federated repositories framework, the Tivoli Storage Productivity Center installation program creates two repositories:

### File-based user repository

This repository contains the user "tpcFileRegistryUser" (This user password is the same as the common user password entered during the Tivoli Storage Productivity Center installation.)

### Operating system repository

In the federated repositories framework, the Tivoli Storage Productivity Center installation program creates two repositories on all the following Tivoli Storage Productivity Center IBM® WebSphere® Application Servers:

- Tivoli Integrated Portal server
- Device server
- Replication server

The Tivoli Integrated Portal server is used as the primary WebSphere Application Server for user authentication in Tivoli Storage Productivity Center. If the Tivoli Integrated Portal server is down, the Device Server and Replication Server are used as the back up WebSphere Application Servers to perform the user authentication and allow the authorized local OS users to log in to the Tivoli Storage Productivity Center stand-alone GUI and Tivoli Storage Productivity Center for Replication web-based GUI. You can add an LDAP repository as a post-install task. This configuration is completed on the Tivoli Integrated Portal server. The LDAP repository configuration settings are not propagated to the Device and Replication servers. So, if the Tivoli Integrated Portal server is down, then the authorized LDAP users cannot log in to Tivoli Storage Productivity Center stand-alone GUI and Tivoli Storage Productivity Center for Replication web-based GUI. The back up user authentication mechanism based on

Device and Replication servers allows the authorized local OS users to log in to the Tivoli Storage Productivity Center stand-alone GUI and the Tivoli Storage Productivity Center for Replication web-based GUI.

This repository is referred to as the localOS repository and contains the users and groups that are managed by the local operating system. On computers that are members of a Windows domain, this local OS repository also contains the domain users and groups that are managed by the Windows domain, provided that the computer is correctly configured with the Windows domain.

Use of the Tivoli Storage Productivity Center single sign-on feature, especially with storage system element managers, is limited with this default authentication configuration. Storage system element managers do not support using the localOS repository or the file-based repository for single sign-on, even when the element manager is installed on the same system as Tivoli Storage Productivity Center.

The LDAP repositories supported by Tivoli Storage Productivity Center depend on the Tivoli Integrated Portal support. For more information about the LDAP repositories supported, see one of the following topics:

- For the Windows operating system: <http://www.ibm.com/support/docview.wss?rs=180&uid=swg27012421> .
- For the AIX operating system: <http://www.ibm.com/support/docview.wss?rs=180&uid=swg27012389>.
- For the Linux operating system: <http://www.ibm.com/support/docview.wss?rs=180&uid=swg27012415>.

Search for *LDAP Servers using Federated Repository Configuration*.

Whenever you change the user authentication configuration (by adding or removing an LDAP repository within the federated repositories framework), you must first back up the existing Tivoli Integrated Portal WebSphere configuration files. The WebSphere backup files provide a restoration point in the event of a failure when performing these procedures. You must also back up the WebSphere configuration files after you add an LDAP repository to the user authentication configuration and want to later change the LDAP authentication settings.

The WebSphere Application Server cannot resolve duplicated users or groups if these users or groups are present in more than one repository in the federated repositories framework. For example, an Administrator user exists in both the local OS and LDAP repository. You must ensure that the duplicated users (or groups) are not used during the configuration or to manage Tivoli Storage Productivity Center.

The following topics describe how to select and configure each user authentication method.

### **Adding an LDAP repository to the federated repositories**

You can configure Tivoli Storage Productivity Center to communicate with an external Lightweight Directory Access Protocol (LDAP) repository such as IBM Tivoli Directory Server or Microsoft Active Directory. To add an LDAP repository to the federated repositories in Tivoli Storage Productivity Center, you must use Tivoli Integrated Portal.

If you installed Tivoli Storage Productivity Center on a correctly configured computer that is a member of a Windows domain, Active Directory users and

groups also exist in the localOS repository. To determine whether the Active Directory users exist in the localOS repository, log on to Tivoli Integrated Portal and click **Users and Groups > Manage users**. You should not add the Active Directory repository if the Active Directory users exist. If you plan to add the Active Directory repository for performance reasons, you must remove the localOS repository from the federated repositories.

The WebSphere Application Server cannot resolve duplicated users or groups if these users or groups are present in more than one repository in the federated repositories framework. For example, an Administrator user exists in both the localOS and LDAP repository. You must ensure that the duplicated users (or groups) are not used during the configuration or to manage Tivoli Storage Productivity Center.

To add an LDAP repository to the federated repositories in Tivoli Storage Productivity Center, complete the following steps. Contact your LDAP server administrator for assistance.

1. Back up the Tivoli Integrated Portal WebSphere Application Server configuration files. The WebSphere Application Server configuration backup files provide a restoration point in the event of a failure when you complete this procedure. This procedure uses the variable name *TIP\_installation\_directory* to indicate where Tivoli Integrated Portal is located.
  - a. Back up the WebSphere Application Server configuration files.  
For the AIX or Linux operating systems, run the following command:  

```
TIP_installation_directory/profiles/TIPProfile/bin/backupConfig.sh
```

  
For the Windows operating systems, run the following command:  

```
TIP_installation_directory\profiles\TIPProfile\bin\backupConfig.bat
```
  - b. Back up the `soap.client.props` file for Tivoli Integrated Portal.  
For the Windows operating systems, use the **copy** command to back up this file:  

```
TIP_installation_directory\profiles\TIPProfile\properties\soap.client.props
```

  
For the AIX or Linux operating systems, use the **cp** command to back up this file:  

```
TIP_installation_directory/profiles/TIPProfile/properties/soap.client.props
```
  - c. Back up the IBM Cognos 8.ear directory.  
For Windows operating systems, enter the **xcopy** command to back up this directory:  

```
TIP_installation_directory\profiles\TIPProfile\installedApps\TIPCell\IBM Cognos 8.ear
```

  
For the AIX or Linux operating systems, enter the **cp** command to back up this directory:  

```
TIP_installation_directory/profiles/TIPProfile/installedApps/TIPCell/IBM Cognos 8.ear
```
  - d. The WebSphere Application Server **backupConfig** command generates a compressed file: `WebSphereConfig_YYYY-DD-MM.zip`. When you run the **backupConfig** command, the Tivoli Integrated Portal server will shut down. The Tivoli Integrated Portal server must be restarted after the **backupConfig** command is finished.

To start the Tivoli Integrated Portal server, follow these steps:

- 1) For Windows operating systems, click **Start > Administrative Tools > Services**. On the Windows Services page, right-click **Tivoli Integrated Portal - V2.2\_TIPProfile\_Port\_xxxx** where *xxxx* indicates the port specified during installation and select **Start**.
- 2) For AIX or Linux operating systems, open a command prompt window and enter the following command:

```
TIP_installation_directory/profiles/TIPProfile/bin/  
startServer.sh
```

2. To restore the WebSphere Application Server and IBM Cognos configuration, complete the following steps:

- a. Restore the WebSphere configuration by running the `restoreConfig.sh` or `restoreConfig.bat` command. The **restoreConfig** command is located here:

- For Windows operating systems:

```
TIP_installation_directory\profiles\TIPProfile\bin\  
restoreConfig.bat
```

- For AIX or Linux operating systems:

```
TIP_installation_directory/profiles/TIPProfile/bin/  
restoreConfig.sh
```

- b. Restore the IBM Cognos 8.ear directory that you backed up in step 1c. For the Windows operating systems, enter the **xcopy** command to replace the contents of this directory:

```
TIP_installation_directory\profiles\TIPProfile\installedApps\TIPCell\IBM Cognos 8.ear
```

For the AIX or Linux operating systems, use the **cp** command to replace the contents of this directory:

```
TIP_installation_directory/profiles/TIPProfile/installedApps/  
TIPCell/IBM Cognos 8.ear
```

3. Open an Internet Explorer or Mozilla Firefox web browser and enter the following information in the address bar:

```
http://hostname:port/ibm/console/logon.jsp
```

or

```
https://hostname:port/ibm/console/logon.jsp
```

Where *hostname* is the server that is running Tivoli Integrated Portal such as the server name or IP address and *port* is the port number for Tivoli Integrated Portal.

The port number differs depending on the protocol that you use (http or https) and the options that you selected during the installation of Tivoli Storage Productivity Center. For more information about port numbers, see “Tivoli Integrated Portal port numbers” on page 229.

You can also contact your Tivoli Storage Productivity Center administrator to verify the host name and port number.

4. On the Tivoli Integrated Portal logon page, log on using the appropriate user ID and password. Your user ID must have Tivoli Integrated Portal administrator authorization.
5. In the Tivoli Integrated Portal navigation tree, click **Settings > WebSphere Administrative Console**.
6. In the Tivoli Integrated Portal window, click **Launch WebSphere administrative console**.
7. In the WebSphere Application Server Administrative Console navigation tree, click **Security > Global security**.

- On the Global security page, in the **User account repository** section, click the **Configure** button next to the **Available realm definitions** list.

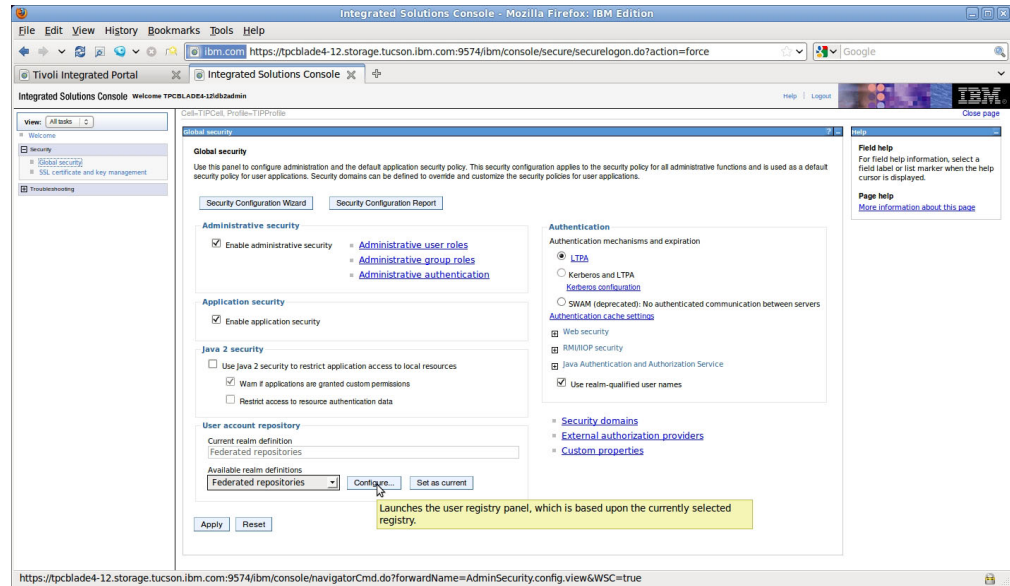

Figure 11. Global security page, configure federated repositories

- On the Global security > Federated repositories page, under "Related Items," click **Manage repositories**.

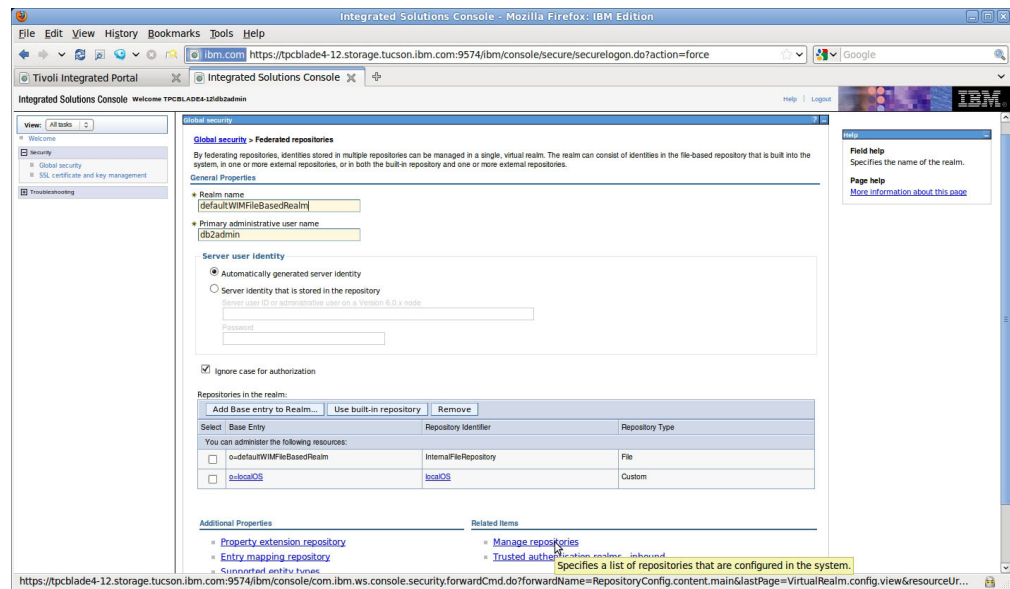

Figure 12. Federated repositories page, Manage repositories

In this window, you must ensure that the **Primary administrative user name** exists only in one repository. The WebSphere Application Server will not start if this user name exists in multiple repositories.

- On the Global security > Federated repositories > Manage repositories page, add the LDAP repository that you want to use for authentication. Follow these steps:

- a. Click **Add** to add a new repository.

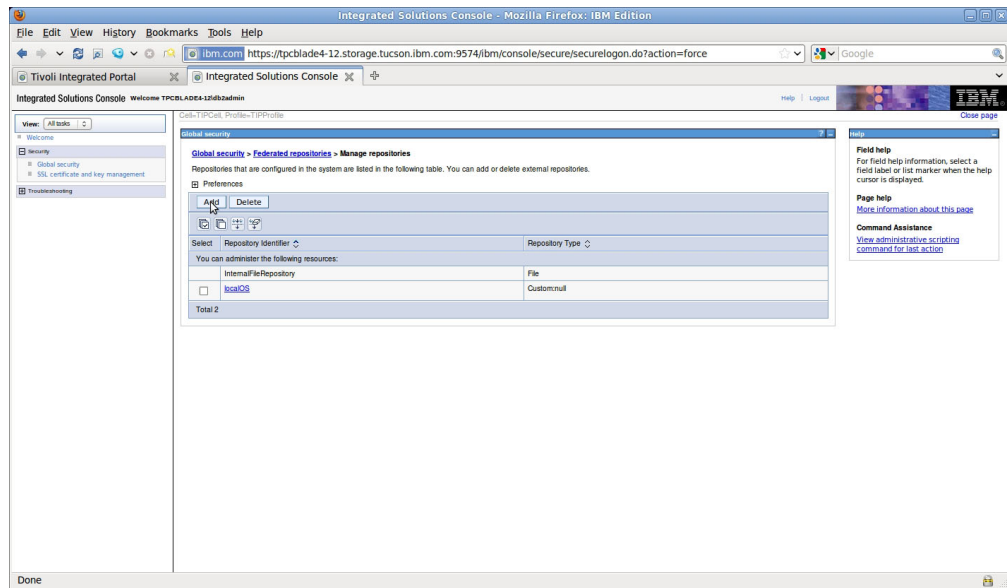

Figure 13. Manage repositories page, Add a new repository

- b. Enter the values for the following fields:

**Repository identifier**

A unique identifier for the LDAP repository. This identifier uniquely identifies the repository within the realm, for example, LDAP1.

**Directory type**

The type of LDAP server that you want to connect to.

**Primary host name**

The host name of the primary LDAP server. This host name is either an IP address or a domain name service (DNS) name.

**Port**

The LDAP server port. The default value is 389. You can specify a different port depending on your LDAP server configuration. If you do not know what port to use, contact your LDAP server administrator.

**Bind distinguished name**

The distinguished name (DN) for WebSphere Application Server to use when binding to the LDAP repository. If no name is specified, WebSphere Application Server binds anonymously. In most cases, bind DN and bind password are required. However, when an anonymous bind can satisfy all the required functions, bind DN and bind password are not required.

**Bind password**

The password for WebSphere Application Server to use when binding to the LDAP repository.

**Login properties**

The authentication properties that are used to log on to WebSphere Application Server. Type uid;cn in this field. This value enables WebSphere Application Server to use the property that is required for the directory type.

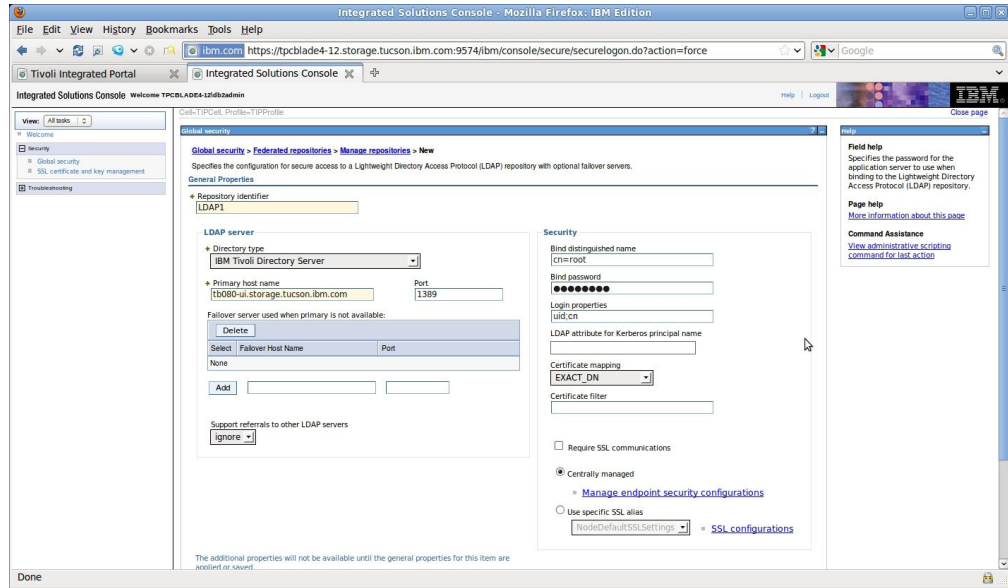

Figure 14. Manage repositories > New page

- c. Click **OK**.
- d. In the messages dialog box that is displayed on the Manage repositories page, click the **Save** link in **Save directly to the master configuration**.

**Important:** On the Global security > Federated repositories > Manage repositories page, do not delete the "localOS" repository.

- 11. From the Manage repositories page, return to the Global security > Federated repositories page.
- 12. Under "Repositories in the realm," click **Add Base entry to Realm**.

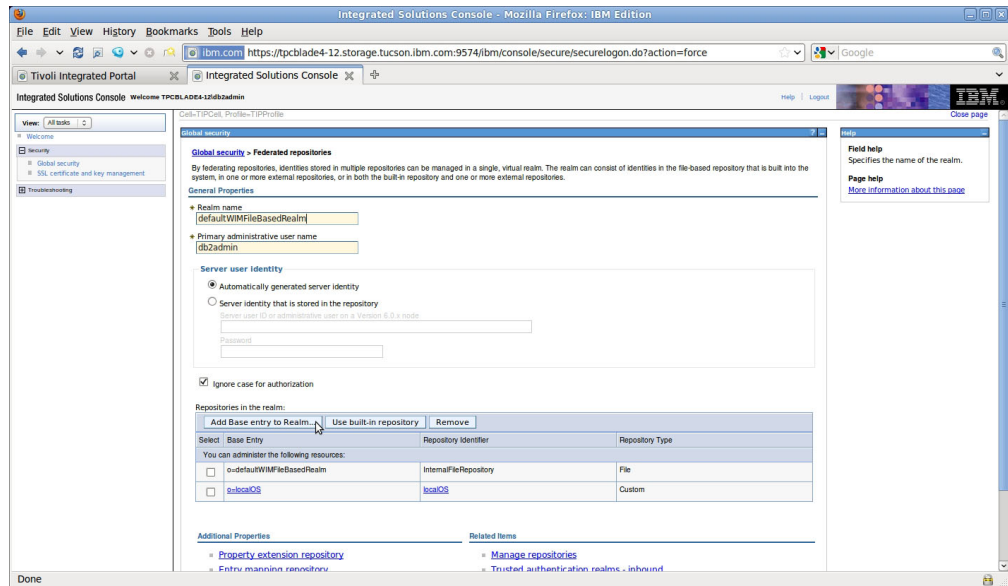

Figure 15. Global security > Federated repositories page, Add base entry to realm

13. If the Messages dialog box is displayed on the Repository reference page, click the **Save** link in **Save directly to the master configuration**.
14. On the Repository reference page, configure the following items:
  - a. In the Repository list, select the repository that you created in step 10 on page 235.
  - b. In the **Distinguished name of a base entry that uniquely identifies this set of entries in the realm** field, enter the distinguished name of a base entry that uniquely identifies the repository in the realm.
  - c. In the **Distinguished name of a base entry in this repository** field, enter the distinguished name of the base entry in the repository. In most instances, this value is the same value that you entered in the **Distinguished name of a base entry that uniquely identifies this set of entries in the realm** field. Click **OK**.
  - d. In the messages dialog box that is displayed, click the **Save** link in **Save directly to the master configuration**.

**Important:** In the **Repositories in the realm** table, do not remove the `InternalFileRepository` entry. Do not remove the `localOS` entry, unless you are planning to add an Active Directory repository to Tivoli Storage Productivity Center that is installed on a computer that is a member of a Windows domain and have verified that the Active Directory users exist in the localOS repository.

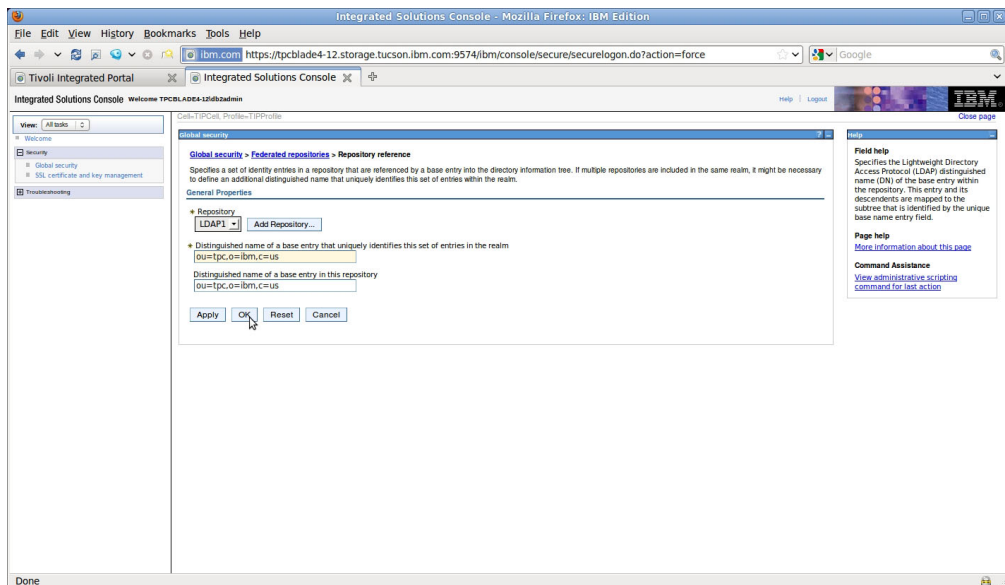

Figure 16. Global security > Federated repositories > Repository reference page, Add base entry to realm

15. Log out from the WebSphere Application Server Administrative Console.
16. Log out from the Tivoli Integrated Portal Administrative Console.
17. Stop and restart the Tivoli Integrated Portal server. For information about stopping and starting the Tivoli Integrated Portal server, see the Tivoli Storage Productivity Center information center. Search for *Starting and stopping the Tivoli Integrated Portal server*.

To verify that the LDAP federated repository is configured correctly, complete the following steps:

1. Log on to Tivoli Integrated Portal by using the same user ID and password from step 4 on page 234.
2. In the Tivoli Integrated Portal navigation tree, click **Users and Groups > Manage Users**.
3. In the Search by list, select **User ID**.
4. Click **Search** to search for users in the federated repositories. The list of users includes users from the local file repository, the operating system repository, and the LDAP repository.
5. In the Tivoli Integrated Portal navigation tree, click **Users and Groups > Manage Groups**.
6. In the Search by list, select **Group name**.
7. Click **Search** to search for groups in the federated repositories. The list of groups includes groups from the operating system repository and the LDAP repository.

**Important:** Before you establish the desired authorization configuration for Tivoli Integrated Portal, Tivoli Storage Productivity Center, and Tivoli Storage Productivity Center for Replication, you must ensure that there are no duplicated user names or group names within the local file repository, the operating system repository, and the LDAP repository.

After you have completed and verified the addition of an LDAP repository to the Tivoli Storage Productivity Center federated repositories authentication configuration, you must establish the desired authorization configuration for Tivoli Integrated Portal. Tivoli Integrated Portal administrators require the `iscadmins` and `administrator` roles. Operators viewing Tivoli Storage Productivity Center reports require the `tcrPortalOperator` role. For Tivoli Storage Productivity Center Version 5.1 single sign-on and launch in context features to work correctly, the LDAP user or group requires the following Tivoli Integrated Portal roles:

- administrator
- iscadmins
- tcrPortalOperator
- chartAdministrator
- monitor

For information about user roles and groups, go to the Tivoli Integrated Portal administrative console online help. On the Welcome page, open the online help by clicking `?`. On the Help welcome page, click **Using the Tivoli Integrated Portal > Users and Groups** in the navigation pane.

You should also assign Tivoli Storage Productivity Center roles to groups using the **Role-to-Group Mapping** node in the Tivoli Storage Productivity Center stand-alone GUI. You can map Tivoli Storage Productivity Center roles, such as Tape Operator or Fabric Administrator, to user groups that you create in your operating system repository and your LDAP repository. For information about the **Role-to-Group Mapping** node, go to the Tivoli Storage Productivity Center information center. Search for *Role-to-Group Mappings*.

For information about assigning roles to users and roles to groups for Tivoli Storage Productivity Center for Replication, go to the Tivoli Storage Productivity Center information center. Search for *Managing replication*. On the Managing replication page, click **Security**.

### **Enabling secure communication between Tivoli Storage Productivity Center and the LDAP repository:**

You can use the Secure Socket Layer (SSL) protocol to secure the communication between Tivoli Storage Productivity Center and the LDAP repository that you are using for user authentication. The SSL protocol provides security and data integrity for communications over Transmission Control Protocol/Internet Protocol (TCP/IP) networks.

To enable SSL for LDAP communications, you must complete the following steps in Tivoli Integrated Portal:

1. Open an Internet Explorer or Firefox web browser. Enter the following information in the address bar: `https://hostname:port/ibm/console/logon.jsp` where *hostname* defines the server that is running Tivoli Integrated Portal such as the server name or IP address and *port* defines the port number for Tivoli Integrated Portal. To view information about Tivoli Integrated Portal port numbers, see "Tivoli Integrated Portal port numbers" on page 229. Contact your Tivoli Storage Productivity Center administrator if you must verify the host name and port number.
2. On the Tivoli Integrated Portal logon page, log on using the appropriate user ID and password. Your user ID must have Tivoli Integrated Portal administrator authorization.
3. In the Tivoli Integrated Portal navigation tree, click **Settings > WebSphere Administrative Console**.
4. In the Tivoli Integrated Portal content pane, click **Launch WebSphere administrative console**.
5. In the WebSphere Administrative Console navigation tree, click **Security > SSL certificate and key management**.
6. On the SSL certificate and key management page, in the "Related Items" section, click **Key stores and certificates**.
7. On the Key stores and certificates page, in the table, click **NodeDefaultTrustStore**.
8. On the NodeDefaultTrustStore page, in the "Additional Properties" section, click **Signer Certificates**.
9. On the Signer Certificates page, click **Retrieve from port**.
10. On the Retrieve from port page, enter the values for the following fields:
  - Host** The fully qualified host name and domain name of your LDAP-compliant repository.
  - Port** The port where the LDAP repository is listening for secure communications; this port is usually 636.
- SSL configuration for outbound connection**
  - Accept the default value.
- Alias** An alias name for the retrieved certificate.
11. Click **Retrieve signer information**.
12. When the signer information is displayed, click **OK**.

13. In the messages dialog box displayed on the Signer certificates page, click the **Save** link in **Save directly to the master configuration**.
14. In the WebSphere Administrative Console navigation tree, click **Security > Global security**.
15. On the Global security page, in the "User account repository" section, click the **Configure** button next to the "Available realm definitions" drop-down list.
16. On the Global security > Federated repositories page, under "Related Items," click **Manage repositories**.
17. On the Global security > Federated repositories > Manage repositories page, click the identifier for the LDAP repository for which you want to enable the SSL protocol.
18. On the configuration page for the LDAP repository, configure the following items:
  - a. In the Port field, enter the port where your LDAP repository is listening for secure communications; this port is usually 636.
  - b. Select **Require SSL communications**.

Click **OK**.
19. In the messages dialog box displayed on the Manage repositories page, click the **Save** link in **Save directly to the master configuration**.
20. Log out from the WebSphere Administrative Console.
21. Log out from the Tivoli Integrated Portal Administrative Console.
22. Stop and restart the Tivoli Integrated Portal server. For information about stopping and starting the Tivoli Integrated Portal server, see the Tivoli Storage Productivity Center information center. Search for *Starting and stopping the Tivoli Integrated Portal server*.

#### **Disabling secure communication between Tivoli Storage Productivity Center and the LDAP repository:**

You can disable the Secure Socket Layer (SSL) protocol between the LDAP repository and the Tivoli Storage Productivity Center system at any time.

To disable the use of SSL, you must complete the following steps in Tivoli Integrated Portal:

1. Open an Internet Explorer or Firefox web browser. Enter the following information in the address bar: `https://hostname:port/ibm/console/logon.jsp` where *hostname* defines the server that is running Tivoli Integrated Portal such as the server name or IP address and *port* defines the port number for Tivoli Integrated Portal. To view information about Tivoli Integrated Portal port numbers, see "Tivoli Integrated Portal port numbers" on page 229. Contact your Tivoli Storage Productivity Center administrator if you must verify the host name and port number.
2. On the Tivoli Integrated Portal logon page, log on using the appropriate user ID and password. Your user ID must have Tivoli Integrated Portal administrator authorization.
3. In the Tivoli Integrated Portal navigation tree, click **Settings > WebSphere Administrative Console**.
4. In the Tivoli Integrated Portal content pane, click **Launch WebSphere administrative console**.
5. In the WebSphere Administrative Console navigation tree, click **Security > Global security**.

6. On the Global security page, in the "User account repository" section, click the **Configure** button next to the "Available realm definitions" drop-down list.
7. On the Global security > Federated repositories page, under "Related Items," click **Manage repositories**.
8. On the Global security > Federated repositories > Manage repositories page, click the identifier for the LDAP repository for which you want to disable the SSL protocol.
9. On the configuration page for the LDAP repository, configure the following items:
  - a. In the Port field, enter the port where your LDAP repository is listening for nonsecure communications; this port is usually 389.
  - b. Clear the **Require SSL communications** check box.
 Click **OK**.
10. In the messages dialog box displayed on the Manage repositories page, click the **Save** link in **Save directly to the master configuration**.
11. Log out from the WebSphere Administrative Console.
12. Log out from the Tivoli Integrated Portal Administrative Console.
13. Stop and restart the Tivoli Integrated Portal server. For information about stopping and starting the Tivoli Integrated Portal server, see the Tivoli Storage Productivity Center information center. Search for *Starting and stopping the Tivoli Integrated Portal server*.

## Removing an LDAP repository from the federated repositories

To remove an LDAP repository from the federated repositories, you must use Tivoli Integrated Portal.

If removing an LDAP repository from the federated repositories in Tivoli Storage Productivity Center leaves only the localOS repository and the file-based repository, then the use of the Tivoli Storage Productivity Center single sign-on feature is limited. Storage system element managers do not support using the localOS repository for single sign-on, even if the element manager is installed on the same system as Tivoli Storage Productivity Center. This procedure uses the variable name *TIP\_installation\_directory* to indicate where Tivoli Integrated Portal is located.

To remove an LDAP repository from the federated repositories, complete the following steps:

1. Back up the Tivoli Integrated Portal WebSphere configuration files. The WebSphere configuration backup files provide a restoration point in the event of a failure when performing this procedure. This procedure uses the variable name *TIP\_installation\_directory* to indicate where Tivoli Integrated Portal is located.
  - a. Back up the WebSphere configuration files.  
 For the AIX or Linux operating systems, run the following command:  

```
TIP_installation_directory/profiles/TIPProfile/bin/
backupConfig.sh
```

 For the Windows operating systems, run the following command:  

```
TIP_installation_directory\profiles\TIPProfile\bin\
backupConfig.bat
```
  - b. Back up the `soap.client.props` file for Tivoli Integrated Portal .  
 For the Windows operating systems, use the **copy** command to back up this file:

```
TIP_installation_directory\profiles\TIPProfile\properties\  
soap.client.props
```

For the AIX or Linux operating systems, use the **cp** command to back up this file:

```
TIP_installation_directory/profiles/TIPProfile/properties/  
soap.client.props
```

c. Back up the IBM Cognos 8.ear directory.

- For Windows operating systems:

```
TIP_installation_directory\profiles\TIPProfile\installedApps\  
TIPCell\IBM Cognos 8.ear
```

- For AIX or Linux operating systems:

```
TIP_installation_directory/profiles/TIPProfile/installedApps/  
TIPCell/IBM Cognos 8.ear
```

d. The WebSphere **backupConfig** command generates a compressed file: WebSphereConfig\_YYYY-DD-MM.zip. When you run the **backupConfig** command, the Tivoli Integrated Portal server will shut down. The Tivoli Integrated Portal server must be restarted after the **backupConfig** command is finished.

To start the Tivoli Integrated Portal server, follow these steps:

- 1) For Windows operating systems, click **Start > Administrative Tools > Services**. On the Windows Services page, right-click **Tivoli Integrated Portal - V2.2\_TIPProfile\_Port\_xxxx** where *xxxx* indicates the port specified during installation. Select **Start**.
- 2) For AIX or Linux operating systems, open a command prompt window and enter the following command:

```
TIP_installation_directory/profiles/TIPProfile/bin/  
startServer.sh
```

2. To restore the WebSphere Application Server and IBM Cognos configuration, complete the following steps:

a. Restore the WebSphere configuration by running the `restoreConfig.sh` or `restoreConfig.bat` command. The **restoreConfig** command is located here:

- For Windows operating systems:

```
TIP_installation_directory\profiles\TIPProfile\bin\  
restoreConfig.bat
```

- For AIX or Linux operating systems:

```
TIP_installation_directory/profiles/TIPProfile/bin/  
restoreConfig.sh
```

b. Restore the IBM Cognos 8.ear directory that you backed up in step 1c.

- For the Windows operating systems, use the **xcopy** command to replace the contents of this directory:

```
TIP_installation_directory\profiles\TIPProfile
```

- For the AIX or Linux operating systems, use the **cp** command to replace the contents of this directory:

```
TIP_installation_directory/profiles/TIPProfile/installedApps/  
TIPCell/IBM Cognos 8.ear
```

3. Open an Internet Explorer or Mozilla Firefox web browser, and type the following information in the address bar:

```
https://hostname:port/ibm/console/logon.jsp
```

Where *hostname* defines the server that is running Tivoli Integrated Portal such as the server name or IP address and *port* defines the port number for Tivoli Integrated Portal. If the default port range was accepted during the

installation of Tivoli Integrated Portal, the port number is 9569. Contact your Tivoli Storage Productivity Center administrator if you must verify the host name and port number.

4. On the Tivoli Integrated Portal logon page, log on using the appropriate user ID and password. Your user ID must have administrator authorization.
5. In the Tivoli Integrated Portal navigation tree, click **Settings > WebSphere Administrative Console**.
6. In the Tivoli Integrated Portal content pane, click **Launch WebSphere administrative console**.

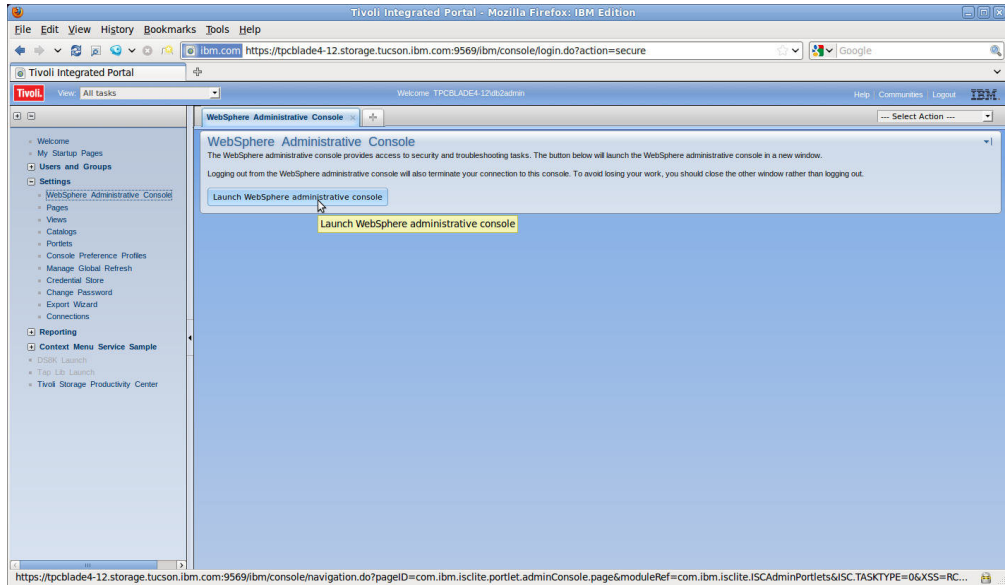

Figure 17. Launch the WebSphere administrative console

7. In the WebSphere Administrative Console navigation tree, click **Security > Global Security**.

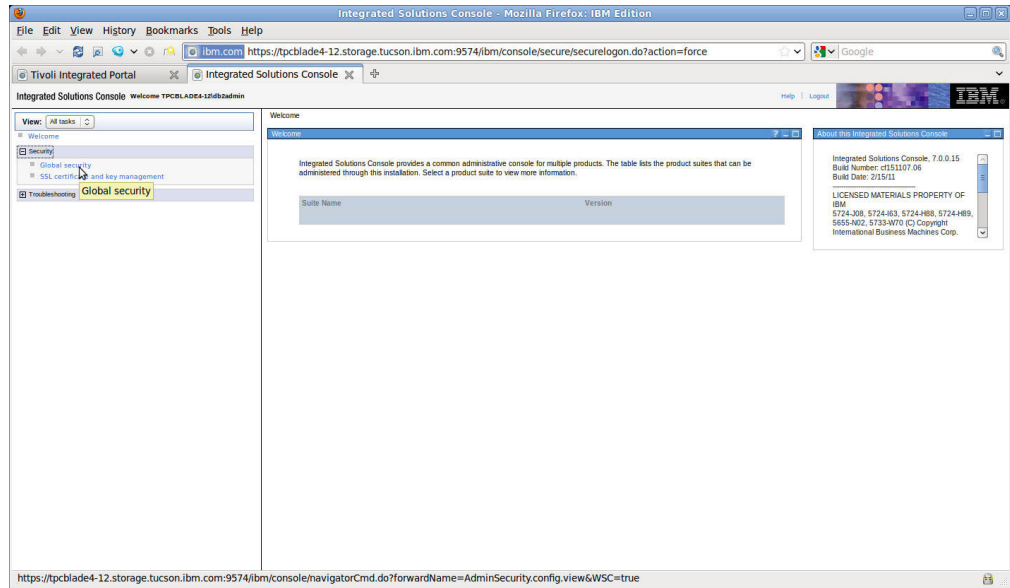

Figure 18. Opening the Global security page

- On the Global security page, in the "User account repository" section, click **Configure** next to the "Available realm definitions" drop-down list.

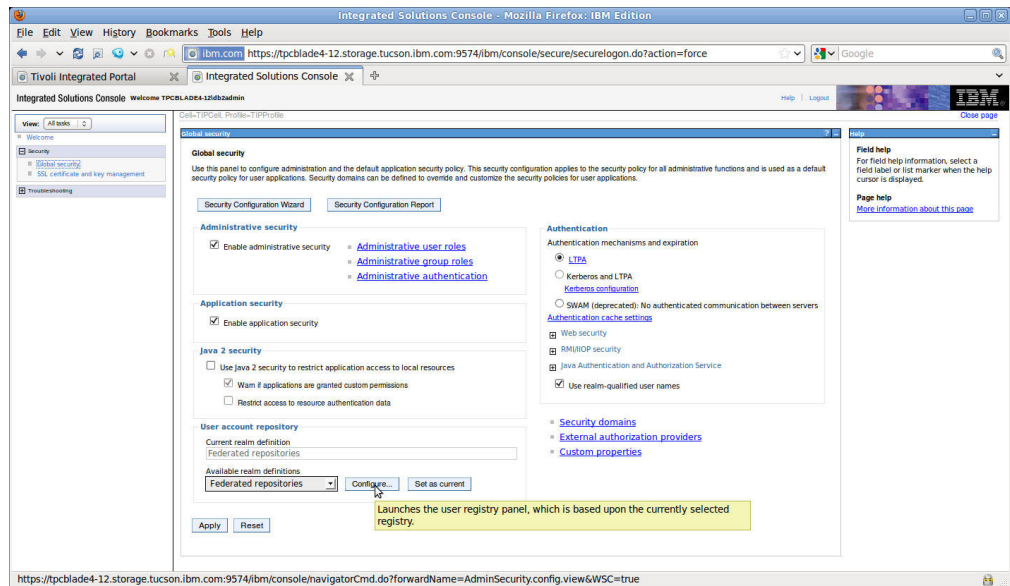

Figure 19. Configuring the available realm definitions

- On the Global security > Federated repositories page, in the "Repositories in the realm" table, select the entry for the LDAP repository you previously added. Click **Remove**.

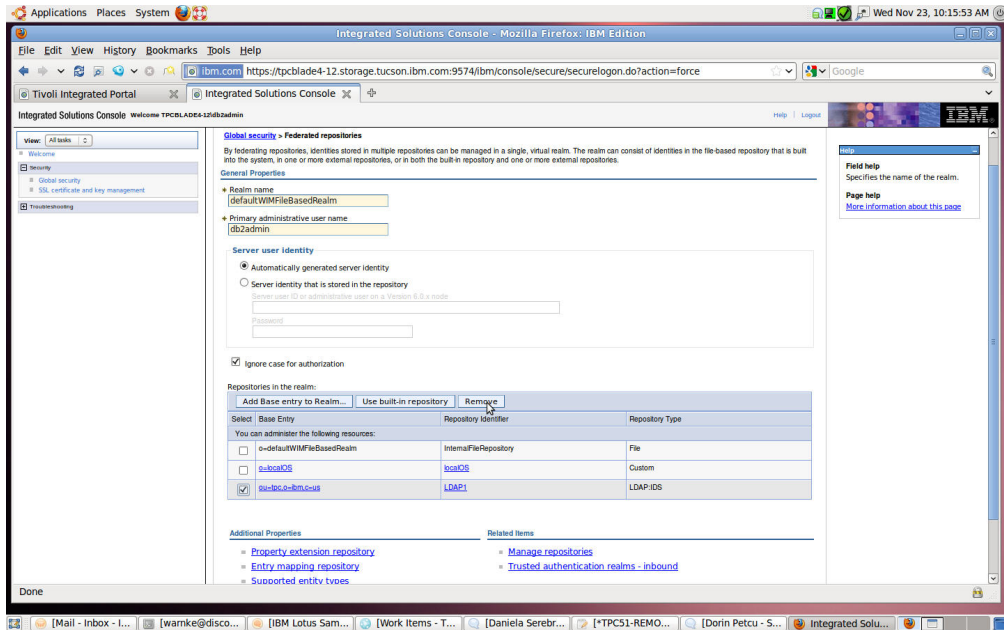

Figure 20. Removing the LDAP repository

10. In the message dialog box displayed on the Federated repositories page, click the **Save** link in **Save directly to the master configuration**.
11. On the Global security > Federated repositories page, under "Related items," click **Manage repositories**.

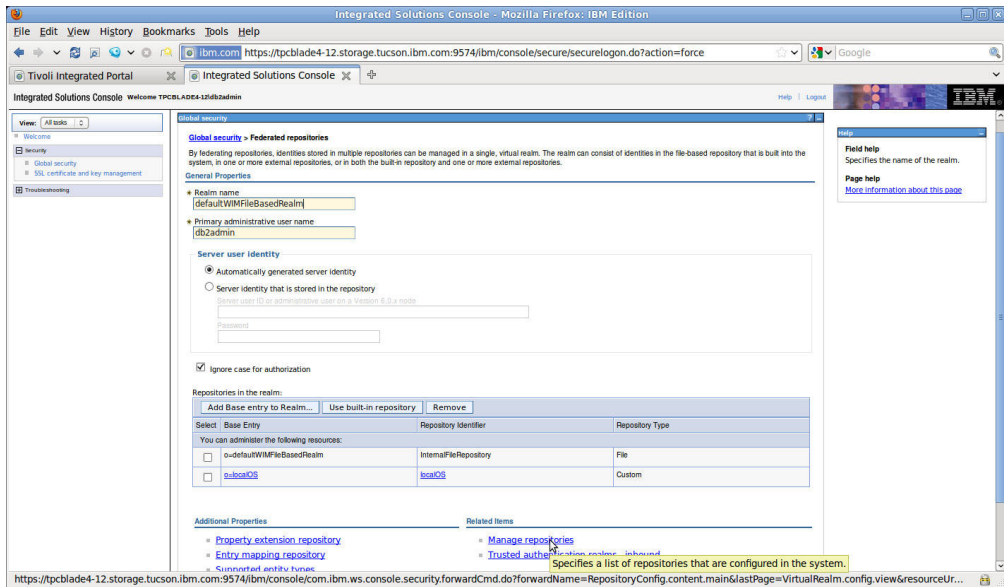

Figure 21. Managing the repositories

12. On the Global security > Federated repositories > Manage repositories page, select the entry for the LDAP repository that you previously added and click **Delete**.

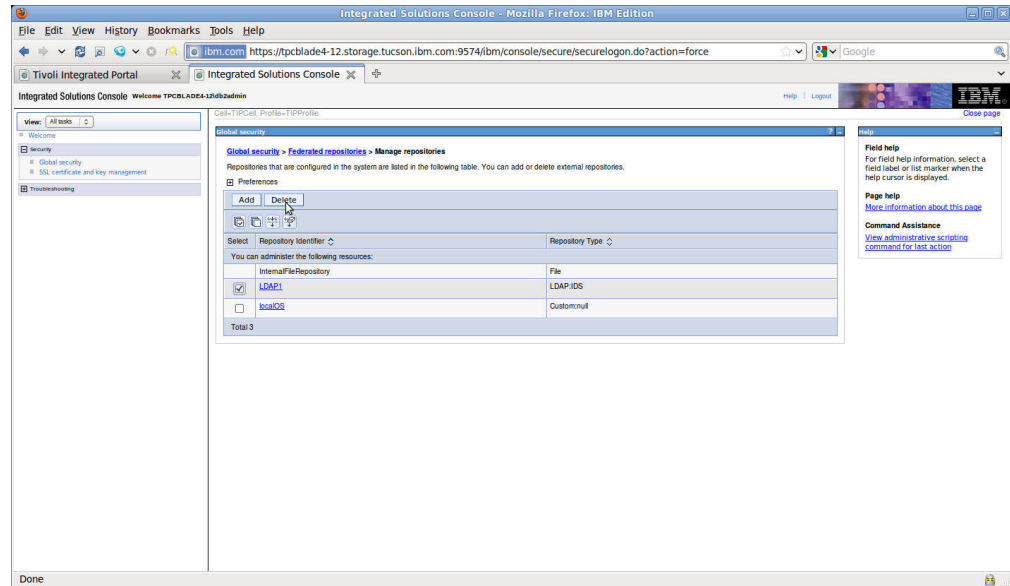

Figure 22. Deleting the LDAP repository

13. In the message dialog box displayed on the Manage repositories page, click the **Save** link in **Save directly to the master configuration**.
14. Log out from the WebSphere Administrative Console.
15. Log out from the Tivoli Integrated Portal Administrative Console.
16. Stop and restart the Tivoli Integrated Portal server. For information about stopping and starting the server, go to the Tivoli Storage Productivity Center information center. Search for *starting and stopping the Tivoli Integrated Portal server*.

**Important:** Before establishing the desired authorization configuration for Tivoli Integrated Portal, Tivoli Storage Productivity Center, and Tivoli Storage Productivity Center for Replication, you must ensure that there are no duplicated user names or group names within the local file-based repository and the localOS repository.

After you have completed the removal of the LDAP repository from the Tivoli Storage Productivity Center federated repositories authentication configuration, you should establish the desired authorization configuration for Tivoli Integrated Portal. Tivoli Integrated Portal administrators require the `iscadmins` and `administrator` roles. Operators viewing Tivoli Common Reporting reports require the `tcrPortalOperator` role. For information about user roles and groups, go to the Tivoli Integrated Portal administrative console online help. On the Welcome page, open the online help by clicking `?`. On the help welcome page, click **Using the Tivoli Integrated Portal > Users and Groups** in the navigation pane.

You should also assign Tivoli Storage Productivity Center roles to groups using the **Role-to-Group Mapping** node in the Tivoli Storage Productivity Center stand-alone GUI. You can map Tivoli Storage Productivity Center roles, such as `Tape Operator` or `Fabric Administrator`, to user groups that you create in your local operating system repository. For information about the **Role-to-Group Mapping** node, go to the Tivoli Storage Productivity Center information center. Search for *Role-to-Group Mappings*.

For information about assigning roles to users and roles to groups for Tivoli Storage Productivity Center for Replication, go to the Tivoli Storage

Productivity Center information center. Search for *Managing replication*. On the Managing replication page, click **Security**.

## Changing the LTPA token expiration for single sign-on

For single sign-on, the user authentication information is passed between applications using Lightweight Third-Party Authentication (LTPA) tokens. By default, the tokens expire after eight hours. You can change the LTPA token expiration time using the Tivoli Integrated Portal user interface.

To change the expiration time for the LTPA tokens, complete the following steps.

1. Start an Internet Explorer or Firefox web browser, and type the following information in the address bar: `https://hostname:port/ibm/console/logon.jsp` where *hostname* defines the server that is running Tivoli Integrated Portal, such as the server name or IP address, and *port* defines the port number for Tivoli Integrated Portal.

To view information about Tivoli Integrated Portal port numbers, see "Tivoli Integrated Portal port numbers" on page 229. Contact your Tivoli Storage Productivity Center administrator if you must verify the host name and port number.

2. On the Tivoli Integrated Portal logon page, log on using the appropriate user ID and password. Your user ID must have Tivoli Integrated Portal administrator authorization.
3. In the Tivoli Integrated Portal navigation tree, click **Settings > WebSphere Administrative Console**.
4. In the Tivoli Integrated Portal content pane, click **Launch WebSphere administrative console**.
5. In the WebSphere Administrative Console navigation tree, click **Security > Global security**.
6. On the Global security page, under "Authentication" and "Authentication mechanisms and expiration", ensure that the **LTPA** radio button is selected. Click the **LTPA** link.
7. On the Global security > LTPA page, under "LTPA Timeout", type the expiration time in minutes in the "LTPA Timeout value for forwarded credentials between servers" field. The default expiration time is 480 minutes (eight hours). The expiration time must be greater than the authentication cache timeout value. The authentication cache timeout value can be found by clicking the **Authentication cache settings** link in the "Authentication" section of the Global security page. The default authentication cache timeout value is 10 minutes. Click **OK**.
8. In the messages dialog box displayed on the Global security page, click the **Save** link in **Save directly to the master configuration**.
9. Log out from the WebSphere Administrative Console.
10. Log out from the Tivoli Integrated Portal Administrative Console.
11. Stop and restart the Tivoli Integrated Portal server. For information about stopping and starting the server, go to the Tivoli Storage Productivity Center information center. Search for *starting and stopping the Tivoli Integrated Portal server*.

---

## Administering data sources

Use the following topics for information about how to administer CIM agents, Storage Resource agents, out-of-band Fabric agents, storage systems, Tivoli Storage Productivity Center servers, and VMware VI data sources.

### Checking the health of your data sources

This topic provides information about checking the health of your data sources.

The storage systems that use the native interfaces (for example, DS8000, the XIV system, SAN Volume Controller, and Storwize V7000) do not use CIMOM agents. Once you successfully connect to the storage system, Tivoli Storage Productivity Center can display the status.

Expand **Administrative Services > Data Sources** and left-click the following nodes:

- **CIMOM Agents**
- **Data/Storage Resource Agents**
- **Inband Fabric Agents**
- **Out of Band Fabric Agents**
- **Storage Subsystems**
- **TPC Servers**
- **VMware VI Data Source**

A list of data sources is displayed in the content pane. If the agents are up and running, there is a green health status icon in the State column. For the CIMOM Agents and Storage Subsystems, a green health status icon is displayed in the Connection Status column.

### Manually changing the Windows service logon for the agent

This topic describes how to change the Windows service logon for the Common agent.

To change the Windows service logon for the Common agent, complete the following steps:

1. In Windows, open the Services panel: **Start > Settings > Control Panel > Administrative Tools > Services**.
2. On the Services panel, right-click **IBM Tivoli Common agent - 'C:\Program Files\IBM\TPC\ca'**. Select **Properties**.
3. Select the Log On tab. Change **This account** field with your changed logon ID. If your Tivoli Storage Productivity Center server is part of a Windows domain, change this logon to <domain>\<account>. For example, **mydomain\myaccount**. Enter the password if you have changed the password. Click **Enable** and then **OK**. The Common agent requires that the domain account have local administrator privileges as well as "Log on as a service" and "Act as part of the operating system" user rights.

### CIM agents

Common Information Model (CIM) agents provide a CIM interface for storage entities. IBM Tivoli Storage Productivity Center uses CIM agents to collect information about the entities that you want to monitor.

These entities include IBM TotalStorage Enterprise Storage Server, IBM System Storage DS4000, IBM System Storage DS5000 Storage Manager, IBM System Storage DS6000, tape, switch, and any SMI-S certified Common Information Model Object Manager (CIMOM).

CIM agents are no longer required for the following storage systems:

- System Storage DS8000
- SAN Volume Controller
- The XIV system
- Storwize V7000
- Storwize V7000 Unified
- IBM SONAS

Before you can monitor the entities that are managed by CIM agents, you must configure the agents in the Tivoli Storage Productivity Center user interface. Use either of the following methods to add a CIM agent:

- Use the Configure Devices wizard to automatically add a CIM agent and discover the entities that it manages. For more information, see “Configure Devices wizard” on page 307.
- Manually add the CIM agent using the **CIMOM Agents** node under **Administrative Services > Data Sources** in the navigation tree. For more information, see “Adding a CIM agent connection.”

After you manually add a CIM agent, you must run a discovery to detect the entities that it manages. For more information about the discovery process, see “Discover storage subsystem, tape library, and fabric information with CIM agents” on page 333 and “Discover CIM agents automatically” on page 252.

## Adding a CIM agent connection

CIM agents provide a Common Information Model (CIM) interface for management applications. This topic discusses how to add a CIM agent connection.

You can add a CIM agent connection to Tivoli Storage Productivity Center by using the Configure Devices wizard or use the manual steps in this procedure.

To add a CIM agent connection using the Configure Devices wizard, see “Configure Devices wizard” on page 307.

To add a CIM agent connection to Tivoli Storage Productivity Center manually, complete the following steps:

1. In the Navigation Tree pane, expand **Administrative Services > Data Sources** and click **CIMOM Agents**.
2. In the content pane, click **Add CIMOM**. The Add CIMOM window opens.
3. Specify information about the CIM agent:

**Host** The hostname of the computer on which the CIMOM is installed. For element managers, you can enter a host name, IPv4, or IPv6 address depending on what is supported within your environment:

- Enter an IPv4 address in the following format: `###.###.###.###`. For example: 192.168.1.65
- Enter an IPv6 address. The preferred IPv6 address representation is written as eight groups of four hexadecimal digits: `xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx`, where each x is a

hexadecimal digit representing 4 bits. For example:  
2001:DB8:0000:1234:0000:0000:5678:ABCD. You can also specify IPv6 addresses using shortened formats that omit leading zeros  
2001:DB8:0:1234:0:0:5678:ABCD or use double colons  
2001:DB8:0000:1234::5678:ABCD in place of a series of zeros.

You can enter an IPv6 address for a CIMOM if the computer where IBM Tivoli Storage Productivity Center is installed is IPv6 or dual stack (IPv4 and IPv6) enabled.

**Port** The port on which the CIMOM is listening. By default this port is 5989 for a secure connection and 5988 for an unsecured connection. See the documentation for the appropriate SMI-S CIM Provider for more information about available ports.

**Username**

The user ID used for authentication, if required by the CIMOM.

**Password**

The password, if required by the CIMOM.

**Interoperability Namespace**

This namespace within the CIMOM allows for accessing the CIM Interop Schema (including the class instances of the Server Profile) and determines how IBM Tivoli Storage Productivity Center interacts with the CIMOM when retrieving information. For information about the namespace to use, see <http://www-01.ibm.com/support/docview.wss?uid=swg21386446>. Click the appropriate version for **Switches & Directors**.

To view a list of default namespaces for CIMOM agents for storage subsystems that is included with Tivoli Storage Productivity Center, open the following file in a text editor: *install\_directory/data/config/namespace.config*, where *install\_directory* represents the directory where the product is installed.

Check the documentation of the appropriate SMI-S CIM Provider or contact the storage system vendor to ensure that you use the most current namespaces.

**Protocol**

The version of the cim-xml protocol. Can be http or https.

**Display Name**

The name of the CIMOM, as specified by the CIMOM provider, to be displayed in the Tivoli Storage Productivity Center interface.

**Description**

An optional description of the CIMOM. This description can be any combination of alphanumeric characters.

**Test CIMOM connectivity before adding**

Select this option to have Tivoli Storage Productivity Center ensure that communication to the CIMOM is working properly before adding information about that CIMOM.

4. Click **Save**.

This procedure does not physically add a CIMOM, but adds the information you have given about the CIMOM to Tivoli Storage Productivity Center so that Tivoli Storage Productivity Center can communicate with the CIMOM.

## Discover CIM agents automatically

This topic discusses how to discover storage subsystem CIMOMs that are visible to the Device server using Service Location Protocol (SLP).

In many cases CIM agents can be automatically discovered using SLP. The criteria is that the CIM agent must be visible to the Device server.

To automatically discover all CIM agents that are visible to the Device server, complete the following steps:

1. In the navigation tree pane, expand **Administrative Services > Discovery** and click **CIMOM**.
  - a. Click the **Options** tab.
  - b. Enter the IP address or host name for the SLP directory agents for CIMOM discovery. Or select the **Scan local subnet** check box.
  - c. Click **File > Save** on the menu bar to save the information.
2. Right-click **CIMOM** and click **Run Now**.
3. After you submit a CIMOM discovery job, a message window is displayed with the text **CIMOM Discovery Job submitted**. Click **OK**. The job name is located in the navigation tree after **CIMOM**. While it is running, the CIMOM job has a blue circle outline by the job name.
4. To determine if the job has completed, right-click **CIMOM** and click **Update Job Status**. If the job has completed successfully, a green box is shown by the job name. If the job has completed but failed, a red circle is shown.

**Note:** The job returns as failed if one or more sub-jobs failed. Some CIMOMs might still have been discovered.

5. After the job completes, the discovered CIM agents are listed in the **CIMOM Agents** table. Expand **Administrative Services > Data Sources** and click **CIMOM Agents**.
6. For each CIM agent that you want to use, highlight the CIM agent and click the magnifying glass for the listing. You must select the CIM agents one at a time. The **CIMOM Agents** window is opened.
7. Enter additional information for the CIM agent, such as the user name and password, and select the **Test CIMOM connectivity before updating** check box.
8. Click **File > Save** on the menu bar to save the information and perform a connectivity check.

**Note:** This procedure does not physically add the CIM agent to your environment, but provides IBM Tivoli Storage Productivity Center with the information it needs to communicate with that CIM agent. This includes information that you have defined and CIM agents discovered using SLP.

## Viewing information about a CIM agent

Use panels and reports in IBM Tivoli Storage Productivity Center to view detailed information about a CIM agent.

Use the following reports to view information about a CIM agent:

- In the Navigation Tree pane, expand **IBM Tivoli Storage Productivity Center > Reporting > Data Source Reports > CIMOM Agents** and click **By CIMOM Agent** or **By Managed Device**. See “Data source reports - CIMOM agents” on page 1133 for more information about these reports.

- In the Navigation Tree pane, expand **Administrative Services > Data Sources** and click **CIMOM Agents**. A list of CIM agents appears in the content pane. Click the magnifying glass next to a CIM agent to view the following information about that agent:

**Service URL**

The service URL of the CIMOM containing the IP address of the CIMOM, the port on which the CIMOM is listening, and the protocol used for communication. This URL has a protocol [http|https], an IP or Hostname, and a port number. This field displays IPv4 and IPv6 addresses as appropriate.

**Display Name**

The name of the CIMOM as specified by the CIMOM provider that will appear in the IBM Tivoli Storage Productivity Center interface.

**Description**

The optional description that was entered on the Add CIMOM window.

**Username**

The CIMOM user ID used for authentication.

**Password**

The password for the CIMOM.

**Interoperability Namespace**

Enter the interoperability namespace of the CIMOM. This namespace within the CIMOM allows for accessing the CIM Interop Schema (including the class instances of the Server Profile) and determines how Tivoli Storage Productivity Center interacts with the CIMOM when retrieving information.

**Truststore Location**

The location (path on this computer) of a certificate file for certificate based authentication in the https protocol.

**User Interface Description**

The name of the Human Interface Service (if any) supported by this CIMOM.

**Software Level**

The software version level of the CIMOM agent.

**Protocol Version**

The version of the cim-xml protocol.

**Authentication Mechanism**

The authentication mechanism supported by the CIMOM. This field can contain the following values: Unknown, None, Other, Basic, Digest.

**Alias** The alias of the CIMOM.

**Service ID**

The service ID for the CIMOM.

**Protocol**

The communication protocol used for the CIMOM. Possible values are http and https.

**SLP Attributes**

The standard set of attributes for this CIMOM. The attributes are retrieved via SLP.

**Connection Status**

The status of this CIMOM with respect to Tivoli Storage Productivity Center. Possible values are: SUCCESS, UNCONFIGURED, UNKNOWN, INVALID\_NAMESPACE, TIMEOUT, REFUSED, LOGIN\_FAILED, SSL\_HANDSHAKE\_ERROR, SSL\_REGISTRATION\_INVALID, CIMCLIENT\_ERROR

**Status Timestamp**

The date/time when the Connection Status information was last collected.

**Test CIMOM connectivity before updating**

If this box is checked Tivoli Storage Productivity Center ensures that communication to the CIMOM is working properly before making any changes.

**Updating CIM agent user identification**

After a CIM agent has been added to the **CIMOM** node, you can update the user ID, password, and other information.

To update the CIM agent user identification, follow this procedure:

1. In the Navigation Tree window, expand **Administrative Services > Data Sources**. Left-click **CIMOM**.
2. In the content pane, click the magnifying glass icon for the agent for which you want to change information.
3. Information about the CIM agent is displayed in the Information window. The fields which can be updated are:

**Display Name**

The name of the CIM agent, as specified by the CIMOM provider, that will appear in the IBM Tivoli Storage Productivity Center interface.

**Description**

The optional description of the CIM agent that was entered on the Add CIMOM Agent window. Tivoli Storage Productivity Center

**Username**

The user ID used for authentication, if required by the CIM agent.

**Password**

The password for the CIM agent, if required by the CIM agent.

**Interoperability Namespace**

This namespace within the CIM agent allows for accessing the CIM Interop Schema (including the class instances of the Server Profile) and determines how Tivoli Storage Productivity Center interacts with the CIM agent when retrieving information.

**Test CIMOM connectivity before updating**

Check box. Check this box to have Tivoli Storage Productivity Center ensure that communication to the CIM agent is working properly before updating information about that CIM agent.

4. Save your changes by clicking the **Save** icon.
  - If you have selected **Test CIMOM connectivity before updating**, the CIMOM connectivity check will be run when you save the changes.
  - If **Test CIMOM connectivity before updating** is not selected, a discovery will be started immediately after you save the changes.

## Testing a CIM agent connection

Manually check to make sure that communication to the CIM agent is working properly.

To test a CIM agent connection, follow this procedure:

1. In the Navigation Tree, expand **Administrative Services > Data Sources**. Left-click **CIMOM**.
2. In the content pane, select a CIM agent. Click **Test CIMOM Connection**. a confirmation dialog appears: "Testing CIMOM connectivity can take up to several minutes in case of an incorrectly entered port number, network problems or an unpassed firewall. Would you like to continue anyway?" Select **yes** to perform the CIMOM connection test.
3. To close the Test CIMOM Connection window, click **OK**.

## Removing a CIM agent

You can remove a CIM agent from the navigation tree and the repository database. Data discovered by the CIM agent is not removed from the repository.

To remove a CIM agent, follow this procedure:

1. In the Navigation Tree pane, expand **Administrative Services > Data Sources**. Click **CIMOM Agents**.
2. In the content pane, select a CIM agent. Click **Remove CIMOM**.
3. The Remove CIMOM confirmation window opens. Click **Yes**. The CIM agent is immediately deleted from the list.

## Show managed devices for a CIM agent

You can display the managed devices for a CIM agent.

To show the managed devices for a CIM agent, follow these steps:

1. In the Navigation Tree pane, expand **Administrative Services > Data Sources**. Click **CIMOM Agents**.
2. In the content pane, select a CIM agent. Click **Show Managed Devices**.
3. The CIMOM Managed Devices window opens displaying the managed devices. Click **OK** to close the window.

## Collecting CIM agent logs

You can collect logs for certain IBM CIM agents using the command line interface.

**Remember:** Storage systems that use the native interfaces (for example, DS8000, the XIV system, SAN Volume Controller, and Storwize V7000) do not use CIM agents.

1. Change to the directory where the CIM agent is installed.
  - On Linux operating systems, DS3000, DS4000, DS5000, DS6000 are installed at `/opt/IBM/cimagent/cimom`
  - On Windows operating systems, DS3000, DS4000, DS5000, DS6000 are installed at `C:\Program Files\IBM\cimagent\cimom`
2. Run one of the following commands:

**On Linux operating systems**  
`collectLogs.sh`

**On Windows operating systems**  
`collectLogs.bat`

A **collectedLogs.zip** file is created.

**Important:** This file is overwritten if you run the script again.

### Verifying that a CIM agent is running

You can verify that a CIM agent is running from the command line interface.

To verify that a CIM agent is up and running, run the following command:

```
telnet <IP> <port>
```

Where <IP> is the IP address of the system where the CIM agent is installed, and <port> is the port number. By default, this is 5989 for a secure connection and 5988 for an unsecure connection.

## Storage Resource agents

This topic provides information about administering, configuring, and viewing information about Storage Resource agents.

See “Deployment guidelines and limitations for Storage Resource agents” on page 118 for information about deploying Storage Resource agents.

### Viewing information about an agent

View detailed information about a Storage Resource agent.

To view information about a Storage Resource agent from the Tivoli Storage Productivity Center GUI, complete the following steps:

1. In the navigation tree, click **Administrative Services > Data Sources**. Left-click **Data/Storage Resource Agents**.
2. In the content pane, click the magnifying glass icon for an agent under the list of agents. In the content pane, a notebook window opens. On the General page, the following information is displayed:

**Agent** Displays the name of an agent and indicates whether the agent is up or down.

**Port** Displays the port number on which an agent is listening for requests.

**Installation Location**

Displays where the agent is installed.

**Host Address**

Displays the host address of the computer on which an agent is running.

**Last update**

Displays the date and time when an agent was last updated.

**Time Zone**

Displays the current time zone for an agent.

**Connection Errors**

Displays any connection errors that occurred for an agent.

**Consecutive Errors**

Displays how many errors occurred consecutively.

**HBA Data**

Displays information about the HBA installed.

3. Click the **Details** tab to view more detailed information. The following information is displayed:

**Agent** Displays the name of the agent.

**Host** Displays the host name of the system on which the agent is running.

**Host ID**

Displays the identifier of the host computer in hexadecimal format. Tivoli Storage Productivity Center collects only Host ID information for Solaris systems. All other platforms display GUID information in the Host ID column.

**Start Time**

Displays the date and time that the agent was started.

**Elapsed Time**

Displays the time elapsed since the agent was last updated.

**VM Size**

Displays the size (in MB) of the disk space that is allotted to virtual memory for an agent. This value does not apply to Storage Resource agents. This size applies only to the size of the Java virtual machines for the agents.

**Manufacturer**

Displays the manufacturer of the system.

**OS Type**

Displays the operating system that is running on the system.

**CPU Architecture**

Displays the architecture of the system.

**Job Count**

Displays the number of jobs scheduled to run against the agent.

4. Click the **Jobs** tab to view information about the jobs scheduled to run on the managed system.

### Viewing an agent log file

The log file for a Storage Resource agent contains informational, warning, and error messages for the previous sessions of the agent. You can use the log file to troubleshoot errors that might occur when starting an agent, processing, or shutting down the agent.

The log file is located in the agent installation directory:

**Storage Resource agents**

For Windows default: C:\Program Files\IBM\TPC\agent\log\  
<computer\_name>\agent.log.

For Linux or AIX (default): /opt/IBM/TPC/agent/log/  
<computer\_name>agent.log.

To view the log for a Storage Resource agent, complete the following steps:

1. In the navigation tree, click **Administrative Services > Data Sources**. Left-click **Data/Storage Resource Agents**.
2. In the content pane, select an agent and click **View Log**.

### Migrating a Data agent

Migrate a selected Data agent to a Storage Resource agent.

Tivoli Storage Productivity Center provides the following benefits when you migrate an existing Data agent or Inband Fabric agent to a Storage Resource agent:

- Storage Resource agents require less resources on a host computer than a Data agent or Fabric agent that is based on Common Agent Services. Additionally, you can deploy a Storage Resource agent as a daemon or non-daemon service.
- Reduced complexity when deploying agents. You can deploy Storage Resource agents directly from the Tivoli Storage Productivity Center user interface and they do not require you to install Agent Manager.
- Improved interface when deploying, upgrading, and administering agents. You can manage Storage Resource agents using the nodes in the **Administrative Services** section of the navigation tree. You can deploy and upgrade Storage Resource agents on schedules that you define.

To migrate a Storage Resource agent from the **Administrative Services > Data Sources** node in the user interface, complete the following steps:

1. In the navigation tree, expand **Administrative Services > Data Sources**. Left-click **Data/Storage Resource Agents**.
2. In the content pane, click **Migrate Agents**.
3. The Create Data/Fabric Agent Migration panel is displayed. Use this panel to schedule the migration of Data agents and Inband Fabric agents to Storage Resource agents.
4. Select **File > Save** to save the migration schedule. The agents on the computers that you specified are migrated according to the schedule that you defined.

The migration process deploys a Storage Resource agent on the target computer and then uninstalls the Data agent. The new Storage Resource agent retains the existing scheduled jobs that were defined for the Data agent. The scripts and batch reports for the Data agent are copied over to the Storage Resource agent. If for any reason the migration fails, Tivoli Storage Productivity Center restores the Data agent so that it can continue to monitor the target computer.

## Migrate Data/Fabric Agent

Define schedules to migrate existing Data agents or in-band Fabric agents to Storage Resource agents. The migration process deploys a Storage Resource agent on a target host and then uninstalls the existing agent.

Tivoli Storage Productivity Center provides the following benefits when you migrate an existing Data agent or in-band Fabric agent to a Storage Resource agent:

- Storage Resource agents require less resources on a host computer than a Data agent or Fabric agent that is based on Common Agent Services. Additionally, you can deploy a Storage Resource agent as a daemon or non-daemon service.
- Reduced complexity when deploying agents. You can deploy Storage Resource agents directly from the Tivoli Storage Productivity Center user interface and they do not require you to install Agent Manager.
- Improved interface when deploying, upgrading, and administering agents. You can manage Storage Resource agents using the nodes in the **Administrative Services** section of the navigation tree. You can deploy and upgrade Storage Resource agents on schedules that you define.

To migrate a Data agent or Fabric agent to a Storage Resource agent from the **Administrative Services > Configuration** node in the user interface, complete the following steps:

1. Use either of the following methods to access the panel for scheduling an agent migration:
  - Expand **Administrative Services > Data Sources** in the navigation tree. Left-click **Data/Storage Resource Agents**. In the topic pane, click **Migrate Agents**.
  - Expand **Administrative Services > Configuration** in the navigation tree. Right-click **Migrate Data/Fabric Agent** and select **Create Data/Fabric Agent Migration** from the menu.

The content pane displays a panel for defining a migration schedule.

2. Use the following pages on the panel to define information about the migration:

#### **Computers**

Use this page to select the computers and groups of computers that contain the Data and Fabric agents that you want to migrate to Storage Resource agents.

#### **When to Run**

Use this page to determine when the Data and Fabric agents in a schedule are migrated.

#### **Options**

Use this page to specify the runtime settings of a Storage Resource agent, the method for migrating an agent, and the login credentials for an agent. If you include multiple agents in a migration schedule, the settings that you define on this panel are applied to all those agent migrations.

**Alerts** Use this page to define the actions that occur if a Data/Fabric Agent Migration schedule fails.

3. Select **File > Save** to save the migration schedule. The agents on the computers that you specified are migrated according to the schedule that you defined.

The migration process deploys a Storage Resource agent on the target computer and then uninstalls the Data agent. The new Storage Resource agent retains the existing scheduled jobs that were defined for the Data agent. The scripts and batch reports for the Data agent are copied over to the Storage Resource agent.

## **Upgrading the Storage Resource agent by using the Data Sources node**

Use this information to upgrade a previous Storage Resource agent to the current release.

To upgrade a Storage Resource agent, follow these steps:

1. In the navigation tree, expand **Administrative Services > Data Sources**. Left-click **Data/Storage Resource Agents**.
2. In the topic pane, select one or more agents for which you want to upgrade. Click **Upgrade Agents**.
3. The Create Storage Resource Agent Upgrade page is displayed. Use this page to schedule an upgrade of the Storage Resource agent. You have the following tabs:

#### **Computers**

You can select Computer Groups or Computers.

#### **When to Run**

You can specify how often to run the job or how to handle time zones.

### Options

You can specify to force an upgrade for an agent, maintenance upgrade for an agent, or language pack to apply to an agent.

**Alerts** You can specify the triggering conditions and triggering actions.

Enter your information in the appropriate fields.

4. Save and run the job.

**Note:** The Storage Resource agent upgrade job delivers the software upgrade packages to the agent computer. The job log displays the status of the delivery. The actual status of the upgrade is found in the agent log on the agent computer. If the agent log indicates that the upgrade failed and the state of the Storage Resource agent remains in the “Upgrading agent software status”, try restarting the agent and running the upgrade job again.

## Storage Resource Agent Upgrades

You can configure IBM Tivoli Storage Productivity Center for a Storage Resource agent upgrade.

When you apply maintenance to Tivoli Storage Productivity Center, you can upgrade the Storage Resource agent now or upgrade the agent at a later time. To ensure that all your agents are at the current release level and to manage your network load, schedule upgrades on a regular basis.

To configure Tivoli Storage Productivity Center for a Storage Resource agent upgrade, complete the following steps:

1. In the navigation tree, expand **Administrative Services > Configuration > Storage Resource Agent Upgrades**.
2. Right-click on **Storage Resource Agent Upgrades**. Click **Create Storage Resource Agent Upgrade**.
3. The Create Storage Resource Agent Upgrade page is displayed in the topic pane. You have the following tabs:

### Computers

You can select Computer Groups or Computers.

### When to Run

You can specify how often to run the job or how to handle time zones.

### Options

You can specify to force an upgrade for an agent, maintenance upgrade for an agent, or language pack to apply to an agent.

**Alerts** You can specify the triggering conditions and triggering actions.

Enter your information in the appropriate fields.

4. Save and run the job.

## Configuring tracing for an agent

You can configure and enable tracing for a Storage Resource agent. This provides extensive logging of exception and trace messages; it can provide useful information for the IBM Support center.

You must have administrator authority to perform this procedure.

To configure tracing for a Storage Resource agent, complete the following steps:

1. In the navigation tree, click **Administrative Services > Data Sources** . Left-click **Data/Storage Resource Agents**.
2. In the topic pane, select a Storage Resource agent. Under the Select Action menu, click **Configure Tracing**. The Tracing Configuration window opens.
3. Select the **Enable Trace** check box.
4. Specify the tracing options:
  - a. In the **Level** field, select one of the following options:
    - DEBUG\_MIN**  
Minimum level of debugging
    - DEBUG\_MID**  
Medium level of debugging
    - DEBUG\_MAX**  
Maximum level of debugging
  - b. In the **Maximum Number of Files** field, specify the maximum number of trace files that are created. When this number is reached, the oldest file is overwritten. By default, this value is set to five.
  - c. In the **Maximum File Size (kilobytes)** field, specify the maximum size of each trace file.
5. Click **OK**. The settings are saved to the AgentTraceLog.config file

### Disabling an agent

You can disable a Storage Resource agent. Disabling the agent signifies that the Storage Resource agent is unavailable and the Data server should not contact that agent for any job processing.

You might want to disable a Storage Resource agent in the following situations:

- The agent computer is undergoing maintenance and is unavailable. This action prevents the server from flagging the agent as "down" if it cannot reach the agent. The amount of times that the server tries to contact the agent is defined by the **agentErrorLimit** parameter in the `server.config` file.
- The agent computer is busy with resource-intensive processing and you do not want to add any jobs to that processing load.

While disabled, the agent name in the user interface is outlined with a red circle with a line through it. The server does not attempt to contact the agent.

To disable a Storage Resource agent, complete the following steps:

1. In the navigation tree, click **Administrative Services > Data Sources > .** Left-click **Data/Storage Resource Agents**.
2. In the topic pane, select a Storage Resource agent. Under the Select Action menu, click **Disable**.

### Enabling an agent

You can enable an agent that is currently disabled. After it is enabled, the Data server resumes communication with that agent. This action is available for disabled agents only.

If the server cannot contact an agent, the server automatically flags the agent as "down". Click **Enable** to reestablish communication between the agent and server. The number of times the server tries to contact the agent is specified in the **agentErrorLimit** parameter in the `server.config` file. The default is 3.

The default directory for the `server.config` file is:

#### Windows

`C:\Program Files\IBM\TPC\Data\config`

#### Linux or UNIX

`/opt/IBM/TPC/Data/config`

**Tip:** Clicking **Check** also enables an agent that is disabled.

To enable an agent, complete the following steps:

1. In the navigation tree, click **Administrative Services > Data Sources**. Left-click **Data/Storage Resource Agents**.
2. In the content pane, select an agent. Under the Select Action menu, click **Enable**.

### Shutting down an agent

You can shut down Storage Resource agents (run as daemon processes) from the graphical user interface.

To shut down an agent, complete the following steps:

1. In the navigation tree, click **Administrative Services > Data Sources**. Left-click **Data/Storage Resource Agents**.
2. In the topic pane, select a Storage Resource agent. Under the **Select Action** menu, click **Shutdown**. This button is unavailable for Storage Resource agents that are deployed as non-daemons.
3. Select how you want an agent to shut down. You can select from the following options:

#### Normal

Shut down the agent software and let all running processes complete. The agent continues to accept new jobs that are submitted and is not shut down until the following conditions are met:

- All running processes are complete.
- There are no new jobs submitted.

#### Immediate

Shut down the agent software when the currently running processes complete. No new jobs are accepted by the agent and shutdown occurs immediately after the last job completes.

**Abort** Shut down the agent software and stop whatever processes are currently running.

For Storage Resource agents that are run as daemon processes, click **Start** on the Data/Storage Resource agent page to start those agents. See “Starting a Storage Resource agent” for more information about how to start Storage Resource agents.

### Starting a Storage Resource agent

You can start a Storage Resource agent if the daemon process for that Storage Resource agent is down.

You can only perform this task for Storage Resource agents running as a daemon service.

To start a Storage Resource agent, complete the following steps:

1. In the navigation tree, click **Administrative Services > Data Sources**. Left-click **Data/Storage Resource Agents**.
2. In the content pane, select a Storage Resource agent. Under the **Select Action** menu, click **Start**.
3. Enter the user ID and password that Tivoli Storage Productivity Center uses when logging in to the host computer for a Storage Resource agent and click **Ok**.

## Checking whether an agent can communicate with the Data server

You can check whether an agent can communicate with the Data server.

To check an agent, complete the following steps:

1. In the navigation tree, click **Administrative Services > Data Sources**. Left-click **Data/Storage Resource Agents**.
2. In the topic pane, select an agent and click **Check**.

This operation verifies that the Data server can communicate with the host system where the Storage Resource agent is deployed with the appropriate authentication information. After verifying that the Data server can communicate with the selected agent, the process checks for the existence of the runtime files for Storage Resource agents.

## Changing authentication for a Storage Resource agent

There are times when you might need to change the user ID, password, and certificate location for a Storage Resource agent.

To change the authentication for a Storage Resource agent, follow these steps:

1. In the navigation tree, expand **Administrative Services > Data Sources**. Left-click **Data/Storage Resource Agents**.
2. In the content pane, select one or more Storage Resource agents for which you want to change authentication information. Use ctrl + click or shift + click to select multiple agents.
3. Click **Change Authentication** from the **Select Action** menu.
4. In the Change Authentication window, enter the following information:

**User** Enter the user ID that IBM Tivoli Storage Productivity Center should use when logging on to the computer on which the Storage Resource agent is installed.

**Requirement:** This ID must have administrative or root privileges when installing a Storage Resource agent on a computer.

### Password

Enter the password.

### Certificate Location

Enter the fully qualified path of the certificate on the computer where the Data server is located. This file is used for certificate-based authentication. If you do not enter a value in this field the default location is used. When deploying Storage Resource agents, Tivoli Storage Productivity Center uses the Secure Shell (SSH) protocol to communicate with the target computer.

### Passphrase

Enter the passphrase for the certificate file. The passphrase was created when the certificate was generated.

Click **Save**.

#### Related Tasks:

See **Planning > General Planning > Planning for Storage Resource agents** section in the *IBM Tivoli Storage Productivity Center Installation and Configuration Guide* for additional configuration information about certificates used after deployment.

### Adding Storage Resource agents

You can add Storage Resource agents to your system by scheduling a job or by adding an agent immediately.

To add a Storage Resource agent, complete the following steps:

1. In the navigation tree, click **Administrative Services > Configuration**. Right-click **Storage Resource Agent Deployments**. On the menu, click **Create Storage Resource Agent Deployments**.
2. The Create Storage Resource agent Deployments window opens displaying the Computers page. Enter the following information:

#### Header fields

##### Creator

Predefined creator name.

**Name** Predefined name.

##### Description (optional)

Enter a user-defined description name for the job.

##### Enabled

Check this box to enable Storage Resource agent deployments.

#### Add Host List

Click this button to manually enter names and logon credentials for the computers on which you want to deploy Storage Resource agents.

If you click this button, the Login Information window opens. You can enter information in the following ways:

- Click **Add Agents from MS Directory** to install Storage Resource agents on one or more Windows computers that are members of a Windows domain. Enter the domain controller name and login information about the displayed window. On the next window, select the domain and click **Get List of Domain Computers**. The host names of computers that you add using this method are displayed in the **Remote Agent Machines** section of the window. In that section, you can also specify an installation location for each computer and indicate whether you are reinstalling a Storage Resource agent on a computer.
- Click this button to retrieve a list of computer names from a flat text file. The computers listed in the file are automatically added to the deployment schedule and displayed in the **Remote Agent Machines** section. In that section, you can also specify an installation location for each computer and indicate whether you are reinstalling a Storage Resource agent on a computer.

The file that you retrieve must contain one host name or IP address per line. For example:

systemxyz.storage.usa.ibm.com  
9.79.179.179  
systemzyx.storage.usa.ibm.com  
9.89.189.189

If Tivoli Storage Productivity Center discovers any syntax problems in the file, none of the host entries in the file are added to the deployment job.

- In the **Remote Agent Machines** section, enter the names or IP addresses of the computers where you want to deploy the Storage Resource agents. Specify the installation location for the Storage Resource agent runtime files. If you do not enter an installation location, the default location is used. The default installation directories are:
  - For Windows: C:\Program Files\IBM\TPC\agent
  - For Linux and UNIX: /opt/IBM/TPC/agent
- Select **Force** under the following circumstances:
  - If an earlier Storage Resource agent installation failed and there are damaged agent files on the computer that cause further installations to fail. If you select this option, Tivoli Storage Productivity Center attempts to overwrite the previous failed deployment on the computer with a new Storage Resource agent.
  - If you want an existing Storage Resource agent to communicate with an additional Tivoli Storage Productivity Center server. To do this, you must create the deployment job from the additional Tivoli Storage Productivity Center server to which you want the Storage Resource agent to communicate.

To install the Storage Resource agent to communicate with two different servers using the same location, follow the example in these steps:

- a. From server 1 (S1), install the Storage Resource agent to the location C:\Program Files\IBM\TPC\agent using port 9510.
- b. From server 2 (S2), install the Storage Resource agent in the same location using the same port 9510 and specify the **Force** option. This option is required when you install the Storage Resource agent in the same location.

If you want to install two Storage Resource agents on the same system, each with a different port, install the agents using different port numbers and different locations.

**Note:**

- You cannot change the communication type for a Storage Resource agent (daemon or non-daemon) when you select the **Force** option. Make sure to select the same communication type as the existing Storage Resource agent when you create a deployment job.
- If a Storage Resource agent exists on a target computer and you do not select **Force**, an error occurs during validation and the Storage Resource agent is not installed.
- Select the **Initial Scan** option to perform a file system scan on the computer where a Storage Resource agent is deployed. If this box is checked, the scan is run immediately after a Storage Resource agent is deployed.

- Click the **Windows Services Information** button to enter login information that Tivoli Storage Productivity Center uses to create a Windows service for the Storage Resource agent. Use the Windows Service Information window to select the local system account, enter information about an existing user account, or create a new local account. If you do not specify a Windows service account, the default itcauser account is created. This action is only available for agents that are deployed to Windows computers as daemon services. This button is disabled if Use Daemon Service for Runtime Operation is not selected.

Enter the following information:

**User** Enter the user ID that Tivoli Storage Productivity Center uses when logging in to the host computer to install a Storage Resource agent. The value in the field is applied to all the computers that appear in the **Remote Agent Machines** table.

**Requirement:** This ID must have administrative or root privileges on the target computer.

**Password**

Enter the password for the user ID.

**Certificate Location**

Enter the fully qualified path of the certificate on the computer where the Data server is located. This file is used for certificate-based authentication. If you do not enter a value in this field the default location is used.

**Passphrase**

Enter the passphrase for the certificate file. The passphrase was created when the certificate was generated.

**Port** Enter the port number on which a Storage Resource agent listens for requests. The default is 9510.

**Tip:** This value is required if you run the Storage Resource agent as a daemon service.

**Use Daemon Service for Runtime Operation**

Select this option to run a Storage Resource agent on the monitored computer as a daemon service.

See Storage Resource agent Deployment Considerations for more information about deploying agents as daemon and non-daemon services.

**Restriction:** Do not select this option to run the Storage Resource agent as a stand-alone executable file on the monitored computer.

**Validate before Save**

Check this box to indicate that Tivoli Storage Productivity Center should attempt to communicate with the computers that are added to the deployment job when you click the **Save** button on this page. If the validation fails for a computer, the agent is not installed on that computer.

**Edit Selected Entries**

Click this button to edit settings for the selected Storage Resource

agents. This information includes user ID, password, certificate location, passphrase, and port. You must submit the deployment job for the changes to take effect.

#### **Remove**

Click this button to remove a Storage Resource agent from the deployment job.

**Tip:** This button does not remove the agent from Tivoli Storage Productivity Center if it is already installed; it only removes it from the deployment job.

3. Click the **When to run** tab to enter the following information:

#### **How often to run**

Specify a time to run:

- **Run now**
- **Run once at** (specify a date and time to run)

#### **How to handle time zones**

Specify a time zone to use:

- **Use the time zone that the server runs in**
- **Use this time zone** (select a time zone)

4. Click the **Alert** tab to specify the following information:

#### **Triggering-Condition**

The triggering condition you can specify is: Storage Resource agent Deployment Failed

#### **Triggered-Actions**

Choose from the following check boxes:

- **SNMP Trap**
- **TEC / OMNIBus Event**
- **Login Notification**
- **Windows Event Log**
- **Email**

Depending on what action you select, you might have other choices to make. For example, if you select the **Windows Event Log** check box, the **Event Type** field becomes active so that you can specify a severity for the event in the Windows event log.

5. Click **File > Save**.

For related tasks, see the *Planning > General Planning > Planning for Storage Resource agents* section in the *Tivoli Storage Productivity Center Installation and Configuration Guide* for additional configuration information about certificates used after deployment.

Check the `TPCD_####.log` file in the Tivoli Storage Productivity Center installation directory to view the error messages related to failed validations. The following are the default locations for this log file:

- Windows: `C:\Program Files\IBM\TPC\data\log`
- UNIX/Linux: `/opt/IBM/TPC/data/log`

If multiple Storage Resource agents are set up to probe or scan the same storage resources, the Storage Resource agent that was added to Tivoli Storage

Productivity Center first is used for the probe or scan. Therefore, only data that is gathered by the first Storage Resource agent is shown.

### Collecting service data

Collect service data about the selected Storage Resource agent. Service data includes diagnostic information such as logs, trace files, configuration information, and computer details. Use this data to troubleshoot any errors that might occur during startup, processing, or shutdown of a Storage Resource agent.

If the collection of service data is successful, Tivoli Storage Productivity Center displays a message that indicates where the resulting archive file (.zip) is stored. The archive file is stored in a directory on the same computer as the Tivoli Storage Productivity Center server. The file is located in the following default locations:

- Windows operating system: C:\Program Files\IBM\TPC\data\log\SRATraces\*SRA\_computer\_name*\TPCServiceInfo.zip
- UNIX or Linux operating system: /opt/IBM/TPC/data/log/SRATraces/*SRA\_computer\_name*/TPCServiceInfo.zip

*SRA\_computer\_name* represents the name of the computer on which the Storage Resource agent is deployed.

If the collection of service data fails, Tivoli Storage Productivity Center displays a message that indicates the job was unsuccessful. See the server log file or the services script output for more information about why the data collection failed. These files are located in the following default locations:

- Server log file (on the computer where the Tivoli Storage Productivity Center server is installed):
  - Windows operating system: c:\Program Files\IBM\TPC\data\log
  - UNIX or Linux operating system: /opt/IBM/TPC/data/log
- Services script output file (on the computer where the Storage Resource agent is deployed):
  - Windows operating system: C:\Program Files\IBM\TPC\agent\service\*SRA\_computer\_name*\TPCServiceInfo.html
  - UNIX or Linux operating system: /opt/IBM/TPC/agent/service/*SRA\_computer\_name*/TPCServiceInfo.html

where *SRA\_computer\_name* represents the name of the computer on which the Storage Resource agent is located.

To collect service data for a Storage Resource agent, complete the following steps:

1. In the navigation tree, click **Administrative Services > Data Sources**. Left-click **Data/Storage Resource agents**.
2. In the content pane, select a Storage Resource agent.
3. In the **Select Action** menu, click **Collect Service Data**.

### Enabling or disabling scripts for Storage Resource agents

You can enable or disable the running of scripts that are sent from the Tivoli Storage Productivity Center server to a Storage Resource agent. If enabled, a Storage Resource agent accepts and runs scripts that are sent from the server for scheduling. If disabled, a Storage Resource agent does not accept scripts that are sent from the server and only runs scripts that are stored on the computer where the agent is deployed.

To enable or disable the running of scripts, complete the following steps:

1. In the navigation tree, expand **Administrative Services > Data Sources > Data/Storage Resource Agents**.
2. In the content pane under the Select Action menu, click **Enable Scripts** to enable the running of scripts. Click **Disable Scripts** to disable the running of scripts.

### Enabling or disabling the monitoring of fabrics by the Storage Resource agents

Enable or disable the monitoring of fabrics by the Storage Resource agent. By default a Storage Resource agent is enabled for fabric monitoring.

To enable or disable the monitoring of fabrics by the Storage Resource agent, complete the following steps:

1. In the navigation tree, expand **Administrative Services > Data Sources > Data/Storage Resource Agents**.
2. In the content pane under the Select Action menu, click **Enable Fabric** to enable the monitoring of fabrics. Click **Disable Fabric** to disable the monitoring of fabrics.

### Help command for Storage Resource agent

The **help** command for the Storage Resource agent provides information about the parameters for installing, uninstalling, and upgrading Storage Resource agents.

For information about the Storage Resource agent commands, run the **help** command. Follow these steps:

1. Go to the installation location for the Storage Resource agent:

```
cd <installation_location>
```

2. Run the following command:

```
bin/Agent -help
```

3. The output from the **help** command is as follows:

Usage:

```
Agent -INSTALL
      [-COMMTYPE DAEMON -AGENTPORT portnumber]
      [-FORCE]
      -INSTALLLOC pathname
      -SERVERIP address[,address,...]
      -SERVERPORT portnumber
      [-USERID username -PASSWORD password -CERT file -PASSPHRASE phrase]
```

```
Agent -UNINSTALL
      [-FORCE]
      -SERVERNAME servername
```

```
Agent -UPGRADE
      -INSTALLLOC pathname
```

For information about how to install the Storage Resource agent using commands, see the information about installing agents in the *Tivoli Storage Productivity Center Installation and Configuration Guide*.

For information about how to uninstall the Storage Resource agent using commands, see the information about uninstalling agents in the *Tivoli Storage Productivity Center Installation and Configuration Guide*.

For information about how to upgrade the Storage Resource agent using commands, see the information about upgrading agents in the *Tivoli Storage Productivity Center Installation and Configuration Guide*.

### Enabling and disabling NFS timeouts

You can enable or disable NFS timeouts for a Storage Resource agent when running scans on network file system (NFS) mounts. Enabling an agent for NFS timeouts prevents scans from locking up indefinitely when NFS mounts the agents are monitoring become unavailable.

This option determines the number of seconds a Storage Resource agent waits for a status system call on an NFS file system before it times out. The default wait time is 10 seconds.

**Note:** Enabling this option might decrease the performance of scans slightly. Disabling this option might increase the performance of scans slightly.

You might want to enable NFS timeouts when the NFS server is down or an NFS file system is stale. This condition can also occur when a scan is running for an agent and that agent is uninstalled.

The **FileSystemScanNFSTimeout** option is in the Data server configuration file (`server.config`). The default location of the `server.config` file is `c:\Program Files\IBM\TPC\config` for Windows and `/opt/IBM/TPC/config` for UNIX and Linux.

To enable or disable NFS timeouts, follow these steps:

1. In the navigation tree, click **Administrative Services > Data Sources**. Left-click **Data/Storage Resource Agents**.
2. In the content pane, select a Storage Resource agent.
3. To enable NFS timeouts for a Storage Resource agent, under the Select Action menu, click **Enable NFS Timeout**.
4. To disable NFS timeouts for a Storage Resource agent, under the Select Action menu, click **Disable NFS Timeout**.

### Deleting or uninstalling an agent using the GUI

You can delete or uninstall a Storage Resource agent and all the data that is collected by that agent from the database repository. The information that is collected by the agent is no longer available within Tivoli Storage Productivity Center reports. When you delete an agent, the agent is uninstalled and you can no longer activate the agent.

To delete or uninstall a Storage Resource agent:

1. In the navigation tree, click **Administrative Services > Data Sources**. Left-click **Data/Storage Resource Agents**.
2. In the content pane, select an agent and under the Select Action menu, click **Delete**.
3. In the confirmation dialog, select **Yes Delete the agent**.

### Exporting a Storage Resource agent list

You can export a Storage Resource agent list to a formatted flat file. This list is used to manage user authentication through a script file. This option is enabled for Storage Resource agents that use non-daemon based communication only.

This list contains the host name, installation location, user ID, encrypted password, and fully qualified certificate file for the selected Storage Resource agents. You can change the user authentication data such as user ID, password, and fully qualified certificate location.

When the file is created, the passwords for the agents are written as "\*\*\*\*\*" for security reasons. Before using this file with the **Update Storage Resource Agent List** action, you must enter an encrypted or non-encrypted password for each host. See the description of the **Update Storage Resource Agent List** action for more information about passwords.

Storage Resource agents can either be run as a daemon service or non-daemon service (on-demand service). If the agent is run as a non-daemon service, there is no agent process running on the managed host. Programs on the host system are run as needed.

To export a Storage Resource agent list, complete the following steps:

1. In the navigation tree, click **Administrative Services > Data Sources**. Left-click **Data/Storage Resource Agents**.
2. In the content pane, select a Storage Resource agent and click **Export Storage Resource Agent List** from the **Select Action** menu.

### Updating a Storage Resource agent list

The Storage Resource agent list file is used to manage user authentication through a script file. This list contains the host name, installation location, user ID, encrypted password, and fully qualified certificate file for the selected Storage Resource agents. The password is in encrypted format with @ENC@ appended to the encrypted password. You can change the user authentication data such as user ID, password, and fully-qualified certificate location.

To update a Storage Resource agent list, complete the following steps:

1. In the navigation tree, click **Administrative Services > Data Sources**. Left-click **Data/Storage Resource Agents**.
2. In the content pane, select the Storage Resource agents you want to update.
3. Under the Select Action menu, click **Update Storage Resource Agent List** to update information about the agent.
4. Edit the information in that file to match the changes that you want to make for the agent. You can update the logon credentials for the Storage Resource agents that are listed with the information in a file that you specify. The file must use the following format for the host names you want to update:

```
host_name|installation_location|user_ID|password
```

If the Data server cannot find any Storage Resource agent with a host name and location that you specify in the file, that entry is ignored and the error is logged.

Keep in mind the following considerations when including a password in the update file:

- For non-encrypted passwords: If you use "|" in the line for an agent, you must provide an "escape" character before it. The escape character is "\". For example, if the password you want to include in an update file is "native|agent", use native\|agent in the update file.

If you use "\" in the line for an agent, you must provide an additional "\" as an escape character. For example, if the password is "native\agent", use native\\agent in the update file.

- For encrypted passwords:
  - To encrypt a password, start IBM Tivoli Storage Productivity Center's command-line tool (tpctool) from the \cli directory where Tivoli Storage Productivity Center is installed and run the following command: `tpctool encrypt [password]`, where [password] represents the password you want to encrypt. This command will generate a text string that represents the encrypted version of the password. For example, output might appear like the following: `iDroqToC070ubh5i4mxMHQ==`. Copy this encrypted password to the correct location in the update file.
  - To include an encrypted password in an update file, you must add the following after the encrypted text: `@ENC@`. For example, an encrypted password in an update file might appear like this:  
`iDroqToC070ubh5i4mxMHQ==@ENC@`

**Note:**

- Do not include `@ENC@` at the end of non-encrypted passwords.
- See the *IBM Tivoli Storage Productivity Center Command-Line Interface Reference* for more information about **tpctool**.

### Registering the Storage Resource agent with a different server

This topic provides information on how to register the Storage Resource agent with a different server.

To register the Storage Resource agent with a different server, complete the following steps:

1. You have a Storage Resource agent that is installed on Server A and you want the Storage Resource agent to also point to Server B.
2. From Server B, in the navigation tree, expand **Administrative Services > Configuration > Storage Resource Agent Deployments**. Right-click **Storage Resource Agent Deployments**.
3. Specify the same port and location with the **force** option.

**Note:** For an RXA Storage Resource agent, just specify the same location with the **force** option.

4. Run the deployment job. The Storage Resource agent now points to Server A and Server B. If you no longer want the Storage Resource agent to point to Server A, just go to the GUI on Server A and delete the Storage Resource agent.

### Managing the daemon Storage Resource agent service

Use this information to start and stop the daemon Storage Resource agent service for the Virtual I/O Server.

#### Starting and stopping the daemon Storage Resource agent service

To start or stop the daemon service, follow these steps:

1. Log in to the Virtual I/O Server using the **padmin** user ID.
2. Run the following command to set up the AIX environment:  
`oem_setup_env`
3. Change to the base directory where the Storage Resource agent is located. For example:
  - To stop the service, run this command:  
`/SRA_install_directory/agent/bin/agent.sh stop`
  - To start the service, run this command:

```
/SRA_install_directory/agent/bin/agent.sh start
```

## Deployment guidelines and limitations for Storage Resource agents

There are a number of guidelines and limitations that you must consider when managing the Storage Resource agents in your environment.

Use the following information when you deploy Storage Resource agents and migrate existing Data agents:

- Multiple Storage Resource agents that are probing or scanning the same storage resources
- Platforms that support Storage Resource agents deployments
- Product functions that are not available for storage devices monitored by Storage Resource agents
- Required authority for deploying Storage Resource agents
- Orphan zones
- Firewalls and Storage Resource agent deployments
- Multiple computers in a deployment
- Communication between the Tivoli Storage Productivity Center server and a Storage Resource agent
- Daemon and non-daemon services
- Authentication between the Tivoli Storage Productivity Center server and a Storage Resource agent
- Storage Resource agents on the same computer
- Time zones for computers monitored by Storage Resource agents
- UNIX systems using RSH protocol
- Deployments on Windows - NetBIOS setting
- Deployments on Windows - User Account Control (UAC) remote restrictions
- Additional information about Storage Resource agents

### Multiple Storage Resource agents that are probing or scanning the same storage resources

If multiple Storage Resource agents are set up to probe or scan the same storage resources, the Storage Resource agent that was added to Tivoli Storage Productivity Center first is used for the probe or scan. Therefore, only data that is gathered by the first Storage Resource agent is shown.

### Platforms that support Storage Resource agents for the same

For a list of platforms on which you can deploy Storage Resource agents, go to the Tivoli Storage Productivity Center support site at [http://www.ibm.com/support/entry/portal/Overview/Software/Tivoli/Tivoli\\_Storage\\_Productivity\\_Center\\_Standard\\_Edition](http://www.ibm.com/support/entry/portal/Overview/Software/Tivoli/Tivoli_Storage_Productivity_Center_Standard_Edition), click the **Documentation** link, and enter **Platform Support: Agents, Servers and GUI** in the **Search** box. Click the link to the document for the appropriate release.

### Product functions that are not available for storage devices monitored by Storage Resource agents

Before you migrate an existing Data agent to a Storage Resource agent or deploy a new Storage Resource agent, make sure that the product functions you want to use on the monitored devices are available for those agents. The following functions are not available for storage devices that are monitored by Storage Resource agents:

- Certain relational database monitoring. For list of relational databases that can be monitored by Storage Resource agents, go to the Tivoli Storage Productivity Center support site at [http://www.ibm.com/support/entry/portal/Overview/Software/Tivoli/Tivoli\\_Storage\\_Productivity\\_Center\\_Standard\\_Edition](http://www.ibm.com/support/entry/portal/Overview/Software/Tivoli/Tivoli_Storage_Productivity_Center_Standard_Edition), click the **Documentation** link, and enter **Platform Support: Agents, Servers and GUI** in the **Search** box. Click the link to the document for the appropriate release.
- The changing of zone configurations and the reporting of HBA, fabric topology, or zoning information for fabrics connected to hosts running Linux on IBM System z hardware. These limitations also apply to Storage Resource agents on all guest operating systems for VMware configurations.

#### **Required authorities for deploying and running Storage Resource agents**

Before you can create deployment schedules and deploy Storage Resource agents on target computers, you must meet the following requirements:

- To create deployment schedules, you must be logged in to Tivoli Storage Productivity Center with a user ID that has the **Productivity Center Administrator** role. See the *IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication Installation and Configuration Guide* for more information about user roles.
- To deploy Storage Resource agents on target computers, you must provide a user ID that has administrative rights on those computers. You enter this ID when creating a deployment schedule. Tivoli Storage Productivity Center uses this ID to log on to the target computers and install and configure the necessary runtime files for the agents.

The user under which a Storage Resource agent (daemon or non-daemon) runs must have the following authorities on the target computers:

- On Linux or UNIX, the user must have root authority. By default, an agent runs under the user 'root'.
- On Windows, the user must have Administrator authority and be a member of the Administrators group. By default, a Storage Resource agent runs under the 'Local System' account.

#### **Orphan zones**

Storage Resource agents do not collect information about orphan zones. An orphan zone is a zone that does not belong to at least one zoneset.

#### **Firewalls and Storage Resource agent deployments**

Before you can deploy a Storage Resource agent on a computer, you must turn off the firewall on that computer. If you do not turn off the firewall, the deployment fails. To turn off the firewall on a Windows 2008 computer, complete the following steps:

1. On the desktop of the Windows 2008 computer, click **Start > Administrative Tools**.
2. Click **Windows Firewall with Advanced Security**.
3. Click **Windows Firewall Properties**.
4. Change the **Firewall state** field to **Off** on the following tabs: **Domain Profile**, **Private Profile**, **Public Profile**.
5. Click **OK** to accept the changes and exit.
6. Deploy a Storage Resource agent to the Windows 2008 computer.

#### **Multiple computers in a deployment**

You can define a deployment schedule to include multiple computers on

which to install Storage Resource agents. The computers you include in a deployment schedule must share the same administrative user ID and password. IBM Tivoli Storage Productivity Center uses these user credentials to log on to the computers when installing Storage Resource agents. If the computers in a deployment schedule do not share the same administrative user credentials, you must create separate deployment jobs for them.

**Note:** When you deploy a Storage Resource agent to multiple computers, a globally unique identifier (GUID) is created for each computer (if one does not exist).

### **Communication between the Tivoli Storage Productivity Center server and a Storage Resource agent**

The Tivoli Storage Productivity Center server connects to a monitored computer when a Storage Resource agent is deployed and whenever a data collection schedule runs against that agent.

During deployment, the server communicates with the target computer using one of the following protocols:

- Windows server message block protocol (SMB)
- Secure Shell protocol (SSH)
- Remote execution protocol (REXEC)
- Remote shell protocol (RSH)

After deployment, the type of communication between the server and agent on that computer depends on whether you deployed the agent as daemon service or non-daemon service. See the *IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication Installation and Configuration Guide* for more information about these protocols.

### **Daemon and non-daemon services**

You can deploy a Storage Resource agent as a daemon or non-daemon service:

- A Storage Resource agent that is deployed as a daemon service runs in the background on the monitored computer and listens for requests from the Tivoli Storage Productivity Center server. Connectivity between the server and agent is established using SSL. The server and agent have their respective certificates and no additional information is required besides those certificates and the security that is provided by the SSL protocol.
- A Storage Resource agent deployed as a service on demand (non-daemon service) runs as a stand-alone executable file on the monitored computer. Communication from the server to the agent uses the same protocol that was used during the deployment of the agent. Communication from the agent to the server uses SSL.

### **Authentication between the Tivoli Storage Productivity Center server and a Storage Resource agent**

Tivoli Storage Productivity Center requires the correct authentication information (user ID, password, port, certificate location, or passphrase) for monitored computers each time it communicates with Storage Resource agents on those computers. If the authentication information changes for a host computer on which a Storage Resource agent is deployed, the authentication information for that agent must be updated using the **Change Authentication** or **Update Storage Resource agent List** functions

on the Data/Storage Resource agents panel located under the **Administrative Services > Data Sources** node in the navigation tree.

#### **Storage Resource agents on the same computer**

You cannot deploy a Storage Resource agent on a computer where a Storage Resource agent is already installed *and* pointing to the same Data server. You can deploy a Storage Resource agent on the same computer as another Storage Resource agent if those agents communicate with different Data servers and use different ports when listening for requests.

#### **Time zones for computers monitored by Storage Resource agents**

The time zones of computers that are monitored by Storage Resource agents are shown as Greenwich Mean Time (GMT) offsets in Tivoli Storage Productivity Center reports. For example, a computer in Los Angeles shows the following time zones in the By Computer report in Asset reporting:

(GMT-8:00) GMT-8:00

#### **UNIX operating systems using Remote Shell protocol (RSH)**

If RSH is configured to use a user ID and password, the connection fails. To successfully connect to a system using RSH, you must set up the .rhosts file (in the home directory of the account). RSH must be configured to accept a login from the system that is running your application.

#### **Deployments on Windows operating systems - NetBIOS setting**

If you want to install a Storage Resource agent on Windows targets, the **Enable NetBIOS over TCP/IP** option must be selected in the Control Panel settings for the computer's network connections properties. To set this option, click **Start > Settings > Control Panel > Network and Dial-Up Connections > <some\_connection> > Properties > Internet Protocol (TCP/IP) > Advanced > WINS > Enable NetBIOS over TCP/IP**.

See the documentation for your firewall to determine if these ports are not blocked for inbound requests.

To determine if security policies are blocking the connection ports, click **Start > Settings > Control Panel > Administrative Tools**.

Depending on whether your policies are stored locally or in Active Directory, follow these directions:

##### **Locally stored policies**

For locally stored policies, click **Start > Settings > Control Panel > Administrative Tools > Local Security Policy > IP Security Policies on Local Computer**.

##### **Policies stored in Active Directory**

For policies stored in Active Directory, examine the IP security policies and edit or remove filters that block the ports:

- Click **Administrative Tools > Default Domain Security Settings > IP Security Policies on Active Directory**.
- Click **Administrative Tools > Default Domain Controller Security Settings > IP Security Policies on Active Directory**.

For all Windows systems, the Server service must be running to connect to a Windows system using the Windows protocol.

The following table lists the ports reserved for NetBIOS. Ensure that these ports are not blocked.

Port	Description
135	NetBIOS Remote procedure call. (Not currently used.)
137	NetBIOS name service.
138	NetBIOS datagram. (Not currently used.)
139	NetBIOS session (for file and print sharing).
445	CIFS (on Windows XP).

For Windows Server 2008, shares must be shared for the Guest or Everyone accounts, and password protected sharing must be disabled. To disable password protected sharing, follow these steps:

1. Click **Control Panel > Networking and Sharing Center**.
2. Click the down arrow next to **Password protected sharing**.
3. Click **Turn off password protected sharing**.
4. Click **Apply**. Exit from the Control Panel.

### Deployments on Windows 2008 - User Account Control (UAC) remote restrictions

If you are planning to install Storage Resource agents remotely on a Windows 2008 operating system, you must disable the User Account Control (UAC) remote restrictions on the Windows operating system. User Account Control is a security component on Windows operating systems.

**Note:** This task contains steps that tell you how to modify the registry. Serious problems might occur if you modify the registry incorrectly. Therefore, make sure that you follow these steps carefully. For added protection, back up the registry before you modify it. Then you can restore the registry if problems occur. For information about how to back up and restore the registry, see <http://support.microsoft.com/kb/322756/>.

To disable UAC remote restrictions, follow these steps:

1. Click **Start > Run**. Enter **regedit** and click **OK**.
2. Locate and click the following registry subkey:  
`HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\  
Policies\System`
3. If the LocalAccountTokenFilterPolicy registry entry does not exist, follow these steps:
  - a. On the **Edit** menu, click **New > DWORD Value**.
  - b. Enter **LocalAccountTokenFilterPolicy** as the name for the DWORD value in the content pane. Click **Enter**.
  - c. Right-click **LocalAccountTokenFilterPolicy**, then click **Modify**.
  - d. In the Edit DWORD Value window, enter **1**, then click **OK**.  
This value can be 0 or 1:
    - 0** This value builds a filtered token. This value is the default value. The administrator credentials are removed.
    - 1** This value builds an elevated token.
  - e. Exit the registry editor.

### Additional information about Storage Resource agents

See *Planning for Storage Resource agents* in the *IBM Tivoli Storage Productivity Center Installation and Configuration Guide* for more information about Storage Resource agents.

## In-band Fabric agents

In-band Fabric agents are no longer installed or supported by Tivoli Storage Productivity Center. You can migrate in-band Fabric agents to Storage Resource agents.

For information about the supported agent types for switch performance management and fabric zone configuration, see “Supported Fabric Agent Types” on page 1426.

### Deleting an in-band Fabric agent

You can delete an in-band Fabric agent from the navigation tree and the database. Data discovered by the agent is removed from the database repository. This action is available for inactive agents only. You must first stop the agent before deleting the information for the agent. The agent is not uninstalled from IBM Tivoli Storage Productivity Center.

To remove information for an in-band Fabric agent, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources**. Left-click **Inband Fabric Agents**.
2. In the content pane, select the agent and click **Delete**.

### Migrating an in-band Fabric agent

Migrate a selected in-band Fabric agent to a Storage Resource agent.

The migration process deploys a Storage Resource agent on the target computer and then uninstalls the in-band Fabric agent. Before the migration, Tivoli Storage Productivity Center must shut down the Fabric agent. The agent is not shut down until 1) all running processes are complete, and 2) there are no new schedules submitted for the agent.

## Out-of-band Fabric agents

Out-of-band agents are used by Fabric Manager for out-of-band SAN operations.

For information about the supported agent types for switch performance management and fabric zone configuration, see “Supported Fabric Agent Types” on page 1426.

### Displaying information about an out-of-band agent

You can view information about an out-of-band agent including the IP address, status, and SNMP community.

To display information about an out-of-band agent, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources**. Click **Out of Band Fabric Agents**.
2. In the content pane, click the icon to the left of the agent for which you want information. In the content pane, a notebook window opens. On the General Information page, the following information is displayed:

**Status** The status of the agent.

**Host Name**

The host name of the system on which the agent is installed.

**IP Address**

The IP address of the system on which the agent is installed. This

column displays Internet Protocol Version 4 (IPv4) and Internet Protocol Version 6 (IPv6) addresses as appropriate.

#### **SNMP Community Read**

The name of the Simple Network Management Protocol (SNMP) community to which the agent belongs. The SNMP community name acts as a password that is shared by one or more SNMP hosts. The community name is used to authenticate messages being received by this SNMP host. This field is optional and might be blank if the SNMP community has not been set.

**Note:** The default SNMP community is public. If the community name is not the correct community name for your environment, the out-of-band agent might not be able to properly perform scans.

#### **SNMP Community Write**

The community string for SNMP writes. Tivoli Storage Productivity Center uses the write community string to refresh information for the Out of Band Fabric Agent. The default is private. This value is used for Cisco switches only.

### **Updating out-of-band agent information**

After an out-of-band agent has been added, you can update the SNMP community information.

To update information for an out-of-band agent, follow this procedure:

1. In the Navigation Tree pane, expand **Administrative Services > Data Sources**. Left-click **Out of Band Fabric Agents**.
2. In the content pane, click on the icon by the agent.
3. In the content pane, a notebook window opens. On the General page, update the following information:

#### **SNMP Community Read**

Enter the name of the Simple Network Management Protocol (SNMP) community to which the agent belongs. The SNMP community name acts as a password that is shared by one or more SNMP hosts. The community name is used to authenticate messages being received by this SNMP host. This field is optional.

**Note:** The default SNMP community is public. If this is not the correct community name for your environment, the out-of-band agent might not be able to properly perform scans.

#### **SNMP Community Write**

Enter the community string for SNMP writes. Tivoli Storage Productivity Center uses the write community string to refresh information for the Out of Band Fabric Agent. The default is private. This value is used for Cisco switches only.

### **Checking the out-of-band agent connection**

You can check to determine if an out-of-band agent is running.

To check the agent connection, follow this procedure:

1. In the Navigation Tree pane, expand **Administrative Services > Data Sources**. Left-click **Out of Band Fabric Agents**.

2. In the content pane, select an agent and click **Check**. The status of the agent is displayed in the Agent Status window. If updates are required, they are automatically installed.

### Adding an out-of-band Fabric agent

This topic provides information about adding an out-of-band Fabric agent.

You can add an out-of-band Fabric agent with the Configure Devices wizard or by using the manual steps in this procedure. To add an out-of-band Fabric agent with the Configure Devices wizard, see “Configure Devices wizard” on page 307.

To add an out-of-band Fabric agent manually, complete the following steps:

1. In the navigation tree, expand **Administrative Services > Data Sources**. Left-click **Out of Band Fabric Agents**.
2. In the content pane, click **Add**.
3. In the Add Out of Band Fabric Agent window, complete the host name, SNMP community read (optional), and SNMP community write (optional) fields. Click **OK**.

### Deleting an out-of-band agent

You can remove an out-of-band agent from the navigation tree and the database. Data discovered by the agent is not removed from the database repository.

To remove an out-of-band agent, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources**. Left-click **Out of Band Fabric**.
2. In the content pane, select an agent and click **Delete**.

## Tivoli Storage Productivity Center servers

Use the **Administrative Services > Data Sources > IBM Tivoli Storage Productivity Center Servers >** function to manage the relationships between a *master* Tivoli Storage Productivity Center server and its *subordinate* Tivoli Storage Productivity Center servers.

By creating master and subordinate relationships between Tivoli Storage Productivity Center servers, you can then use a single interface to generate reports based on data and metrics collected by multiple servers in a storage environment:

- A **master** server is a server that performs normal monitoring and reporting of storage resources like a standard server, but also gathers the storage information (using Tivoli Storage Productivity Center server probes) that was collected by subordinate servers.
- A **subordinate** server is a server that monitors and reports on storage resources like a standard server, but also communicates with the master server during Tivoli Storage Productivity Center server probes. During these probes, the master server collects the storage information gathered by a subordinate server's agents and stores that information in its own database repository.

Figure 23. Master and subordinate server architecture

The rollup reports that reflect the storage information collected by the master server from subordinate servers are available in the **Tivoli Storage Productivity Center > Rollup Reports** node. This node is available in the navigation tree for the master server.

If the master server is on an IPv6-only server, it can communicate with existing subordinate servers under the following conditions:

- The subordinate servers are upgraded to Tivoli Storage Productivity Center V5.1 or higher and
- The IPv6 protocol is enabled on the machines where they are located.

Before you can configure and manage subordinate servers, keep in mind the following items:

- The master server must be up and running.
- You must be log on to the user interface as an Tivoli Storage Productivity Center administrator or superuser
- We recommend that the master server monitor no more than 500 unique data sources. This number includes subordinate servers, Storage Resource agents, CIMOM agents, and VM servers (VMWare).
- We recommend that each subordinate server monitors no more than 1200 unique data sources. This number includes Storage Resource agents, CIMOM agents, and VM servers (VMWare). After this threshold is met for a server, a new server is deployed and all new agents point to it.
- After upgrading to Tivoli Storage Productivity Center 5.1, you must run probes against the monitored storage assets for the master server to have information about those assets displayed in **Tivoli Storage Productivity Center > Reporting > Rollup Reports**.

- After you remove a data source (agent) from a subordinate server or a storage entity that it monitors, the master server continues to display information about that agent or storage resource in rollup reports for a specified amount of time. You can specify how quickly that information is removed by accessing the Administrative Services > Configuration > Removed Resource Retention panel and changing the settings for **TPC servers**. Additionally, if a master server is unable to contact a subordinate server for the number of days defined in the **TPC Servers** setting on the Removed Resource Retention panel, that server is removed from the subordinate server as well as information about the storage entities it was monitoring.
- A host might appear more than once in a rollup report and its data is counted multiple times in report totals. Multiple entries for a host might occur if the following conditions are true:
  - An agent is removed from a host, the GUID (globally unique identifier) for the host is changed, and then an agent is redeployed on the host.
  - The amount of time that information about a host is retained is longer than the time it took to remove the original agent and change the GUID for the host.

For example, if the number of days to retain information about a host is 14 days, and then you 1) remove the agent on the host, 2) change the GUID of the host, and 3) redeploy an agent on that host all in less than 14 days, duplicate entries for the host appears in rollup reports. After 14 days have passed, the entry for the host before the GUID change is removed from the database and only one entry appears for the host in rollup reports.

You can specify how quickly information is removed by changing the settings for **TPC servers** on the Administrative Services > Configuration > Removed Resource Retention panel.

## Adding an Tivoli Storage Productivity Center Server

Learn how to add an Tivoli Storage Productivity Center server as a subordinate sever.

Keep in mind the following when adding a Tivoli Storage Productivity Center server as a subordinate server:

- How subordinate servers are configured to monitor storage entities within your environment can determine if fragmentation occurs within rollup reports. See Rollup reports - Fragmentation for more information.
- Tivoli Storage Productivity Center servers must be at version 3.3 or greater to be added as a subordinate server.
- We recommend that the master server monitor no more than 500 unique data sources. This number includes subordinate servers, Storage Resource agents, CIMOM agents, and VM servers (VMWare).
- We recommend that each subordinate server monitors no more than 1200 unique data sources. This number includes Storage Resource agents, CIMOM agents, and VM servers (VMWare). After this threshold is met for a server, a new server is deployed and all new agents point to it.
- If the master server is located on an IPv6-only server, it can communicate with existing subordinate servers under the following conditions:
  - The subordinate servers are upgraded to Tivoli Storage Productivity Center V4.1 or higher and
  - The IPv6 protocol is enabled on the machines where they are located.

To add a server as a subordinate server, follow this procedure:

1. In the Navigation Tree pane, expand **Administrative Services > Data Sources > Tivoli Storage Productivity Center Servers**.
2. In the content pane, click **Add Tivoli Storage Productivity Center Server**.
3. In the Add Tivoli Storage Productivity Center Server window, enter the following information:

**Host Name**

Enter the host name of the machine on which the subordinate server is installed.

**Host Device server Port**

Enter the port with which the subordinate server's Device server is listening for requests. The default port for Tivoli Storage Productivity Center servers is 9550.

**Host Authentication Password**

Enter the password for the subordinate Tivoli Storage Productivity Center server. This host authentication password is entered when installing Tivoli Storage Productivity Center. Contact your system administrator or the person who installed Tivoli Storage Productivity Center to determine this password.

**Display Name (optional)**

Enter a name for the subordinate server.

**Description (optional)**

Enter a description for the subordinate server.

**Test Tivoli Storage Productivity Center Server Connectivity before adding**

Select this check box to have the master server connect and log into the subordinate server using the information provided on this window. This test is performed when you click **Save**.

4. Click **Save** to add the server as a subordinate server.
  - If you selected **Test Tivoli Storage Productivity Center Server Connectivity before adding**, IBM Tivoli Storage Productivity Center attempts to connect to the subordinate server using the information provided on this window.
  - If you did not select **Test Tivoli Storage Productivity Center Server Connectivity before adding**, the subordinate server is automatically added as a subordinate server but has a connection status of **Unknown** on the **Administrative Services > Data Sources > Tivoli Storage Productivity Center Servers** window.

**Note:** If the login information for a subordinate server is incorrect, an error occurs and an associated error message dialog box is displayed.

## Viewing subordinate server details

Learn how to view information about the subordinate servers that have been associated with a master server.

After you add a subordinate server to a master server, basic information about that server appears on the **Administrative Services > Data Sources > TPC Servers** window. To view additional information about a subordinate server on the TPC Servers window, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > TPC Servers**.
2. In the content pane, double-click a server row or click the icon next to a server for more detailed information about that server. Information about a

subordinate server appears on the **Administrative Services > Data Sources > TPC Servers > TPC Server Details** window.

## Testing the connection to subordinate servers

Learn how to test the connection from a master server to its associated subordinate servers.

After you add a subordinate server to a master server, basic information about that server appears on the **Administrative Services > Data Sources > TPC Servers** window. To verify that the master server can use the information provided to connect to subordinate server, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > TPC Servers**.
2. In the content pane, highlight the row for a subordinate server and click **Test TPC Server Connection** to test its connection to the master server. A message window will appear with the results of the tested connection. The information that appears in the **Connection Status** field will be updated to reflect its status.

## Removing subordinate servers

Learn how to remove a subordinate server from its association with a master server.

Use the **Administrative Services > Data Sources > TPC Servers** window to remove a subordinate server from a master server. Removing a subordinate server removes subordinate server information from:

- The master server database repository
- All rollup reports
- The **TPC Servers** list on the **Administrative Services > Data Sources > TPC Servers** window

To remove a subordinate server, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > TPC Servers**.
2. In the content pane, highlight the row of a subordinate server and click **Remove TPC Server**. A confirmation window appears.
3. Click **Yes** to confirm the removal of the subordinate server.

## Modifying subordinate server information

Learn how to modify information about the subordinate servers that have been associated with a master server.

After you add a subordinate server to a master server, basic information about that server appears on the **Administrative Services > Data Sources > TPC Servers** window. You can edit the information for a subordinate server by modifying its Display Name, Description, and Host Authentication Password. To view modify information about a subordinate server on the TPC Servers window, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > TPC Servers**.
2. In the content pane, double-click a server row or click the icon next to a server to edit information about that server. Information about a subordinate server appears on **Administrative Services > Data Sources > TPC Servers > TPC Server Details**.
3. Edit the information in the following fields:

**Host Authentication Password**

Enter the password for the subordinate IBM Tivoli Storage Productivity Center server.

**Display Name (optional)**

Enter a name for the subordinate server.

**Description (optional)**

Enter a description for the subordinate server.

**Test TPC Server Connectivity before adding**

Select this check box to have the master server connect and log into the subordinate server using the information provided on this window.

This test is performed when you click **Save**.

4. Select **File > Save** . If successful, the TPC Servers window appears and any new values for **Display Name** and **Description** are shown for a subordinate server.

**Rollup reports - fragmentation**

Fragmentation occurs when related storage entities are being monitored by different subordinate IBM Tivoli Storage Productivity Center servers.

The following example shows when fragmentation can occur using subordinate servers and rollup reports:

- **Example:** Host A is assigned a volume from storage subsystem 1. Host A is being monitored only by one Tivoli Storage Productivity Center subordinate server (Server 1) and storage subsystem 1 is being monitored by another subordinate server (Server 2). Server 1 and Server 2 are subordinate servers to the master server (Server 3).

**Reason for fragmentation:** In this example, the host and subsystem are fragmented because they are not being monitored by the same Tivoli Storage Productivity Center server. This will cause the **Correlated Volume Space** value in the rollup reports for storage subsystems and volumes to be incorrect.

To prevent fragmentation when using master and subordinate server relationships to generate rollup reports, we recommend the following:

- Do not monitor a storage subsystem and the hosts to which its volumes are assigned with different subordinate servers that are associated with the same master server.
- Do not monitor a fabric and its related switches with different subordinate servers that are associated with the same master server.
- If an agent machine is using storage from a subsystem, then both the agent and subsystem should be monitored by the same subordinate server.
- Configure all the subordinate servers to discover all the storage subsystems within your environment. Note that if a subordinate server is monitoring a subsystem with an agent other than the agent that is using storage on that subsystem, the value for the **Correlated Volume Space** column in rollup reports will be incorrect. For example:
  - Host A has storage from Subsystem 1
  - Subordinate server B is Monitoring Host A and Subsystem 1
  - Subordinate server C is Monitoring Subsystem 1 and probed the subsystem more recently than server B.
  - The master server is monitoring subordinate servers B and server C.

The master server will report the storage subsystem data from server C. Because the master server does not know about Host A, the value for the **Correlated Volume Space** column will be incorrect.

## Storage systems

This topic provides information about administering, configuring, and viewing information about monitored storage systems in your IBM Tivoli Storage Productivity Center environment.

You can add many different types of storage systems to your Tivoli Storage Productivity Center environment. Use the native storage system interfaces provided to connect to the following storage systems:

- DS8000
- SAN Volume Controller
- Storwize V7000
- IBM Storwize V7000 Unified
- The XIV system
- IBM SONAS

For other storage systems, use the Common Interface Model (CIM) agent interfaces.

### Adding a storage system

Learn how to add a storage system to your IBM Tivoli Storage Productivity Center environment.

Tivoli Storage Productivity Center provides multiple ways to add a storage system to your environment. Use the Configure Devices wizard to guide you through the steps for adding a storage subsystem using its native interface or a CIMOM, or manually add a CIMOM and discover the storage subsystem that it manages. See “Configuring storage subsystems” on page 308 for details of how to use the Configure Devices wizard.

To add a storage subsystem, use any of the following methods:

- If you want to add a new storage subsystem to Tivoli Storage Productivity Center using its native interface, use the Configure Devices wizard. The wizard guides you through the steps for adding a storage subsystem and running a discovery. To use this method, you can click the Configure Devices icon in the toolbar or you can complete the following steps:
  1. In the navigation tree, expand **Administrative Services > Data Sources > Storage Subsystems**.
  2. Click **Add**. This action launches the Configure Devices wizard. See “Configuring storage subsystems” on page 308 for details of how to use the Configure Devices wizard.
- If you want to add a CIMOM to Tivoli Storage Productivity Center and discover the storage subsystem that it manages, use the Configure Devices wizard. The wizard guides you through the steps for adding a CIMOM and running a discovery. To use this method, you can click the Configure Devices icon in the toolbar or you can complete the following steps:
  1. In the navigation tree, expand **Administrative Services > Data Sources > Storage Subsystems**.

2. Click **Add**. This action launches the Configure Devices wizard. See “Configuring storage subsystems” on page 308 for details of how to use the Configure Devices wizard.
- If you want to manually add a new CIMOM to Tivoli Storage Productivity Center and then manually discover the storage subsystem that it manages, use the following steps:
    1. In the navigation tree, expand **Administrative Services > Data Sources** and click **CIMOM Agents**.
    2. In the content pane, click **Add CIMOM**. The Add CIMOM window opens. See “Adding a CIM agent connection” on page 250 for details of how to add the CIMOM.
    3. To discover the storage subsystem that a CIMOM manages, in the navigation tree pane, expand **Administrative Services > Discovery** and click **CIMOM**. See “Discover storage subsystem, tape library, and fabric information with CIM agents” on page 333 for details about how to discover the storage subsystems managed by the CIMOMs that you manually added.

## Viewing storage system details

Learn how to view information about monitored storage systems in your IBM Tivoli Storage Productivity Center.

After you add storage systems, basic information about those systems appears on the **Administrative Services > Data Sources > Storage Subsystems** panel. To view information about a storage system on the Storage Subsystems panel, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > Storage Subsystems**.
2. In the content pane, you can view basic information about the storage systems in the Storage Subsystems area.

### Magnifying glass icon

The function of this icon depends on the value that is in the Credential Status column:

- If the value is **Present**, click the icon to view and modify more detailed information about the system.
- If the value is **Missing**, click the icon to start the Configure Devices wizard and provide the configuration information for the storage system.
- If the value is **Required**, click the icon to open the subsystem credentials update dialog box.

**Name** The name of the storage system.

**Label** A user-defined name of the system.

**Type** The type of storage system.

### IP Address

The IP address of the storage system.

### Credential Status

The status of the credentials that are used to connect to the storage system. Possible values are:

- **Present** (the credentials are available).
- **Missing** (no credentials are available because the system had been discovered using the automated discovery process. To add the

required credentials, click the  icon to open the Configure Devices wizard. Follow the steps in the wizard.

- **Required** (the system must be updated from CIM object manager [CIMOM] to native interface connection). To update the connection method, click the  icon to open the Update Subsystem Credentials dialog box.

#### Connection Status

The status of the connection between Tivoli Storage Productivity Center and the storage system.

#### Data Source IP Address

The IP address of the entity that Tivoli Storage Productivity Center uses to connect to the storage system. If Tivoli Storage Productivity Center uses the native interface of a system for connection, this IP address is the same as the address in the **IP Address** field. If Tivoli Storage Productivity Center uses a CIMOM for connection, the data source IP address is the address for the CIMOM.

## Modifying XIV system details

Learn how to modify information for an IBM XIV Storage System device that connects to IBM Tivoli Storage Productivity Center.

After you add an XIV system device, basic information about that system appears on the **Administrative Services > Data Sources > Storage Subsystems** panel. To modify information about the XIV system device on the Storage Subsystems panel, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > Storage Subsystems**.
2. In the content panel, double-click a storage subsystem row or click the icon next to a row to edit information about that storage subsystem. Information about the storage subsystem appears on the Storage Subsystems Details window.
3. You can edit the information in the following fields:

#### Username

Displays the user name for the device.

#### Password

Displays the password for the device.

The information in the following fields cannot be edited:

#### Storage Subsystem

Displays the name of the device.

#### IP Address

Displays the IP address or host name for the device.

4. Select **File > Save**. If successful, the Storage Subsystems window appears and any new values for the storage subsystem are shown.

## Modifying SAN Volume Controller or Storwize V7000 storage system details

Learn how to modify information about SAN Volume Controller or Storwize V7000 storage systems that connect to IBM Tivoli Storage Productivity Center.

After you add a SAN Volume Controller or Storwize V7000 device, basic information about that system appears on the **Administrative Services > Data**

**Sources > Storage Subsystems** panel. To modify information about a SAN Volume Controller on the Storage Subsystems panel, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > Storage Subsystems**.
2. In the content panel, double-click a storage subsystem row or click the icon next to a row to edit information about that storage subsystem. Information about the storage subsystem appears on the Storage Subsystems Details window.
3. You can edit the information in the fields that are specified in bold in the window:

**Software Version**

Displays the version of the SAN Volume Controller or Storwize V7000 device.

**Storage Subsystem**

Displays the name of the device.

**IP Address**

Displays the IP address or host name for the device.

**Select Key**

Lists the actions that are available for the public Secure Shell (SSH) key:

- **Use existing uploaded key.** This action is the default. If you select this action, the **Admin Username** and **Admin Password** fields are optional.
- **Upload new key.** If you select this action, the **Admin Username** and **Admin Password** are required.

**Admin Username**

If you selected **Upload new key** in the **Select Key** list, enter the name of a user that has the administrator role for the SAN Volume Controller or Storwize V7000 cluster that contains the device. If you selected **Use existing uploaded key**, this field is optional.

**Admin Password**

Enter the password for the user that you entered in the **Admin Username** field.

**Username**

Enter an authorized user for the device. This field is active if you have selected **Upload new key** in the **Select Key** list and have entered a user name and password in the **Admin Username** and **Admin Password** fields. To search for a user, click **Select User**. You must enter a valid administrator name and password to retrieve a list of users.

**Private SSH Key**

Displays the path for the private SSH key. If you want to change this path, enter a new path or click the **Browse** button to search for a new path.

**Passphrase (optional)**

Displays the passphrase for the SSH key pair.

4. Select **File > Save**. If successful, the Storage Subsystems window appears and any new values for the storage subsystem are shown.

## Modifying Storwize V7000 Unified storage system details

After you add a Storwize V7000 Unified storage system, information about the system is displayed in the Storage Subsystems Details page. You can modify the information that is in the available fields that are on this page.

Storwize V7000 Unified is composed of Storwize V7000 and Storwize V7000 File Module. You can connect to only Storwize V7000 or to both Storwize V7000 and Storwize V7000 File Module. Storwize V7000 provides block-level data and Storwize V7000 File Module provides file-level data.

To modify information about a Storwize V7000 Unified storage system, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > Storage Subsystems**.
2. On the Storage Subsystems page, double-click a storage subsystem row to edit information about that storage subsystem. The following information about the storage subsystem is displayed:

### Storwize V7000

#### Storage Subsystem

Displays the name of the storage system.

#### IP Address

Enter the IP address or host name of the Storwize V7000 storage system. You can enter an IPv4 or IPv6 address, for example:

- 127.0.0.1
- [2001:DB8:0:0:0:0:0:0/32]

#### Select Key

An SSH key is required to access Storwize V7000. Select one of the following actions for the SSH key:

- **Upload new key:** Select this option to upload a new key. Public key content is extracted from the private key that is provided in the **Private SSH Key** field and is uploaded to the Storwize V7000 cluster. If you select this action, the **Administrator User Name** and **Administrator Password** fields are required.
- **Use existing uploaded key:** Select this option if you want to use a public key that was already uploaded by using a method other than through Tivoli Storage Productivity Center, such as the Storwize V7000 web interface. Enter the location of the private key file that corresponds to the public key in the **Private SSH Key** field. The **Administrator User Name** and **Administrator Password** fields are not required if you select this option.

#### Administrator User Name

If you selected **Upload new key** in the **Select Key** list, enter the name of a user that has the Security Administrator role for the Storwize V7000 cluster that contains the storage system. Tivoli Storage Productivity Center uses this value during the setup process to contact the cluster and configure the SSH keys for the user. This user must belong to the Security Administrator

role, which has privileges to modify other user accounts. Otherwise, Tivoli Storage Productivity Center cannot configure the SSH keys.

If you selected **Use existing uploaded key**, this field is optional.

#### **Administrator Password**

Enter the password for the user name that you entered in the **Administrator User Name** field.

If you selected **Use existing uploaded key**, this field is optional.

#### **User Name**

Enter an authorized user name for the storage system. Tivoli Storage Productivity Center uses this value to monitor and configure the storage system. If the user name does not exist, it is created. This user name must belong to the Administrator role.

This field is active if you selected **Upload new key** in the **Select Key** list and entered a user name and password in the **Administrator User Name** and **Administrator Password** fields.

**Important:** If you upload a new key for the existing Storwize V7000 user by using Tivoli Storage Productivity Center, that new key overrides the existing key for the user name. If you have another application that is using that user name (for example Tivoli Storage Productivity Center for Replication), the application cannot log on to Storwize V7000 because the key associated with the user is overwritten.

If this situation occurs, create a user ID specifically for Tivoli Storage Productivity Center or Tivoli Storage Productivity Center for Replication on the Storwize V7000 cluster. Add the Storwize V7000 storage system to Tivoli Storage Productivity Center for Replication using the new user ID and password (or change the user ID and password while the storage system is in the disconnected state).

#### **Select User**

Select a user name from the list. The names are defined on Storwize V7000.

#### **Private SSH Key**

By default, the private key entry includes `${device.conf}\tpc_svc.pem`, which represents the Tivoli Storage Productivity Center default key `tpc_svc.pem`. The `tpc_svc.pem` key is in the `conf` directory where the Device server is installed. If you want to use your own key, the key must exist on the system where you are running the Tivoli Storage Productivity Center user interface. The key is uploaded to the Tivoli Storage Productivity Center server system. To identify a new key, click **Browse**.

The private SSH key must be in OpenSSH format or in PuTTY (.ppk) format that is not password protected. If you have a password protected PuTTY .ppk key, use the PuTTYgen utility on a Windows operating system to convert that key to OpenSSH format by following these steps:

- a. Start the PuTTYgen utility.

- b. Load the .ppk file by clicking **File > Load private key**.
- c. From the menu bar, click **Conversion > Export OpenSSH key conversion**.

This action saves the key in OpenSSH format.

#### **Passphrase (Optional)**

Enter the passphrase for the private SSH key. The passphrase protects your private SSH key file. If you do not have a passphrase, leave this field blank.

#### **Storwize V7000 File Module (Optional)**

If this check box *was not* selected when the storage system was added, you can select the check box to connect to the Storwize V7000 File Module. If this check box *was* selected when the storage system was added, you cannot clear the box.

Depending on the configuration of Storwize V7000 Unified, the information that is required to connect to this system can be the same as or different from the information for Storwize V7000. The fields and field descriptions are the same as the fields in the Storwize V7000 pane with the following exceptions:

- The **IP Address** field is not displayed because the IP address is retrieved automatically.
- The **User Name** field is always required.
- The private SSH key must be in OpenSSH format. The PuTTY format is not supported. You can use the PuTTYgen utility to convert the key to the OpenSSH format.
- The **Select Key** list contains the option **Use user password** in addition to the **Upload new key** and **Use existing uploaded key** options. If you select **Use user password**, the **User Password** field is enabled and you can use a user name and password to connect to the file module.

If you select **Use user password**, the **Administrator User Name** and **Administrator Password** fields are optional.

3. Click **File > Save** on the menu bar. If the modifications are successful, the Storage Subsystems page is displayed and any new values for the storage subsystem are shown.

## **Modifying System Storage DS8000 details**

Learn how to modify information about a IBM System Storage DS8000 device that connects to IBM Tivoli Storage Productivity Center.

After you add a System Storage DS8000 device, basic information about that system appears on the **Administrative Services > Data Sources > Storage Subsystems** panel. To modify information about a System Storage DS8000 device on the Storage Subsystems panel, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > Storage Subsystems**.
2. In the content panel, double-click a storage subsystem row or click the icon next to a row to edit information about that storage subsystem. Information about the storage subsystem appears on the Storage Subsystems Details window.
3. You can edit the information in the fields that are specified in bold in the window:

**Storage Subsystem**

Displays the name of the System Storage DS8000 device.

**HMC Address**

Displays the IP address or host name for the Hardware Management Console (HMC) that is used to manage the device.

**HMC2 Address (optional)**

Displays the IP address or host name for a second HMC that is used to manage the device.

**Username**

Displays the user name for the device.

**Password**

Displays the password for the device.

4. Select **File > Save**. If successful, the Storage Subsystems window appears and any new values for **Username** and **Password** for the storage subsystem are shown.

**Modifying other storage system details**

Learn how to modify information about the storage systems that connect to IBM Tivoli Storage Productivity Center using CIM object managers (CIMOMs).

After you add a CIMOM, basic information about that CIMOM appears on the **Administrative Services > Data Sources > Storage Subsystems** panel. To modify information about a CIMOM on the Storage Subsystems panel, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > Storage Subsystems**.
2. In the content panel, double-click a storage subsystems row or click the icon next to a row to display a table of the CIMOMs that the storage subsystem is registered with.

**Service URL**

Displays the service Web address of the CIMOM. This Web address contains the IP address of the CIMOM, the port on which the CIMOM is listening, and the protocol used for communication. This Web address has a protocol (http | https), an IP address (IPv4 or IPv6), and a port number. For example: IPv4: https://127.0.0.1:5989 IPv6: https://2001:DB8:0:0:0:0:0:0:5989.

**Connection Status**

Displays the status of the connection between Tivoli Storage Productivity Center and the CIMOM.

**Interoperability Namespace**

Displays the interoperability namespace of the CIMOM. This namespace within the CIMOM allows the CIM Interop Schema (including the class instances of the Server Profile) to be accessed. The namespace also determines how Tivoli Storage Productivity Center interacts with the CIMOM when retrieving information. For a NetApp CIMOM, the value is /interop.

**Display Name**

Displays the name of the CIMOM as specified by the CIMOM provider.

**Description (optional)**

Displays the description that was entered on the Add CIMOM Agent window.

3. In the content panel, double-click a CIMOM row or click the icon next to a row to display details for the CIMOM. The connection information that you enter for a CIMOM is like the information that you enter on the Add CIMOM Agent panel. See “Adding a CIM agent connection” on page 250 for descriptions of the fields on this panel.
4. Select **File > Save**. If successful, the View and Edit CIMOM window appears and any new values for the CIMOM are shown.

### Testing the connection to a storage system

Learn how to test the connection from IBM Tivoli Storage Productivity Center to a storage system.

You must have Administrator privileges to perform this action.

After you add a storage system to Tivoli Storage Productivity Center, basic information about that system appears on the **Administrative Services > Data Sources > Storage Subsystems** panel. To verify that Tivoli Storage Productivity Center can use the information provided to connect to the storage system, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > Storage Subsystems**.
2. In the content panel, highlight the row for a storage system and click **Test Connection** to test its connection to Tivoli Storage Productivity Center. The results of the test are displayed in the Test Subsystem Connection dialog box.
3. Click **OK** to close the dialog box. The **Connection Status** field is updated to reflect the status.

### Removing a storage system

Learn how to remove the connection between a storage system and IBM Tivoli Storage Productivity Center.

You must have Administrator privileges to perform this action.

Use the **Administrative Services > Data Sources > Storage Subsystems** panel to remove a storage system. Removing a storage system will:

- Remove the storage system information from master server database repository
- Remove the storage system information from all rollup reports
- Remove the storage system from the **Storage Subsystems** table

To remove a storage system, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > Storage Subsystems**.
2. In the content panel, select a storage system and click **Remove**. A dialog box appears.
3. Click **Yes** to confirm the removal of the connection between the storage system and Tivoli Storage Productivity Center.

## VMware data source

VMware Virtual Infrastructure data sources are used by IBM Tivoli Storage Productivity Center to collect information from the hypervisors and virtual machines within them.

When you add a VMware data source in IBM Tivoli Storage Productivity Center, you need a user ID that has permission to browse through the data stores on

VMware. IBM Tivoli Storage Productivity Center needs to browse through the data stores to collect information from the ESX Servers. However the "Read Only" role as defined by VMware does not allow IBM Tivoli Storage Productivity Center to browse the data stores. You can use the "Virtual Machine Power User" role as a choice if you do not want to use the Administrator role, or you can create a custom role with the required permissions.

To check what user role you have for VMware, follow these steps:

1. Connect a VI client to the ESX Server or VirtualCenter (whichever is used as the data source). Click the ESX Server and go to the **Summary** tab. Select a data source, right-click the data source and select **Browse**, to confirm that the browse permission is working correctly.
2. Connect the VI client to the data source with the admin role, go to the **Permission** tab and determine if the role name is used for the user.
3. Open the **Permissions** view, select that role, then right-click and select the **Edit** role. See what permissions are checked. Expand the check groups to find the specific ones.

For more information about VMware user roles, see: [http://www.vmware.com/pdf/vi3\\_vc\\_roles.pdf](http://www.vmware.com/pdf/vi3_vc_roles.pdf).

## Adding a VMware VI Data Source

This topic provides information about adding a VMware Virtual Infrastructure data source.

To add a VMware VI data source, follow this procedure:

1. In the Navigation Tree pane, expand **Administrative Services > Data Sources > VMware VI Data Source**.
2. In the content pane, click **Add VMware VI Data Source**.
3. In the Add VMware VI Data Source window, enter the following information:

### Host Name

The host name for the VMware data source (ESX Server or VirtualCenter).

### Protocol

This is http or https. If you use https, you must have first imported the SSL certificate into IBM Tivoli Storage Productivity Center. For information about how to import the SSL certificate, see the *IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication Installation and Configuration Guide Version 4 Release 1*. The protocol must match the same protocol that is set for the ESX Server or VirtualCenter.

**Port** The port used by the VMware data source.

### Username

The user name for the VMware data source.

### Password

The password for the VMware data source.

### Password Confirm

The password is confirmed for the VMware data source.

### Display Name

The name displayed in reports for the VMware data source.

**Description**

The description for the VMware data source.

**Test VMware VI Data Source connectivity before adding**

Check this box to check the connectivity for the VMware data source.

4. Click **Save**.

**Updating VMware data source information**

After a VMware data source has been added, you can update the administrator name or password for the VMware data source.

To update information for a VMware data source, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > VMware VI Data Source**.
2. In the content pane, click on the icon by the VMware data source you wish to change.
3. In the content pane, a notebook window opens. Make the appropriate changes.

**Displaying information about a VMware data source**

You can view information about a VMware data source including its host name, protocol, port, and type.

To display information about a VMware data source, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > VMware VI Data Source**.
2. In the content pane, click on the magnifying glass icon for the VMware data source for which you want information for. In the content pane, a notebook window opens. The following information is displayed:

**Host Name**

The IP address of the data source.

**Protocol**

This is http or https.

**Port** The port used by the VMware data source.

**Type** Virtual Center.

**Administrator Name**

The name of the administrator for the VMware data source.

**Password**

The password for the VMware data source.

**Password Confirm**

Confirm the password for the VMware data source.

**Display Name**

The name displayed for the VMware data source.

**Description**

Description for the VMware data source.

**Software Level**

The software level for the VMware data source.

**ConnectionStatus**

The connection status to the VMware data source.

**Status Timestamp**

### Test VMware VI Data Source connectivity before updating

Check this box to check the connectivity to the VMware data source.

### Show managed devices for VMware

You can view information about the managed devices for VMware.

To show the managed devices for VMware, follow this procedure:

1. In the navigation tree, expand **Administrative Services > Data Sources > VMware VI Data Source**.
2. In the content pane, click **Show Managed Devices**.
3. A pop-up window displays the VMware managed devices. Click **OK** to close the window.

### Deleting a VMware VI Data Source

This topic provides information about deleting a VMware Virtual Infrastructure data source.

To delete a VMware VI data source, follow this procedure:

1. In the Navigation Tree pane, expand **Administrative Services > Data Sources > VMware VI Data Source**.
2. In the content pane, click **Remove VMware VI Data Source**.
3. In the confirmation dialog window to remove a VMware data source, click **OK**.

---

## Managing schedules, jobs, and runs

Use the Job Management panel to view and manage all the schedules, runs, and jobs related to the storage devices that are monitored by IBM Tivoli Storage Productivity Center.

Specifically, you can use the Job Management panel to perform the following tasks:

- View information about all schedules, runs, and jobs in one central location. In previous versions of the product, this information was available only through nodes under each schedule type in the navigation tree.
- Identify all the schedules that include a particular storage device.
- Identify all the schedules, runs, and jobs that are encountering problems when executing.
- Ensure that a storage device is fully monitored by Tivoli Storage Productivity Center.
- Edit, rename, delete, and run schedules. You must be logged in as the user who created a schedule to perform some of these actions.

Use either of the following methods to access the Job Management panel:

- Click the job management icon  in the toolbar.
- Open the definition of a schedule and click the **View Job History** button to view the runs and jobs related to the schedule. For example, in the navigation tree, click **IBM Tivoli Storage Productivity Center > Monitoring > Probes > TPCUser.Default Probe** to view the probe definition panel and click **View Job History**.

The following terms are used on this panel:

- **Schedule:** A schedule is a definition of a monitoring task that collects data about storage resources. Monitoring tasks include scans, probes, pings, quotas,

discovery, and performance monitors. For example, define a probe schedule to collect data about storage subsystems; define a scan schedule to collect file-level information about hosts.

- **Run:** A run is a single invocation of a schedule.
- **Job:** A job is a unit of work within a run for a schedule. One run might have multiple jobs. For example, a subsystem probe schedule has one job created per subsystem for which it collects data.

The Job Management panel is divided into the following sections:

#### **Filters section**

Use this section to perform the following tasks:

- Determine the type of storage entities whose schedules are displayed on the panel.
- View recommendations for storage entities that are not fully monitored by Tivoli Storage Productivity Center.

Filtering the contents of this panel based on entity type is optional. You select **Show All** from the **Entity Type** menu to display all the schedules defined in Tivoli Storage Productivity Center.

#### **Schedules section**

Use this section to manage the schedules related to the entities you selected in the **Filters** section. You can perform the following actions for each schedule:

- View and edit the definition of a schedule.
- Run a schedule immediately.
- Rename a schedule.
- Delete a schedule.
- Display schedules that have a certain status, such as Success, Running, or Failed.
- View basic information about a schedule, including the ID of the user who created it, description, job type (for example, ping, probe, or scan), the last time the schedule was run, and the next time the schedule is run.

#### **Jobs for Selected Schedule section**

Use this section to manage each run of a schedule and the jobs associated with a run. You can perform the following tasks for jobs and runs:

- View the status of a run and the date and time when it was executed.
- View information about the jobs associated with each run, including the name of the computer on which a job was run, the type of the monitored device, and the status of the job.
- View the log files for one or more jobs at a time.
- Display jobs that have started or completed within a specified length of time. For example, display jobs that have completed in the last two weeks.
- Display jobs that have a certain status, such as Success, Running, or Failed.

Click and drag the horizontal lines on the panel to resize each section. Click the names of columns in the **Schedules** and **Jobs for Selected Schedule** sections to sort the contents of lists based on the clicked column.

## Filters

### Refresh All

Click this button to update all the lists that are displayed on the panel.

### Entity Type

Select the type of storage entity whose related schedule information you want to view. By default all schedules are displayed when you first access this panel. When you select a specific entity type, the following actions take place:

- The schedules, runs, and jobs related to the entity type are displayed in the appropriate sections on the panel.
- The names of the devices that belong to that entity type are displayed in the **Entity Name** list box.
- The text that is displayed above the **Show Recommendations** button indicates if the devices are fully monitored.

You can select from the following entity types in the **Entity Type** menu:

### Show All

(default) View all the schedules defined in Tivoli Storage Productivity Center.

### Storage Subsystem

View the schedules for storage subsystems that are monitored by Tivoli Storage Productivity Center.

**Fabric** View the schedules for fabrics that are monitored by Tivoli Storage Productivity Center.

### Computer

View the schedules for computers that are monitored by Tivoli Storage Productivity Center.

### Switch

View the schedules for switches that are monitored by Tivoli Storage Productivity Center.

### Tape Library

View the schedules for tape libraries that are monitored by Tivoli Storage Productivity Center.

### Monitoring Group

View the schedules that contain monitoring groups.

### Storage Resource Group

View the schedules for all the devices contained within a particular storage resource group.

### Entity Name Filter

Enter text to filter the names of entities that are displayed in the **Entity Name** list box. You can enter a combination of letters, numbers, dashes, underscores, and spaces. The filter text is not case sensitive. You can also enter the following wildcard characters:

- Use an asterisk (\*) to represent zero or more unknown characters of any value. For example, enter **DS8\*** to display devices of the selected type that begin with **DS** in their names, such as DS6000-A12-IBM, DS8000-B34-IBM, and DS5000-B35-IBM.

- Use a question mark to represent a single unknown character of any value. For example, enter **D?000-B3?-IBM** to include devices such as DS8000-B34-IBM, DS8000-B36-IBM, and DS5000-B35-IBM in the **Entity Name** list box.

#### **Text that is displayed above the Show Recommendations button**

Warning text is displayed above the **Show Recommendations** button if the devices selected in the **Entity Name** list box are not fully monitored.

A device is considered not fully monitored if it is not included in all data collection schedules that are available in the licensed edition of Tivoli Storage Productivity Center that is installed. For example, if using the Advanced edition of Tivoli Storage Productivity Center to monitor a host, that host must appear in the following schedule definitions to be considered fully monitored: ping, probe, and scan. If using the Disk edition of Tivoli Storage Productivity Center to monitor a storage subsystem, that storage subsystem must appear in the following schedule definitions to be considered fully monitored: probe.

If a device is considered not fully monitored, click **Show Recommendations** to view a list of recommended actions you can take to address the warning.

#### **Show Recommendations**

Click this button to view recommended actions for a selected device that is not fully monitored. From the Recommendations panel, you can perform the following tasks:

- View the schedules that are recommended for a device.
- Click the **Take Action** button to create the recommended schedule for a device.

## **Schedules**

#### **View Detail**

View the definition of a schedule that is selected in the schedule list. The schedule definition panel opens when you click this button. Use this panel to view and edit the definition of a schedule.

#### **Run Now**

Run the selected schedule immediately. This option is only available if the job is not currently running.

#### **Refresh**

Update the status of the schedule that is selected in the schedule list. The process to refresh the status of a schedule might take a few moments based on the current server load and network speed.

#### **action drop down menu**

Use the options in this menu to perform actions against the selected schedule. The menu includes **View Detail**, **Run Now**, **Stop Now** (for performance monitor schedules) and the following actions:

##### **Rename**

Rename a schedule. You must be the owner of a schedule or the Tivoli Storage Productivity Center superuser to perform this action. This action is not available for the default schedules that are owned by TPCUser.

**Delete** Delete a schedule. When you delete a schedule, all the runs and jobs associated with the schedule are also deleted. You must be the

owner of a schedule or the Tivoli Storage Productivity Center superuser to perform this action. This action is not available for the default schedules that are owned by TPCUser.

### **Only show schedules with status**

Filter the schedules that appear in the schedules list based on their status. For example, use this menu to indicate that only schedules with a status of **Running** are displayed in the schedules list. The default setting displays all schedules.

You can filter schedules using the following statuses:

- Show All
- Show All Unsuccessful
- Success
- Running
- Warnings
- Failed
- The job is waiting
- The job is running

Tivoli Storage Productivity Center automatically updates the schedules list if you change the value selected in this menu.

### **schedules list**

Use this list to view the schedules for the storage entities that are selected in the **Filters** section of the panel. The schedules that are displayed must also meet the filter selected in the **Only show schedules with status** menu. Click the name of a column to sort the contents of this list based on that column.

Some jobs that run in Tivoli Storage Productivity Center do not have a schedule associated with them. For example, jobs that are run through the command-line interface (CLI) do not have a schedule defined for them. To ensure that these job types are displayed on the Job Management panel, a new schedule called **CLI and Event Driven Jobs** was created. Select this schedule to view the runs and jobs that do not have user-created schedules associated with them. The job log files for the CLI and Event Driven Jobs schedule are automatically retained for 90 days and then deleted.

The following information is displayed for each schedule:

#### **Creator**

The ID of the Tivoli Storage Productivity Center user who created the schedule.

**Name** The name of a schedule.

#### **Description**

The description of a schedule.

#### **Job Type**

The type of the schedule, such as Probe, Ping, Scan, Aggregator Job, CIMOM Discovery, or Subsystem Performance Monitor.

#### **Last Run Finished**

The data and time when the most recent run of a schedule completed. This column is blank if the schedule has never been run.

### Last Run Status

The status of the most recent run of a schedule.

### Next Run

The date and time when the next run of the schedule is planned. The value **On Demand** is displayed for schedules that are defined with the **Run Now** option. The value **Never** is displayed for schedules that are defined with the **Run Once** option and have already run.

### row number

Appears in the lower right corner of the schedules list and indicates the number of rows in the schedules list. One row is displayed for each schedule. Use the horizontal lines on the panel to resize the section and increase or decrease the number of rows that are displayed.

## Jobs for Selected Schedule

### View Log File(s)

View the log files of jobs that are selected in the runs list. Use the Shift + click and Ctrl + click keyboard shortcuts to select multiple jobs. You can view up to 10 logs at one time. The Log File Viewer panel opens when you click this button or when you double-click a row for a job. Use this panel to view all the processing performed by the Tivoli Storage Productivity Center server and agents for jobs.

**Note:** The number of job log files that are retained for a schedule is determined by the values defined on the Log File and Cached Batch Report Retention panel under **Administrative Services > Configuration**. However, for CLI and Event Driven Jobs schedules, job log files are automatically retained for 90 days.

### Show Jobs, in the last

Use these fields to determine the runs that are displayed for the selected schedule. Use the following conditions in the filter:

- Select **Started** or **Completed** from the **Show Jobs** menu to display runs based on whether they started or completed in the time frame specified on the **last** field.
- Specify a time frame for started or completed runs by entering a number in the **last field** and selecting a unit of measurement from the menu.

For example, select **Started**, enter **4**, and select **weeks** to display the runs for a schedule that have started within the last four weeks. Tivoli Storage Productivity Center automatically updates the runs list if you change the value selected in these fields.

### Only show jobs with status

Determine the runs that are displayed in the runs list based on their status. For example, use this menu to indicate that only runs with a status of **Completed with warning(s)** are displayed. The default setting displays all runs for the selected schedule.

You can filter the display of runs using the following statuses:

- Show All
- Show All Unsuccessful
- The job is waiting
- Running
- The job is running

- Completed successfully
- Running with warning(s)
- Completed with warning(s)
- Completed with error(s)
- System error occurred
- The agent did not respond (to a request from the server)
- The agent is being upgraded
- The agent is not licensed
- Agent not found
- Agent could not be reached
- The job delay limit was exceeded.
- The agent disconnected
- Host was shutdown or recycled
- Cluster resource group unreachable: no IP
- Scripts are disabled for this agent
- Script was not found or has an invalid extension
- The agent disk space is low

Tivoli Storage Productivity Center automatically updates the runs list if you change the value selected in this menu.

#### runs list

Use this list to view the runs and jobs of the schedule selected in the **Schedules** section of the panel. This list displays runs based on the criteria specified in the **Show jobs** and **in the last** fields.

Click the + symbol next to an entry in the **Run** field to view the jobs associated with a run. Click the name of a column to sort the contents of this list based on that column.

The following information is displayed for each run or job:

#### Run Status

The status of a run.

**Run** The run number assigned to a run and the date and time when the run was started.

#### Computer

(jobs only) The name of the computer where a job is executed. For database probes, this column displays the name of the Storage Resource agent that is performing the probe. For storage subsystem probes, this column displays **localhost** because the probe is performed by the Tivoli Storage Productivity Center server.

#### Device

(jobs only) The name of the device to which a job applies. This column is blank if the job is not related to a specific device.

**Status** (jobs only) The status of a job.

#### Start Time

(jobs only) The date and time when a job started.

#### Finish Time

(jobs only) The data and time when a job completed.

**Log File Name**

(jobs only) The name of the log file for a job. Click the **View Log File** to view the contents of a job log.

**row number**

Appears in the lower right corner of the runs list and indicates the number of rows in the runs list. One row is displayed for each run. You can expand each run row to view the jobs related to that run. Use the horizontal lines on the panel to resize the section and increase or decrease the number of rows that are displayed.

## Job Management - Recommendations

Use this window to view and apply the recommendations for storage devices that are not fully monitored by IBM Tivoli Storage Productivity Center.

A device is not fully monitored if it is not included in all the data collection schedules that are available in the licensed edition of Tivoli Storage Productivity Center that is installed. For example, if using the IBM Tivoli Storage Productivity Center Advanced license to monitor a host, that host must appear in the following schedule definitions to be considered fully monitored: ping, probe, and scan. If using IBM Storage Productivity Center Select Edition to monitor a storage subsystem, that storage subsystem must appear in a probe schedule to be considered fully monitored.

**Recommendation Severity**

Indicates whether a recommendation is a **Warning** or **Informational**.

- A **Warning** message indicates an action that you can take to more fully use Tivoli Storage Productivity Center to monitor a device. For example, when using a probe schedule in the IBM Tivoli Storage Productivity Center Advanced license to collect data about a storage system, a warning message is displayed. This message recommends that you also include the storage subsystem in a performance monitor schedule. You can then use the data collected by performance monitor to identify the bottlenecks in storage usage and performance for the storage subsystem.
- An **Informational** message is a recommendation to upgrade Tivoli Storage Productivity Center to an edition that includes additional monitoring functions. For example, when using probe schedules in IBM Storage Productivity Center Select Edition to collect data about a fabric, an informational message is displayed. This message indicates that if you upgrade to IBM Tivoli Storage Productivity Center Advanced, performance data can be collected about the fabric.

For **Warning** messages, select the corresponding row and click **Take Action** to perform the recommended action.

**Entity** Displays the name of a storage entity to which the recommendation applies.

**Recommendation**

Indicates the recommended actions for a storage entity. One row is displayed per recommendation. Click **Take Action** to resolve recommendations that have a **Warning** severity.

If multiple recommendations are displayed for a device, sometimes performing one of the recommended actions might resolve the other recommendations. For example, consider if these two recommendations are displayed for a fabric:

- In order to collect information about device configuration, define a probe schedule for fabric {0}
- To enable zone control, add a data source that is capable of zone control for fabric {0}

If you click **Take Action** for the first recommendation and include the fabric in a probe, the second recommendation is also resolved. Both recommendations are then automatically removed from the **Recommendation** list

**Take Action**

Perform the recommended action for a warning. When you click this button, the corresponding panel for the action is displayed. For example, if the recommended action is to include a storage subsystem in a performance monitor, the panel is displayed.

**Cancel**

Exit the window without taking action.

---

## Chapter 5. Managing resources in the stand-alone GUI

You can use the stand-alone GUI to manage and monitor the resources and storage infrastructure in an enterprise environment. This interface provides all the tools to manage data, disk, fabric, tape, and replication.

Tivoli Storage Productivity Center also provides a web-based GUI for monitoring resources. Each GUI provides different functions for managing your storage. To view a comparison of the functions that are available in each GUI, see “Available functions and report information in the interfaces” on page 19.

### Related concepts:

Chapter 6, “Managing resources in the web-based GUI,” on page 623

You can use the web-based GUI to monitor the condition, capacity, and relationships of the monitored resources within your storage environment.

---

## Configure Devices wizard

Use the Configure Devices wizard to set up storage devices for monitoring by IBM Tivoli Storage Productivity Center. The wizard guides you through the steps for adding a device as a data source, running a discovery, including devices in groups, specifying alerts, and setting up data collection schedules.

In previous versions of IBM Tivoli Storage Productivity Center, setting up a storage device for monitoring required performing tasks in different locations of the user interface, and each type of device required different steps. In Tivoli Storage Productivity Center v4.2 and later, all the tasks for setting up and configuring a device are included in the Configure Devices wizard.

Use the wizard to configure the following device types for monitoring:

- Storage subsystems
- Fabrics and switches
- Computers
- Tape libraries

You can add multiple devices of the same type using a single session of the wizard. For example, you can add an IBM DS8000, IBM XIV, IBM SAN Volume Controller, IBM Storwize V7000, IBM Storwize V7000 Unified, IBM SONAS, and storage subsystems associated with CIM agents by using a single session of the wizard. You cannot configure multiple devices of different types at the same time. For example, you cannot add a storage subsystem and a fabric using a single session of the wizard.

**Note:** The Configure Devices wizard queries all schedules to identify whether a subsystem or entity is part of a scheduled probe. If a probe schedule has been defined for a global entity such as **All Computers** or **All Storage subsystems**, the Configure Devices wizard will not display a new device as an entity requiring configuration.

The pages in the wizard are divided into two sections:

**Steps** Displays the steps for completing in the wizard. An icon is displayed next to the current step. The wizard includes the following steps for configuring a device:

1. Select the device type that you want to configure.
2. Select the specific devices that you want to configure.
3. Determine how data is collected from the devices.
4. Review your selections and run the wizard.
5. Review the results of the wizard.

How you access the wizard determines on what step you begin. For example, if you click the **Configure Devices** icon in the toolbar or select the **Configure Devices** node in the navigation tree, you start by selecting the device type that you want to configure. If you click the **Add Storage Subsystem** button on the Disk Manager > Storage Subsystem panel, you begin by entering connection information about the storage systems that you want to configure.

**Options**

Displays the options and fields that you must select and complete for each step.

**Related reference:**

“Alerts and schedules associated with monitoring groups and templates” on page 1419

Use alerts to notify you when conditions for storage devices are detected by a data collection schedule. Include storage devices in monitoring groups or templates to automatically associate alerts and schedules with those devices.

## Configuring storage subsystems

Use the Configure Devices wizard to configure storage systems so that these storage systems can be monitored by Tivoli Storage Productivity Center. Storage subsystems that you configure using the wizard are automatically included in probe schedules and associated with alert conditions.

You can configure more than one storage system at a time by using the Configure Devices wizard. All the storage systems that you configure by using the wizard share probe schedule and alert conditions.

Depending on the type of storage system that you want to configure, you must define connection information for its native interface or associated CIMOM. Enter information in the wizard about the native interfaces for the following storage systems:

- System Storage DS8000
- SAN Volume Controller
- The XIV system
- Storwize V7000
- Storwize V7000 Unified
- IBM SONAS

For all other storage systems, you must enter information about the CIM agents that manage them.

To configure storage systems to be monitored by Tivoli Storage Productivity Center, complete the following steps:

1. Select one of the following ways to access the wizard:
  - To configure existing storage systems, click the **Configure Devices** icon on the toolbar. You cannot configure existing storage systems if they are already included in a probe schedule.  
If you select this method, you must also complete the following steps:
    - a. On the Select Device Type page, select **Storage Subsystem**.
    - b. Click **Configure existing storage subsystems**. The page displays the storage systems that are known to Tivoli Storage Productivity Center. Continue to next step.
  - To only add storage systems, select one of the following methods and proceed to step 4:
    - In the navigation tree, expand **Disk Manager > Storage Subsystems** and click **Add Storage Subsystem**.
    - In the navigation tree, expand **IBM Tivoli Storage Productivity Center > Configuration Utility > Services > Storage Subsystem Interfaces** and click **Add**.
2. Select the existing storage systems that you want to configure. Storage systems that are already included in probe schedules are not displayed.  
If the Credentials column indicates Missing or New Credentials Required for the storage systems that you select, you must update the storage system connection properties before you continue.
3. Enter valid connection properties for each storage system that you want to configure, and continue to step 6.
4. Configure the storage system or CIMOM connections. Tivoli Storage Productivity Center uses this information to connect to a storage system or CIMOM.  
Enter information for a storage system or CIMOM, and then click **Add**. Repeat steps 1 - 3 to configure multiple storage systems or CIMOMs in the same session of the wizard.  
Tivoli Storage Productivity Center will discover the storage systems managed by each of the CIMOM connections that you entered.
5. Select the storage systems that you want to configure. Any storage systems that were added in previous steps are automatically selected. Deselect storage systems that you do not want to configure.
6. Specify how data is collected for storage systems by including them in a monitoring group or template. Use monitoring groups and templates to determine when data is collected and what alert conditions are checked for the storage systems that you are configuring.
  - Select a monitoring group if you want to manage a collection of storage systems in the same manner. By default, the monitoring group that you select is associated with an existing probe schedule and set of alerts. When you select the group, its data collection schedule and alerts are automatically applied to all the storage systems that you are configuring. After completing the wizard, the storage systems remain in the group and you can use that group when working in other parts of the user interface, such as in reports.

**Tip:** Tivoli Storage Productivity Center provides a number of default monitoring groups for storage systems. If you want to include a storage system in a user-defined group rather than in a default group, that group must be associated with a data collection schedule. If the user-defined group is not associated with a data collection schedule, it is not displayed in the list of monitoring groups from which you can select.

- Select a template if you want to create a unique probe schedule and set of alerts for a storage system rather than using the settings of an existing group.

The option that you select in this step determines the next step in the wizard.

- If you select a monitoring group, the following actions occur:
  - The storage systems are automatically included in a probe schedule to which the group is associated. For example, if you select Subsystem Basic Group, the storage systems are included in the Subsystem Basic Probe schedule. The Subsystem Basic Probe schedule runs one time per week on Tuesday at 1:00 am.
  - A set of alert conditions are applied to the storage systems in a group. When any of these conditions are detected during data collection, an alert is triggered. The group that you select determines the alerts that are associated with the storage systems. For example, if you select Subsystem Basic Group, 14 alert conditions are automatically checked for the storage systems.
  - The storage systems are included in the group. You can use that group in other parts of the user interface, such as in reports.
- If you select a monitoring template, the following actions occur:
  - The storage systems are automatically included in a probe schedule that is created for the template. For example, if you select the Basic Subsystem Monitoring template, the storage systems are automatically included in a new probe that runs one time per week on Tuesday. The probe is created after the wizard is completed. Tivoli Storage Productivity Center determines the time when the probe is run based on server load to ensure optimal performance.
  - A set of alert conditions is applied to storage systems in the template. When any of these conditions are detected during data collection, an alert is triggered. The template you select determines the alerts that are associated with the storage systems. For example, if you select to the Basic Subsystem Monitoring template, 14 alert conditions are automatically checked for the storage systems.
  - You must enter a prefix for the probe schedule and alerts that are created for the template. This prefix is used to identify the probe and alerts in the user interface. For example, if you select the Basic Subsystem Monitoring template and enter the prefix "ABC", a probe schedule named "*userID*.ABCssBasicProbe" and alerts such as "*userID*.ABCPool Discovered (Basic)" are created, where *userID* represents the ID of the user that is logged on to Tivoli Storage Productivity Center.

The new probe and alerts are displayed under the corresponding node in the navigation tree for you to view and edit. For example, a probe schedule created from a template in the wizard appears under the **IBM Tivoli Storage Productivity Center > Monitoring > Probes** node; new storage system alerts appear under the **Disk Manager > Alerting** node.

See Alerts and schedules associated with monitoring groups and templates for a list of groups and templates with their associated schedules and alerts.

7. On the summary page of the wizard, review the selections that you made.

View the results of the device configuration and close the wizard. The devices that you configured are probed.

## Configure storage subsystem connections page

Use this page in the Configure Devices wizard to enter or update connection properties for the storage systems and CIMOMs that you are configuring. Tivoli Storage Productivity Center uses this information to collect data about the storage systems.

Use the Configure storage system connections page to enter or update connection properties for the following storage entities. Depending on the type of storage system that you want to configure, you must define connection information for its native interface or associated CIMOM. Enter information on the page about the native interfaces for the following storage systems:

- System Storage DS8000
- XIV system
- SAN Volume Controller / Storwize V7000
- Storwize V7000 Unified
- IBM SONAS

The entity that is selected from the **Device Type** list determines the information that Tivoli Storage Productivity Center requires to connect to that entity. The following sections describe the fields for each entity.

**Requirement:** If you are adding or updating connection properties for a SAN Volume Controller or Storwize V7000 storage system, select **IBM SAN Volume Controller / IBM Storwize V7000** in the **Device Type** list. If you are adding or updating connection properties for a Storwize V7000 Unified storage system, select **IBM Storwize V7000 Unified**.

### IBM DS8000

Enter or update the following information to have Tivoli Storage Productivity Center connect to a System Storage DS8000 storage system.

#### HMC Address

Enter the IP address or host name for the Hardware Management Console (HMC) that is used to manage the System Storage DS8000 storage system.

#### HMC2 Address (Optional)

Enter the IP address or host name for a second HMC that is used to manage the storage system.

#### Username

Enter the user name for logging in to the System Storage DS8000 element manager. The default user name is admin.

**Note:** This user name is the same as the ESSNI user name.

#### Password

Enter the password for the user name.

### IBM XIV

Enter or update the following information to have Tivoli Storage Productivity Center connect to the XIV system.

#### IP Address

Enter the IP address or host name for the XIV system that you want to configure.

**Username**

Enter the user name for the XIV system.

**Password**

Enter the password for the user name.

**IBM SAN Volume Controller / IBM Storwize V7000**

Enter or update the following information to have Tivoli Storage Productivity Center connect to a SAN Volume Controller or Storwize V7000 storage system.

**Software Version**

Enter the version of the SAN Volume Controller or Storwize V7000 software that you want to configure.

**IP Address**

Enter the IP address or host name of the SAN Volume Controller or Storwize V7000. You can enter an IPv4 or IPv6 address, for example:

- 127.0.0.1
- [2001:DB8:0:0:0:0:0/32]

**Select Key**

A Secure Shell (SSH) key is required to access the storage system. Select one of the following actions for the SSH key:

- **Upload new key:** Select this option to upload a new key. Public key content is extracted from the private key that is provided in the **Private SSH Key** field and is uploaded to the SAN Volume Controller or Storwize V7000 cluster. If you select this option, the **Admin Username** and **Admin Password** fields are required.
- **Use existing uploaded key:** Select this option if you want to use a public key that was already uploaded by using a method other than through Tivoli Storage Productivity Center, such as the SAN Volume Controller or Storwize V7000 web interface. Enter the location of the private key file that corresponds to the public key in the **Private SSH Key** field. The **Admin Username** and **Admin Password** fields are not required if you select this option.

**Administrator User Name**

If you selected **Upload new key** in the **Select Key** list, enter the name of a user that has the Security Administrator role for the SAN Volume Controller or Storwize V7000 cluster that contains the storage system. Tivoli Storage Productivity Center uses this value during the setup process to contact the cluster and configure the SSH keys for the user. This user name must have privileges to modify other user accounts (Security Administrator role); otherwise, Tivoli Storage Productivity Center cannot configure the SSH keys.

If you selected the **Use existing uploaded key** option, this field is optional.

**Note:** The **Administrator User Name** applies to only SVC5.x+; it does not apply to SVC 4.x.

**Administrator Password**

Enter the password for the user name that you entered in the **Administrator User Name** field.

**User Name**

Enter an authorized user name for the storage system. Tivoli Storage Productivity Center uses this value when monitoring and configuring the

storage system. If the user name does not exist it is created. This user name must be assigned the Administrator role.

This field is active if you selected **Upload new key** in the **Select Key** list and entered a user name and password in the **Administrator User Name** and **Administrator Password** fields.

**Important:** If you upload a new key for the existing SAN Volume Controller or Storwize V7000 user by using Tivoli Storage Productivity Center, that new key overrides the existing key for the user. If you have another application that is using that user (for example Tivoli Storage Productivity Center for Replication), the application cannot log on to SAN Volume Controller or Storwize V7000 because the key associated with the user is overwritten.

If you have this situation, create a user ID specifically for Tivoli Storage Productivity Center or Tivoli Storage Productivity Center for Replication on the SAN Volume Controller or Storwize V7000 cluster. Add the SAN Volume Controller or Storwize V7000 to Tivoli Storage Productivity Center for Replication using the new user ID and password (or change the user ID and password while the storage system is in the disconnected state).

#### Select User

Click this button to select from a list of existing users that are defined on the SAN Volume Controller or Storwize V7000.

#### Private SSH Key

By default, the private key entry includes `${device.conf}\tpc_svc.pem`, which represents the Tivoli Storage Productivity Center default key `tpc_svc.pem`. The `tpc_svc.pem` key is in the `conf` directory where the Device server is installed. If you want to use your own key, the key must exist on the system where you are running the Tivoli Storage Productivity Center user interface. The key is uploaded to the Tivoli Storage Productivity Center server system. To identify a new key, click **Browse**.

The private SSH key must be in OpenSSH format or in PuTTY (.ppk) format that is not password protected. If you have a password protected PuTTY .ppk key, use the PuTTYgen utility on a Windows operating system to convert that key to OpenSSH format by following these steps:

1. Start the PuTTYgen utility.
2. Load the .ppk file by clicking **File > Load private key**.
3. From the menu bar, click **Conversion > Export OpenSSH key conversion**.

This action saves the key in OpenSSH format.

#### Passphrase (Optional)

Enter the passphrase for the private SSH key. The passphrase protects your private SSH key file. If you do not have a passphrase, leave this field blank.

#### Storwize V7000 Unified

Enter or update the following information to have Tivoli Storage Productivity Center connect to a Storwize V7000 Unified storage system.

Storwize V7000 Unified is composed of Storwize V7000 and Storwize V7000 File Module. You can connect to only Storwize V7000 or to both Storwize V7000 and

Storwize V7000 File Module. Storwize V7000 provides block-level data and Storwize V7000 File Module provides file-level data.

### Storwize V7000

Use the information in this section to connect Storwize V7000.

#### IP Address

Enter the IP address or host name of the Storwize V7000 storage system. You can enter an IPv4 or IPv6 address, for example:

- 127.0.0.1
- [2001:DB8:0:0:0:0:0/32]

#### Select Key

An SSH key is required to access Storwize V7000. Select one of the following actions for the SSH key:

- **Upload new key:** Select this option to upload a new key. Public key content is extracted from the private key that is provided in the **Private SSH Key** field and is uploaded to the Storwize V7000 cluster. If you select this action, the **Administrator User Name** and **Administrator Password** fields are required.
- **Use existing uploaded key:** Select this option if you want to use a public key that was already uploaded by using a method other than through Tivoli Storage Productivity Center, such as the Storwize V7000 web interface. Enter the location of the private key file that corresponds to the public key in the **Private SSH Key** field. The **Administrator User Name** and **Administrator Password** fields are not required if you select this option.

#### Administrator User Name

If you selected **Upload new key** in the **Select Key** list, enter the name of a user that has the Security Administrator role for the Storwize V7000 cluster that contains the storage system. Tivoli Storage Productivity Center uses this value during the setup process to contact the cluster and configure the SSH keys for the user. This user must belong to the Security Administrator role, which has privileges to modify other user accounts. Otherwise, Tivoli Storage Productivity Center cannot configure the SSH keys.

If you selected **Use existing uploaded key**, this field is optional.

#### Administrator Password

Enter the password for the user name that you entered in the **Administrator User Name** field.

If you selected **Use existing uploaded key**, this field is optional.

#### User Name

Enter an authorized user name for the storage system. Tivoli Storage Productivity Center uses this value to monitor and configure the storage system. If the user name does not exist, it is created. This user name must belong to the Administrator role.

This field is active if you selected **Upload new key** in the **Select Key** list and entered a user name and password in the **Administrator User Name** and **Administrator Password** fields.

**Important:** If you upload a new key for the existing Storwize V7000 user by using Tivoli Storage Productivity Center, that new key overrides the existing key for the user name. If you have another application that is using that user name (for example Tivoli

Storage Productivity Center for Replication), the application cannot log on to Storwize V7000 because the key associated with the user is overwritten.

If this situation occurs, create a user ID specifically for Tivoli Storage Productivity Center or Tivoli Storage Productivity Center for Replication on the Storwize V7000 cluster. Add the Storwize V7000 storage system to Tivoli Storage Productivity Center for Replication using the new user ID and password (or change the user ID and password while the storage system is in the disconnected state).

#### Select User

Select a user name from the list. The names are defined on Storwize V7000.

#### Private SSH Key

By default, the private key entry includes `${device.conf}\tpc_svc.pem`, which represents the Tivoli Storage Productivity Center default key `tpc_svc.pem`. The `tpc_svc.pem` key is in the `conf` directory where the Device server is installed. If you want to use your own key, the key must exist on the system where you are running the Tivoli Storage Productivity Center user interface. The key is uploaded to the Tivoli Storage Productivity Center server system. To identify a new key, click **Browse**.

The private SSH key must be in OpenSSH format or in PuTTY (.ppk) format that is not password protected. If you have a password protected PuTTY .ppk key, use the PuTTYgen utility on a Windows operating system to convert that key to OpenSSH format by following these steps:

1. Start the PuTTYgen utility.
2. Load the .ppk file by clicking **File > Load private key**.
3. From the menu bar, click **Conversion > Export OpenSSH key conversion**.

This action saves the key in OpenSSH format.

#### Passphrase (Optional)

Enter the passphrase for the private SSH key. The passphrase protects your private SSH key file. If you do not have a passphrase, leave this field blank.

#### Storwize V7000 File Module (Optional)

To connect to the Storwize V7000 Unified system, select the check box.

Depending on the configuration of Storwize V7000 Unified, the information that is required to connect to this system can be the same as or different from the information for Storwize V7000. The fields and field descriptions are the same as the fields in the Storwize V7000 pane with the following exceptions:

- The **IP Address** field is not displayed because the IP address is retrieved automatically.
- The **User Name** field is always required.
- The private SSH key must be in OpenSSH format. The PuTTY format is not supported. You can use the PuTTYgen utility to convert the key to the OpenSSH format.
- The **Select Key** list contains the option **Use user password** in addition to the **Upload new key** and **Use existing uploaded key** options. If you

select **Use user password**, the **User Password** field is enabled and you can use a user name and password to connect to the file module.

If you select **Use user password**, the **Administrator User Name** and **Administrator Password** fields are optional.

## IBM SONAS

Enter or update the following information so that Tivoli Storage Productivity Center can connect to an IBM SONAS system.

### IP Address

Enter the IP address or host name of the IBM SONAS system. You can enter an IPv4 or IPv6 address, for example:

- 127.0.0.1
- 2001:DB8:0:0:0:0:0/32

### Select Key

You must use a Secure Shell (SSH) key to access the storage system. Select one of the following actions for the SSH key:

- **Upload new key:** Select this option to upload a new key. Public key content is extracted from the private key that is provided in the **Private SSH Key** field and is uploaded to the IBM SONAS system. If you select this action, you must specify a value for the **Administrator User Name** and **Administrator Password** fields.
- **Use existing uploaded key:** Select this option if you want to use a public key that was already uploaded by using a method outside of Tivoli Storage Productivity Center, such as the IBM SONAS system web interface. Enter the location of the private key file that corresponds to the public key in the **Private SSH Key** field. You do not have to specify a value in the **Administrator User Name** and **Administrator Password** fields.
- **Use user password:** Select this option if you want to use a user name and password to connect to the file module. If you select this option, the **User Password** field is enabled and you can use a user name and password to connect to the file module.

If you select **Use user password**, the **User Password** field is enabled and the **Administrator User Name** and **Administrator Password** fields are optional.

### Administrator User Name

If you selected **Upload new key** in the **Select Key** list, enter the name of a user that has the Security Administrator role for the IBM SONAS system. Tivoli Storage Productivity Center uses this value during the setup process to contact the system and configure the SSH keys for the user. This user name must have privileges to modify other user accounts (Security Administrator role); otherwise, Tivoli Storage Productivity Center cannot configure the SSH keys.

If you selected **Use existing uploaded key**, this field is optional.

### Administrator Password

Enter the password for the user name that you entered in the **Administrator User Name** field.

### User Name

Enter an authorized user name for the storage system. Tivoli Storage Productivity Center uses this value when it configures and monitors the

storage system. If the user name does not exist it is created. This user name must have the Administrator role.

This field is active if you selected **Upload new key** in the **Select Key** list and entered a user name and password in the **Administrator User Name** and **Administrator Password** fields.

#### Select User

Select from a list of existing user names that are defined on the IBM SONAS system.

#### Private SSH Key

By default, the private key entry includes `${device.conf}\tpc_svc.pem`, which represents the Tivoli Storage Productivity Center default key `tpc_svc.pem`. The `tpc_svc.pem` key is in the `conf` directory where the Device server is installed. If you want to use your own key, the key must exist on the system where you are running the Tivoli Storage Productivity Center user interface. The key is uploaded to the Tivoli Storage Productivity Center server system. To identify a new key, click **Browse**.

The private SSH key must be in OpenSSH format or in PuTTY (.ppk) format that is not password protected. If you have a password protected PuTTY .ppk key, use the PuTTYgen utility on a Windows operating system to convert that key to OpenSSH format by following these steps:

1. Start the PuTTYgen utility.
2. Load the .ppk file by clicking **File > Load private key**.
3. From the menu bar, click **Conversion > Export OpenSSH key conversion**.

This action saves the key in OpenSSH format.

#### Passphrase (Optional)

Enter the passphrase for the private SSH key. The passphrase protects the private SSH key file. If you do not have a passphrase, leave this field blank.

#### User Password

Enter the password for the user name that you entered in the **User Name** field.

#### Other (CIMOM)

Enter or update connection properties for a CIMOM. Tivoli Storage Productivity Center uses this information to discover the storage systems that are managed by a CIMOM. You can then configure those storage systems as part of the wizard session.

The connection information that you enter for a CIMOM is similar to the information that you enter when adding a CIMOM on the Add CIMOM page. See "Adding a CIM agent connection" on page 250 for descriptions of the fields on this page.

#### Discovered Storage Systems

After you run a discovery job, a table is displayed on the "Configure storage subsystem connections" page. This table provides information about the storage systems that were discovered for the selected storage system type.

You can remove the connection to a storage system by clicking the row for the system in the table, and then clicking **Remove**.

## Configure fabrics and switches

Use the Configure Devices wizard to set up fabrics and switches for monitoring by Tivoli Storage Productivity Center. Fabrics and switches that you configure in the wizard are automatically included in probe schedules and associated with alert conditions.

You can use the wizard to configure the following fabric and switch types for monitoring:

- Brocade
- Cisco
- QLogic

You can configure one or more fabrics using a single session of the Configure Devices wizard. All the fabrics and switches that you configure in a single pass through the wizard share the same probe schedule and alert conditions.

To configure fabrics and switches using the wizard, complete the following steps:

1. Access the wizard based on the task you want to perform:
  - If you want to add new or configure existing fabrics and switches, click the configure devices icon in the toolbar or select the **Configure Devices** node in the navigation tree. If you use this method, you must also complete the following steps:
    - a. Select **Fabrics/Switches** on the Select Device Type page.
    - b. Determine whether to add new fabrics or configure existing fabrics that are known to Tivoli Storage Productivity Center.
      - To add fabrics and switches, select **Add and configure new fabrics** and go to step 3.
      - To configure existing fabrics and switches, select **Configure existing fabrics**. The page displays the fabrics that are known to Tivoli Storage Productivity Center. Go to step 2.
  - If you only want to add new fabrics and switches, go to **Fabric Manager > Fabrics** and click the **Add Fabric** button. Go to step 3.
2. Select the existing fabrics that you want to configure. Fabrics that are already included in probe schedules are not displayed. Go to step 6 after selecting the fabrics that you want to configure.
3. Configure CIMOM or agent connections. The fields for entering connection information for a fabric changes based on the type of fabric you are adding. Tivoli Storage Productivity Center uses the information you enter in this step to connect to a fabric or CIMOM. Click **Add** to configure multiple fabrics in a session of the wizard.

**Note:** Depending on the type of fabric you are adding, the wizard recommends whether to enter CIMOM or agent information. For example, if you are configuring a Brocade fabric, the recommended way to administer it is with a CIMOM. If a CIMOM is not available, enter connection information for an out of band fabric agent.

4. Discover the fabrics and fabrics managed by the CIMOMs that you entered in the previous step. Tivoli Storage Productivity Center collects initial configuration information for these entities.

5. Select the fabrics that you want to configure for monitoring. Any fabrics that were added in previous steps are automatically selected. Clear the checkboxes for the fabrics that you do not want to configure.
6. Specify how data is collected for fabrics by including them in a monitoring group or template. Use monitoring groups and templates to determine when data is collected and what alert conditions are checked for the fabrics that you are configuring.

- Select a monitoring group if you want to manage a collection of fabrics in the same manner. Each monitoring group that you can select is associated with an existing probe schedule and set of alerts. When you select a group, its data collection schedule and alerts are automatically applied to all the fabrics that you are configuring. After completing the wizard, the fabrics remain in the group and you can use that group when working in other parts of the user interface, such as in reports.

**Tip:** Tivoli Storage Productivity Center provides a number of default monitoring groups for fabrics. If you want to include a fabric in a user-defined group rather than in a default group, that group must be associated with a data collection schedule. If the user-defined group is not associated with a data collection schedule, it is not displayed in the list of monitoring groups from which you can select.

- Select a template if you want to create a unique probe schedule and set of alerts for a fabric rather than using the settings of an existing group.

The option that you select in this step determines the field and pages that appear next in the wizard.

- If you select a monitoring group, the following actions occur:
  - The fabrics are automatically included in a probe schedule to which the group is associated. For example, if you select Fabric Basic Group, the fabrics are included in the Fabric Basic Probe schedule. The Fabric Basic Probe schedule runs two times per week on Monday and Wednesday at 3:00 am.
  - A set of alert conditions is applied to the fabrics in a group. When any of these conditions are detected during data collection, an alert is triggered. The group that you select determines the alerts that are associated with the fabrics. For example, if you select Fabric Basic Group, nine alert conditions are automatically checked for the fabrics.
  - The fabrics are included in the group. You can use that group in other parts of the user interface, such as in reports.
- If you select a monitoring template, the following actions occur:
  - The fabrics are automatically included in a probe schedule that is created for a template. For example, if you select the Basic Fabric Monitoring template, the fabrics are automatically included in a new probe that runs two times per week on Monday and Wednesday. The probe is created after the wizard is completed. Tivoli Storage Productivity Center determines the time when the probe is run based on server load to ensure optimal performance.
  - A set of alert conditions is applied to the fabrics in a template. When any of these conditions are detected during data collection, an alert is triggered. The template you select determines the alerts that are associated with the fabrics. For example, if you select the Basic Fabric Monitoring template, nine alert conditions are automatically checked for the fabrics.
  - You must enter a prefix for the probe schedule and alerts that are based on a template. This prefix is used to identify the probe and alerts in the

user interface. For example, if you select the Basic Fabric Monitoring template and enter the prefix "ABC", a probe schedule named "*userID*.ABCfabBasicProbe" and alerts such as "*userID*.ABCFabric State Change (Basic)" are created, where *userID* represents the ID of the user that is logged on to Tivoli Storage Productivity Center.

The new probe and alerts are displayed under the corresponding node in the navigation tree for you to view and edit. For example, a probe schedule created from a template in the wizard appears under the **Tivoli Storage Productivity Center > Monitoring > Probes** node; new storage system alerts appear under the **Fabric Manager > Alerting** node.

See Alerts and schedules associated with monitoring groups and templates for a list of groups and templates with their associated schedules and alerts.

7. On the summary page of the wizard, review the selections that you made.

View the results of the device configuration and close the wizard. The devices that you configured are probed.

## Configure computers

Use the Configure Devices wizard to set up computers for monitoring by Tivoli Storage Productivity Center. Computers that you configure in the wizard are automatically included in probe and ping schedules and associated with alert conditions.

Use the Configure Devices wizard to configure computers that meet the following conditions:

- A Storage Resource agent was deployed on the computer.
- The computer is not included in an existing probe schedule. Devices that are included in existing probe schedules are not displayed in the Configure Devices wizard because they are considered to be already configured for monitoring.

**Important:** When computers are added to Tivoli Storage Productivity Center, they are automatically included in the default computer group, and that group is included in the default probe schedule (TPCUser.Default Probe). Because the computers are included in TPCUser.Default Probe, they are considered to be configured for monitoring and are not displayed in the wizard.

To use the Configure Devices wizard to configure computers that were included in TPCUser.Default Probe, move them into a group that is not associated with an existing probe schedule. To move them into a new group, complete the following steps:

1. In the navigation tree, go to **Data Manager > Monitoring > Groups > Computer**.
2. Right click **Computer** and select **Create Computer Group**.
3. Select the computers that you want to configure in the Configure Devices wizard and click the right arrow icon to move them into the new group.
4. Click the save icon in the toolbar to save the group. Do not associate this group with a probe schedule.
5. Start the Configure Devices wizard to the configure computers. The computers in the new group are displayed in the wizard.

You can configure one or more computers using a single session of the Configure Devices wizard. All the computers that you configure in a single pass through the wizard share the same probe schedule, ping schedule, and alert conditions.

To configure computers using the wizard, complete the following steps:

1. Click the configure devices icon in the toolbar or select the **Configure Devices** node in the navigation tree.
2. Select **Computers** on the Select Device Type page.
3. Select the computers that you want to configure. Computers that are already included in an existing probe schedule are not displayed.
4. Specify how data is collected for computers by including them in a monitoring group or template. Use monitoring groups and templates to determine when data is collected and what alert conditions are checked for the computers that you are configuring.
  - Select a monitoring group if you want to manage a collection of computers in the same manner. Each monitoring group that you can select is associated with existing probe and ping schedules and a set of alerts. When you select a group, its data collection schedules and alerts are automatically applied to all the computers that you are configuring. After completing the wizard, the computers remain in the group and you can use that group when working in other parts of the user interface, such as in reports.

**Tip:** Tivoli Storage Productivity Center provides a number of default monitoring groups for computers. If you want to include a computer in a user-defined group rather than in a default group, that group must be associated with a data collection schedule. If the user-defined group is not associated with a data collection schedule, it is not displayed in the list of monitoring groups from which you can select.

- Select a template if you want to create a unique probe schedule, ping schedule, and set of alerts for a computer rather than using the settings of an existing group.

The option that you select in this step determines the field and pages that appear next in the wizard.

- If you select a monitoring group, the following actions occur:
  - The computers are automatically included in probe and ping schedules to which the group is associated. For example, if you select Computer Basic Group, the computers are included in the Computer Basic Probe and Computer Basic Ping schedules. The Computer Basic Probe schedule runs two times per week on Monday and Wednesday at 3:00 am. The Computer Basic Ping schedule runs every 3 hours.
  - A set of alert conditions is applied to the computers in a group. When any of these conditions are detected during data collection, an alert is triggered. The group that you select determines the alerts that are associated with the computers. For example, if you select Computer Basic Group, seven alert conditions are automatically checked for the computers.
  - The computers are included in the group. You can use that group in other parts of the user interface, such as in reports.
- If you select a monitoring template, the following actions occur:
  - The computers are automatically included in a probe and ping schedule that are created for the template. For example, if you select the Basic Computer Monitoring template, the computers are automatically included in a new probe that runs two times per week on Monday and Wednesday and a ping that runs every three hours. The probe and ping are created

after the wizard is completed. Tivoli Storage Productivity Center determines the time when the probe is run based on server load to ensure optimal performance.

- A set of alert conditions is applied to the computers in a template. When any of these conditions are detected during data collection, an alert is triggered. The template you select determines the alerts that are associated with the computers. For example, if you select to the Basic Computer Monitoring template, seven alert conditions are automatically checked for the computers.
- You must enter a prefix for the probe schedules, ping schedules, and alerts that are based on a template. This prefix is used to identify these definitions in the user interface. For example, if you select the Standard Computer Monitoring template and enter the prefix "ABC", the following definitions are created in the user interface after the wizard is completed:
  - A probe schedule named "*userID*.ABCcompStandardProbe"
  - A ping schedule named "*userID*.ABCcompStandardPing"
  - Seven alerts that follow this naming convention: *userID*.ABCStatus Change Online (Standard)

Where *userID* represents the ID of the user that is logged in to Tivoli Storage Productivity Center.

The new schedule definitions and alerts are displayed under the corresponding node in the navigation tree for you to view and edit. For example, a probe schedule created from a template in the wizard is displayed under the **Tivoli Storage Productivity Center >Monitoring > Probes** node; a ping schedule is displayed under the **Data Manager > Monitoring > Pings** node; new storage system alerts appear under the **Data Manager > Alerting** node.

See Alerts and schedules associated with monitoring groups and templates for a list of groups and templates with their associated schedules and alerts.

5. Review the selections that you made in the wizard. The Review user selections page includes the following information:
  - A list of devices that you are configuring.
  - The name of the monitoring group that you selected. This value is not displayed if you selected a template.
  - The name of the probe and ping schedules that are created based on the template you selected. This value is not displayed if you selected a monitoring group.
  - Information about the schedules created for a template.
  - The names of the alerts that are created based on the template you selected. This value is not displayed if you selected a monitoring group.

View the results of the device configuration and close the wizard. The devices that you configured are probed.

## Configure tape libraries

Use the Configure Devices wizard to set up tape libraries for monitoring by IBM Tivoli Storage Productivity Center. Tape libraries that you configure in the wizard are automatically included in probe schedules.

You can configure one or more tape libraries using a single session of the Configure Devices wizard. All the tape libraries that you configure in a single pass through the wizard share the same probe schedule.

To configure tape libraries using the wizard, complete the following steps:

1. Access the wizard based on the task you want to perform:
  - If you want to add new or configure existing tape libraries, click the configure devices icon in the toolbar or select the **Configure Devices** node in the navigation tree. If you use this method, you must also complete the following steps:
    - a. Select **Tape Libraries** on the Select Device Type page.
    - b. Determine whether to add new tape libraries or configure existing tape libraries that are known to Tivoli Storage Productivity Center.
      - To add tape libraries, select **Add and configure new tape libraries** and go to step 3.
      - To configure existing tape libraries, select **Configure existing tape libraries**. The page displays the tape libraries that are known to Tivoli Storage Productivity Center. Go to step 2.
  - If you only want to add new tape libraries, go to **Tape Manager > Tape Libraries** and click the **Add Tape Library** button. Go to step 3.
2. Select the existing tape libraries that you want to configure. Tape libraries that are already included in probe schedules are not displayed. Go to step 6 after selecting the tape libraries that you want to configure.
3. Configure CIMOM connections for tape libraries. Tivoli Storage Productivity Center uses the information you enter in this step to connect to a CIMOM. Click **Add** to configure multiple CIMOMs in a session of the wizard.

The connection information that you enter for a CIMOM is like the information that you enter on the Add CIMOM panel.
4. Discover the tape libraries that are managed by the CIMOMs you entered in the previous step. Tivoli Storage Productivity Center uses the information you enter in this step to connect to a CIMOM. Click **Add** to configure multiple CIMOMs in a session of the wizard.
5. Select the tape libraries that you want to configure for monitoring. Any tape libraries that were added in previous steps are automatically selected. Deselect tape libraries that you do not want to configure.
6. Specify how data is collected for tape libraries by including them in a monitoring group or template. Use monitoring groups and templates to determine when data is collected for the tape libraries that you are configuring.
  - Select a monitoring group if you want to manage a collection of tape libraries in the same manner. Each monitoring group that you can select is associated with an existing probe schedule. When you select a group, its data collection schedule is automatically applied to all the tape libraries that you are configuring. After completing the wizard, the tape libraries remain in the group and you can use that group when working in other parts of the user interface, such as in reports.

**Tip:** Tivoli Storage Productivity Center provides a number of default monitoring groups for tape libraries. If you want to include a tape library in a user-defined group rather than in a default group, that group must be associated with a data collection schedule. If the user-defined group is not associated with a data collection schedule, it is not displayed in the list of monitoring groups from which you can select.

- Select a template if you want to create a unique probe schedule for a tape library rather than using the settings of an existing group.

The option that you select in this step determines the field and pages that appear next in the wizard.

- If you select a monitoring group, the following actions occur:
  - The tape libraries are automatically included in a probe schedule to which the group is associated. For example, if you select Tape Basic Group, the tape libraries are included in the Tape Basic Probe schedule. The Tape Basic Probe schedule runs one time per week on Sunday at 4:00 am.
  - The tape libraries are included in the group. You can use that group in other parts of the user interface, such as in reports.
- If you select a monitoring template, the following actions occur:
  - The tape libraries are automatically included in a probe schedule that is created for a template. For example, if you select the Basic Tape Monitoring template, the tape libraries are automatically included in a new probe that runs one time per week on Sunday. The probe is created after the wizard is completed. Tivoli Storage Productivity Center determines the time when the probe is run based on server load to ensure optimal performance.
  - You must enter a prefix for the probe schedule and alerts that are based on a template. This prefix is used to identify the probe and alerts in the user interface. For example, if you select the Basic Tape Monitoring template and enter the prefix "ABC", a probe schedule named "*userID*.ABCtapeBasicProbe" is created, where *userID* represents the ID of the user that is logged in to Tivoli Storage Productivity Center.

The new probe is displayed under the corresponding node in the navigation tree for you to view and edit. For example, a probe schedule created from a template in the wizard appears under the **Tivoli Storage Productivity Center >Monitoring > Probes** node.

See Alerts and schedules associated with monitoring groups and templates for a list of groups and templates with their associated schedules and alerts.

7. On the summary page of the wizard, review the selections that you made.

View the results of the device configuration and close the wizard. The devices that you configured are probed.

---

## Discovering storage resources

Run discovery schedules to collect information about the storage resources in your environment.

The process of finding storage resources within an enterprise, including detection of network topology, is called discovery. Use discovery schedules in Tivoli Storage Productivity Center to collect basic information about the storage resources in your environment, including computers, CIMOMs, storage systems, fabrics and switches, filers, clusters, and tape libraries. You must run discovery schedules before you can collect more detailed information about storage resources using other data collection schedules, such as probes, scans, and pings.

You are not required to run discovery schedules for storage resources that meet either of the following conditions:

- Storage resources that use native interfaces to connect to the Tivoli Storage Productivity Center.

- Storage resources that are configured using the Configure Devices wizard.

## Discovery overview

IBM Tivoli Storage Productivity Center supports various discovery types. Use discovery schedules to find new CIMOMs, Out of Band Fabrics, Windows Domains, NAS filers, and SAN File System that have been introduced into your environment.

The discovery types in Tivoli Storage Productivity Center are summarized in the following table. Additionally the table summarizes the types of information that each discovery provides.

*Table 34. Discovery types, their data sources, and top-level entities that are discovered*

Type of discovery	Data source	Top-level entities
CIMOM	CIM Agent	<ul style="list-style-type: none"> <li>• Fabric (switches)</li> <li>• Storage subsystems</li> <li>• Tape subsystems</li> </ul>
Out-of-band	SNMP agents on the switches	Fabric (switches). A fabric discovery gets all the fabric information switches that have been added as out-of-band agents. All information is collected by using the SNMP protocol to send queries across the IP network to the management information bases (MIBs) supported on the switch.
Storage Resource agents or In-band Fabric agents	Storage Resource agent or In-band Fabric agents	<p>Fabric (switches). If you have deployed Storage Resource agents or have In-band Fabric agents on the computers attached to the fabric, you do not need to perform a specific discovery step for these Storage Resource agent. The fabric is automatically discovered.</p> <p><b>Note:</b> In Tivoli Storage Productivity Center v4.2 and later, you can deploy Storage Resource agents only. If you want to install an Inband fabric agent (Fabric agent), you must own a previous version of the product. See the documentation for the previous version of the product for information about how to install a Fabric agent.</p>
Windows domain, NAS, and SAN File System	Data agent or Storage Resource agent	<ul style="list-style-type: none"> <li>• Computers</li> <li>• Filers</li> <li>• Clusters</li> <li>• Names or agents</li> </ul>

Table 34. Discovery types, their data sources, and top-level entities that are discovered (continued)

Type of discovery	Data source	Top-level entities
VMWare VI	VMWare VI data source	The data source can be a hypervisor (ESX Server or VirtualCenter).

Generally, discovery only provides information about the existence of a resource. Use probes and scans to obtain detailed information about a specific resource after it has been discovered.

For a Windows domain, Tivoli Storage Productivity Center only performs a discovery on the first Windows system on the domain; not all the systems on the domain.

### CIMOM discovery

This topic describes how the IBM Tivoli Storage Productivity Center manages and monitors disk, switch, and tape devices through Common Information Model Object Managers (CIMOMs).

**Note:** CIMOM can be referred to by a variety of names, such as CIM agents or SMIS agents. A CIM agent consists of a CIMOM and an SMIS provider for the managed device.

CIM agents on the same subnet as the Tivoli Storage Productivity Center Device server are automatically discovered with CIMOM discovery. If CIM agents are not in the same subnet, they can be discovered using a Service Location Protocol (SLP) Directory Agent (DA) or they can be added manually. If you do not want Tivoli Storage Productivity Center to discover CIM agents in the local subnet, clear the Scan local subnet box in the CIMOM discovery Options panel. To include SLP Directory Agents in the discovery, add the IP address of the DA in the CIMOM discovery Options panel and click **Add**. CIMOM discovery has several purposes. It can scan the local subnet to find CIM agents and contact CIM agents that have been added through the dialog. After it has found a CIM agent, it attempts to log in and discover the storage entities being managed by the CIM agent. If a CIM agent is discovered but requires login information, you need to enter it in the View and Edit CIMOM panel and then rerun the discovery to collect the information for the storage entities. The amount of time CIMOM discovery takes depends on the number of CIM agents, the number of storage entities, and whether you are scanning the local subnet.

CIMOM discovery can be run on a schedule. How often you run it depends on how dynamic your environment is. It must be run to detect a new subsystem. CIMOM discovery also performs basic health checks of the CIM agent and subsystem.

For Tivoli Storage Productivity Center to successfully communicate with the CIM agents, the CIMOM service must be accessible through the IP network. The TCP/IP network configuration on the host where Tivoli Storage Productivity Center is installed must include in its list of domain names, all the domains that contain storage devices that are discoverable by Tivoli Storage Productivity Center.

The CIM agents are installed outside of Tivoli Storage Productivity Center. Contact your device vendor for information about installing the CIM agent.

## SLP registration with slptool

This topic describes how IBM Tivoli Storage Productivity Center uses Service Location Protocol (SLP) discovery.

SLP discovery requires that all of the CIMOMs that Disk Manager discovers are registered using the SLP. However, for CIMOMs outside of the IP subnet, you need to use an SLP DA and register the CIMOM using **slptool**. In a non-multicast network environment, you must use the **slptool** as SLP can only discover CIMOMs that are registered in its IP subnet. When you use **slptool**, ensure that the **CIM\_InteropSchemaNamespace** and **Namespace** attributes are specified.

For example, enter the following command:

```
slptool register service:wbem:https://<myhost.com>:<port>
```

Where *myhost.com* is the name of the machine hosting the CIMOM, and *port* is the port number of the service, for example 5989.

**Note:** **slptool** is installed with a CIMOM. Run the command from the machine hosting the CIMOM.

## SMI-S discovery

This topic describes how the IBM Tivoli Storage Productivity Center can discover storage devices that comply with the Storage Management Initiative Specification (SMI-S).

SMI-S-compliant CIM Agents are discovered using the Service Location Protocol (SLP). The Tivoli Storage Productivity Center server software performs SLP discovery on the network. The SLP User Agent (UA) looks for all registered services with a service type of **service:wbem**.

The Tivoli Storage Productivity Center performs the following discovery tasks:

- Locates individual storage devices
- Retrieves vital characteristics for those storage devices
- Populates the internal Tivoli Storage Productivity Center databases with the discovered information

## Device server and discovery on a SAN

Storage Management Initiative (SMI) agents, out-of-band Simple Network Management Protocol (SNMP) agents, and Storage Resource agents can be used to discover and probe switches and fabrics. When multiple agents are available, Tivoli Storage Productivity Center creates a list of the agents. The first agent on the list is started first. If an agent fails, the next agent on the list is started.

Host and device information is gathered by Storage Resource agents. Topology information is gathered using SMI (Brocade switches only), out-of-band, or Storage Resource agents. The topology discovery operations of all agent types provide a similar level of information. However, zone information is available only through certain agent types for certain vendors. See Table 35 on page 328 for details.

For Brocade fabrics, the preferred type of agent is the SMI agent. The SMI agent provides most fabric functions and the other agent types can be added for redundancy. However, Storage Resource agents are required to gather host bus adapter (HBA) information.

For QLogic and Cisco fabrics, a combination of different agent types is required to enable all functions. If Storage Resource agents are not used, the devices and hosts are displayed as entities of unknown type. You can change the icon and labels of the unknown entities to something more appropriate for your enterprise.

If you want to use out-of-band fabric agents, you must configure the switches to send SNMP traps to the the Device server. A similar configuration is not required for CIM indications for SMI agents because they are automatically subscribed to after a CIMOM discovery. However, in some environments, manual configuration of certain settings might be required. SNMP traps and CIM indications determine when to start an automatic rediscovery operation

The following table shows the actions that trigger data collection and the data that is collected depending on the type of agent that is used.

Table 35. Information collected by agent

Action that triggers data collection	Storage Resource agent	Out-of-band fabric agent (SNMP)	SMI agent (Brocade)	SMI agent (Cisco and QLogic)
<b>Administrative Services &gt; Discovery &gt; Out of Band Fabric</b>	–	<ul style="list-style-type: none"> <li>• Discovers switches and connections within an IP range</li> <li>• Retrieves switch and topology information</li> <li>• Retrieves Cisco VSAN information</li> </ul>	–	–
<b>Administrative Services &gt; Discovery &gt; CIMOM</b>	–	–	<ul style="list-style-type: none"> <li>• Discovers SMI agents through Service Location Protocol (SLP)</li> <li>• Retrieves switch information</li> <li>• Retrieves fabric information</li> </ul>	<ul style="list-style-type: none"> <li>• Discovers SMI agents through SLP</li> <li>• Retrieves switch information</li> <li>• Retrieves fabric information</li> </ul>
<b>IBM Tivoli Storage Productivity Center &gt; Probe (including fabric)</b>	<ul style="list-style-type: none"> <li>• Retrieves zoning information, excluding zone alias information, for QLogic and Cisco</li> <li>• Retrieves switch and topology information</li> <li>• Retrieves attribute information for hosts and devices connected to the fabric</li> </ul>	<ul style="list-style-type: none"> <li>• Retrieves switch and topology information</li> <li>• Retrieves Cisco VSAN information</li> </ul>	<ul style="list-style-type: none"> <li>• Retrieves detailed fabric, switch, switch port, and blade information</li> <li>• Retrieves zoning information, including zone aliases for Brocade devices</li> <li>• Retrieves fabric topology connectivity information</li> <li>• Subscribes to CIM indications</li> </ul>	<ul style="list-style-type: none"> <li>• Retrieves detailed fabric, switch, switch port, and blade information</li> </ul>

Table 35. Information collected by agent (continued)

Action that triggers data collection	Storage Resource agent	Out-of-band fabric agent (SNMP)	SMI agent (Brocade)	SMI agent (Cisco and QLogic)
Action of Storage Resource agent <sup>1</sup> : <ul style="list-style-type: none"> <li>• Turns on</li> <li>• Connectivity changes</li> <li>• Change event detected</li> </ul>	<ul style="list-style-type: none"> <li>• Retrieves zoning information, excluding zone alias information</li> <li>• Retrieves switch and topology information</li> <li>• Retrieves attribute information for hosts and devices connected to the fabric</li> </ul>	<ul style="list-style-type: none"> <li>• Retrieves switch and topology information</li> <li>• Retrieves Cisco VSAN information</li> </ul>		
SNMP trap received from switch	<ul style="list-style-type: none"> <li>• Retrieves zoning information, excluding zone alias information</li> <li>• Retrieves switch and topology information</li> <li>• Retrieves attribute information for hosts and devices connected to the fabric</li> </ul>	<ul style="list-style-type: none"> <li>• Retrieves switch and topology information</li> <li>• Retrieves Cisco VSAN information</li> </ul>		
CIM indication received from fabric SMI agent			Performs a mini-probe to collect information that is relevant to the indication received, or sets entities as missing. Might do one of the following actions: <ul style="list-style-type: none"> <li>• Retrieves switches and fabrics, or</li> <li>• Retrieves zoning data, or</li> <li>• Retrieves switch port status and connection to node, or</li> <li>• Retrieves switch blade status and all port connections for the blade, or</li> <li>• Sets fabric, switch, blades, connections, or nodes as missing</li> </ul>	

Table 35. Information collected by agent (continued)

Action that triggers data collection	Storage Resource agent	Out-of-band fabric agent (SNMP)	SMI agent (Brocade)	SMI agent (Cisco and QLogic)
<p>1. The Storage Resource agent has two distinct functions:</p> <ul style="list-style-type: none"> <li>• <b>Discovery</b> When a discovery job is run, Tivoli Storage Productivity Center gathers information about the fabrics, fabric to switch relationships, and other key attributes about the switches in the fabrics.</li> <li>• <b>Probe</b> When a probe job is run, Tivoli Storage Productivity Center gathers additional details for topology and zoning information.</li> </ul> <p>If you deploy a Storage Resource agent and a fabric probe job is not run, the connections from the Storage Resource agents to the switches are not displayed, and all the Fibre Channel (FC) ports are reported as unused</p>				

## SMI agents

In general, it is most beneficial to use SMI agents as the primary agent type for Brocade fabrics. See Table 35 on page 328 for the fabric information that is gathered by SMI agents. The use of SMI agents enables support for fabrics composed of switches from Brocade.

The following SMI agent profiles and their respective subprofiles are supported:

Table 36. Supported SMI agent profiles and subprofiles

Profile	Subprofile
Fabric	<ul style="list-style-type: none"> <li>• Zone Control</li> <li>• Enhanced Zoning and Enhanced Zoning Control</li> </ul>
Switch	<ul style="list-style-type: none"> <li>• Blades</li> <li>• Access Points</li> <li>• Multiple Computer System</li> <li>• Physical Package</li> <li>• Software</li> </ul>

The level of support depends on the subprofiles registered with the SMI agent. For example, zone control support requires that the SMI agent has the Zone Control subprofile registered with it.

SMI agents also notify the Device server of changes on the fabric, such as changes to the topology or to the zoning. This notification is done through CIM indications. The CIM indications are subscribed to for a SMI agent through the CIMOM discovery job. Some extra configuration might be required set up CIM indications for environments with systems that have multiple IP addresses.

The CIM indications send specific details of a change on the fabric to the Device server. Rather than recollect the complete topology and zoning information for every CIM indication received, the Device server analyzes the CIM indication. In most cases, the Device server either sends a small set of post-indication discovery requests to the SMI agent to collect information pertinent to that event, or sets certain devices as missing without any post-indication requests made to the SMI agent. For CIM Indications that represent a zoning change, the complete zoning information is recollecting from the SMI agent.

## Other agents

Although the SMI agents provide the most benefits, the use of multiple agent types also has advantages, such as redundant collection of information if one type of agent fails. Also, some types of agents provide certain features the other agents do not. However, the use of multiple agent types can increase network traffic and management load on the switches.

See Table 35 on page 328 for a list of the different types of jobs that collect data for the fabrics. You can use this table to determine which agent types to use for your fabric.

Out-of-band agents and Storage Resource agents provide the same information, such as a change that occurred in the SAN, by indicating that a discovery operation should be performed. The agents notify the Device server when something happened in the SAN and then a discovery is done to identify the changes.

The fabric agents that are running on the managed hosts detect Storage Resource agent events.

The the Device server out-of-band change agent detects the SNMP traps. For the Device server to receive the SNMP traps, configure the device, such as a switch, to send traps to the Device server.

The SNMP traps that are sent by the devices and by the Device server can be sent to the IBM Tivoli Storage Productivity Center graphical user interface (GUI). The events can be displayed in the event browser, or they can be sent to another trap console for monitoring. You then can provide error recovery or other advanced processing, such as paging.

### Fabric discovery

This topic describes how the Fabric Manager uses SNMP queries to discover information about selected fabric switches.

Management Information Base (MIB) information is collected from those switches. Out-of-band agents are configured for the Device server and contacted from the server through SNMP.

## Discovering computers in the Windows domain, NAS, and SAN File System

This topic describes how a NAS discovery finds SAN File System clusters.

When you run a discovery to find Windows computers on a domain, it discovers only new Windows computers. For IBM Tivoli Storage Productivity Center to recognize a non-Windows computer, you must install an agent on that computer.

For a Windows domain, Tivoli Storage Productivity Center only performs a discovery on the first Windows system on the domain; not all the systems on the domain.

A NAS discovery finds NAS Filers, and a SAN File System discovery finds the SAN File System clusters.

For information about configuring your system for NAS and SAN File System discovery, see the section about the Manual NAS/NetWare Server Entry node in the *IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication Installation and Configuration Guide*.

### **Discovering NetWare Filer systems that do not have agents**

This topic describes how you can discover NetWare Filer systems that do not have installed Storage Resource agents or Data agents.

To discover NetWare Filer systems, complete the following steps:

1. In the Navigation Tree pane, expand **Administrative Services > Discovery**.
2. Right-click **NetWare Filers** and click **Run Now**.

### **Discovering Windows computers that do not have agents**

Use discovery schedules to detect Windows computers that do not have Data agents or Storage Resource agent deployed on them.

To discover Windows computers that do not have agents in your Windows domain, perform the following steps:

1. In the navigation tree, expand **Administrative Services > Discovery**.
2. Right-click **Windows Domain, NAS, and SAN FS** and click **Run Now**.
3. After you have identified the computers, you can deploy Storage Resource agent on the computers to get detailed information about the computers and file systems. Computers that are discovered by Tivoli Storage Productivity Center but do not have Data agents or Storage Resource agents deployed on them are displayed on the Data Manager > Reporting > System-wide > Unmanaged Computers report.

### **Discovering VMware VI data sources**

This topic describes how you can discover VMware VI data sources.

To display information about VMware VI data sources, complete the following steps:

1. In the Navigation Tree pane, expand **Administrative Services > Discovery > VMware VI Data Source**.
2. Right-click **VMware VI Data Source**. Click **Run Now**.

## **Discovering computers**

This topic describes how Tivoli Storage Productivity Center gathers information from the computers that are discovered.

You must install Storage Resource agents directly on the computer it manages so that you can gather information about that computer. To gather information from the agents, you create ping, probe, and scan jobs. A scan job discovers the largest amount of information but is the most time-consuming and intensive job.

When an agent shuts down and Tivoli Storage Productivity Center detects that the agent is no longer responding, the agent is put into the missing state (represented by a black circle  ) to indicate that it is not detectable. Tivoli Storage Productivity Center also does a heartbeat ping to the agents every 30 minutes. If this ping detects the host while the agent is not running, the host is put into the warning state (represented by a warning status icon  ) to indicate that the host is responding but the agent is not.

If Tivoli Storage Productivity Center can no longer communicate with an agent, the agent is marked as missing (a black circle ). Information about the host continues to be displayed until the host is removed from the database. To remove the host from the database, you must uninstall the Storage Resource agent.

## Discover storage subsystem, tape library, and fabric information with CIM agents

This topic describes how you can discover storage subsystems, tape libraries, and fabrics in your environment using CIM agents.

CIM agents can be referred to by various names, such as CIMOM (CIM Object Manager) or SMIS agent. A CIM agent consists of a CIMOM and an SMI-S provider for the managed device. CIMOM discovery performs basic health checks of the CIMOMs. Even if you do not expect the number of CIMOMs to vary, be sure to schedule a CIMOM discovery often enough to be kept informed about your environment.

To automatically discover CIMOMs that are visible to the Device server with SLP, follow the instructions in “Discover CIM agents automatically” on page 252.

To add and discover CIMOMs manually, follow the instructions in “Adding a CIM agent connection” on page 250.

When your CIMOMs are manually added you must perform a CIMOM discovery to gather information about the CIMOMs so that IBM Tivoli Storage Productivity Center can communicate with them.

You are not required to run discovery jobs for storage resources that connect to Tivoli Storage Productivity Center using native interfaces:

- DS8000
- SAN Volume Controller
- Storwize V7000
- IBM Storwize V7000 Unified
- The XIV system
- IBM SONAS

To discover CIMOM information for any CIMOMs that you manually added, complete the following steps:

1. Expand **Administrative Services > Data Sources > CIMOM Agents**. CIMOMs are listed in the CIMOM Agents table along with their connection status. For each automatically discovered CIMOM you want to use, click the magnifying glass by the CIMOM name in the table. The View and Edit window for that CIMOM opens. Enter missing information, such as user name and password, for that CIMOM. Also make sure that you check the **Test CIMOM connectivity before updating** box. Click **File > Save** on the menu bar. This action saves your information and performs a connectivity check based on the information you entered. You must repeat this process for each SLP-discovered CIMOM you choose to use.
2. Expand **Administrative Services > Discovery > CIMOM**. The **Edit CIMOM** page opens in the content pane.
3. Optional: Click the **Options** tab. Enter the IP addresses or host names for the directory agents to be discovered.

**Note:** If you do not want to discover every CIMOM in the local subnet of your system, clear the Scan Local Subnet check box. If you clear this box the CIMOM discovery runs only on those CIMOMs already listed under **Administrative Services > Data Sources > CIMOM Agents**. If you chose not to clear this box CIMOM discovery searches for and discover all the CIMOMs in your subnet which might take a long time.

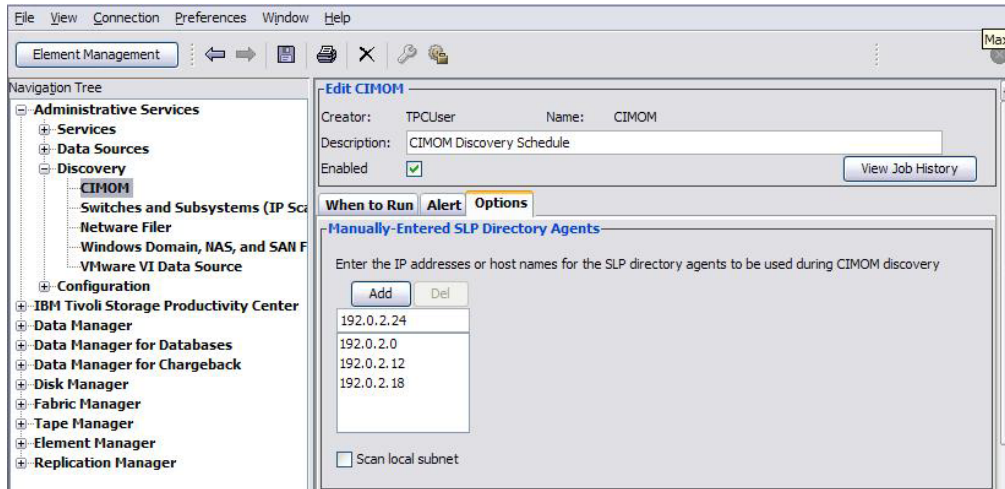

Figure 24. Editing the CIMOM discovery job (Options tab)

4. Click the **When to Run** tab and indicate how often and when to run this discovery job.
5. Click **File > Save** to save the job.

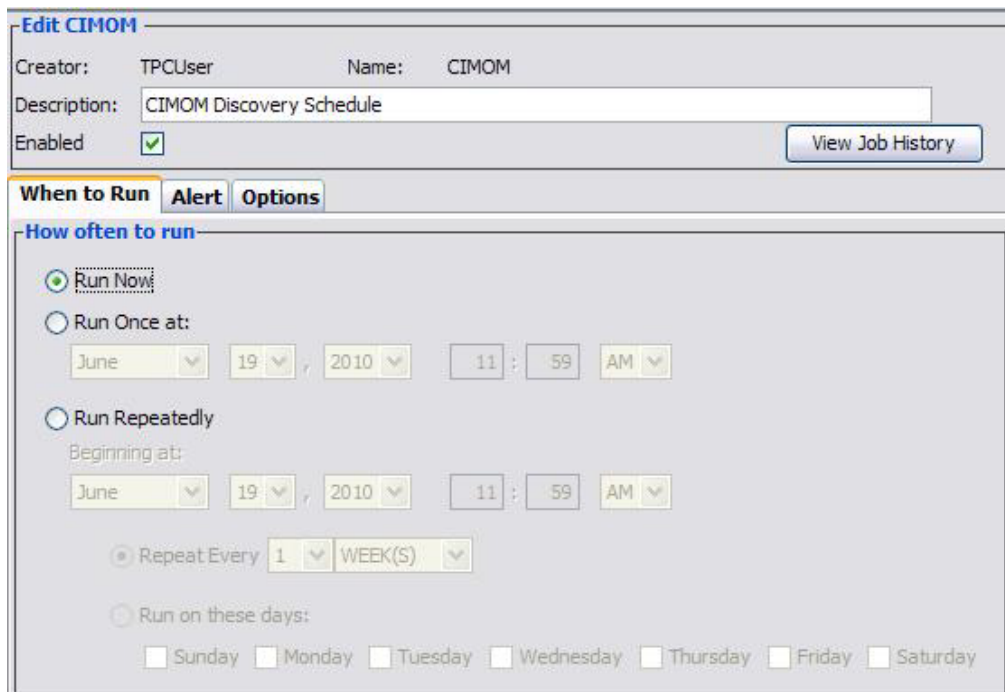

Figure 25. Editing the CIMOM discovery job (When to Run tab)

6. After you set the parameters for a CIMOM discovery, perform the discovery to gather information about all the CIMOMs you entered in the Options page.

Expand **Administrative Services > Discovery**. Right-click on **CIMOM** and click **Run Now**.

7. Click the Job Management icon (📁) in the toolbar to view the status of the discovery.
8. When the discovery finishes, view the list of discovered storage subsystems or tape libraries by expanding either **Disk Manager** and click **Storage Subsystems**, or **Tape Manager** and click **Tape Libraries**.

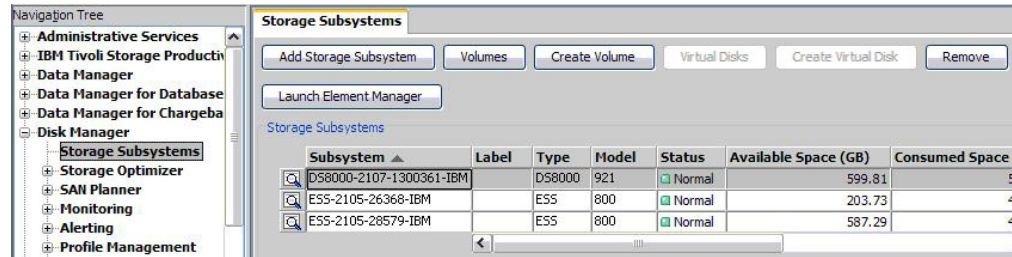

Figure 26. Checking storage subsystems

## Discovering fabrics with Storage Resource agents

When you deploy Storage Resource agents to computers, the agents automatically run discovery and provide information about the fabrics or switches to which the computers are attached. You do not need to run a specific discovery step for the fabrics connected to computers on which Storage Resource agent are deployed.

For example, if you have QLogic switches and have Storage Resource agents deployed on the computers that are attached to these switches, the switches are automatically discovered when you deploy the Storage Resource agents.

Discovering fabrics with the Storage Resource agent provides the following information:

- Fabric WWN, information about fabric-to-switch relationships, and key attributes
- Host and device information (collected from Storage Resource agents only), including HBA information
- Basic information to identify the host and devices in the fabric

After a discovery is run, you can run probes to collect topology and zoning information for the fabrics.

The vendors of fabric switches can help you determine whether to use CIM agents or Storage Resource agents to discover and monitor fabrics. For example, for Brocade switches, use CIM agents to collect all fabric data and enable performance monitoring and zone control. Use Storage Resource agents to collect information about HBAs. For Cisco and QLogic switches, you must have one or more Storage Resource agents on the fabric to collect full topology and zoning information, and to enable the zone control functions.

See the *Planning for Fabric Manager* section in the *Tivoli Storage Productivity Center Information Center* or *Installation and Configuration Guide* for more information about using CIM and Storage Resource agents to collect information about fabrics.

## Discovering storage subsystems and switches

Use the Switches and Subsystems (IP Scan) discovery schedule to find switches and storage systems in your environment. This discovery schedule searches for devices with a range of IP addresses that you specify.

Keep in mind the following considerations before running this discovery schedule:

- Switches and storage systems that require a CIM object manager (CIMOM) are not discovered using an IP scan. Use CIMOM discovery to discover these devices.
- Before a switch can be discovered, you must have an out-of-band fabric agent installed on the computer where the switch is installed or have the agent installed on a computer that has access to the switch.
- Before you can discover storage devices, ensure that port 7 (ECHO port) is open on the devices, and Internet Control Message Protocol (ICMP) is available. If you run Internet Protocol Version 6 (IPv6), it can take up to 30 seconds to discover the storage devices.
- If no CIM Agents for your Brocade switches are configured, you must discover out-of-band Fabric agents to get zone information for the Brocade switches.

To edit a discovery schedule for scanning a range of IP addresses, complete these steps:

1. In the navigation tree, expand **Administrative Services > Discovery**.
2. Click **Switches and Subsystems (IP Scan)**. The Edit Switches and Subsystems (IP Scan) panel is displayed.
3. Click **Options** to display the Options page.
4. Specify the IP address ranges that you want to scan in the **From** and **To** fields. You can enter an IPv4 or IPv6 address depending on what is supported within your environment:
  - Enter IPv4 addresses in the following format: ###.###.###.###. For example, if you enter **192.168.1.68** in the **From** field and **192.168.1.254** in the **To** field, Tivoli Storage Productivity Center scans IP addresses that fall in the range between 192.168.x.68 and 192.168.x.254.
  - Enter IPv6 addresses according to the standards in your environment. The preferred IPv6 address representation is written as eight groups of four hexadecimal digits: xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx, where each x is a hexadecimal digit representing 4 bits. For example: 2001:DB8:0000:1234:0000:0000:5678:ABCD. You can also specify IPv6 addresses using shortened formats that omit leading zeros 2001:DB8:0:1234:0:0:5678:ABCD or use double colons 2001:DB8:0000:1234::5678:ABCD in place of a series of zeros.

For example, if you enter **2001:DB8::0** in the **From** field and **2001:DB8::FF** in the **To** field, Tivoli Storage Productivity Center scans the IP addresses that fall in the range between 2001:DB8:x:0 to 2001:DB8:x:FF.

The address range that you specify determines how long an SNMP scan takes to run. For example, if the range includes over 256 addresses, the scan might take some time to complete. A warning message is displayed if you indicate a range that includes between 257 and 4096 (0xFFFF) addresses. This warning message notifies you that the scan requires significant time to run as more addresses are included. Keep in mind that the scan range you enter cannot exceed 4096 (0xFFFF) addresses.

**Note:** It takes about 5 minutes to search a subnet. For out of band fabric discovery to work, the FC Management MIB and FE MIB must be enabled on the switch.

5. On the **When to Run** page, determine when and how often to run the discovery.
6. On the **Alert** page, specify any alerts to trigger if the discovery schedule fails to run.
7. Click **File > Save** to save the discovery. The discovery runs according to the schedule that you defined on the **When to Run** page.

### **Gathering switch performance data**

This topic describes how to gather performance data from a switch to evaluate the switches that are in your environment.

To complete the discovery process for switch performance functions, a SMI agent must be enabled for your switch.

- For some switches, if you have the prerequisite firmware, you must enable the SMI agent (also referred to as an embedded SMI agent).
- For other switch vendors, you must install the SMI agent on any host computer and configure the agent to run providers for one or more switches. An SMI agent that is installed on a host is referred to as an external SMI agent.

Contact your switch vendor for information about how to enable the embedded SMI agent or to install the external CIM agent. For the SMI agents that are supported by IBM Tivoli Storage Productivity Center, see the support matrix at [http://www.ibm.com/support/docview.wss?rs=40&q1=switch&uid=swg21384219&loc=en\\_US&cs=utf-8&lang=en](http://www.ibm.com/support/docview.wss?rs=40&q1=switch&uid=swg21384219&loc=en_US&cs=utf-8&lang=en).

To gather switch performance data, complete the following steps:

1. Run a CIMOM discovery for a switch SMI agent.
2. Run a Fabric Probe for the Fabric that the switch is a part of.

For information about creating a switch performance monitor, see “Creating a switch performance monitor” on page 377.

---

## **Collecting data**

Create data collection jobs to gather information about the storage resources in your environment. There are different data collection jobs within IBM Tivoli Storage Productivity Center depending on the type of information is collected and from which types of resources the information is retrieved: discovery, probes, Tivoli Storage Productivity Center Server probes, scans, and pings.

### **Collecting storage statistics**

Use probes to collect statistics about the monitored storage resources in your environment, such as computers, storage systems, fabrics, volumes, disk controllers, hard disks, and file systems. Probe jobs can also discover information about new or removed disks and file systems. You can view the information collected by probes in Asset, Capacity, Storage Subsystems, and System reports.

You can define any number of probes to collect statistics for different storage resources at different times.

- From the **IBM Tivoli Storage Productivity Center** node, you can collect statistics on computers, disk controllers, hard disks, clusters, fabrics, storage subsystems, volumes, tape libraries, and file systems.

**Important:** For file system probes, the default behavior of the probe is to discard export paths that are not at the root of the file system. This behavior prevents a situation in which the product counts information twice on a file system. If you want to collect data for all file systems regardless of their location, add the **saveNonRoot=1** parameter to the [server] section of the TPCD.config file. Restart the Data server after you have saved the updated file. The TPCD.config file is located in the *TPC\_installation\_directory/data/config* directory where *TPC\_installation\_directory* is where Tivoli Storage Productivity Center is installed.

- From the **Data Manager for Databases** node you can itemize and create an inventory of the files, instance, logs, and objects that make up your enterprise's monitored RDBMSs.

The login ID that Data Manager for Databases uses to log into Microsoft SQL Server instances that you want to probe must have "Permit" access. For information about how to set the logins for Microsoft SQL Server instances, see the *IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication Installation and Configuration Guide*.

To ensure the accuracy and consistency of the data that appears in the reports, run regularly scheduled probes against the hosts that use/import volumes and the storage systems upon which you want to report. You should run probes against storage systems after running probes against any hosts.

## Creating probes

Create and schedule a probe to job to gather information about your storage resources. You can define any number of probes to gather information about different storage resources at different times.

To create a probe, complete the following steps:

1. Expand **IBM Tivoli Storage Productivity Center > Monitoring > Probes**. For Data Manager for Databases, expand **Data Manager for Databases > Monitoring > Probes**.
2. Right-click **Probes** A menu is displayed.
3. Select **Create Probe**.
4. In the **What to Probe** or **Instance** page, perform the following steps:
  - a. In the **Available** list box, highlight the resources you want to probe.
  - b. Click . The resources are moved to **Current Selections** list box. Use  to move resources to the **Available** list box.
5. In the **When to Run** page, schedule when you want the probe to run. You have the following options:
  - Run the job immediately
  - Run the job once at a specified time and date. Use the list boxes to specify the month, day, year, and the hour, minute, and AM or PM.
  - Run the job repeatedly according to a schedule you specify. You can perform the following tasks:
    - Specify the month, day, year, and the hour, minute, and AM or PM when the job is to run.

- Indicate how often the job runs. You can use the list boxes to specify the number of minutes, hours, days, weeks, or months.
- Indicate which days on which run the job. A check mark is displayed next to the days you select.

Use the fields in the **How to handle timezones** section to indicate the time zone that Data Manager for Databases uses when scheduling and running the action. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:

- 9:00 AM of the time zone where the server resides
- 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on a Storage Resource agent or Data agent located in the PST time zone.

#### Use the timezone that the server runs in

Select this option to use the time zone of the location where the Data server resides.

#### Use this timezone

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

- In the **Alert** page, set the following options:
  - The condition that triggers an alert. The default setting is **Probe Failed**. No other conditions are currently available.
  - The notification method of an alert: SNMP Trap, IBM Tivoli Enterprise Console Event, Login Notification, Windows Event Log, UNIX Syslog, running a script, and email. If you select SNMP Trap, Tivoli Enterprise Console Event, or email for the method by which you are notified of an alert, you must define a destination for the method on the **Administrative Services** → **Configuration** → **Alert Dispositions** window.
- Click  to save the probe. You must save the probe before Tivoli Storage Productivity Center can collect data about storage resources.
- Enter a name for the probe and click **OK**. An entry for the probe is displayed under the **Probes** node in the navigation tree. The probe is run at the date and time specified in the schedule definition.
- Use the Job Management panel to manage view information about the runs and jobs that are related to the probe. For example, use the Job Management panel to view the status of a run for a schedule, the date and time when it was run, and the log files of the jobs associated with the run.

#### Related reference:

“Managing schedules, jobs, and runs” on page 297

Use the Job Management panel to view and manage all the schedules, runs, and jobs related to the storage devices that are monitored by IBM Tivoli Storage Productivity Center.

## Editing probes

Change the settings in an existing probe job.

To edit an existing probe, complete the following steps:

- Expand **IBM Tivoli Storage Productivity Center** > **Monitoring** > **Probes**. For Data Manager for Databases, expand **Data Manager for Databases** > **Monitoring** > **Probes**.

2. Click the name of the probe you want to edit. The content pane displays information about that job.
3. Edit the probe definition.
4. Click  to save the updated probe definition.

## Creating fabric probes

Use probes to collect statistics about fabrics and fabric groups.

After you have defined your fabric groups, you can use Fabric Manager to run probes against fabrics and fabric groups to collect information.

To run probes against fabrics, complete the following steps:

1. Expand **IBM Tivoli Storage Productivity Center** → **Monitoring**, right-click **Probes**, and select **Create Probe**.
2. In the **What to Probe** tab enter a description for the probe, and from the **Available** column, select the fabrics and fabric groups to be probed. Move them to the **Current Selections** column by clicking .
3. In the **When to Run** tab specify when the probe is to begin. You can begin the probe immediately, schedule it to begin at a later time, and specify whether to run the probe repeatedly.
4. In the **Alert** tab specify the action to be taken if the probe fails. See “Running scripts with alerts” on page 493 for a description of these triggered actions.
5. Click  to save the probe. You must save the probe before Tivoli Storage Productivity Center can collect data about storage resources.
6. Enter a name for the probe and click **OK**. An entry for the probe is displayed under the **Probes** node in the navigation tree. The probe is run at the date and time specified in the schedule definition.
7. Use the Job Management panel to manage view information about the runs and jobs that are related to the probe. For example, use the Job Management panel to view the status of a run for a schedule, the date and time when it was run, and the log files of the jobs associated with the run.

### Related reference:

“Managing schedules, jobs, and runs” on page 297

Use the Job Management panel to view and manage all the schedules, runs, and jobs related to the storage devices that are monitored by IBM Tivoli Storage Productivity Center.

## Creating tape library probes

Probes collect data from the tape libraries that have been discovered.

You can create tape library probes that collect information from all your tape libraries, or a subset. Probes can be scheduled to run immediately, or at a scheduled point in time. The data that probes collect is put into the database and is displayed in various places throughout the product, such as the topology viewer and the **Tape Manager > Tape Libraries** node.

To create a tape library probe:

1. Expand **IBM Tivoli Storage Productivity Center** > **Monitoring** > **Probes** and select **Create Probe**
2. Enter the information in the three tabbed pages:

- **What to Probe** - select the tape libraries and tape library groups to include in this probe
- **When to Probe** - specify the scheduling information for this probe
- **Alert** - specify the triggering condition that will cause an alert to be generated for this probe, and the actions taken when an alert is generated

3. Click  to save the probe. You must save the probe before Tivoli Storage Productivity Center can collect data about storage resources.
4. Enter a name for the probe and click **OK**. An entry for the probe is displayed under the **Probes** node in the navigation tree. The probe is run at the date and time specified in the schedule definition.
5. Use the Job Management panel to manage view information about the runs and jobs that are related to the probe. For example, use the Job Management panel to view the status of a run for a schedule, the date and time when it was run, and the log files of the jobs associated with the run.

There are some special situations to note when creating and running probes of tape libraries:

- Do not include more than three tape libraries in the same probe if they are all registered with the same IBM SMI-S Agent for Tape. Doing so can increase the load on the SMI-S agent and can increase the possibility of timeouts. To avoid timeouts, create multiple probes with different start times, and split the libraries up among the probes.
- After the list of tape libraries that are registered with the IBM SMI-S Agent for Tape has been altered, a condition can occur in which not all of the tape cartridges are returned to the CIM client, in this case, Tivoli Storage Productivity Center. To resolve this situation, restart the IBM SMI-S Agent for Tape. For instructions, see the documentation for the SMI-S Agent.
- When the probe of a tape library successfully completes, some of the buttons in the Tape Libraries GUI panel might be disabled. To enable the buttons, close and then redisplay the panel.

**Related reference:**

“Managing schedules, jobs, and runs” on page 297

Use the Job Management panel to view and manage all the schedules, runs, and jobs related to the storage devices that are monitored by IBM Tivoli Storage Productivity Center.

**Locating a tape cartridge:**

View a list of all the cartridges for each discovered tape library.

Tape libraries can contain many cartridges (sometimes called tape volumes), and it can be difficult to find a particular tape cartridge among all the cartridges for a particular tape drive. IBM Tivoli Storage Productivity Center simplifies this task by listing all the cartridges for each discovered tape library. To find a particular tape cartridge:

1. Expand the **Tape Manager** node and click **Tape Libraries**.
2. Select a tape library from the list of discovered tape libraries.
3. Click **Cartridges**.
4. Click the **Label** column header to sort the list of cartridges by label.
5. Scroll through the list of cartridges to find the one you are looking for.

6. The **Location** column will indicate exactly where the tape is located in the library.

**Note:** You can also sort by other columns by clicking on the column headers. For example, if you know that the cartridge you are looking for is dual sided, you can sort the list by that criterion. This can make finding a particular cartridge much easier, especially for libraries that have many cartridges.

### Creating a VMware VI probe

Probes collect data from the VMware VI data sources that have been discovered.

To create a VMware probe, complete the following steps:

1. In the Navigation Tree pane, expand **IBM Tivoli Storage Productivity Center > Monitoring > Probes**.
2. Right-click on **Probes** and click **Create Probes**.
3. Enter the information in the three tabbed pages:

#### What to Probe

Enter a description for the probe and from the **Available** column, select **Hypervisors** to include in the group to be probed. Click >> to move the group to the **Current Selections** column.

#### When to Run

Specify when the probe is to begin. You can begin the probe immediately, schedule it to begin at a later time, and specify if it should be run repeatedly.

**Alert** Specify the triggering condition that will cause an alert to be generated for this probe, and the actions that should be taken when an alert is generated.

4. To save the probe, click **Save**.
5. In the **Save As** window, enter the probe name and click **OK**.

## Collecting storage statistics from Tivoli Storage Productivity Center servers

Schedule probes from the master server for Tivoli Storage Productivity Center to collect storage information that has been gathered by subordinate servers. The information gathered by probes of subordinate servers is displayed in the **Tivoli Storage Productivity Center > Rollup Reports** node in the navigation tree of the master server. You can define server probes by selecting **TPC Server Probe** in the navigation tree.

A subordinate server is a server that monitors and reports on storage resources like a standard server, but also communicates with the master server during TPC server probes. During these probes, the master server collects the storage information gathered by a subordinate server's agents and stores that information in its own database repository.

**Note:** If the same storage entity is managed by multiple subordinate servers, rollup reports reflect the storage information from the subordinate server that most recently probed that entity.

Before you run TPC server probes, make sure to perform the following:

1. Associate subordinate servers with the master server on the **Administrative Services > Data Sources > TPC Servers** window. See "Adding an Tivoli

Storage Productivity Center Server” on page 282 for information on how to associate subordinate servers with a master server.

2. Run discoveries, probes, and scans on the subordinate servers to gather information about their locally-managed entities.

The information collected by TPC server probes from subordinate servers includes the following:

- Asset information: detailed statistics about agents (Tivoli Storage Productivity Center), computers, storage subsystems, disk and volume groups, disks, filesystems, logical volumes, volumes, and fabrics.
- Database asset information: detailed statistics about the RDBMSs in your environment, including Oracle, SQL Server, Sybase, and UDB.
- Capacity information: storage metrics related to the disk capacity, filesystem capacity, filesystem used space, and filesystem freespace of the storage entities in your environment.
- Database capacity information: storage metrics related to the storage capacity of the RDBMSs in your environment, including Oracle, SQL Server, Sybase, and UDB.

Additional storage information collected by a subordinate server and used within such Tivoli Storage Productivity Center functions as the topology viewer, data path explorer, volume provisioning, volume performance, and SAN Planner is available for only that subordinate server. That information is not collected by the master server, and thus not rolled up into the reports available through the master server.

Also, the Tivoli Storage Productivity Center functions within the master server use the storage information collected by only the master server.

### Creating Tivoli Storage Productivity Center server probes

Use Tivoli Storage Productivity Center server probes from the master server to collect storage information that has been gathered by subordinate servers.

To create a Tivoli Storage Productivity Center server probe, complete the following steps:

1. Expand **IBM Tivoli Storage Productivity Center > Monitoring > TPC Server Probes**.
2. Right-click **TPC Server Probes** and select **Create TPC Server Probes** from the menu.
3. Enter a brief description of the probe in the **Description** field.
4. In the **What to Probe** page, perform the following steps:
  - a. In the **Available** list box, highlight the Tivoli Storage Productivity Center servers you want to probe. You can do any of the following: 1. Select the **All TPC Servers** item to automatically include all subordinate servers in the probe. 2. Select the name of a specific subordinate server and all its related storage entities that you want to probe. 3. Select the specific entities on a subordinate server that you want to probe. For example, you can expand the node for a subordinate server and select the specific entities for which you want to collect data: All Resources, Clusters, Computer Groups, Computers (including Hypervisors), Database Instances, Fabrics, RDBMS Computer Groups, Storage Subsystem Groups, and Storage Subsystems.
  - b. Click  to include highlighted Tivoli Storage Productivity Center servers or storage entities in the probe. The entities that you selected are moved to **Current Selections** list box.

5. In the **When to Run** page, schedule when you want the probe to run. You have the following options:

- Run the job immediately
- Run the job once at a specified time and date. Use the list boxes to specify the month, day year, and the hour, minute, and AM/PM.
- Run the job repeatedly according to a schedule you specify. You can perform the following tasks:
  - Specify the month, day, year, and the hour, minute, and AM or PM when the job is to run.
  - Indicate how often the job runs. Use the list boxes to specify the number of minutes, hours, days, weeks, or months.
  - Indicate which days on which run the job. A check mark is displayed next to the days you select.

Use the fields in the **How to handle timezones** section to indicate the time zone that Data Manager for Databases uses when scheduling and running the action. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:

- 9:00 AM of the time zone where the server resides
- 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on a Storage Resource agent or Data agent located in the PST time zone.

**Use the timezone that the server runs in**

Select this option to use the time zone of the location where the Data server resides.

**Use this timezone**

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

6. In the **Alert** page, set the following options:

- The condition that triggers an alert. The default setting is **Probe Failed**. No other conditions are currently available.
- The notification method of an alert: SNMP Trap, IBM Tivoli Enterprise Console Event, Login Notification, Windows Event Log, UNIX Syslog, running a script, and email. If you select SNMP Trap, Tivoli Enterprise Console Event, or email for the method by which you are notified of an alert, you must define a destination for the method on the **Administrative Services → Configuration → Alert Dispositions** window.

7. Click  to save the probe. You must save the probe before Tivoli Storage Productivity Center can collect data about storage resources.
8. Enter a name for the probe and click **OK**. An entry for the probe is displayed under the **TPC Server Probes** node in the navigation tree. The probe is run at the date and time specified in the schedule definition.
9. Use the Job Management panel to manage view information about the runs and jobs that are related to the probe. For example, use the Job Management panel to view the status of a run for a schedule, the date and time when it was run, and the log files of the jobs associated with the run.

### Related reference:

“Managing schedules, jobs, and runs” on page 297

Use the Job Management panel to view and manage all the schedules, runs, and jobs related to the storage devices that are monitored by IBM Tivoli Storage Productivity Center.

## Editing TPC Server probes

Learn how to edit the definition of a TPC server probe.

To edit an existing TPC server probe, complete the following steps:

1. Expand **IBM Tivoli Storage Productivity Center > Monitoring > TPC Server Probes**.
2. Click the name of the TPC server probe you want to edit. The content pane displays information about that probe.
3. Edit the values on the What to PROBE, When to Run, and Alert pages to change the TPC server probe definition.
4. Click  to save the updated TPC server probe definition.

## Managing the runs and jobs for TPC Server Probes

View information about the runs, jobs, and log files for TPC Server Probes.

Tivoli Storage Productivity Center creates a run each time a TPC Server Probe schedule collects data from subordinate servers. A job is a unit of work within a run for a schedule. Use the Job Management panel to manage TPC Server Probe schedules and view information about the related runs and jobs. Specifically, use this panel to perform the following tasks for schedules:

- View or edit the definition of a schedule.
- Run a schedule immediately.
- Rename or delete a schedule.
- View basic information about a schedule, including the ID of the user who created it, description, the last time the schedule was run, and the next time the schedule is run.

Use the Job Management panel to perform the following tasks for the runs and jobs related to TPC Server Probe schedules:

- View the status of a run and the date and time when it was executed.
- View information about the jobs associated with each run, including the name of the computer on which a job was run, the type of the monitored device, and the status of the job.
- View the log files for one or more jobs at a time.
- Display jobs that have started or completed within a specified length of time. For example, display jobs that have completed in the last two weeks.
- Display jobs that have a certain status, such as Success, Running, or Failed.

To access the Job Management panel for a TPC Server Probe schedule, complete the following steps:

1. In the navigation tree, expand **IBM Tivoli Storage Productivity Center > Monitoring > TPC Server Probes**.
2. Select the probe schedule whose runs and jobs you want to manage. The content pane displays information about the schedule.

3. In the content pane, click **View Job History**. The Job Management panel is displayed and the selected schedule is highlighted in the **Schedules** section. View the entries in the **Jobs for Selected Schedules** section to manage the jobs and runs for the schedule.

You can also access the Job Management panel at any time by clicking the related icon () in the toolbar. Use the **Filters** section on the Job Management panel to display the TPC Server Probe schedule that you want to manage. See “Managing schedules, jobs, and runs” on page 297 for more information.

## Collecting storage usage and trending information

Use scans to collect statistics about the usage and trending of storage consumption of storage resources in your environment. You can view the information collected by scans in reports and use it as part of a quota analysis.

Use a Data agent or Storage Resource agent to collect information for a scan. These agents must be deployed on the storage resources that you want to monitor. By running scans and generating the results of those scans in reports, you can perform the following tasks:

- View when files were created, accessed, and modified and by what group or user.
- Map storage resources to the consumers of those resources.
- Generate historical views of storage consumption and utilization that show usage trends over time. System administrators can use these views to project and plan for future storage consumption.
- Collect detailed RDBMS space usage reports at the table, index, and user levels.
- Gather individual user space usage at the table space, database, instance, computer, and network wide levels.
- Collect detailed space usage information about monitored tables and their associated indexes. For example, when scanning UDB tables, this information includes many of the calculated REORGCHK values. These include Used Page %, Used Space %, and Cluster Ratio.
- Historically track database, table space, and user usage and use that data to forecast and display future usage.
- Gather information for quotas that can be created to trigger alerts (and create reports) when users exceed a specified amount of space usage.
- (UDB only) Perform (optionally) runstats on all tables involved in the scan process.
- Assign costs to space used at the user level when combined with Data Manager for Chargeback.

### Note:

1. A licensed agent must be installed on a computer that contains instances against which you want to run a scan. You must run a probe against an instance before you can select any tablespaces against which you want to run a scan.
2. The login ID that Data Manager uses to log in to Microsoft SQL Server instances that you want to scan must have "Permit" access.

## Creating scans

Create and schedule a scan to gather usage information about your storage resources. You can specify which file systems, computers, clusters, directories,

databases, and other storage resources that you want to scan. You can define any number of scans to gather information about different storage resources at different times.

To create a scan, complete the following steps:

1. Expand **Data Manager > Monitoring > Scans**. For Data Manager for Databases, expand **Data Manager for Databases > Monitoring > Scans**.
2. Right-click the **Scans** node and select **Create Scan**.
3. For Data Manager, define the following scan properties:
  - The computers and file systems whose storage usage and consumption you want to monitor. For more information, see “Including storage resources in a scan” on page 348.
  - The directory groups to scan. For more information, see “Selecting directory groups to scan” on page 349.
  - The profiles to use during a scan. For more information, see “Using profiles in a scan” on page 350.
  - The schedule when you want a scan to run. For more information, see “When to run the scan” on page 351.
  - An alert to notify you if the scan fails. For more information, see “Defining alert values for a scan” on page 352.
4. For Data Manager for Databases, define the following scan properties:
  - The databases, table spaces, instances, and computers whose storage usage and consumption you want to scan. For more information, see “Selecting databases, tablespaces to scan” on page 349.
  - The table groups you want to scan. For more information, see “Select the table groups to scan” on page 350.
  - The profiles to use during a scan. For more information, see “Using profiles in a scan” on page 350.
  - The schedule when you want a scan to run. For more information, see “When to run the scan” on page 351.
  - The options for Oracle and UDB. For more information, see “Specify options for Oracle and UDB” on page 352.
  - An alert to notify you if the scan fails. For more information, see “Defining alert values for a scan” on page 352.
5. Click  to save the scan. You must save the scan before Tivoli Storage Productivity Center can collect data about storage resources.
6. Enter a name for the scan and click **OK**. An entry for the scan is displayed under the **Scans** node in the navigation tree. The scan is run at the date and time specified in the schedule definition.
7. Use the Job Management panel to manage view information about the runs and jobs that are related to the scan. For example, use the Job Management panel to view the status of a run for a schedule, the date and time when it was run, and the log files of the jobs associated with the run.

**Related reference:**

“Managing schedules, jobs, and runs” on page 297

Use the Job Management panel to view and manage all the schedules, runs, and jobs related to the storage devices that are monitored by IBM Tivoli Storage Productivity Center.

**Including storage resources in a scan:**

In a scan, include the computers, computer groups, file systems, file system groups, and clusters whose storage usage and consumption that you want to monitor.

Use the **Filesystems** page to select the storage resources that you want to scan. Include clusters, individual file systems and computers, or file system and computer groups (that have been predefined using the “Working with groups of resources” on page 373 facility).

The **Current Selections** list box shows the storage resources that have been selected for the scan. The **Available** list box shows which storage resources are still available for selection in the scan.

**Note:** A cluster name is displayed next to individual computers that are members of a PowerHA or Microsoft Cluster Server cluster. Cluster resource groups are identified with a special icon. Clusters displayed in the **Available** list box cannot be expanded to show member nodes. You can move a cluster to the **Current Selections** list box to view and, if necessary, exclude member nodes.

**To include storage resources in a scan:**

1. Highlight the file systems, file system groups, computer groups, computers, and clusters you want to include in the scan in the **Available** list box.

**Note:** Before you can include file systems in a scan, you must probe the computers that contain those file systems. If you do not probe a computer before you define a scan, the file systems on that computer are unavailable for the scan.

2. Click . The storage resources that you selected are displayed in the **Current Selections** list box.

**To remove storage resources from a scan:**

- Highlight the file systems, file system groups, computer groups, computers, and clusters that you want to remove and click . This action removes the storage resources from the **Current Selections** list box and moves them to the **Available** list box.

**To exclude one or more file systems or computers from a selected cluster or group:**

Perform the following steps if you want to exclude specific file systems or computers from a cluster or group that you included in a scan:

1. Double click the cluster or group name in the **Current Selections** list box.
2. Right click on the file systems or computers that you want to exclude. A pop-up menu is displayed.

3. Select **Exclude**. This action creates an **Excludes** section in the **Current Selections** list box that displays the names of the file systems or computers that you have excluded from a scan. This action is useful when you want to select a group or cluster for scanning, but you want to exclude a few file systems or computers from that monitoring.

### Selecting directory groups to scan:

This topic describes how to select the directory groups that you want to scan.

Use the Directory Groups tab to select the groups of directories that you want to scan. Including directory groups within a scan enables you to monitor and gather information about specific directories across a number of machines.

The **Selected Directory Groups** list box shows what directory groups have been included in the scan. The **Available Directory Groups** list box shows the groups that are still available for selection. You can select directory groups that have been predefined using the groups facility.

#### To select a directory group:

1. Highlight the desired directory group in the **Available Directory Groups** list box.
2. Click . The group you selected appears in the **Selected Directory Groups** list box.

#### To remove a directory group from a scan:

- Highlight the groups you want to remove and click . This will remove the groups from the **Selected Directory Groups** list box and move them to the **Available Directory Groups** list box.

#### To create a new directory group:

- Click **New Directory Group**. The **New Directory Group** window opens, enabling you to create a new group. See “Creating directory groups” on page 374 for more information on how to create a directory group.

### Selecting databases, tablespaces to scan:

This topic describes how to select the databases and tablespaces that you want to scan.

Use the Database-Tablespaces page to select what databases, tablespaces, instances, and computers whose storage usage and consumption you want to monitor. You can include single or groups of databases, tablespaces, and computers against which to run the scan.

The **Current Selections** list box shows the databases, tablespaces, tablespace groups, computers, and computer groups that have been selected for the job. The **Available** list box shows what items are still available for selection.

#### To include a database, tablespace, computer, instance, or group in a scan:

1. Highlight the desired databases, tablespaces, computers, instances, or groups in the **Available** list box.

2. Click . The databases, tablespaces, computers, instances, or groups you selected appear in the **Current Selections** list box.

For example, if you select a computer to include in a scan, that job will scan all the databases and/or tablespaces on all the instances that reside on that computer.

#### To remove a database, tablespace, computer, instance, or group from a scan:

- Highlight the items you want to remove and click . This will remove the databases, tablespaces, computers, instances, or groups from the **Current Selections** list box and move them to the **Available** list box.

#### Select the table groups to scan:

Select the table groups that you want to scan.

Use this page to select the table groups you want to scan. A table group represents a group of defined tables. By choosing a table group on this window, you can perform more detailed scans of tables that might not appear within other Data Manager for Databases reports (such as the Largest Table or Monitored Tables reports).

**Note:** Before you can view detailed information about tables in an RDBMS, you must have 1) defined a table group that contains the tables about which you want to view storage information and 2) scheduled and run a scan against that table group.

The **Selected Table Groups** list box shows the table groups that have been selected for the job. The **Available Table Groups** list box shows the table groups that are still available for selection.

#### To include a table group in a scan:

1. Highlight the desired group in the **Available Table Groups** list box.
2. Click . The group you selected appears in the **Selected Table Groups** list box.

#### To remove a table group from a scan:

- Highlight the groups you want to remove and click . This will remove the groups from the **Selected Table Groups** list box and move them to the **Available Table Groups** list box.

#### To create a new table group:

- Click **New Table Group**. The **New Table Group** window opens, enabling you to create a new group.

#### Using profiles in a scan:

Select the profile to use as part of a scan. Profiles enable you to control what files are scanned and what statistics are gathered.

Use the **Profiles** page to select which profiles to use during a scan. Using profiles is a powerful method for determining the statistics you want to gather during

scans. Keep in mind that the more profiles you include within a scan, the longer the scan will take to gather the statistics specified by those profiles.

#### To include profiles in a scan:

1. Highlight the desired profiles in the **Available Profiles** list box.
2. Click the  for the **Profiles to apply to Filesystems** list box to apply the selected profiles to file systems; click the  for the **Profiles to apply to Directories** list box to apply the selected profile(s) to directories. The profiles you selected appear in the either the **Profiles to apply to Filesystems** or **Profiles to apply to Directories** list box

**Note:** To collect statistics according to Data Manager default settings, select all of the default profiles.

#### To remove profiles from a scan:

- Highlight the profiles you want to remove and click the corresponding . This will move the selected profiles to the **Available Profiles** list box.

#### To create a new profile:

- Click **New Profile**. The **Statistics** tab on the **Create Profile** window is displayed, enabling you to create a new profile. See “Using profiles” on page 354 for more information.

#### Related concepts:

“Using profiles” on page 354

Use profiles to specify what statistical information is gathered and to fine tune and control what files are scanned during a scan. You can also use profiles with some reports to determine what statistics are displayed.

#### When to run the scan:

Schedule when and how often to run a scan.

You have the following options for determining when to run a scan:

- Run the job immediately
- Run the job once at a specified time and date. Use the list boxes to specify the month, day, year, and the hour, minute, and AM or PM.
- Run the job repeatedly according to a schedule you specify. You can:
  - use the list boxes to specify the month, day, year, and the hour, minute, and AM or PM when the job should begin running.
  - indicate how often the job should run. You can use the list boxes to specify the number of minute(s), hour(s), day(s), week(s), or month(s).
  - select which days you wish to run the job.

Use the fields in the **How to handle timezones** section to indicate the time zone that Data Manager should use when scheduling and running the scan. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:

- 9:00 AM of the time zone where the server resides
- 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

**Use the timezone that the server runs in.** Select this option to use the time zone of the location where the Data server resides.

**Use this timezone.** Select this option to indicate a specific time zone for when to run the job. When you select this option, a list box is activated. Select a timezone from the list box.

### **Specify options for Oracle and UDB:**

Specify options for Oracle and UDB when defining a scan.

Use the Options page to do the following:

- Determine if the job should scan the freelist chains associated with the segments in your Oracle environment. Free list chains represent the pages allocated to a segment that have enough free space for additional rows. Note that checking this option will increase the time required by the scan to complete.
- Set the number of pages Data Manager for Databases should scan on a chain before stopping.
- Determine if the job should gather segment extent data for locally-managed tablespaces.
- Run the DB2 utility runstats against the tables being scanned. Checking this box will enable Data Manager for Databases to collect the most up-to-date storage statistics about tables from the DB2 catalog. Note that checking this option will increase the time required by the scan to complete, but will ensure that table and user statistics are up-to-date in UDB/DB2 databases. Alerts based on table and user stats will not function until runstats is run.

### **Defining alert values for a scan:**

This topic describes how to set an alert that will be triggered if the scan job fails.

Use the Alert page to can define an alert to notify you if a scan fails and how to notify you. You can choose to be notified by SNMP trap, IBM Tivoli Enterprise Console event, login notification, Windows event log, UNIX Syslog, running a script, and e-mail. If you select SNMP trap, Tivoli Enterprise Console event, or e-mail, you must also define a destination (for example, an e-mail address). Define this destination by expanding **Administrative Services > Configuration > Alert Dispositions**.

To define an alert for a scan, complete the following steps:

1. Click the **Alert** tab; the Alert page opens.
2. In the **Triggering Condition** area, select Scan Failed. This indicates that an alert will be triggered if the scan fails to run.
3. In the **Triggered Actions** area, select the actions that occur as a result of the triggering condition You can choose from the following actions:

#### **SNMP trap**

An SNMP trap is sent to any NMS, console, or terminal when the condition occurs.

#### **TEC / OMNIBus Event**

A IBM Tivoli Enterprise Console event is sent when the condition occurs. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze Tivoli Storage Productivity Center events according to the event definitions specified in the

tivoliSRM.baroc file (provided with the product). It also performs responses such as sending further notification, creating or updating trouble tickets, running programs, and so on.

**Login notification**

The alert is sent to a Tivoli Storage Productivity Center user. The user receives the alert upon logging in to Tivoli Storage Productivity Center. In the **Login ID** field, type the user ID.

**Login ID**

The ID of the user who receives alert notification upon logging in to the system.

**Windows Event Log, UNIX Syslog**

The ID of the user who receives alert notification upon logging in to the system.

**Event Type (Windows Event Log only)**

The type of event that is recorded to the OS log.

**Facility (UNIX Syslog only)**

The location where the UNIX Syslog is sent. You can select User or Local.

**Level (UNIX Syslog only)**

The level of UNIX Syslog event. You can select Informational, Notice, Warning, Error, Critical, or Alert.

**Run script**

A script is run when the condition occurs. Click **Define** to specify the script that is run when the triggering condition occurs. The parameters listed in the **Specify Script** window are passed to the script when the alert is triggered

**E-mail** An e-mail is sent. Click **Add** or **Delete** to edit the list of e-mail addresses to which an e-mail is sent. Click **Edit e-mail** to change the actual e-mail message.

4. Click **File > Save** to save the scan.
5. Enter a name for the scan and click **OK**. An entry for the scan appears under the **Scans** node.

## Editing scans

Change the settings in an existing scan job.

To edit an existing scan, complete the following steps:

1. Expand **Data Manager > Monitoring > Scans**. For Data Manager for Databases, expand **Data Manager for Databases > Monitoring > Scans**.
2. Click the name of the scan you want to edit. The content pane displays information about that job.
3. Edit the scan definition by changing the values that appear on the following pages:
  - Filesystems. Use this page to edit the computers and file systems whose storage usage and consumption you want to monitor as part of a scan.
  - Directory Groups. Use this page to edit the groups of directories that you want to scan.
  - Databases-Tablespaces. Use this page to edit the databases, tablespaces, instances, and computers whose storage usage and consumption you want to monitor as part of a scan.

- **Table Groups.** Use this page to edit the table groups that you want to scan. A table group represents a group of defined tables.
- **Profiles.** Use this page to edit which profiles are used during a scan. Using profiles is a powerful method for determining the statistics you want to gather during scans.
- **When to Run.** Use this page to edit when a scan is run.
- **Options (Oracle and UDB only).** Use this page to edit the scan options for Oracle or UDB.
- **Alert.** Use this page to edit how you are notified if a scan fails.

4. Click  to save the updated scan definition.

## Using profiles

Use profiles to specify what statistical information is gathered and to fine tune and control what files are scanned during a scan. You can also use profiles with some reports to determine what statistics are displayed.

Until you begin creating your own profiles, you can use the default profiles that are supplied with IBM Tivoli Storage Productivity Center. Each of these default profiles allows you to select a specific statistic that you want to gather. If you want to scan a computer or filesystem, and want to gather all of the statistical information available, simply select all of the default profiles when you create your scan job.

See “Default profiles” for more information about default profiles.

### Default profiles:

Default Profiles are provided for your use with IBM Tivoli Storage Productivity Center. Each default profile represents a specific statistic that you can gather (which is included in the name of the profile for convenient identification).

If you want to scan a computer or filesystem and gather all of the statistical information available, select all of the default profiles when you create your scan. TPCUser is shown as the creator of the default profiles, and TPCUser is the prefix name for each of the profiles. The following list identifies the default Data Manager profiles and describes their functions.

#### By Access

Gathers statistics by length of time since last access of files.

#### By Creation

Gather storage statistics by the length of time since the creation of files. This profile applies to scans run against Windows computers only. Scans with this profile do not gather any creation time data from non-Windows computers.

#### By Mod Not Backed Up

Gathers statistics by length of time since last modification, only for files not backed up since modification. (Windows operating systems only)

#### By Modification

Gathers statistics by length of time since last modification of files.

#### Size Distribution

Gathers information on the size distribution of files.

**Largest Directories**

Gathers statistics on the  $n$  largest directories. (20 is the default amount.)

**Largest Files**

Gathers statistics on the  $n$  largest files. (20 is the default amount.)

**Largest Orphans**

Gathers statistics on the  $n$  largest orphan files. (20 is the default amount.)

**Most At Risk**

Windows operating systems only: Gathers statistics on the  $n$  files that have been modified the longest time ago and have not yet been backed up since they were modified. (20 is the default amount.)

**Oldest Orphans**

Gathers statistics on the  $n$  oldest orphan files. (20 is the default amount.)

**Most Obsolete Files**

Gathers statistics on the  $n$  most obsolete files (i.e., files that have not been accessed or modified for the longest period of time). (20 is the default amount.)

**Summary By File Type**

Summarizes space usage by file types (for example, .exe., .dll, .doc, .mp3, etc.).

**Summary By Filesystem/Directory**

Summarizes space usage by file system or directory.

**Summary By Group**

Summarizes space usage by OS Group.

**Summary By Owner**

Summarizes space usage by Owner.

**Temporary Files**

Gathers statistics on the non-OS files not accessed in the last year and orphan files.

**Wasted Space**

Gathers statistics on the non-OS files not accessed in the last year and orphaned files.

The following list identifies the default Data Manager for Databases profiles and describes their functions.

**DB User Space**

Gathers statistics about the user space usage within a database or tablespace.

**Largest Tables**

Gathers statistics on the  $n$  largest tables. (20 is the default amount)

**Segment Most Extents**

Gathers statistics on the  $n$  segments with the most extents. (20 is the default amount)

**Segment Most Unused Space**

Gathers statistics on the  $n$  segments with the most empty used space. (20 is the default amount). Empty used space represents the space allocated to a segment that is currently empty/not being used. Gathering this information can help you discover space that can be reclaimed and allocated to other objects. Specifically, use this Profile to:

- find objects that are over-allocated (not using all their associated free space)
- find the free space that exists in excess of a table's high-water mark (the high water mark is the highest block that was written for a table)
- find segments that have the largest amount of blocks that are not filled

### Summary

Summarizes space usage by database or tablespace, such as how many segments are in a tablespace (Oracle only), how many of those segments are tables (Oracle only), indexes, etc.

### Creating a profile:

Create a profile for use within a scan.

To create a profile perform the following steps:

1. Expand **Data Manager > Monitoring**. For Data Manager for Databases, expand **Data Manager for Databases > Monitoring**.
2. Perform one of the following actions:
  - Select **Create Profile** from the pop-up menu.
  - Click **New Profile** from the **Profiles** tab of the Create scan window.

Use the Create Profile window to specify exactly what level of detail to collect when running a scan. The more information that you specify, the more reports that you will be able to run against the information that you collect during the scan. Statistics are tied to a specific profile.

3. The **Statistics** tab on the **Create Profile** window is displayed.
4. Select statistics you want the scan to collect. Statistics are tied to a specific profile.  
See "Default profiles" on page 354 for more information about statistics.
5. If you want to further limit specific files to be scanned, select the **File Filters** tab. You can define exclusive conditions that filter what files are analyzed during the scan.  
See the "Creating file filters" on page 359 section for more information on using this tab.
6. The first time you view a new profile, this window is blank except for the text **All files selected**. That is the default and indicates that information will be collected for all files. To create your first group or condition, simply right-click **All files selected** and choose to create a new group or condition.
7. In the **File Filters** page, the default condition **All files selected** is displayed. Right-click **All files selected** and select **New Condition** from the pop-up menu. You can also specify groups for these conditions, by selecting **New Group**.

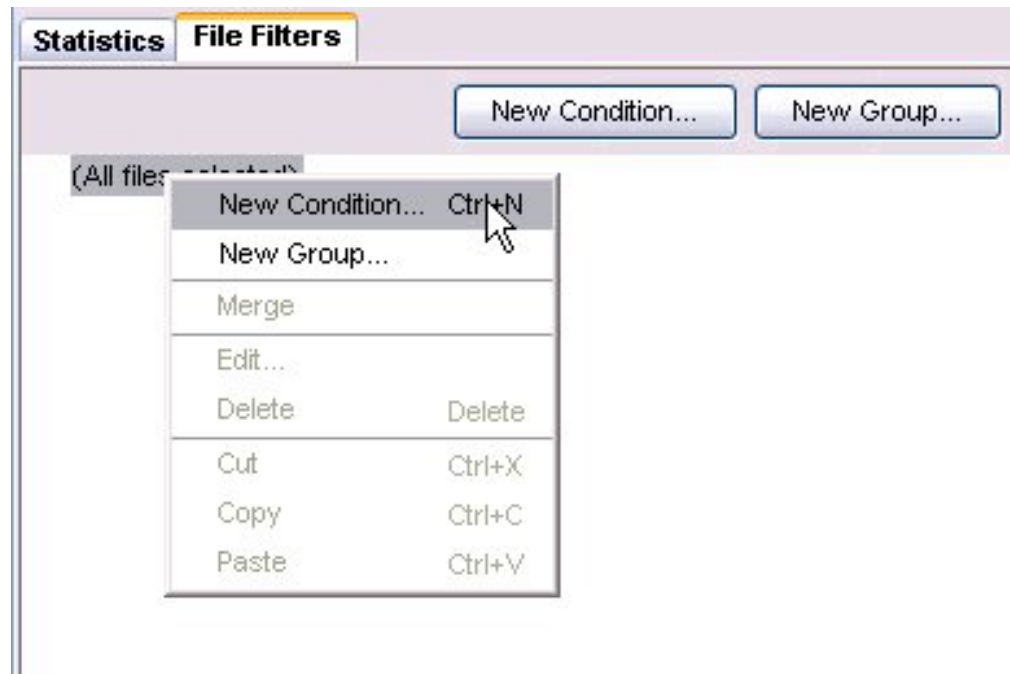

Figure 27. File Filters tab, pop-up menu

8. In the preceding figure, **New Condition** is selected. The **Create Condition** window opens, enabling you to define your file conditions. You can create conditions based on access time, creation time, file name or group, modification time, file attributes, size, type, owner, or length.

Figure 28. Create Condition window

9. Press **OK** after defining each condition.
10. If you are defining more than one condition, the **Create Group** dialog box displays to help you associate the conditions you created:

Figure 29. Create Group Window

11. Select how you want to associate the conditions you have defined. See “Associating conditions with groups” on page 364 for more information on creating groups.
12. The condition is displayed in the **File Filter** window.

Figure 30. File Filter window

13. Click  to save the profile.
14. Enter a name for the profile and click **OK**. An entry for the profile appears as a node under the **Profiles** node.

*Creating file filters:*

Use file filters as part of a profile to further define the files that you want to include or exclude in a scan. Filters limit the files on which you are gathering data during the scan based on criteria that you define.

In the following example, a group (All of) has been created with three conditions:

- The first controls the type of files to collect information on (MP3, GIF, AVI, and JPG files).
- The second specifies that the files must have been created within the last year.
- The third limits the profile to analyzing only files greater than 500 KB.

To create file filters within profile, complete the following steps:

1. To edit the file filters in an existing profile, expand **Data Manager > Monitoring > Profiles** and select an existing profile in the navigation tree. To create a new profile and add file filters, expand **Data Manager > Monitoring**, right-click **Profiles**, and select **Create Profile**.
2. Click the **File Filters** tab.
3. The first time you view a new profile, this window is blank except for **All files selected**. Selecting all files is the default and indicates that information is collected for all files. To create your first group or condition, right-click **All files selected** and choose to create a new group or condition.
4. In the File Filters page, the default condition **All files selected** is displayed. Right-click **All files selected** and select **New Condition**. You can also specify groups for these conditions by selecting **New Group**.

The **Create Condition** window opens, enabling you to define your file conditions. You can create conditions based on access time, creation time, file name or group, modification time, file attributes, size, type, owner, or length.

5. Press **OK** after defining each condition. See “Defining a filter condition” for more information on creating groups.

Each condition is displayed in the **File Filter** window.

If you are defining more than one condition, the **Create Group** dialog box helps you associate the conditions you create.

6. Associate the conditions you have defined.

See “Associating conditions with groups” on page 364 for more information on creating groups.

*Defining a filter condition:*

Define a condition for a filter.

On the File Filters page, right-click **All files selected** and select **New Condition**. The Create Condition window opens.

The first drop down list displays file criteria that you can select to define your condition. You can define file criteria based on access time, creation time, file name or group, modification time, file attributes, size, type, owner, or length. Depending on the criteria you choose to define, the second drop down list and window fields change dynamically to help you set parameters for the selected criteria. The following table describes the file criteria you can select for your file filter.

Condition	Description	Method for filtering the files	Condition Modifiers
<b>Last Accessed</b>	Use this condition to limit files based on the last time they were accessed. For example, you can define a filter that includes files that were last accessed between 12:01 on January 1, 2005 and 11:59 on January 30, 2005.	<ul style="list-style-type: none"> <li>• later than</li> <li>• earlier than</li> <li>• between</li> <li>• not between</li> </ul>	<ul style="list-style-type: none"> <li>• Length of time before scan: enter the years, weeks, days, hours, or minutes before a scan</li> <li>• Timestamp - select files based on the timestamp</li> </ul>
<b>Created</b>	Use this condition to limit files based on when they were created. For example, you can define a filter that includes files that were created between 12:01 on January 1, 2005 and 11:59 on January 30, 2005.	<ul style="list-style-type: none"> <li>• later than</li> <li>• earlier than</li> <li>• between</li> <li>• not between</li> </ul>	<ul style="list-style-type: none"> <li>• Length of time before scan: enter the years, weeks, days, hours, or minutes before a scan</li> <li>• Timestamp: select files based on the timestamp</li> </ul>

Condition	Description	Method for filtering the files	Condition Modifiers
<b>Name</b>	Use this condition to limit files based on their name. For example, you can define a filters that include files that end in *.html, or include files that end in .cmd and appear within a specified subdirectory.	<ul style="list-style-type: none"> <li>• matches any of</li> <li>• matches none of</li> <li>• matches</li> <li>• does not match</li> </ul>	<p>Enter the file name upon which you want the condition to be based. For example, you can specify, *.exe, *.mp3, *.avi. in the <b>Match</b> field. See “Using wildcards in file filters” on page 365 for information about how to use wildcards (*, %, etc.) in this field.</p> <p>Select the location where the file name will be searched during the scan:</p> <ul style="list-style-type: none"> <li>• <b>In any directory.</b> During a scan, Data Manager will look for the file name in any directory. In this condition, the search string will occur at the end of the full directory path.</li> <li>• <b>Append to scanned directory.</b> This option enables you to restrict what directory to scan. Data Manager will look for the file type in the specified file system root directory or in a monitored directory in a directory group tied to a scan. In this option, you must first specify what directory groups you want scanned in the <b>Directory Groups</b> tab of the <b>Scan</b> window. See “Selecting directory groups to scan” on page 349 for more information.</li> <li>• <b>Fully-qualified path.</b> Enter the fully-qualified path when you enter the file type in the <b>Match</b> field. During a scan, Data Manager will look for the file type in the exact path you specify here. This is useful when you want to exclude system directories and files in a Most Obsolete Files report.</li> </ul>
<b>Group</b>	Use this condition to limit files based on the OS group to which those files belong.	<ul style="list-style-type: none"> <li>• matches any of</li> <li>• matches none of</li> <li>• between</li> <li>• not between</li> <li>• matches</li> <li>• does not match</li> <li>• &gt;=</li> <li>• &lt;</li> <li>• &gt;</li> <li>• &lt;=</li> </ul>	Name of the OS group
<b>Last Modified</b>	Use this condition to limit files based on when they were last modified.	<ul style="list-style-type: none"> <li>• later than</li> <li>• earlier than</li> <li>• between</li> <li>• not between</li> </ul>	<p>Specify the time as:</p> <ul style="list-style-type: none"> <li>• Length of time before scan: enter the years, weeks, days, hours, or minutes before a scan</li> <li>• Timestamp: select files based on the timestamp</li> </ul>

Condition	Description	Method for filtering the files	Condition Modifiers
<b>Attributes</b>	Use this condition to limit files based on file attributes such as read only, system, temporary, etc.	<ul style="list-style-type: none"> <li>• include any of</li> <li>• include none of</li> <li>• include all of</li> <li>• don't include all of</li> </ul>	<p>Select the file attribute upon which you want the condition to be based. You can select:</p> <ul style="list-style-type: none"> <li>• Read only: Users cannot write to the file.</li> <li>• Hidden: A file that cannot be seen by users during a normal directory listing.</li> <li>• System: A file used by the operating system that cannot normally be viewed by users.</li> <li>• Archive: A file that has been backed-up and the archive bit is turned off. An Archive bit signifies that the file has been changed since it was last archived.</li> <li>• Normal: A file with no special attributes set to it.</li> <li>• Temporary: (Windows only) A temporary or backup copy of a file.</li> <li>• Sparse: A file with a special kind of compression that does not take up a lot of CPU time. The logical size of the file looks bigger than is actually allocated. It contains some blank pages which are not on disk.</li> <li>• Reparse Point: New NTFS file system objects that have a definable attribute containing user-controlled data and are used to extend functionality in the input/output (I/O) Subsystem.</li> <li>• Compressed: A file to which a compression algorithm was applied. This file takes up less space on disk, but it will be slower to read.</li> <li>• Offline: A file that was migrated to tape.</li> <li>• Not Content Indexed: A file that is not indexed--the Windows indexing service was told that this is not a file that should be searched through for text strings.</li> <li>• Encrypted: A file that was saved with a password (is password-protected).</li> <li>• Orphaned: (for Windows, UNIX, and Linux) The user who owns the file is no longer present in the system database.</li> </ul>

Condition	Description	Method for filtering the files	Condition Modifiers
<b>Attributes</b> (continued)			<ul style="list-style-type: none"> <li>Block Device: (UNIX/Linux only) A disk device file (not a real file).</li> <li>Executable: A file that you can run or execute.</li> <li>Sticky: A special type of executable file that is read into memory when it is first run and never released. Use Scans to find these types of files and set them to "unsticky".</li> <li>SETGID: (UNIX/Linux only, for executable files) When a file is run, its group changes to the group of the file. For example, if a user belongs to User group and runs a file from a different group (e.g., Root), then the user's group will be changed to Root while running the file (for security purposes).</li> <li>SETUID: (UNIX/Linux only, for executable files) When a file is run, the user's effective user will be changed when the file is run. For example, if a file is SETUID =Root, a users effective user ID becomes Root when running the file. This is considered a security hole by UNIX Administrators, so you can define a Profile to search for files that have a SETUID = Root.</li> </ul>
<b>Size</b>	Use this condition to limit files based on their physical file size.	<ul style="list-style-type: none"> <li>• between</li> <li>• not between</li> <li>• &gt;=</li> <li>• &lt;</li> <li>• &gt;</li> <li>• &lt;=</li> </ul>	<ul style="list-style-type: none"> <li>• KB (kilobytes)</li> <li>• MB (megabytes)</li> <li>• GB (gigabytes)</li> <li>• TB (terabytes)</li> </ul>
<b>Type</b>	Use this condition to limit files based on pre-defined file types.	<ul style="list-style-type: none"> <li>• in</li> <li>• not in</li> <li>• =</li> <li>• &lt;</li> <li>• &gt;</li> </ul>	<ul style="list-style-type: none"> <li>• Link</li> <li>• Directory</li> <li>• Fifo</li> <li>• Socket</li> <li>• Device</li> </ul>
<b>Owner</b>	Use this condition to limit files based on their owner.	<ul style="list-style-type: none"> <li>• matches any of</li> <li>• matches none of</li> <li>• between</li> <li>• not between</li> <li>• matches</li> <li>• does not match</li> <li>• &gt;=</li> <li>• &lt;</li> <li>• &gt;</li> <li>• &lt;=</li> </ul>	Enter the name of the owner upon which you want the condition to be based in the <b>Entry</b> field.

Condition	Description	Method for filtering the files	Condition Modifiers
Length	Use this condition to limit files based on the logical size of the files contents.	<ul style="list-style-type: none"> <li>• between</li> <li>• not between</li> <li>• &gt;=</li> <li>• &lt;</li> <li>• &gt;</li> <li>• &lt;=</li> </ul>	Enter the file length range. You can qualify both values by selecting from one of the following: <ul style="list-style-type: none"> <li>• KB (kilobytes)</li> <li>• MB (megabytes)</li> <li>• GB (gigabytes)</li> <li>• TB (terabytes)</li> </ul>

*Associating conditions with groups:*

Associate multiple conditions in a group or groups.

Groups can further define your file filter by including or excluding certain files based on specific criteria.

1. Create a new group using one of the following options.
  - In the **File Filters** tab, right-click a condition and select **New Group** from the pop-up menu.  
The **Create Group** dialog box is displayed.
  - Create each file condition for your file filter.  
As you create a new file condition, the **Create Group** dialog box is displayed.
2. Select the grouping for the file conditions you created. The grouped condition is displayed in the **File Filters** tab.

Select one of the following groups.

Group	Description
<b>All of</b>	All inclusive. All the conditions must be met.  For example: <ul style="list-style-type: none"> <li>• a and b and c</li> </ul>
<b>Any of</b>	Any one or more of the following conditions will be met.  For example: <ul style="list-style-type: none"> <li>• a or b or c</li> </ul>
<b>None of</b>	None of the conditions are met.  For example: <ul style="list-style-type: none"> <li>• not (a or b or c)</li> </ul>
<b>Not all of</b>	All of the following conditions are not met.  For example: <ul style="list-style-type: none"> <li>• not (a and b and c)</li> </ul>

For example, say you want to create a file filter with the following conditions:

- Name in (\*.gif, \*.jpg)
- Size > 1 MB
- Attribute is Read Only

How you group the conditions produces different results. The following table shows the different results depending on the group you select:

File	Group	Result
A.gif 500KB read only	• All of	• False
	• Any of	• True
	• None of	• False
	• Not all of	• True
B.jpg 2 MB read only	• All of	• True
	• Any of	• True
	• None of	• False
	• Not all of	• False
C.gif 2 MB read/write	• All of	• False
	• Any of	• True
	• None of	• False
	• Not all of	• True
D.txt 500KB read/write	• All of	• False
	• Any of	• False
	• None of	• True
	• Not all of	• True

*Using wildcards in file filters:*

Use wildcard characters within the conditions of file filters to perform pattern matching of file names. A wildcard is a special symbol that represents one or more characters.

You can use wildcards in File Filter conditions to identify multiple files and directories with a single specification. The following table describes the wildcards that are available in Data Manager:

Wildcard Character	Description	Examples
*	Use the asterisk (*) to represent unknown characters in file names. It can act as a wildcard for zero or more characters of any value within a directory or file name.	<ul style="list-style-type: none"> <li>• <b>s*</b> refers to all files that begin with <b>s</b></li> <li>• <b>*.exe</b> refers to all files that have <b>.exe</b> as an extension</li> <li>• <b>/user/*</b> refers to all files under the <b>/user</b> directory</li> </ul>
%	Use the percent (%) character to specify a wildcard for a directories within the path of a file. It can act as a wildcard for zero or more directories within a path.	<ul style="list-style-type: none"> <li>• <b>/home/%/*cmd</b> will match all files with the extension <b>.cmd</b> and located in any of the subdirectories under the <b>/home</b> directory</li> <li>• <b>/usr/%/*</b> will match all files and subdirectories under the <b>/usr</b> directory (for example, <b>/usr/files/c</b>, <b>/usr/c</b>, <b>/usr/files/documents/c</b>)</li> </ul>

Wildcard Character	Description	Examples
?	Use the question mark (?) to represent a character within a file name or directory name. It can be used as a wildcard for a character within a directory or file name.	<ul style="list-style-type: none"> <li>• <code>/home/usr?/</code> will match directories like: <code>/home/usr1/</code>, <code>/home/usr2/</code>, etc.</li> <li>• <code>/usr/temp/temp??.tmp</code> will match files like <code>/usr/temp/temp01.tmp</code>, <code>/usr/temp/temp02.tmp</code>, etc.</li> </ul>

Data Manager supports standard UNIX shell path name expansion wildcarding within file filter conditions. See the appropriate UNIX man pages for more information about the wildcards that you can use.

## Determining the availability of storage resources

Use pings to collect information about the availability of the storage resources in your environment. You can view the information collected by pings in Availability and System reports.

Pings enable you to monitor and report on the availability of your storage from a network point of view or from a computer uptime perspective. See the percentage of off-network time due to network problems or system downtime. Define any number of pings that each check the availability of a unique storage resource.

### Creating pings

Create pings to collect information about the availability of the storage resources in your environment. You can define any number of pings to gather information about different storage resources at different times.

To create a ping, complete the following steps:

1. Expand **Data Manager > Monitoring > Pings**.
2. Right-click **Pings**. A menu is displayed.
3. Select **Create Ping**.
4. Select the computers whose availability you want to check. "Select computers to ping" on page 367.
5. Schedule when you want a ping to run. "When to run the ping" on page 367.
6. Specify how often you want the server to write out the ping results to the database repository for viewing in reports. "Specify ping options" on page 368.
7. Click  to save the ping. You must save the ping before Tivoli Storage Productivity Center can collect data about storage resources.
8. Enter a name for the ping and click **OK**. An entry for the ping is displayed under the **Pings** node in the navigation tree. The ping is run at the date and time specified in the schedule definition.
9. Use the Job Management panel to manage view information about the runs and jobs that are related to the ping. For example, use the Job Management panel to view the status of a run for a schedule, the date and time when it was run, and the log files of the jobs associated with the run.

**Related reference:**

“Managing schedules, jobs, and runs” on page 297

Use the Job Management panel to view and manage all the schedules, runs, and jobs related to the storage devices that are monitored by IBM Tivoli Storage Productivity Center.

**Select computers to ping:**

Select the computers and clusters that you want to ping.

Use the **Computers** page to select the computers and clusters whose availability statistics you want to collect. The **Available** list box shows the computers, computer groups, or clusters that are currently being monitored and available for inclusion in the ping. After you include storage resources in the ping it is removed from this list and moved to the **Current Selections** list box. The **Current Selections** list box shows the computers, computer groups, or clusters that have been selected for the ping.

**Note:** A cluster name is displayed next to individual computers that are members of a PowerHA or Microsoft Cluster Server cluster. Cluster resource groups are identified with a special icon. Clusters displayed in the **Available** list box cannot be expanded to show member nodes. You can move a cluster to the **Current Selections** list box to view and, if necessary, exclude member nodes.

You can include individual computers, computer groups, or clusters against which to run a ping. See “Working with groups of resources” on page 373 for information about groups.

**• To include storage resources in a ping:**

1. In the **Available** list box, highlight the computers, computer groups, and clusters that you want to include in the ping.
2. Click . The storage resource that you selected is moved to the **Current Selections** list box.

**• To remove storage resources from a ping:**

- Highlight the computers, computer groups, and clusters that you want to remove and click . The storage resource is removed from the ping and moved from the **Current Selections** list box to the **Available** list box.

**• To exclude one or more computers from a selected computer group or cluster:**

1. Double click the group or name of the cluster in the **Current Selections** list box.
2. Right click the computers that you want to exclude. A menu is displayed.
3. Select **Exclude**. An **Excludes** section is created in the **Current Selections** list box that displays the names of the computers that you have excluded from the ping.

**When to run the ping:**

Schedule when and how often to run a ping.

You have the following options for determining when to run a ping:

- Run the job immediately
- Run the job once at a specified time and date. Use the list boxes to specify the month, day, year, and the hour, minute, and AM or PM.

- Run the job repeatedly according to a schedule you specify. You can do the following:
  - Use the list boxes to specify the month, day, year, and the hour, minute, and AM or PM when the job should begin running.
  - Indicate how often the job should run. Use the list boxes to specify the number of minutes, hours, days, weeks, or months.
  - Select which days you wish to run the job.

Use the fields in the **How to handle timezones** section to indicate the time zone that Data Manager should use when scheduling and running the ping. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:

- 9:00 AM of the time zone where the server resides
- 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

**Use the timezone that the server runs in.** Select this option to use the time zone of the location where the Data server resides.

**Use this timezone.** Select this option to indicate a specific time zone for when to run the job. Select the timezone from the list provided.

#### **Specify ping options:**

Determine how often the results of pings are written from memory and stored in the database repository.

For greater efficiency, the server temporarily stores ping results in memory. The unit of time you specify in the **Options** tab determines how often these results are externalized to the repository.

You can specify a unit of time in a number of pings, minutes, hours or days.

#### **Define alert values for a ping:**

Set an alert that will be triggered if the ping job fails.

Use the Alert page to define an alert to notify you if a computer that a ping is trying to check is unreachable for a certain amount of time. You can choose to be notified by SNMP trap, IBM Tivoli Enterprise Console event, login notification, Windows event log, UNIX Syslog, running a script, and e-mail. If you select SNMP trap, Tivoli Enterprise Console event, or e-mail, you must also define a destination (for example, an e-mail address). Define this destination by expanding **Administrative Services > Configuration > Alert Dispositions**.

To define an alert for a ping, complete the following steps:

1. Click the **Alerts** tab; the Alert page opens.
2. Define the conditions that will trigger the alert. The default setting is **Computer Is Unreachable More Than**. No other alerting conditions are currently available. Enter the **Value** and **Value Units**. These values specify how many pings occur before an error is generated. By default, **Value Units** is set to **Times**.

3. In the **Triggered Actions** area, select the actions that occur as a result of the triggering condition. You can choose from the following actions:

**SNMP trap**

An SNMP trap is sent to any NMS, console, or terminal when the condition occurs.

**TEC / OMNIBus Event**

A IBM Tivoli Enterprise Console event is sent when the condition occurs. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze Tivoli Storage Productivity Center events according to the event definitions specified in the tivoliSRM.baroc file (provided with the product). It also performs responses such as sending further notification, creating or updating trouble tickets, running programs, and so on.

**Login notification**

The alert is sent to a Tivoli Storage Productivity Center user. The user receives the alert upon logging in to Tivoli Storage Productivity Center. In the **Login ID** field, type the user ID.

**Login ID**

The ID of the user who receives alert notification upon logging in to the system.

**Windows Event Log, UNIX Syslog**

The ID of the user who receives alert notification upon logging in to the system.

**Event Type (Windows Event Log only)**

The type of event that is recorded to the OS log.

**Facility (UNIX Syslog only)**

The location where the UNIX Syslog is sent. You can select User or Local.

**Level (UNIX Syslog only)**

The level of UNIX Syslog event. You can select Informational, Notice, Warning, Error, Critical, or Alert.

**Run script**

A script is run when the condition occurs. Click **Define** to specify the script that is run when the triggering condition occurs. The parameters listed in the **Specify Script** window are passed to the script when the alert is triggered.

**E-mail** An e-mail is sent. Click **Add** or **Delete** to edit the list of e-mail addresses to which an e-mail is sent. Click **Edit e-mail** to change the actual e-mail message.

4. Click **File > Save** to save the ping.
5. Enter a name for the ping and click **OK**. An entry for the ping appears under the **Pings** node.

## Editing pings

Change the settings in an existing ping job.

To edit an existing ping, complete the following steps:

1. Expand **Data Manager > Monitoring > Pings**.
2. Click the name of the ping you want to edit. The content pane displays information about that job.

3. Edit the ping definition by changing the values that appear on the following pages:
  - Computers. Use this page to edit the computers, computer groups, and clusters whose availability you want to monitor as part of a ping.
  - When to Run. Use this page to edit when a ping is run.
  - Options Use this page to edit how often the results of pings are written from memory and stored in the database repository.
  - Alert. Use this page to edit how long a storage entity is unreachable before you are notified that the ping has failed.
4. Click  to save the updated ping definition.

## Data collection groups

Groups enable you to define a set of related resources such as a computer, fabric, or storage subsystem once and save these selections as a named group for future use in scans, pings, and probes, making data collection more efficient. For example, you can create a group that contains a number of related computers. You can then reference that group within a monitoring job when you want to collect data about all those computers at the same time.

Each type of group is represented by a node under the **Monitoring > Groups** and **IBM Tivoli Storage Productivity Center > Monitoring > Probes** sections. You can expand the tree for each type of group to see what groups exist for that type. Resources can belong to only one group at a time. For example, if a computer already belongs to a computer group and you attempt to add it to a different computer group, the system removes it from the first computer group before adding it to the new computer group (this includes removing it from the default group if it had never been previously assigned to a user defined group). This is to prevent a resource from being counted twice statistically.

Additionally, you can use Data Manager for Chargeback to create invoices for these groups. When implementing your chargeback system, it is recommended that you group the IT resources within your organization into functional groups. Accurately identifying the types and locations of your stored data and resources is the first step in implementing an effective and equitable chargeback policy. Defining groups with Data Manager enables you to classify your data and resources into billable entities, which in turn provides information on who is using what storage. This enables you to bill specific groups according to their usage of storage space.

The following table lists and describes the types of groups that you can create.

Group Type	Description
<b>Data Manager</b>	
<b>Computer</b>	<p>A logical grouping of related computers. A computer can belong to one computer group only. A computer will automatically be removed from a group if you add it to another group. You can use computer groups to monitor computers that are related to each other or belong to a common group such as a department, location, territory, and so on.</p> <p>Examples of computer groups include Sales, Accounting, Development, IT, West, East, Midwest, NAS Filers, Remote Servers</p>

Group Type	Description
Filesystem	<p>A grouping of file systems across multiple computers. A file system can belong to one file system group only. A file system will automatically be removed from a group if you add it to another group.</p> <p>Here is an example of file system groups: C:\, D:\, /boot, /home, /usr</p>
Directory	<p>A grouping of directories across multiple computers. You can include a directory in multiple directory groups.</p> <p>Examples of directory groups include:</p> <p>WindowsTempDir Included Computer Name:Directory -  a:\machine1\winnt\temp, b:\machine2\winnt\temp,  c:\machine3\winnt\temp</p> <p><b>Note:</b> To monitor directories from the IBM Tivoli Storage SAN File Systems, you must create a directory group and add the desired directories as follows:</p> <pre>/&lt;SAN File System cluster name&gt;/&lt;directory name&gt;</pre> <p>where &lt;SAN File System cluster name&gt; represents the name of the SAN File System cluster that contains the directory that you want to add and &lt;directory name&gt; represents the name of the directory you want to add (for example, /IBM/myFilesetName/myDirectoryName, /IBM/myDirectoryName).</p>
User	<p>A grouping of related users. A user can belong to one user group only. A user will automatically be removed from a group if you add it to another group. Users that were discovered by Tivoli Storage Productivity Center can be included in a user group.</p> <p><b>Note:</b> The user groups that you define in Data Manager for Databases will also be available in Data Manager, and vice versa.</p> <p>Examples of user groups include Administrators, Developers, Marketing staff, HR staff</p>
OS User Group	<p>A grouping of OS user groups that were defined outside of Tivoli Storage Productivity Center at the operating system level. OS user groups are the operating system groups that Tivoli Storage Productivity Center finds that own files and directories in the environment.</p> <p>Examples of OS user groups include Windows, Linux, UNIX</p>
<b>Data Manager for Databases</b>	
Computer	<p>A logical grouping of related computers. A computer can belong to one computer group only. A computer will automatically be removed from a group if you add it to another group. You can use computer groups to monitor computers that are related to each other or belong to a common group such as a department, location, territory, and so on.</p> <p>Examples of computer groups include Sales, Accounting, Development, IT, West, East, Midwest, NAS Filers, Remote Servers</p>

Group Type	Description
Databases- Tablespaces	<p>A grouping of RDBMS databases or tablespaces. You can use database-tablespace groups to monitor entire databases or tablespaces (depending on the RDBMS) across multiple instances. A database or tablespace will automatically be removed from a group if you add it to another group. A database or tablespace can belong to one database-tablespace group only.</p> <p>Examples of database-tablespace groups include DB2 databases, system tablespaces</p>
Table	A grouping of related RDBMS tables.
User	<p>A grouping of related users. A user can belong to one user group only. A user will automatically be removed from a group if you add it to another group. Users that were discovered by Tivoli Storage Productivity Center can be included in a user group.</p> <p><b>Note:</b> The user groups that you define in Data Manager for Databases will also be available in Data Manager, and vice versa.</p> <p>Examples of user groups include Administrators, Developers, Marketing staff, HR staff</p>
<b>Disk Manager</b>	
Storage Subsystem	A storage subsystem group can contain subsystems and SAN Volume Controllers.
<b>Fabric Manager</b>	
Fabric	A grouping of fabrics.
<b>Tape Manager</b>	
Tape Libraries	A grouping of tape libraries.

## Default groups

Default groups for each storage resource are also provided within each group type node. As IBM Tivoli Storage Productivity Center discovers these resources within your enterprise through discovery, probes, and scans, the resources are automatically added to the corresponding default groups.

The following table lists the names of the default groups for each group type.

Manager	Group Type	Default Group Name
<b>Data Manager</b>	Computer	TPCUser.Default Computer Group
	Filesystem	TPCUser.Default FS Group
	Directory	n/a
	User	TPCUser.Default User Group
	OS User Group	TPCUser.Default OSGroup Group
<b>Data Manager - Databases</b>	Computer	TPCUser.Default Computer Group
	Databases- Tablespaces	TPCUser.Default Tablespace Group
	Table	n/a
	User	TPCUser.Default User Group

Manager	Group Type	Default Group Name
Disk Manager	Storage Subsystems	TPCUser.Default Storage Subsystem Group
Fabric Manager	Fabrics	TPCUser.Default Fabric Group
Tape Manager	Tape Library	TPCUser.Default Tape Group

## Working with groups of resources

Create resource groups to logically arrange resources and to permit actions against the entire group.

### Creating a group

You can create named groups that represent a set of resources, such as computers, databases, table spaces, tables, and users, to later use in pings, scans, and probes.

To create a new group, perform the following steps.

1. Expand **Monitoring > Groups**. For example, **Data Manager > Monitoring > Groups**.
2. Right-click the type of group you want to create and select **Create group type**, where *group type* represents the group you want to create, such as a **Create Computer Group**, **Create Filesystem Group**, or **Create Table Group**.
3. In the *Create group type* Groups page, select the resources in the **Available** column that you want to include in the group. Hold down the Ctrl key as you click to select multiple resources.

**Note:** For computer and file system groups in Data Manager, a **Group By Cluster** check box is displayed. When this option is not selected, the **Available** pane displays a cluster name next to any clustered computers and cluster resource groups. When this option is selected, any computer or cluster resource group that belongs to a PowerHA or MSCS cluster is grouped under its cluster name. Cluster resource groups are identified with a special icon along with the name of the current host node. All other computers will be grouped under **Non-Clustered Computers**.

4. Click  to move the selected resources to the **Current Selections** column.  
Click  to move resources from the **Current Selections** column and move them to the **Available** column.
5. Optional: Type a description of the group in the **Description** field.
6. Click the save icon in the menu bar to save the group.
7. Type a descriptive name for the group and click **OK**.

### Creating tape library groups

Create groups of tape libraries that have similar attributes to make it easier to perform storage management tasks on the grouped libraries.

1. Expand the **Tape Manager > Monitoring > Groups** node and right-click **Tape Library**.
2. Select **Create Tape Library Groups**.
3. In the *Create Tape Library Groups* page, select the libraries in the **Available** column to include the libraries in the group.  
Hold down **Ctrl** to click multiple libraries.
4. Click  to move selected libraries to the **Current Selections** column.

5. Optional: Enter a description of the tape library group in the **Description** field.
6. Click  to type a descriptive name for the group in the **Save As** dialog. Then click **OK** to save the group.

The new tape library group is listed under the **Tape Library** node in the navigation tree.

## Grouping fabrics

You can group fabrics to run reporting jobs against all the fabrics in the group. A fabric can belong to multiple groups at a time.

For more information on groups, see “Data collection groups” on page 370.

To create a fabric group, complete the following steps:

1. Expand **Fabric Manager > Monitoring > Groups**, right-click on **Fabric**, and select **Create Fabric Group**.
2. Enter a description for the group, and from the **Available** column, select the fabrics to be added to the group. Move them to the **Current Selections** column by clicking .
3. To save the group, click **File > Save**.
4. In the **Save As** window, enter the group name and click **OK**.

## Editing groups

When you update the resources that are included within a group, those updates are automatically picked up by the jobs that reference that group.

To edit an existing group, perform the following steps.

1. Expand **Monitoring > Groups**. For example, to edit groups within Disk Manager, expand **Disk Manager > Monitoring > Groups > Storage Subsystem**.
2. Expand a group type to view the list of groups defined for that type. For example, to view storage subsystem groups, expand the **Storage Subsystem** node under Disk Manager.
3. Click the name of the group you want to edit. Details for the selected group are displayed in the Create *group type* Groups page, where group type is the type of group (for example, Directory or Computer).
4. Edit the values defined for the group as desired. Click  to move the selected resources to the **Current Selections** column. Click  to move resources from the **Current Selections** column and move them to the **Available** column.
5. Click the save icon in the menu bar to save the group.

## Creating directory groups

Create and use directory groups within scans to monitor and gather information about specific directories within filesystems across a number of machines.

**Note:** IBM Tivoli Storage SAN File Systems information: To monitor directories from the SAN File System, you must create a directory group and add the desired directories as follows:

```
/<IBM Tivoli Storage SAN File Systems cluster name>/<directory name>
```

where:

- *<IBM Tivoli Storage SAN File Systems cluster name>* represents the name of the IBM Tivoli Storage SAN File Systems cluster that contains the directory you want to add
- *<directory name>* represents the name of the directory you want to add

Examples:

- /IBM/myFilesetName/myDirectoryName
- /IBM/myFilesetName
- /IBM/myDirectoryName

To create a directory group, perform the following steps.

1. Expand **Data Manager > Monitoring > Groups > Directory** or click **Create Directory Group** from the **Directory Groups** tab of the Scan window. The Create Directory Group window opens.
2. Use the New Directory window to edit or add directories to a directory group.

Field	Description
<b>Creator</b>	Displays the creator of the group.
<b>Name</b>	Displays the name of the group you are adding or editing. This name can be helpful in determining the content of the group. For example, a directory group named UnixUserHomes might consist of the /home directory on all the UNIX and Linux computers within an organization.
<b>Description</b>	A description of the group you are adding or editing.
<b>New Computer, New Directory</b>	Click these buttons to add a directory or computer to the group.

#### Viewing directory groups:

When adding directories to a group, you can determine how you want to view groups of directories. You can choose either of the following options:

- **Directories by computer.** Use this option to display the directories in the directory group according to the computer on which they exist.
  1. Expand Data Manager.
  2. Expand Monitoring.
  3. Expand Groups.
  4. Expand Directory.
  5. Double-click a directory object.
  6. In the content pane, under View, select Directories by Computer which is the default setting.

**Note:** You might need to try more than one directory object to find one with data.

- **Computers by directory.** Use this option to display the computers in the group according to the directories included in the directory group.
  1. Expand Data Manager.
  2. Expand Monitoring.
  3. Expand Groups.
  4. Expand Directory.
  5. Double-click a directory object.

6. In the content pane, under View, select Computers by Directory.

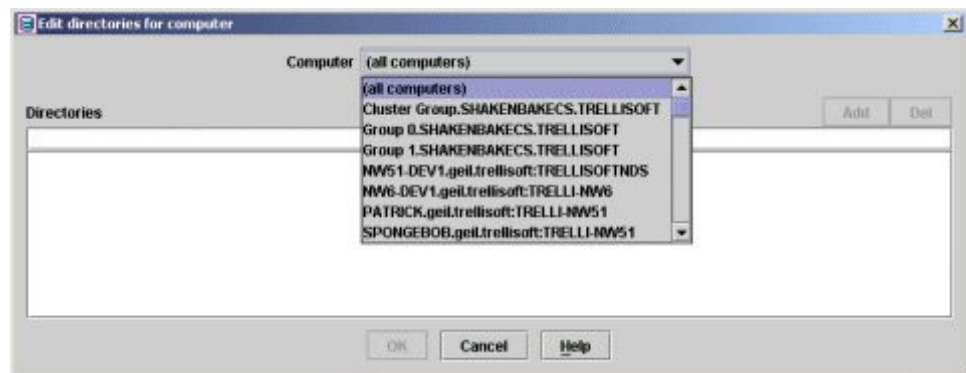

**Note:** You might need to try more than one directory object to find one with data.

**Tip:** Choosing these different buttons enables you to add directories to a directory group in different ways. For example, if you want to monitor or receive alerts on different directories on multiple computers, choose the Directories by Computer option. If you want to monitor or receive alerts on the same directory across multiple computers, choose the Computers by Directory option.

#### Adding new directories by computer:

If you want to add new directories to a directory group by first selecting the computers on which they exist, perform the following steps:

1. Select **directories by computer** on the Create Directory Group window.
2. Click **New computer**. The Edit Directories for Computer window opens. This window enables you to select the computer for which you want to monitor specific directories, and enter the directories for the selected computer.

3. Click the **Computer** list box.
4. Select the computer for which you want to monitor specific directories.
5. Enter the directory you want to add to the group in the **Directories** field. For example: c:\or /home/\*.
6. Click **Add**. The directory is added to the list box.
7. Click **OK** when you are done adding directories. The New Directory Group window opens. The computer you added will be displayed as a node in the display area, with the specified directories under the node.

#### Adding new computers by directory:

If you want to add new directories to a directory group by first specifying the directory and then selecting the computers on which they exist, perform the following steps:

1. Select **computers by directory** on the Create Directory Group window.
2. Click **New computer**. The Edit Computers for Directory window opens. This window enables you to enter the directories you want to add to the directory group and specify which computers contain those directories.
3. Enter the directory you want to add to the group in the **Directory** field. For example: c:\, /home/\*, \user\\*, \windows\temp\, /usr/\*.

4. Select the computers you want to include in the group and click . The computer will be displayed in the **Current Selections** column. Select the **All computers** option to include all computers that contain the directory in the Directory Group.
5. Click **OK**. The New Directory Group window opens. The directory you added will be displayed as a node in the display area, with the selected computers under the node.

---

## Collecting performance data

Use the tasks in this section to collect performance data about your storage subsystems, fabric switches, and tape libraries.

### Monitoring switch performance

You can monitor the performance of those switches in your fabrics from which you can collect performance data.

#### Creating a switch performance monitor

You can monitor the performance of selected fabric switches. Fabric Manager can collect performance data for the switches and generate reports from the results of those monitors.

Report data is collected on data rates, operations rates, switch port errors, and other performance statistics. For information about generating those reports, see “Creating switch performance reports” on page 1003.

**Note:** A fabric probe is now required after a CIMOM discovery before a switch performance monitor job can be run.

To create a switch performance monitor, complete the following steps:

1. Expand **Fabric Manager > Monitoring**, right-click **Switch Performance Monitors**, and select **Create Switch Performance Monitors**.
2. In the **Switches** tab, enter a description for the performance monitor, and from the **Available** column, select the switches to be added to the monitor definition.

Move them to the **Current Selections** column by clicking .

**Note:** Only those switches from which Fabric Manager can collect performance data are listed in the **Available** column. If a switch is added to a performance monitor, it is no longer listed as an available switch.

3. In the **Sampling and Scheduling** tab, specify an interval for the performance averages, the duration of the data collections, and a schedule for the monitor. You can begin the monitor immediately, schedule it to begin at a later time, and specify whether to run the monitor repeatedly.
4. In the **Alert** tab, specify the action to be taken if the monitor fails. See “Running scripts with alerts” on page 493 for a description of these triggered actions.
5. Click  to save the performance monitor. You must save the monitor before Tivoli Storage Productivity Center can collect data about storage resources.

6. Enter a name for the performance monitor and click **OK**. An entry for the monitor is displayed under the **Switch Performance Monitors** node in the navigation tree. The monitor is run at the date and time specified in the schedule definition.
7. Use the Job Management panel to manage view information about the runs and jobs that are related to the performance monitor. For example, use the Job Management panel to view the status of a run for a schedule, the date and time when it was run, and the log files of the jobs associated with the run.

### Editing a switch performance monitor

Edit a saved switch performance monitor to change settings, such as which switches to include in the collection.

1. Expand **Fabric Manager > Monitoring > Switch Performance Monitors**. There will be a node for each saved monitor definition.
2. Click the name of the monitor you want to edit.
3. Edit the monitor definition.
4. To save the edited monitor, click **Save**.

## Monitoring storage-subsystem performance

Discover, probe, define performance thresholds, and view performance data and alerts to monitor a storage system.

1. Configure the storage system for monitoring by IBM Tivoli Storage Productivity Center. Use one of the following methods based on the storage system connects with Tivoli Storage Productivity Center:
  - To monitor any of the following storage systems, use the Configure Devices wizard to enter connection information for their native interfaces:
    - System Storage DS8000
    - SAN Volume Controller
    - The XIV system
    - Storwize V7000
    - Storwize V7000 Unified
    - IBM SONAS
  - To monitor storage systems that use CIM object manager (CIMOM) connections, there are a number of ways to enter the connection information into Tivoli Storage Productivity Center. If the CIMOM is in the same subnet as the Device server, it can be discovered through Service Location Protocol (SLP). You can manually add the CIMOM to Tivoli Storage Productivity Center by expanding the **Administrative Services > Data Sources** node and clicking **CIMOM Agents**. See Adding a CIM agent manually for details of how to add the CIMOM. Alternatively, you can also use the Configure Devices wizard to enter the CIMOM information.
2. Discover the storage system.
 

Discovery gets general information about the devices that affiliated with the CIMOMs. These devices are switches and other storage systems such as IBM System Storage DS5000 and other DS series systems, and IBM TotalStorage Enterprise Storage Server. You can run discovery for CIMOMs by expanding the **Administrative Services > Discovery > CIMOM** node. Alternatively, you can also use the Configure Devices wizard to run discovery for CIMOMs.

The discovery step is not required for the storage systems that are connected to Tivoli Storage Productivity Center using native interfaces.
3. Probe the storage system.

Probes collect information about logical devices, such as volumes and virtual disks, that are associated with the storage system. Probes also collect information about hosts that are mapped to the logical devices.

If you use the Configure Devices wizard, storage subsystems are included automatically in probes. To create probes manually, expand **IBM Tivoli Storage Productivity Center > Monitoring > Probes**. For Data Manager for Databases, expand **Data Manager for Databases > Monitoring > Probes**.

4. Define storage-system performance thresholds.

Thresholds draw your attention to exceptions to normally expected values in the data that you collect.

5. Collect storage-system performance data.

Collect performance data for an individual storage system.

6. View storage system performance data.

**Related information:**

For details of how to use the Configure Devices wizard to enter connection information for any of the storage systems that connect to Tivoli Storage Productivity Center using native interfaces, see “Configuring storage subsystems” on page 308.

## Creating storage subsystem performance monitor

Create a subsystem performance monitor to gather performance data for storage systems.

**Note:** If you schedule a performance monitor to collect data about a storage subsystem at the same time you plan to create many volumes on that subsystem, the performance of the volume creation job and the general performance of the associated CIMOM might decrease. Consider scheduling a performance monitoring job at a different time than when you plan to create many volumes on a subsystem.

Complete the following steps to collect performance data for a storage system:

1. In the navigation tree pane, expand **Disk Manager > Monitoring**.
2. Right-click **Subsystem Performance Monitor** and click **Create Performance Monitor**.

The Create Storage Subsystem Performance Monitor window opens in the content pane.

3. Optional: In the **Description** field, type a description of the threshold.
4. Click the **Storage Subsystems** tab. The Storage Subsystems page is displayed and all storage subsystems that have been discovered are listed.
5. In the **Available subsystems** field, click storage subsystems to select them for collection. Then click .

The selected storage subsystems are displayed in the **Current selections** field.

6. Verify that you have created and run a probe for each selected storage subsystem, as described in “Creating probes” on page 338.

Storage-subsystem reports use data gathered by probes, including data on storage assets in the enterprise, such as computers, storage subsystems, disk controllers, hard disks, and file systems. Data collection fails if a selected system has not yet been probed.

7. Click the **Sampling and Scheduling** tab. The **Sampling and Scheduling** page is displayed.

8. In the **Sampling** area, specify the length of the sampling window and how frequently the performance data is gathered.
  - a. In the **Interval length** field, select the length of the sampling window.

The interval length is the number of minutes over which performance data is averaged. For example, if you select 15 minutes, all performance-data samples gathered from the storage subsystem represent an average of the performance of the subsystem over the previous 15 minute interval.
  - b. In the **Duration** field, specify how long the monitoring task will run.

You can specify that the task runs indefinitely or specify the length of time that the performance data is gathered.
  - c. In the **Scheduling** area, click either **Begin immediately** or **Schedule to begin later**.

If you click **Schedule to begin later**, specify the date and time that you want the data collection to start. You also can specify that the data collection recurs, how frequently it recurs, and whether certain days of the week are excluded.

**Important:** When you specify a start time for using performance monitor data in a plan, a report, or an optimization plan, the start time might not coincide with the start of a performance monitor data collection interval. If the requested start time is after the start of a data collection interval and the duration of the data collection interval is long enough so that it ends at or after the requested start time, Tivoli Storage Productivity Center includes all data from the collection interval that began before the requested start time. This might include data collected before the start time that you specified. This processing ensures that the maximum amount of available performance data is utilized. For example, if a performance monitor collects data every 20 minutes starting at 01:00, but you request performance data starting at 1:15, Tivoli Storage Productivity Center still analyzes performance data starting at 01:00 that has a duration of 20 minutes.

9. Click the **Alert** tab. The **Alert** page is displayed. In the **Condition** area **Monitor Failed** is the triggering condition.
10. In the **Triggered Actions** area, select actions to trigger when the data collection task fails.

You can select from the following check boxes:

- **SNMP Trap**
- **TEC / OMNIBUS Event**
- **Login Notification**
- **Windows Event Log**
- **Run Script**
- **Email**

Depending on what action you select, you might have other choices to make. Suppose that you select the **Windows Event Log** check box, for example. The **Event Type** field becomes activate to specify a severity for the event in the Windows event log.

11. Click **File** → **Save**. You must save the performance monitor before Tivoli Storage Productivity Center can collect data about storage resources.
12. Enter a name for the performance monitor and click **OK**.

An entry for the monitor is displayed under the **Subsystem Performance Monitors** node in the navigation tree. The monitor is run at the date and time specified in the schedule definition.

13. After the monitoring job completes, expand the name of the storage-subsystem performance monitor.

The following information is displayed:

- A status icon that indicates whether the task completed successfully
- Number of times that the task ran
- Date that the task ran
- Time that the task began

14. To view additional information, click the task information.

In the content pane, the following additional information is displayed:

- Time that the task finished
- Number of jobs in the task
- Number of jobs that failed

A table contains information about the storage subsystems in the data collection.

15. In the table, click a storage subsystem, and then click  to display the contents of the log file.
16. Use the Job Management panel to manage view information about the runs and jobs that are related to the monitor. For example, use the Job Management panel to view the status of a run for a schedule, the date and time when it was run, and the log files of the jobs associated with the run.

## Example log file

The following example is a log file for a SAN Volume Controller:

```
Job log file: <Location of log file>
<date><time>HWNPM21131 The performance monitor for device
<name> (<IP address>:<?>) is starting in an active state
<date><time>HWNPM21151 Monitor Policy:name="svcProbe",
creator="administrator", description=""
<date><time>HWNPM21161 Monitor Policy:retention period:
sample data=14 days,hourly data=30 days,daily data=90 days
<date><time>HWNPM21171 Monitor Policy:interval length=900 secs,
frequency=900 secs, duration=1 hours
<date><time>HWNPM21181 Threshold Policy:name=
"Default Threshold Policy for SVC",creator="System",
description="Current default performance threshold policy for
SAN Volume Controller"
<date><time>HWNPM21191 Threshold Policy:retention period:
exception data=14 days
<date><time>HWNPM21201 Threshold Policy:threshold name=
Total I/O Rate Threshold,enabled=no,boundaries=-1,-1,-1,-1 ops/sec
<date><time>HWNPM21201 Threshold Policy:threshold name=
Total Data Rate Threshold,enabled=no,boundaries=-1,-1,-1,-1 MB/sec
<date><time>HWNPM21201 Threshold Policy:threshold name=
Total Backend I/O Rate Threshold,enabled=no,boundaries=3,2,1,0 ops/sec
<date><time>HWNPM21201 Threshold Policy:threshold name=
Total Backend Data Rate Threshold,enabled=yes,boundaries=3,2,1,0 MB/sec
<date><time>HWNPM21201 Threshold Policy:threshold name=
Overall Backend Response Time Threshold,enabled=yes,
boundaries=-1,-1,-1,-1 ms/sec
<date><time>HWNPM02001 This operation (startPerfCollection())
on Performance Manager was successful.
<date><time>HWNPM22001 Successfully retrieved the configuration
data for the storage system.
Found 1 I/O Groups,2MDisk Groups,25MDisks, and 1 VDisk
<date><time>HWNPM21231 Performance data was collected and processed
successfully.
27 performance data records were inserted into the database.
<date><time>HWNPM21231 Performance data was collected and processed
successfully.
54 performance data records were inserted into the database.
<date><time>HWNPM21261 The performance monitor for device
<name> (<IP address>:<?>) is stopping because its
intended duration has elapsed.
```

Descriptions of variables in the log file include:

- <date> is the date, for example, 1/23/06.
- <time> is the time, for example, 12:45:20 PM.
- <name> is the device ID of the storage subsystem, for example, SVC-2145-RedC3-IBM.
- <IP address> is the IP address of the storage subsystem, for example, 9.47.97.159.

This log also provides the following information:

- The monitoring task was targeted against a single SAN Volume Controller, SVC-2145-RedC3-IBM.
- The name of the monitoring task is **svcProbe**, and it was created by a user with an ID **administrator**.
- The retention period for exception data.
- The user had provided the following values for the task: interval length: sampling window of 900 seconds (15 minutes) and duration of one hour.

- The monitoring task successfully retrieved the configuration data from the SAN Volume Controller. The task associated the following logical entities with the SAN Volume Controller:
  - One I/O group
  - Two managed-disk groups (MDisk groups)
  - 25 managed disks (MDisks)
  - One virtual disk (VDisk)
- The monitoring task successfully collected and processed data for two performance metrics. A total of 81 performance records were written to the database.
- The monitoring task stopped when its duration (one hour) had elapsed.

## Editing a storage-subsystem performance monitor

Edit a storage-subsystem performance monitor.

Complete the following steps to edit storage subsystem performance monitor:

1. In the left-hand pane, expand Disk Manager > **Monitoring** > **Subsystem Performance Monitors**. The list of existing subsystem performance monitors is displayed.
2. Click the monitor that you want to edit. The Edit Subsystem Performance Monitor window opens.  
The Create Storage Subsystem Performance Monitor window opens in the right-hand pane.
3. Make any necessary changes.
4. Click **File** → **Save**.

## Monitoring tape libraries

Monitor the performance of tape libraries to be aware of events that occur, and to respond to alerts.

1. Create one or more tape library groups, as described in “Creating tape library groups” on page 373.
2. Create a probe job to collect data about your tape libraries and library groups, as described in “Creating tape library probes” on page 340.
3. View alerts that are generated by your tape libraries, as described in “Viewing alert logs” on page 403.

## Viewing performance data

View collected performance data and recognized threshold exceptions in various user-friendly formats to stay aware of usage trends and exceptions.

Display data in a tabular format (actual values of the collected metrics), a graphical format (primarily as line-graphs), or export the data to a file. Select whether recent data, historical data, or information about threshold exceptions (constraint violations) is displayed.

Select a device or a device component, select a particular metric, and specify a time range to plot the data over the time range.

Use constraint violation reports to view a list of any threshold exceptions that occurred during a particular time range. Bar graphs of exceptions are commonly used to show the total number of threshold violations.

## Viewing storage-subsystem performance data

View collected storage-subsystem performance data and recognized threshold exceptions to stay aware of storage-subsystem usage trends and exceptions.

1. In the navigation tree, expand **Disk Manager** → **Reporting** → **Storage Subsystem Performance**.

A list of reports is displayed under **Storage Subsystem Performance** node.

The following reports generate information concerning SAN Volume Controller models:

- By Storage Subsystem
- By Controller
- By I/O Group
- By Module/Node
- By Array
- By Managed Disk Group
- By Volume
- By Managed Disk
- By Port
- Constraint Violations

2. Click **By I/O Group** to view information about I/O groups.

In the content pane, the Selection page is displayed. By default, all applicable performance metrics are selected for inclusion in the report.

3. Select the data or performance metrics that you want to exclude from the report in the **Included Columns** field. See “Performance metrics” on page 1468 for a list of performance metrics.

a. Click the items that you want to exclude from the report.

- b. Click .

Excluded items are displayed in the **Available Columns** field.

- c. Select a metric and click either  or  to change the order of the selected metric in the report.

4. Type the number of I/O groups to include in the report, in the **Return maximum of** field.

Limit the number of I/O groups to reduce the amount of performance information in the report. By default, this value is set to 2500.

5. Click **Selection** to open the Select Resources window.
6. Select check boxes to select I/O groups for the report, then click **OK**.
7. Click **Filter** to open the Edit Filter window.
8. Specify filter conditions for the report.
9. Click **Generate Report**.

An I/O Group page opens and the report is displayed.

10. Optional: View the report in chart format.

- a. Click , to specify charting options, then click **OK**.
- b. Click **Customize this chart** to further customize the chart.

11. Optional: Click  and type a name to save the report settings for future use.

The report is saved under the **IBM Tivoli Storage Productivity Center** node.

### Viewing tape library information

View collected tape library data to stay aware of discovered tape libraries and usage information.

- Click **Tape Manager**. Left-click **Tape Libraries**. In the content pane, the Tape Libraries page is displayed, which lists the discovered tape libraries.  
Select a library from the table and then click one of the buttons to see further details about that library. For example, select a library and click **Drives** to open a page that lists all the drives for that library.  
You can also right-click a library in the **Tape Libraries** table and select **View Details**.
- Use the **View Details** feature in the topology viewer, as described in “Working with tape libraries in the topology viewer” on page 539.

---

## Working with alerts

Create an alert, configure how the alert is publicized, or edit, delete, disable, rename, or view an alert.

### Related reference:

“Performance thresholds” on page 1457

Performance thresholds are triggering conditions which are used to monitor a component with user-defined values.

## Creating alerts

You can define alerts so that IBM Tivoli Storage Productivity Center notifies you when a specified event occurs. The specific triggering conditions that you can use depend on the type of storage resource that you are monitoring.

**Note:** Alerts are not generated in a Tivoli Storage Productivity Center instance for actions that you perform from that instance. For example, if you start Tivoli Storage Productivity Center and use Disk Manager to assign or unassign volumes for a subsystem, you will not receive alerts for those volume changes in that instance. However, if you assign and unassign volumes outside of that Tivoli Storage Productivity Center instance, an alert is generated.

### Related reference:

“Performance thresholds” on page 1457

Performance thresholds are triggering conditions which are used to monitor a component with user-defined values.

## Creating computer alerts

You can use these alerts to monitor computers for changes in configuration or status. When a condition is detected during a probe, an alert is generated. Computer alerts can be applied to computers, computer groups, and clusters.

If necessary, complete the following prerequisites before you begin the task:

- If you want a script to be run after an event has triggered an alert, you must create the script before you create the alert.
- If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or e-mail as an alert notification, you must

specify disposition values in the Alert Dispositions window. Expand **Administrative Services > Configuration > Alert Disposition**.

To create a computer alert, complete the following steps:

1. In the Navigation Tree pane, expand **Data Manager > Alerting**.
2. Right-click **Computer Alert** and click **Create Alert**. The Create Alert window opens and the Alert page is displayed.
3. Select the **Enabled** check box.
4. In the **Description** field, type a brief description of the job.
5. In the **Triggering-Condition** area, specify the event that will trigger the alert:
  - a. In the **Condition** field, select the triggering condition.
  - b. In the **Value** field, type a numeric value. Depending on the triggering condition that you selected, this field might be unavailable.
  - c. In the **Value Units** field, select the unit of measurement. Depending on the triggering condition that you selected, this field might be unavailable.
6. In the **Triggered-Actions** pane, select the actions that occur as a result of the triggering condition. For an explanation of triggered actions, see “Triggered actions for alerts” on page 1453.
7. Click the **Computer** tab; the Computers page opens.
8. Select the resources to which you want the alert to apply:
  - a. In the **Available** field, click the resources.
  - b. Click . The resources are moved to the **Current Selections** field.
9. Save the alert:
  - a. Click **File > Save**.
  - b. In the Save As window, type a name for the alert in the **Specify Alert name** field and click **OK**. The alert is displayed in the navigation tree.

## Creating directory alerts

You can use these alerts to be notified when either a directory is not found or a directory consumes more than a specified amount of storage space. When a condition is detected during a scan, an alert is generated. These alerts can be applied to directories only.

Before you can create a directory alert, you must have completed the following prerequisites:

- If you want a script to be run after an event has triggered an alert, you must create the script before you create the alert.
- If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or e-mail as an alert notification, you must specify disposition values in the Alert Dispositions window. Expand **Administrative Services > Configuration > Alert Disposition**.
- Directories must be grouped into a directory group before they can be included in an alert.

To create a directory alert, complete the following steps:

1. In the Navigation Tree pane, expand **Data Manager > Alerting**
2. Right-click **Directory Alert** and click **Create Alert**. The Create Alert window opens and the Alert page is displayed.
3. Select the **Enabled** check box.
4. In the **Description** field, type a brief description of the job.

5. In the **Triggering-Condition** area, specify the event that will trigger the alert:
  - a. In the **Condition** field, select the triggering condition.
  - b. In the **Value** field, type a numeric value. Depending on the triggering condition that you selected, this field might be unavailable.
  - c. In the **Value Units** field, select the unit of measurement. Depending on the triggering condition that you selected, this field might be unavailable.
6. In the **Triggered-Actions** pane, select the actions that occur as a result of the triggering condition. For an explanation of triggered actions, see “Triggered actions for alerts” on page 1453.
7. Click the **Directories** tab; the Directories window opens.
8. Select the resources to which you want the alert to apply:
  - a. In the **Available** field, click the resources.
  - b. Click . The resources are moved to the **Current Selections** field.
9. Save the alert:
  - a. Click **File > Save**.
  - b. In the Save As window, type a name for the alert in the **Specify Alert name** field and click **OK**. The alert is displayed in the navigation tree.

### Creating file system alerts

You can use these alerts to monitor file systems for available free space, changes in configuration, or a file system being removed or unmounted. When the condition is detected during a scan, a probe, or upon an SNMP event, an alert is generated.

If necessary, complete the following prerequisites before you begin the task:

- If you want a script to be run after an event has triggered an alert, you must create the script before you create the alert.
- If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or e-mail as an alert notification, you must specify disposition values in the Alert Dispositions window. Expand **Administrative Services > Configuration > Alert Disposition**.

File system alerts can be applied to file systems, file system groups, computers, computer groups, storage systems, storage system groups, and clusters. To create a file system alert, complete the following steps:

1. In the navigation tree, expand **Data Manager > Alerting**.
2. Right-click **Filesystem Alert**, and then click **Create Alert**. The Create Alert panel opens and the Alert page is displayed.
3. Select the **Enabled** check box.
4. In the **Description** field, type a brief description of the job.
5. In the **Triggering-Condition** area, specify the event that will trigger the alert:
  - a. In the **Condition** field, select the triggering condition.
  - b. In the **Value** field, type a numeric value. Depending on the triggering condition that you selected, this field might be unavailable.
  - c. In the **Value Units** field, select the unit of measurement. Depending on the triggering condition that you selected, this field might be unavailable.
6. In the **Triggered-Actions** pane, select the actions that occur as a result of the triggering condition. For an explanation of triggered actions, see “Triggered actions for alerts” on page 1453.
7. Click the **Filesystems** tab; the Filesystems window opens.

8. Select the resources to which you want the alert to apply:
  - a. In the **Available** field, click the resources.
  - b. Click . The resources are moved to the **Current Selections** field.
9. Save the alert:
  - a. Click **File > Save**.
  - b. In the Save As window, type a name for the alert in the **Specify Alert name** field and click **OK**. The alert is displayed in the navigation tree.

### Creating other NAS alerts

You can use other network-attached storage (NAS) alerts to monitor systems that include NAS and are not included in other alert types. When a change in configuration or status is detected during a probe or from an SNMP event, an alert is generated.

If necessary, complete the following prerequisites before you begin the task:

- If you want a script to be run after an event has triggered an alert, you must create the script before you create the alert.
- If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or e-mail as an alert notification, you must specify disposition values in the Alert Dispositions window. Expand **Administrative Services > Configuration > Alert Disposition**.

Other NAS alerts can be applied to NAS clusters, nodes, storage systems, and storage system groups. To create a NAS alert, complete the following steps:

1. In the navigation tree, expand **Data Manager > Alerting**.
2. Right-click **Other NAS Alerts**, and then click **Create Alert**. The Create Alert panel opens and the Alert page is displayed.
3. Select the **Enabled** check box.
4. In the **Description** field, type a brief description of the job.
5. In the **Triggering-Condition** area, specify the event that will trigger the alert:
  - a. In the **Condition** field, select the triggering condition.
  - b. In the **Value** field, type a numeric value. Depending on the triggering condition that you selected, this field might be unavailable.
  - c. In the **Value Units** field, select the unit of measurement. Depending on the triggering condition that you selected, this field might be unavailable.
6. In the **Triggered-Actions** pane, select the actions that occur as a result of the triggering condition. For an explanation of triggered actions, see “Triggered actions for alerts” on page 1453.
7. Click the **NAS** tab; the NAS page opens.
8. Select the resources to which you want the alert to apply:
  - a. In the **Available** field, click the resources.
  - b. Click . The resources are moved to the **Current Selections** field.
9. Save the alert:
  - a. Click **File > Save**.
  - b. In the Save As window, type a name for the alert in the **Specify Alert name** field and click **OK**. The alert is displayed in the navigation tree.

## Creating instance alerts

You can use these alerts to monitor instances for changes. When the condition is detected during a probe, an alert is generated. These alerts can be applied to instances, computers, and computer groups.

If necessary, complete the following prerequisites before you begin the task:

- If you want a script to be run after an event has triggered an alert, you must create the script before you create the alert.
- If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or e-mail as an alert notification, you must specify disposition values in the Alert Dispositions window. Expand **Administrative Services > Configuration > Alert Disposition**.

To create an instance alert, complete the following steps:

1. From the Navigation Tree pane, expand **Data Manager for Databases > Alerting**.
2. Right-click **Instance Alerts** and click **Create Alert..** The Create Alert window opens and the Alert page is displayed.
3. Select the **Enabled** check box.
4. In the **Description** field, type a brief description of the job.
5. In the **Triggering Condition** area, specify the event that will trigger the alert:
  - a. In the **Rdbms Type** field, select the type of database application. You can choose **All Rdbms**, **Oracle**, **SQL\Server**, **Sybase**, or **UDB**.
  - b. In the **Condition** field, select the triggering condition.
  - c. In the **Value** field, type a numeric value. Depending on the triggering condition that you selected, this field might be unavailable.
  - d. In the **Value Units** field, select the unit of measurement. Depending on the triggering condition that you selected, this field might be unavailable.
6. In the **Triggered-Actions** pane, select the actions that occur as a result of the triggering condition. For an explanation of triggered actions, see “Triggered actions for alerts” on page 1453.
7. Click the **Instances** tab; the **Instances** window opens.
8. Select the resources to which you want the alert to apply:
  - a. In the **Available** field, click the resources.
  - b. Click . The resources are moved to the **Current Selections** field.
9. Save the alert:
  - a. Click **File > Save**.
  - b. In the Save As window, type a name for the alert in the **Specify Alert name** field and click **OK**. The alert is displayed in the navigation tree.

## Creating database and tablespace alerts

You can use these alerts to monitor database and tablespaces for changes. When a scans or probes are run, events are recognized and alerts triggered. These alerts can be applied to databases, database groups, table spaces, table space groups, instances, computers, and computer groups.

If necessary, complete the following prerequisites before you begin the task:

- If you want a script to be run after an event has triggered an alert, you must create the script before you create the alert.

- If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or e-mail as an alert notification, you must specify disposition values in the Alert Dispositions window. Expand **Administrative Services > Configuration > Alert Disposition**.

**Note:** (DB2 only) Alerts triggered by table and user statistics will not function until the **runstats** utility is run. This utility ensures that table and user statistics are up-to-date. When you define a scan job for DB2 databases, select the **Perform runstats on all tables being scanned** check box on the **Options** page.

**Note:** (DB2 only) When the following conditions apply, an alert is not generated:

- The triggering condition selected is Database-Tablespace Free Space Less Than.
- The storage entities selected are DB2 databases.
- The table spaces affected by the triggering condition are System Managed Space (SMS) tablespaces.

The alert is not triggered because IBM Tivoli Storage Productivity Center considers SMS containers to be directories on a file system

To create a database-table space alert, complete the following steps:

1. From the Navigation Tree pane, expand **Data Manager for Databases > Alerting**.
2. Right-click **Database-Tablespace Alerts** and click **Create Alert**. The Create Alert window opens and the Alert page is displayed.
3. Select the **Enabled** check box.
4. In the **Description** field, type a brief description of the job.
5. In the **Triggering Condition** area, specify the event that will trigger the alert:
  - a. In the **Rdbms Type** field, select the type of database application. You can choose **All Rdbms**, **Oracle**, **SQL\Server**, **Sybase**, or **UDB**.
  - b. In the **Condition** field, select the triggering condition.
  - c. In the **Value** field, type a numeric value. Depending on the triggering condition that you selected, this field might be unavailable.
  - d. In the **Value Units** field, select the unit of measurement. Depending on the triggering condition that you selected, this field might be unavailable.
6. In the **Triggered-Actions** pane, select the actions that occur as a result of the triggering condition. For an explanation of triggered actions, see “Triggered actions for alerts” on page 1453.
7. Click the **Databases-Tablespaces** tab; the **Databases-Tablespaces** window opens.
8. Select the resources to which you want the alert to apply:
  - a. In the **Available** field, click the resources.
  - b. Click . The resources are moved to the **Current Selections** field.
9. Save the alert:
  - a. Click **File > Save**.
  - b. In the Save As window, type a name for the alert in the **Specify Alert name** field and click **OK**. The alert is displayed in the navigation tree.

### Creating table alerts

You can use these alerts to monitor tables for certain conditions. When the condition is detected during a scan, an alert is generated. These alerts can be applied to table groups and tables only.

- If you want a script to be run after an event has triggered an alert, you must create the script before you create the alert.
- If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or e-mail as an alert notification, you must specify disposition values in the Alert Dispositions window. Expand **Administrative Services > Configuration > Alert Disposition**.
- Tables must be grouped into a table group before they can be included in an alert.

To create a table alert, complete the following steps:

1. From the Navigation Tree pane, expand **Data Manager for Databases > Alerting**.
2. Right-click **Table Alerts** and click **Create Alert..** The Create Alert window opens and the Alert page is displayed.
3. Select the **Enabled** check box.
4. In the **Description** field, type a brief description of the job.
5. In the **Triggering Condition** area, specify the event that will trigger the alert:
  - a. In the **Rdbms Type** field, select the type of database application. You can choose **All Rdbms**, **Oracle**, **SQL\Server**, **Sybase**, or **UDB**.
  - b. In the **Condition** field, select the triggering condition.
  - c. In the **Value** field, type a numeric value. Depending on the triggering condition that you selected, this field might be unavailable.
  - d. In the **Value Units** field, select the unit of measurement. Depending on the triggering condition that you selected, this field might be unavailable.
6. In the **Triggered-Actions** pane, select the actions that occur as a result of the triggering condition. For an explanation of triggered actions, see “Triggered actions for alerts” on page 1453.
7. Click the **Tables** tab; the **Tables** window opens.
8. Select the resources to which you want the alert to apply:
  - a. In the **Available** field, click the resources.
  - b. Click . The resources are moved to the **Current Selections** field.
9. Save the alert:
  - a. Click **File > Save**.
  - b. In the Save As window, type a name for the alert in the **Specify Alert name** field and click **OK**. The alert is displayed in the navigation tree.

## Creating fabric alerts

You can use these alerts to monitor fabrics for changes. When the condition is detected during a probe, an alert is generated. These alerts can be applied to fabrics, zones, and zone sets.

If necessary, complete the following prerequisites before you begin the task:

- If you want a script to be run after an event has triggered an alert, you must create the script before you create the alert.
  - If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or e-mail as an alert notification, you must specify disposition values in the Alert Dispositions window. Expand **Administrative Services > Configuration > Alert Disposition**.
1. In the Navigation Tree pane, expand **Fabric Manager > Alerting**.

2. Right-click **Fabric Alert** and click **Create Fabric Alerts**. The Create Fabric Alerts window opens and the Alert page is displayed.
3. Select the **Enabled** check box.
4. In the **Description** field, type a brief description of the job.
5. In the **Triggering Condition** area, specify the event that will trigger the alert.
6. In the **Triggered-Actions** pane, select the actions that occur as a result of the triggering condition. For an explanation of triggered actions, see “Triggered actions for alerts” on page 1453.
7. Click the **Fabrics** tab; the Fabrics page opens.
8. Select the resources to which you want the alert to apply:
  - a. In the **Available** field, click the resources.
  - b. Click . The resources are moved to the **Current Selections** field.
9. Save the alert:
  - a. Click **File > Save**.
  - b. In the Save As window, type a name for the alert in the **Specify Alert name** field and click **OK**. The alert is displayed in the navigation tree.

### Creating storage system alerts

You can use storage systems alerts to monitor systems for changes in configuration or status. When the condition is detected during a probe, an alert is generated. These alerts can be applied to storage subsystem groups and storage subsystems.

If necessary, complete the following prerequisites before you begin the task:

- If you want a script to be run after an event has triggered an alert, you must create the script before you create the alert.
- If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or e-mail as an alert notification, you must specify disposition values in the Alert Dispositions window. Expand **Administrative Services > Configuration > Alert Disposition**.

To create a storage subsystem alert, complete the following steps:

1. Expand the **Disk Manager > Alerting** node in the navigation tree.
2. Right-click **Storage Subsystem Alerts**, and click **Create Storage Subsystem Alert**. The Create Storage Subsystem Alert window is opened.
3. In the **Description** field, type a brief description of the job.
4. Select the **Enabled** check box.
5. In the **Triggering Condition** pane, specify the event that will trigger the alert:
  - a. In the **Condition** field, select the triggering condition. See “Triggering conditions for alerts” on page 1439 for a list of triggering conditions that are available for each alert type.
  - b. If you selected a performance threshold, specify the thresholds:
    - 1) In the **Critical Stress** field, type the upper-threshold boundary. When this boundary is exceeded, a critical condition is recognized.
    - 2) In the **Warning Stress** field, type the upper-threshold boundary. When this boundary is exceeded, a warning condition is recognized.
    - 3) In the **Warning Idle** field, type the lower-threshold boundary. When the value falls under this boundary, a warning condition is recognized.
    - 4) In the **Critical Idle** field, type the lower-threshold boundary. When the value falls under this boundary, a critical condition is recognized.

For more information about thresholds, see “Performance thresholds” on page 1457.

6. In the **Alert Suppression** pane, choose the condition under which alerts are triggered, and then choose how to manage repeating alerts. For an explanation of the options in this pane, see “Alert suppression actions” on page 1453.
7. In the **Triggered-Actions** pane, select the actions that occur as a result of the triggering condition. For an explanation of triggered actions, see “Triggered actions for alerts” on page 1453.
8. Click the **Storage Subsystems** tab. The Storage Subsystems page is displayed.
9. Select the storage systems and storage system groups to which you want the alert to apply:
  - a. In the **Available** field, click the storage entities.
  - b. Click . The storage entities are moved to the **Current Selections** field.
10. Save the alert:
  - a. Click **File > Save**.
  - b. In the Save As window, type a name for the alert in the **Specify Alert name** field and click **OK**. The alert is displayed in the navigation tree.

## Creating switch alerts

You can use these alerts to monitor switches for changes in configuration or status. When the condition is detected during a probe, an alert is generated. These alerts can only be applied to switches.

If necessary, complete the following prerequisites before you begin the task:

- If you want a script to be run after an event has triggered an alert, you must create the script before you create the alert.
- If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or e-mail as an alert notification, you must specify disposition values in the Alert Dispositions window. Expand **Administrative Services > Configuration > Alert Disposition**.

To create a switch alert, complete the following steps:

1. In the Navigation Tree pane, expand **Fabric Manager > Alerting**.
2. Right-click **Switch Alerts** and click **Create Switch Alerts**. The Create Switch Alerts page opens and the Alert page is displayed.
3. Select the **Enabled** check box.
4. In the **Description** field, type a brief description of the job.
5. In the **Triggering Condition** pane, specify the event that will trigger the alert:
  - a. In the **Condition** field, select the triggering condition. See “Triggering conditions for alerts” on page 1439 for a list of triggering conditions that are available for each alert type.
  - b. If you selected a performance threshold, specify the thresholds:
    - 1) In the **Critical Stress** field, type the upper-threshold boundary. When this boundary is exceeded, a critical condition is recognized.
    - 2) In the **Warning Stress** field, type the upper-threshold boundary. When this boundary is exceeded, a warning condition is recognized.
    - 3) In the **Warning Idle** field, type the lower-threshold boundary. When the value falls under this boundary, a warning condition is recognized.

- 4) In the **Critical Idle** field, type the lower-threshold boundary. When the value falls under this boundary, a critical condition is recognized.

For more information about thresholds, see “Performance thresholds” on page 1457.

6. In the **Alert Suppression** pane, choose the condition under which alerts are triggered, and then choose how to manage repeating alerts. For an explanation of the options in this pane, see “Alert suppression actions” on page 1453.
7. In the **Triggered-Actions** pane, select the actions that occur as a result of the triggering condition. For an explanation of triggered actions, see “Triggered actions for alerts” on page 1453.
8. Click the **Switches** tab. The Switches page is displayed.

**Note:** If you selected a performance threshold as the triggering condition, only those switches for which performance data can be collected are listed.

9. Select the storage entities to which you want the alert to apply:
  - a. In the **Available** field, click the storage entities.
  - b. Click . The storage entities are moved to the **Current Selections** field.

**Note:** You can select one or more switches from the **Switches** category. For device triggering conditions only, you can select one or more fabrics from the **Switches In Fabric** category. Selecting fabrics will include all switches in those fabrics. You can also select from both categories.

10. Save the alert:
  - a. Click **File > Save**.
  - b. In the Save As window, type a name for the alert in the **Specify Alert name** field and click **OK**. The alert is displayed in the navigation tree.

## Creating endpoint device alerts

You can use these alerts to monitor endpoint devices. When the condition is detected during a probe, an alert is generated. These alerts can be applied to endpoint devices only.

If necessary, complete the following prerequisites before you begin the task:

- If you want a script to be run after an event has triggered an alert, you must create the script before you create the alert.
- If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or e-mail as an alert notification, you must specify disposition values in the Alert Dispositions window. Expand **Administrative Services > Configuration > Alert Disposition**.

To create an endpoint device alert, complete the following steps:

1. In the Navigation Tree pane, expand **Fabric Manager > Alerting**.
2. Right-click **Endpoint Device Alerts** and click **Create Endpoint Device Alerts**. The Create Endpoint Device Alerts window opens and the Alert page is displayed.
3. Select the **Enabled** check box.
4. In the **Description** field, type a brief description of the job.
5. In the **Triggering Condition** area, specify the event that will trigger the alert.

6. In the **Triggered-Actions** pane, select the actions that occur as a result of the triggering condition. For an explanation of triggered actions, see “Triggered actions for alerts” on page 1453.
7. Click the **Endpoint Devices** tab; the Endpoint Devices page opens.
8. Select the resources to which you want the alert to apply:
  - a. In the **Available** field, click the resources.
  - b. Click . The resources are moved to the **Current Selections** field.
9. Save the alert:
  - a. Click **File > Save**.
  - b. In the Save As window, type a name for the alert in the **Specify Alert name** field and click **OK**. The alert is displayed in the navigation tree.

### Database connection alerts

Database connection alerts notify the Tivoli Storage Productivity Center administrator when the database connection used by the Tivoli Storage Productivity Center server is lost unexpectedly and when the database connection is restored.

If necessary, complete the following prerequisites before you begin the task:

- If you want a script to be run after an event has triggered an alert, you must create the script before you create the alert.
- If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or e-mail as an alert notification, you must specify disposition values in the Alert Dispositions window. Expand **Administrative Services > Configuration > Alert Disposition**.

The database connection alerts are always enabled and configured to add the alert to the alert log and send an e-mail to the data administrator.

The database connection alerts are:

- DB connection failed
- DB connection successful

You cannot create, configure, delete, disable, edit, or rename these alerts. You can, however, change the destination for the database connection alerts. Expand **Administrative Services > Configuration**. Left-click **Alert Disposition**. In the content pane, under Email, you can change all of the fields.

## Configuring alert destinations

Entries in the Alert Disposition window define destination host addresses for SNMP, IBM Tivoli Enterprise Console, and e-mail.

If you want to send SNMP traps, IBM Tivoli Enterprise Console events, or e-mail when an alert is triggered, you must configure IBM Tivoli Storage Productivity Center with the alert destinations and e-mail settings.

To configure alert dispositions, complete the following steps:

1. In the Navigation Tree pane, expand **Administrative Services > Configuration**.
2. Click **Alert Disposition**. The Edit Alert Disposition window opens.
3. In the **SMNP** area, specify the information about where SNMP traps are sent:

- a. In the **Community** field, type the name of the SNMP community. By default, this is set to public.
  - b. In the **Host** field, type the fully qualified name of the system that you have configured to receive SNMP traps.
  - c. In the **Port** field, type the port number to which Tivoli Storage Productivity Center will direct SNMP traps. By default, this is set to 162.
  - d. If you want to configure a second SNMP destination, type the required information in the fields in the **SNMP Destination 2** area.
4. In the **TEC** area, specify information about where Tivoli Enterprise Console events are sent:
    - a. In the **Server** field, type the fully qualified name of the Tivoli Enterprise Console server.
    - b. In the **Port** field, type the port number to which Tivoli Storage Productivity Center will direct Tivoli Enterprise Console events. By default, this is set to 5529.
  5. In the **Email** area, configure e-mail settings:
    - a. In the **Mail Server** field, type the name of the mail server.
    - b. In the **Mail Port** field, type the port number for the SMTP server.
    - c. In the **Default Domain** field, type the domain, for example, MyCompany.com.
    - d. In the **Return to** field, type the e-mail address to which undeliverable mail is sent.
    - e. In the **Reply to** field, type the e-mail address to which e-mail is sent when someone replies to an e-mail notification about an alert. (It is a best practice to specify the e-mail address of an Tivoli Storage Productivity Center administrator.)
    - f. In the **Data Administrator** field, type the e-mail address of the Data Administrator.
  6. In the **Alert Log Disposition** field, select the length of time to keep entries in the alert logs. The default is 90 days.

## Deleting alerts

To ensure that the list of alerts in the navigation tree is up-to-date, you can delete alerts that you no longer want to implement.

To delete an alert, complete the following steps:

1. In the navigation tree, complete one of the following actions:

Alert type	Action
For computer alerts	Expand <b>Data Manager &gt; Alerting &gt; Computer Alerts</b> .
For file system alerts	Expand <b>Data Manager &gt; Alerting &gt; Filesystem Alerts</b> .
For directory alerts	Expand <b>Data Manager &gt; Alerting &gt; Directory Alerts</b> .
For hypervisor alerts	Expand <b>Data Manager &gt; Alerting &gt; Hypervisor Alerts</b> .
For other NAS alerts	Expand <b>Data Manager &gt; Alerting &gt; Other NAS Alerts</b> .

For instance alerts	Expand <b>Data Manager for Databases &gt; Alerting &gt; Instance Alerts.</b>
For database-tablespace alerts	Expand <b>Data Manager for Databases &gt; Alerting &gt; Database-Tablespace Alerts.</b>
For table alerts	Expand <b>Data Manager for Databases &gt; Alerting &gt; Table Alerts.</b>
For storage subsystem alerts	Expand <b>Disk Manager &gt; Alerting &gt; Storage Subsystem Alerts.</b>
For fabric alerts	Expand <b>Fabric Manager &gt; Alerting &gt; Fabric Alerts.</b>
For switch alerts	Expand <b>Fabric Manager &gt; Alerting &gt; Switch Alerts.</b>
For endpoint device alerts	Expand <b>Fabric Manager &gt; Alerting &gt; Endpoint Device Alerts.</b>

The list of existing alerts is displayed.

- Right-click the alert and click **Delete**. The Delete Alert window opens.

**Tip:** If **Delete** is not available, you do not have authority to delete the alert.

- Click **Yes**.

## Disabling an alert

You can disable an alert. This retains the alert definition but prevents the alert from being run.

To disable an alert, complete the following steps:

- In the Navigation Tree pane, complete one of the following actions:

**For computer alerts**

Expand **Data Manager > Alerting > Computer Alerts.**

**For file system alerts**

Expand **Data Manager > Alerting > Filesystem Alerts.**

**For directory alerts**

Expand **Data Manager > Alerting > Directory Alerts.**

**For hypervisor alerts**

Expand **Data Manager > Alerting > Hypervisor Alerts.**

**For other NAS alerts**

Expand **Data Manager > Alerting > Other NAS Alerts.**

**For instance alerts**

Expand **Data Manager for Databases > Alerting > Instance Alerts.**

**For database-tablespace alerts**

Expand **Data Manager for Databases > Alerting > Database-Tablespace Alerts.**

**For table alerts**

Expand **Data Manager for Databases > Alerting > Table Alerts.**

**For storage subsystem alerts**

Expand **Disk Manager > Alerting > Storage Subsystem Alerts.**

**For fabric alerts**

Expand **Fabric Manager > Alerting > Fabric Alerts.**

#### For switch alerts

Expand **Fabric Manager > Alerting > Switch Alerts.**

#### For endpoint device alerts

Expand **Fabric Manager > Alerting > Endpoint Device Alerts.**

The list of existing alerts is displayed.

2. Click the alert that you want to disable. The Edit Alert page opens.
3. Clear the **Enabled** check box.
4. Click **File > Save.**

“Alerts” on page 108

## Editing alerts

You can edit an alert if you want to change the triggering condition, triggered action, or the storage resources against which it is deployed.

To edit an alert, complete the following steps:

1. In the navigation tree, complete one of the following actions:

Alert type	Action
For computer alerts	Expand <b>Data Manager &gt; Alerting &gt; Computer Alerts.</b>
For file system alerts	Expand <b>Data Manager &gt; Alerting &gt; Filesystem Alerts.</b>
For directory alerts	Expand <b>Data Manager &gt; Alerting &gt; Directory Alerts.</b>
For hypervisor alerts	Expand <b>Data Manager &gt; Alerting &gt; Hypervisor Alerts</b>
For other NAS alerts	Expand <b>Data Manager &gt; Alerting &gt; Other NAS Alerts</b>
For instance alerts	Expand <b>Data Manager for Databases &gt; Alerting &gt; Instance Alerts.</b>
For database-tablespace alerts	Expand <b>Data Manager for Databases &gt; Alerting &gt; Database-Tablespace Alerts.</b>
For table alerts	Expand <b>Data Manager for Databases &gt; Alerting &gt; Table Alerts.</b>
For storage subsystem alerts	Expand <b>Disk Manager &gt; Alerting &gt; Storage Subsystem Alerts.</b>
For fabric alerts	Expand <b>Fabric Manager &gt; Alerting &gt; Fabric Alerts.</b>
For switch alerts	Expand <b>Fabric Manager &gt; Alerting &gt; Switch Alerts.</b>
For endpoint device alerts	Expand <b>Fabric Manager &gt; Alerting &gt; Endpoint Device Alerts.</b>

The list of existing alerts is displayed.

2. Click the alert that you want to edit. The Edit Alert page opens.
3. Make any necessary changes.
4. Click **File > Save.**

**Tip:** Some alerts are shown automatically when a client application is registered to receive alerts from Tivoli Storage Productivity Center. You can identify these alerts by the keyword *Pre-defined* in their names. You can hide these alerts from view in the GUI. For more information, see the IBM Tivoli Storage Productivity Center Problem Determination Guide.

## Renaming alerts

You can rename alerts. This might be useful if the original name is ambiguous or lacks clarity.

To rename an alert, complete the following steps:

1. In the navigation tree, complete one of the following actions:

Alert type	Action
For computer alerts	Expand <b>Data Manager &gt; Alerting &gt; Computer Alerts.</b>
For file system alerts	Expand <b>Data Manager &gt; Alerting &gt; Filesystem Alerts.</b>
For directory alerts	Expand <b>Data Manager &gt; Alerting &gt; Directory Alerts.</b>
For hypervisor alerts	Expand <b>Data Manager &gt; Alerting &gt; Hypervisor Alerts</b>
For other NAS alerts	Expand <b>Data Manager &gt; Alerting &gt; Other NAS Alerts</b>
For instance alerts	Expand <b>Data Manager for Databases &gt; Alerting &gt; Instance Alerts.</b>
For database-tablespace alerts	Expand <b>Data Manager for Databases &gt; Alerting &gt; Database-Tablespace Alerts.</b>
For table alerts	Expand <b>Data Manager for Databases &gt; Alerting &gt; Table Alerts.</b>
For storage subsystem alerts	Expand <b>Disk Manager &gt; Alerting &gt; Storage Subsystem Alerts.</b>
For fabric alerts	Expand <b>Fabric Manager &gt; Alerting &gt; Fabric Alerts.</b>
For switch alerts	Expand <b>Fabric Manager &gt; Alerting &gt; Switch Alerts.</b>
For endpoint device alerts	Expand <b>Fabric Manager &gt; Alerting &gt; Endpoint Device Alerts.</b>

The list of existing alerts is displayed.

2. Right-click the alert, and click **Rename**. The Rename Alert window opens.
3. Type the new name, and click **OK**.

## Viewing alerts

This section describes different methods for viewing alerts.

To view an alert, choose one of the following methods:

### Alert log

Click **IBM Tivoli Storage Productivity Center > Alerting > Alert Log**. Click **All Alerts** or any node that is highlighted in red and preceded by a red circle. Depending on what you select, the Alert History page displays

all alerts or only the alerts that you selected. Figure 31 shows the alert history page.

	Computer	Obj. Type	Object	Alert Type	First Triggered
	(N/A)	Configuration Analysis	db2admin.sqz5d3	Policy Violation	Apr 23, 2007 9:30:32 AM
	(N/A)	Configuration Analysis	db2admin.sqz5d3	Policy Violation	Apr 23, 2007 9:30:32 AM
	(N/A)	Discovery	TPCUser.CIMOM Discovery	Job Failed	Apr 23, 2007 3:39:59 AM
	(N/A)	Discovery	TPCUser.CIMOM Discovery	Job Failed	Apr 22, 2007 3:39:58 AM
	\\WORKGROUP\smartblued840	Discovery		Entity Discovered	Apr 22, 2007 2:29:56 AM
	(N/A)	Discovery	TPCUser.CIMOM Discovery	Job Failed	Apr 21, 2007 3:41:52 AM
	bubs.sanjose.ibm.com	(N/A)		Performance monitor failed	Apr 20, 2007 1:31:06 PM

Figure 31. Alert History page

To view details about each alert, click or double-click . The Detail for Alert page displays additional information (see Figure 32). You can obtain similar information about any alert by clicking **Topology** to access the topology viewer. Details are available through the *alert overlay* in the graphical view and the Alert tab in the table view. The following figure shows the Detail for Alert page, which lists the name of the job, number of the run, type of alert, state of the alert, timestamp, name of the alert creator, name of the alert, and text about the alert

<b>Configuration Analysis</b>	db2admin.sqz5d3
<b>Run</b>	1
<b>Alert Type</b>	Policy Violation
<b>State</b>	Active
<b>Timestamp</b>	Apr 23, 2007 9:30:32 AM
<b>Alert Creator</b>	TPCUser
<b>Alert Name</b>	Default Configuration Analysis Alert
<b>Alert Text</b>	ALR0077W: Policy 1 got violated 14 times during the run number 1 of Analyzer db2admin.sqz5d3.

The configuration analysis policy violation details can be viewed in the Alert overlay within the topology viewer.

[Topology](#)

Figure 32. Detail for Alert page

### Alert overlay

The alert overlay represents various types of alerts. You can enable or disable the alert overlay in the graphical view of the topology viewer by right-clicking a blank space in the background of the graphical view, clicking **Global Settings** from the pop-up menu, and clicking **Alert** under Active overlays (see Figure 33 on page 401). After you make your selection,

click OK.

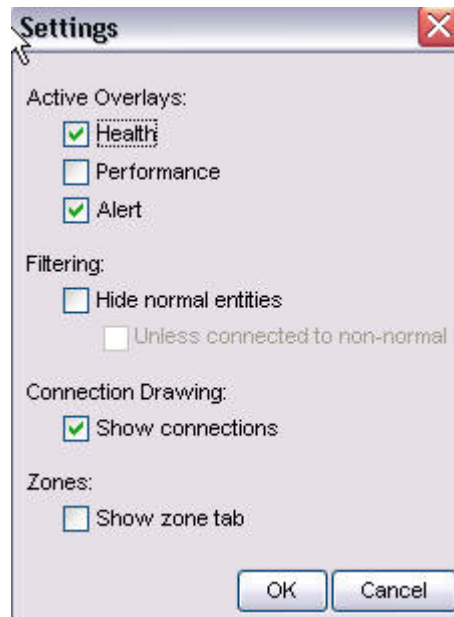

Figure 33. Enabling or disabling the alert overlay. In this example, the alert overlay is enabled.

When the alert overlay is active, entities that have alerts associated with them display a red alert overlay icon  by the pinning icon. The icon also appears in the title bar of groups and tabs. Note that in the Configuration History page the alert overlay is disabled.

The alert overlay provides rollup, similar to pinning. If alerts are inside a collapsed group, the number of alerts within that group are aggregated and indicated in the collapsed group with an alert icon. All alerts are aggregated into one count, independent of type or entity involved. Hover over the alert icon for a tab or group to determine the total number of alerts that are rolled up into that icon and the time stamp of the newest alert.

In the topology viewer, right-click an entity with an alert icon to display the pop-up menu. Click **Show Alerts in Tabular View** to move to the Alert tab and to highlight alerts that are associated with that entity in the table view (see Figure 34 on page 402). When you select an alert under the Alert tab, entities that are associated with that alert are highlighted in purple in the graphical view. Such an action might highlight more than one entity in the topology viewer.

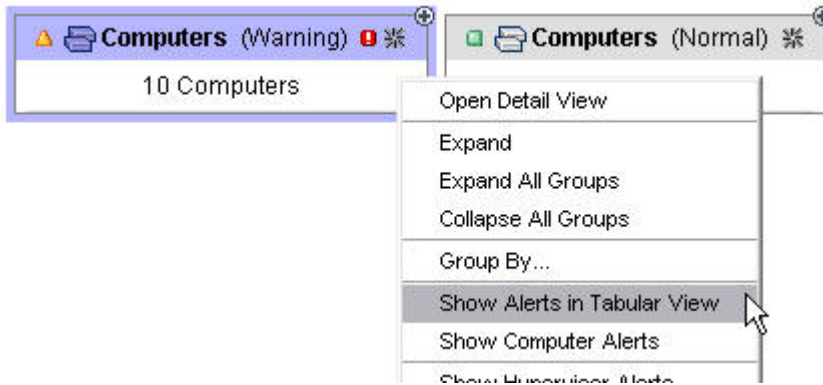

Figure 34. Using the pop-up menu to view alerts in the table view

External alerts do not display in the alert overlay. These alerts are usually Common Information Model (CIM) indications that cannot be tied to specific resources. To view the list of external alerts, click **IBM Tivoli Storage Productivity Center > Alerting > Alert Log > External**.

### Alert tab

The Alert tab is located in the table view of the topology viewer (see Figure 35). Click this tab to view a hierarchical list of all current alerts that are associated with entities shown in the topology. For configuration analysis alerts, the highest level provides information about which policy was violated during a particular analyzer run. The next level indicates the number of times that the policy was violated. This list contains one node for each policy violation. The Alert tab only lists the policy violations that contain at least one of the affected entities that are displayed in the graphical view. The remaining policy violations are filtered. The only exception is the Overview panel where the Alert tab lists all of the Tivoli Storage Productivity Center alerts. Click each violation to view a list of affected entities. Parent (enclosing) entities display in a separate column.

Action: Expand All Groups		Locate		
Computer		Alert		
...	Condition	△ Last Triggered	Enclosing Entity	Affected Entity
⊖	<b>Policy 1 Violated</b>	Apr 23, 2007 9:30:32 AM		
⊖	<b>Violation 1</b>			
	Violation 1		Fabric (200000000000B000)	Zone Set (ZS1-FAB2-TAPE)
	Violation 1		Computer (hydrogen.almaden.ibm...)	FCPort (A00000000000A003)
⊕	<b>Violation 2</b>			
⊕	<b>Violation 3</b>			
⊕	<b>Policy 2 Violated</b>	Apr 23, 2007 9:30:32 AM		

Figure 35. Viewing alerts by using the Alert tab in the table view. Expand the levels to view information about each violation.

For information about fixing policy violations, see “Resolving policy violations” on page 416. You can resort the alert list by clicking the headers in the table. To find entities associated with an alert in the graphical view, click the alert in the table to highlight (in purple) the corresponding entity and any associated entities.

## Viewing alert logs

Use the alert log to view and manage the alert conditions that were detected on the monitored resources in your environment. The alert log contain entries for all alert conditions so that you can monitor and address critical storage events from a central location.

There are two alert logs that are available in the stand-alone GUI. The type of alert determines where information about the alert is shown:

- For alerts generated by Data Manager for Databases, expand **Data Manager for Databases > Alerting > Alert Log**. You can view:
  - All alerts or alerts organized by RDBMS such as by Oracle, SQL Server, Sybase, and UDB. If you do not license for a specific RDBMS, no nodes for that RDBMS are displayed under the **Alert Log** node.
  - Alerts by type (such as by Instance, Database-Tablespace, Table, User)
  - Alerts directed to you (the user currently logged on to the UI component)
- For alerts generated by all other components, expand **IBM Tivoli Storage Productivity Center > Alerting > Alert Log**. The alert types that are displayed depend on the Tivoli Storage Productivity Center license type. The following is a list of the possible alert types that are displayed under **Alert Log**:
  - All
  - Alerts Directed to <user-id> - Alerts directed to the user logged on to the interface.
  - Authentication Configuration
  - Replication
  - Storage Subsystem
  - Computer
  - Disk
  - Filesystem
  - Directory
  - User
  - OS User Group
  - Fabric
  - Switch
  - Endpoint Device
  - External
  - Tape Library
  - Configuration Analysis
  - Hypervisor

For alert types that are not displayed for certain license types, see “Product licenses for Tivoli Storage Productivity Center” on page 12

Each alert node has an icon next to it that indicates its status:

- Red-outlined circle: a negative alert occurred, such as job failed, new disk defect.
- Green-outlined box: a neutral alert was detected, such as a new disk detected.

When you click an alert node, the alert log window opens a table that contains

information for all the alerts for that node. Click  on a row to drill down for more information.

The following table describes the buttons on the Alert Log window:

Button	Description
Clear	Clear the selected alerts. When you click this button, the icon for the alert changes to indicate that the alert was cleared. The alert continues to be displayed in the alert log.
Delete	Delete the selected alerts from the alert log.
Clear ALL	Clear all of the alerts in the report. When you click this button, the icon for all the alerts changes to indicate that the alerts were cleared. The alerts continue to be displayed in the alert log.
Delete ALL	Delete all of the alerts in the current report from the alert log.
Refresh	Regenerate the report you are viewing to pick up any newly generated alerts that were triggered since you last generated the report.

**Tip:** Some alerts are shown automatically when a client application is registered to receive alerts from Tivoli Storage Productivity Center. You can identify these alerts by the keyword *Pre-defined* in their names. You can hide these alerts from view in the GUI. For more information, see the IBM Tivoli Storage Productivity Center Problem Determination Guide.

**Restriction:** For database tables, the values in the **Resource Type** and **Resource Name** columns are set to N/A for the following alerts:

- Total Table Size Greater Than
- Chained Row Count Greater Than

## Viewing tape library alerts

View discovered alert conditions in the tape libraries. Alerts are based on the CIM\_AlertIndication specification of SMI-S.

To view these alerts, expand **IBM Tivoli Storage Productivity Center > Alerting > Alert Log** and click the **Tape Library** node.

---

## Checking storage configurations

This section introduces methods that a system administrator can use to assess changes that have occurred in SAN configurations over time and to check whether SAN configurations comply with predefined policies.

## Using configuration history

This topic describes how system administrators can capture and analyze historical data that identifies possible problems with a storage area network (SAN) configuration.

**Note:** The configuration history feature is available only with the IBM Tivoli Storage Productivity Center Advanced Edition.

The configuration history feature takes and displays snapshots of changes that occurred in your SAN configuration over a period of time that you specify. After you set the time period (how often to take snapshots and how long to store them), in a page similar to the topology viewer you can manipulate a snapshot selection

panel to show changes that occurred between two or more points in the time period. System administrators can use the configuration history feature to:

#### **Correlate performance statistics with configuration changes**

For example, during collection of performance statistics (including volume performance statistics) on an TotalStorage Enterprise Storage Server system you might delete a volume. While no new statistics are reported on that volume, the Tivoli Storage Productivity Center Performance Manager would have already collected partial statistical information prior to the deletion. At the end of the data collection task, reporting of the partially collected statistics on the (now) deleted volume would require access to its properties which would not be available. The configuration history feature, with its ability to take and store snapshots of a system's configuration, could provide access to the volume's properties.

#### **Analyze end-to-end performance**

You want to know why performance changed on volume A during the last 24 hours. To learn why, it is useful to know what changes were made to the storage subsystem's configuration that might affect the volume's performance, even if performance statistics were not recorded on some of those elements. For example, even if performance statistics on a per-rank basis are not collected, but the number of volumes allocated on a rank is increased from 1 to 100 over time, access to that configuration history information helps with analyzing the volume's degraded performance over time.

#### **Aid in planning and provisioning**

The availability of configuration history can enhance the quality of both provisioning and planning. For example, historical data is useful when using the Tivoli Storage Productivity Center Volume Performance Advisor to provision a volume or when using the Tivoli Storage Productivity Center Version 3.3 Integrated Host, Security and Subsystem Planner to plan tasks.

To use the configuration history feature, complete the following steps:

1. In the Navigation tree pane, expand **Administrative Services > Configuration > Configuration History Settings**. The Configuration History Settings page displays for you to indicate how often to capture SAN configuration data and how long to retain it.
2. Perform the following to collect historical data:
  - a. In the **Create snapshot every** field, click the check box to enable this option and type how often (in hours) you want the system to take snapshot views of the configuration.
  - b. In the **Delete snapshots older than** field, click the check box to enable this option and type how long (in days) you want the snapshots to be stored.
  - c. The page displays the total number of snapshots in the database and the date and time of when the latest snapshot was taken. To refresh this information, click **Update**.
  - d. To optionally create and title a snapshot on demand, in the **Title this snapshot** field type a name for the on demand snapshot and click **Create Snapshot Now**. If you do not want to title the on demand snapshot, simply click **Create Snapshot Now**.
  - e. To return to the default settings (the default settings are create snapshots every 12 hours and delete snapshots older than 14 days), click **Reset to defaults**.

- f. To save your settings, click **File > Save**.
3. In the Navigation tree pane, expand **Tivoli Storage Productivity Center > Analytics > Configuration History**, and click **Configuration History**. The software loads the snapshot data for the length of time that you specified. The Configuration History page (a variation of the topology viewer) displays the configuration's entities and a floating snapshot selection panel. The panel allows you to define the time periods against which the configuration is compared to determine whether changes have occurred.

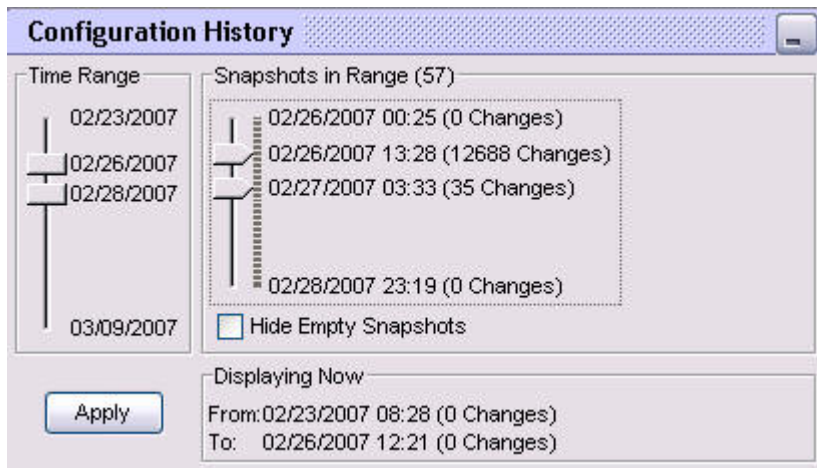

Figure 36. Snapshot selection panel. Use the thumb sliders to establish the time interval that you want to examine.

4. To define the time periods that you want to compare, perform the following:
  - a. Using the mouse, drag the two “thumbs” in the **Time Range** slider to establish the desired time interval. The Time Range slider covers the range of time from the oldest snapshot in the system to the current time. It indicates the date as *mm/dd/yyyy*, where *mm* equals the month, *dd* equals the day, and *yyyy* equals the year.
  - b. Drag the two thumbs in the **Snapshots in Range** slider to indicate the two snapshots to compare. The Snapshots in Range slider allows you to select any two snapshots from the time interval specified by the Time Range slider. The value in parentheses for the Snapshots in Range slider indicates the total snapshots in the currently selected time range. The Snapshots in Range slider has one tick mark for each snapshot from the time interval that you specified in the Time Range slider. Each snapshot in the Snapshots in Range slider is represented as time stamp *mm/dd/yyyy hh:mm*, where the first *mm* equals the month, *dd* equals the day, *yyyy* equals the year, *hh* equals the hour, and the second *mm* equals the minute. The value in parentheses for each snapshot indicates the number of changes that have occurred between this and the previous snapshot. Snapshots with zero changes are referred to as empty snapshots. If you provided a title while creating an on demand snapshot, the title displays after the time stamp. If you want to remove empty snapshots, click the check box to display a check mark in **Hide Empty Snapshots**. The **Displaying Now** box indicates the two snapshots that are currently active.
  - c. Click **Apply**.
5. Determine the changes that have occurred to the entities by examining the icons and colors associated with them in the graphical and table views: For

information about viewing the changes, see “Viewing configuration changes in the graphical view” and “Viewing configuration changes in the table view” on page 409.

One single snapshot selection panel applies for all Configuration History views that are open at the same time. Any change that you make in this panel is applied to all of the Configuration History views.

**Important:** If you manually deleted a missing entity from the Tivoli Storage Productivity Center, the configuration history feature rediscovers and displays the entity in the configuration history viewer as both Missing and in a Normal state. For example, Entity A (with ID 12) is missing and you decide to manually delete it by using the Remove From Database option from the pop-up menu for Entity A in the topology viewer or configuration history viewer. Later, the Tivoli Storage Productivity Center rediscovers Entity A and assigns it a new ID (ID 22). The configuration history feature treats the same Entity A (with ID 12 and ID 22) as two different entities and displays them in both Missing and Normal states in the configuration history viewer. This scenario can also occur if a missing entity is removed by the Tivoli Storage Productivity Center removed resource retention function and is rediscovered by the Tivoli Storage Productivity Center again at a later time.

**Important:** Name changes for volumes, storage pools, and managed disks are not highlighted as being changed in the Configuration History topology viewer.

### Viewing configuration changes in the graphical view

This section describes how to determine the changes that have occurred to a configuration over time by examining the icons and colors of the change overlay in the graphical view of the Configuration History page.

In the Configuration History page, a *change overlay* presents icons and colors that indicate changes in the configuration between the time that a snapshot was taken and the time that a later snapshot was taken:

- The icons display next to the name of the entity in the graphical view and in the change status column of the table view.
- The colors display as background colors for entities in the graphical view and for affected rows in the table view.

Table 37 describes the icons and colors of the change overlay.

Table 37. Icons and colors of the change overlay

Change overlay icon	Change overlay color indicator	Description
 Yellow pencil	Blue background	Entity changed between the time that the snapshot was taken and the time that a later snapshot was taken.
 Light gray circle	Dark gray background	Entity did not change between the time that the snapshot was taken and the time that a later snapshot was taken.
 Green cross	Green background	Entity was created or added between the time that the snapshot was taken and the time that a later snapshot was taken.
 Red minus sign	Red background	Entity was deleted or removed between the time that the snapshot was taken and the time that a later snapshot was taken.

Table 37. Icons and colors of the change overlay (continued)

Change overlay icon	Change overlay color indicator	Description
Not applicable	Light gray background	Entity did not exist at the time that the snapshot was taken or at the time that a later snapshot was taken.

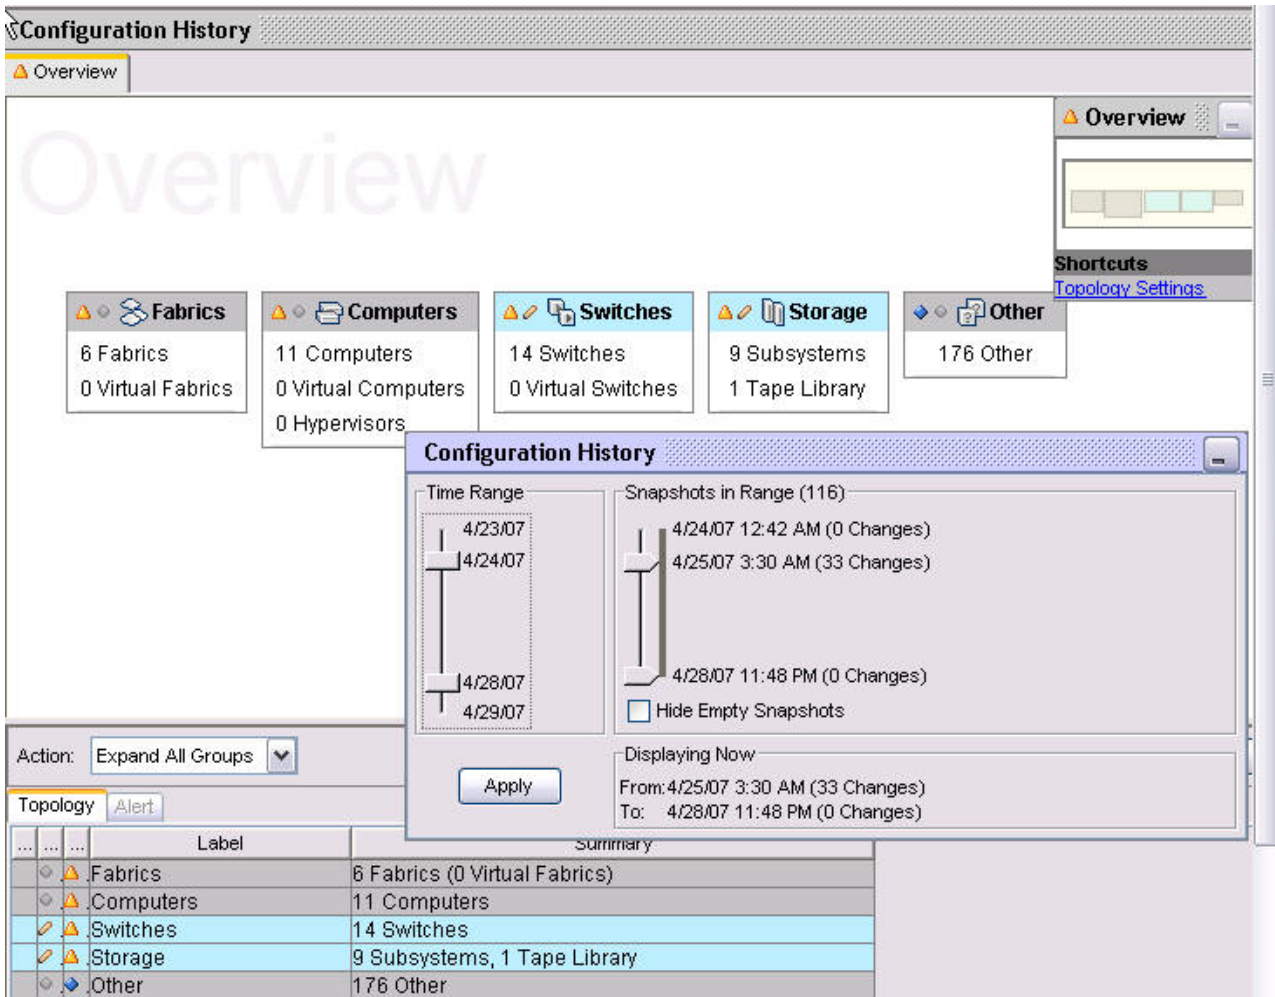

Figure 37. Icons and colors of the change overlay. In the graphical view, the pencil icon next to the switches and storage entities and the blue background color indicate that change occurred to these entities. The pencil icon and blue background also appears for these entities in the table view. In the snapshot selection panel, use the Time Range and Snapshots in Range sliders to determine when the change occurred.

To distinguish them from tabs in the topology viewer page, tabs in the Configuration History page (Overview, Computers, Fabrics, Storage, and Other) have a light gray background and are outlined in orange. The minimap in the Configuration History page uses the following colors to indicate the aggregated change status of groups:

- **Blue** - One or more entities in the group have changed. Note that the addition or removal of an entity is considered a change.
- **Gray** - All of the entities in the group are unchanged.

Entities in the graphical view may be *active* (they existed at one or both snapshots) or *inactive* (not yet created or deleted). *Active entities* act like they normally do in the topology viewer; when you select them all relevant information also appears in

the table view. You can adjust a grouping of active entities, but you may not perform actions that change the database, such as pinning. *Inactive entities* do not exist in the selected snapshots, but exist in the other snapshots. They are shown in a light gray background and do not have a change icon associated with them. Inactive entities display to keep the topology layout stable and to make it easier to follow what has changed (instead of having the entities flicker in and out of existence when you change the snapshot selection). Inactive entities are not listed in the table view.

An entity that is moved from one group to another group appears only once in the new group in the graphical view. For example, if the health status of a computer has changed from Normal to Warning, the Configuration History page displays the computer as changed in the Warning health group (and no longer displays the computer in the Normal health group).

**Note:** In the Configuration History view, the performance and alert overlays are disabled and the minimap's shortcut to the Data Path Explorer is not available.

### Viewing configuration changes in the table view

This section describes how to determine the changes that have occurred to a configuration over time by examining the icons and colors of the change overlay in the table view of the Configuration History page.

In the table view, a changed cell or tab is color coded. The change overlay uses the same colors and icons for the table view as for the graphical view (see Table 37 on page 407). The changed cell or tab displays both the old and new values as **Old Value > New Value**. To display a summary of change for the entire row, hover over the changed row. The summary displays the title of the column. It also displays the old and new value for each cell or tab that changed. For example, if a group contains one new entity but everything else in the group is unchanged, the group as a whole displays as “changed.” If you click the group, the one new entity displays as “created” and all other entities display as “unchanged.”

The Change column in the table view also indicates changed entities.

An object that is moved from one group to another group appears only once in the new group in the graphical view. For example, if the health status of a computer has changed from Normal to Warning, the Configuration History page displays the computer as changed in the Warning health group (and no longer displays the computer in the Normal health group).

## Using configuration analysis

This topic describes how system administrators can determine whether an existing SAN configuration complies with predefined best practices (policies).

**Note:** The configuration analysis feature is available only with the IBM Tivoli Storage Productivity Center Advanced Edition.

The configuration analysis feature allows a system administrator to select up to 16 policies and to specify the name of a target SAN (or zone set) for the analysis. The analysis tool reads the specified SAN data and the policy information for the specified policies from the IBM Tivoli Storage Productivity Center database. It outputs the policy violations as Tivoli Storage Productivity Center alerts. To view an alert, you can use one of three methods:

- Click the alert in the Configuration Analysis alert log

- Click the alert overlay icon () next to the affected entity
- Click the Alert tab in the table view of the topology viewer

System administrators can use configuration analysis to learn of any best-practices violations their actions might have caused. For example, in provisioning a new storage subsystem, an administrator might inadvertently violate a zoning-related policy. If the zoning-related configuration changes persist in the database, configuration analysis can detect this policy violation.

To perform configuration analysis, complete the following steps:

1. Ensure that you have previously run discovery and probe jobs for the computers, fabrics, switches, storage, and other objects of interest.
2. Ensure that the Tivoli Storage Productivity Center Data Server and Device server are running. To do so, in the navigation tree pane, expand the following:
  - **Administrative Services > Services > Data Server > Server**
  - **Administrative Services > Services > Device Server > Device server**
3. Ensure that the following Tivoli Storage Productivity Center agents are installed and configured.

**Tip:** The agent information that is required to evaluate a policy for violations must be collected and stored in the Tivoli Storage Productivity Center database.

- You can have a combination of in-band or Storage Resource agent, out-of-band agent, and CIMOM fabric agents to collect all fabric topology information. This information includes switches, interconnections, and zoning, and is required to evaluate all configuration analysis policies.
  - You can have CIMOM agents for storage subsystems, which collect the storage subsystem information. This information includes subsystem details, storage volumes, storage ports, and storage volumes to hosts mappings, and is required to evaluate configuration analysis policies 2, 3, 5, 7 and 11. CIMOMs are not required to communicate with storage systems that use native interfaces. Tivoli Storage Productivity Center uses native interfaces to connect to the following storage systems:
    - DS8000
    - SAN Volume Controller
    - Storwize V7000
    - IBM Storwize V7000 Unified
    - The XIV system
    - IBM SONAS
  - Data agents or Storage Resource agents to collect the host information (operating system type and version). This information is needed for the evaluation of configuration analysis policies 3 and 9.
  - In-band Fabric agents or Storage Resource agents to collect the attribute information from the host information (HBA and host port details). This information is needed for the evaluation of configuration analysis policies 2, 3, 4, 8 and 9.
  - CIMOM agents for Tape to collect the tape information. This information is needed for the evaluation of configuration analysis policy 2.
4. In the navigation tree pane, expand **IBM Tivoli Storage Productivity Center > Analytics**.

5. Right-click **Configuration Analysis**. A selection list displays.
6. Click **Create Analyzer**. The Create Analyzer window opens (see Figure 38).

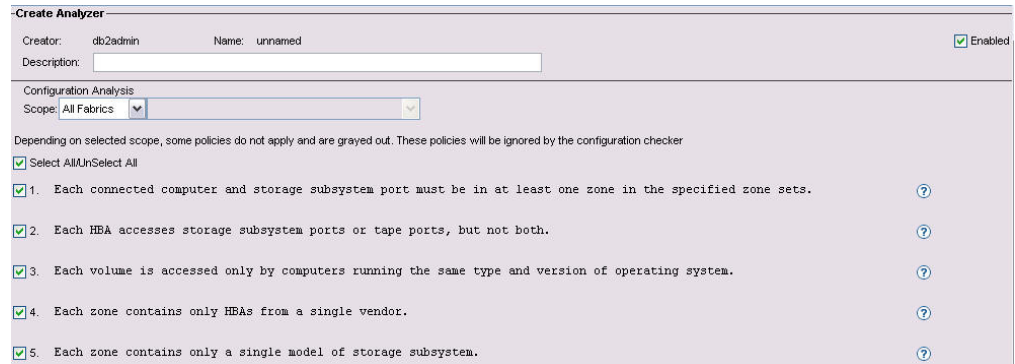

Figure 38. The Create Analyzer window. The figure shows a partial view of the window. Use the Create Analyzer window to select the scope and the policies of the configuration analysis.

7. To define the analysis, do the following steps:
  - a. Select the check box for **Enabled**.
  - b. In the **Description** field, type a brief description of the analysis job.
  - c. To specify the scope of the SAN data to be checked, make a selection from the **Configuration Analysis Scope** list. Choices include:
    - All Fabrics
    - One fabric
    - One Zoneset
 If you select One fabric or One Zoneset, an adjacent list displays for you to click a specific fabric or zone set.
  - d. Check the SAN data against up to 16 policies by performing one of the following:
    - Choose all of the policies by selecting the **Select All/UnSelect All** check box.
    - Choose one or more individual policies by selecting the check box for each policy.

**Note:** For Policies 12 and 13, type values up to a maximum of 9999.

The policies are described in the following list. You can also access each explanation by clicking  for that policy.

**Each connected computer and storage subsystem port must be in at least one zone in the specified zone sets.**

Determines whether an administrator forgot to zone a connected port. Putting connected ports into zones is useful for security and performance reasons. Ports are usually grouped into zones based on applications, server operating systems, or HBA vendors. The Fabric scope is not supported by this policy.

**Each HBA accesses storage subsystem ports or tape ports, but not both.**

Determines whether an HBA accesses both storage subsystem and tape ports. Because HBA buffer management is configured differently for storage subsystems and tape, it is not desirable to use the same

HBA for both disk and tape traffic. The Fabric and Zone Set scopes are not supported by this policy because an HBA can be connected to multiple fabrics.

**Each volume is accessed only by computers running the same type and version of operating system.**

Determines whether computers that run different operating systems access the same storage volumes. Use of the same volumes by computers that run different operating systems may corrupt the data that is stored on the volumes. This applies, regardless of whether the computers are in the same zone.

**Each zone contains only HBAs from a single vendor.**

Determines whether HBAs from different vendor types are in their own zone. Receiving a registered state change notification (RSCN) may cause an HBA to lose a zoned device, preventing the HBA from seeing or communicating with other devices in the zone. To avoid losing a zoned device, keep HBAs from different vendor types in their own zone.

**Each zone contains only a single model of storage subsystem.**

Determines whether different storage subsystems are in the same zone. While no technical problem is associated with storage subsystems from different vendors and of different models being in the same zone, an administrator may find them more difficult to organize. When similar storage systems are in the same zone, an administrator can easily group them for different applications.

**Each zone is part of a zone set.**

Determines the presence of orphan zones. Orphan zones are not associated with any zone set. They are not useful because their definitions are not used and they take up switch resources.

**Each host must be zoned so that it can access all of its assigned volumes.**

Determines whether the zones that were configured by the storage administrator allow each computer to access all of the storage volumes that are assigned to it. The administrator specifies the storage subsystem ports through which the computer port accesses volumes, but may forget to configure zones that enable the ports to communicate during volume assignment. This policy also determines whether zoning makes assigned volumes inaccessible to the computer ports. The Fabric scope is not supported by this policy.

**Each computer has only HBAs of the same model and firmware version.**

Checks whether there is only one type of HBA in each computer. Using only one type of HBA minimizes configuration problems. The policy also checks whether firmware upgrades have been done properly for all HBAs in a computer. The Zone Set scope is not supported by this policy.

**For each host type and operating system, every HBA of a given model must have the same firmware version.**

Determines whether all firmware upgrades have been done for the HBAs in the operating system. The Zone Set scope is not supported by this policy.

**Every SAN switch of a given model must have the same firmware version.**

Determines whether firmware upgrades have been done for all switches of the same type. For example, if you have four identical models of SAN switches from the same vendor and you perform a

firmware upgrade on one, it is best to perform the upgrade on all of the others. The Zone set scope is not supported by this policy.

**Every storage subsystem of a given model must have the same firmware version.**

Determines whether firmware upgrades have been done for all storage subsystems of the same type. For example, if you have four identical storage subsystems from the same vendor and you perform a firmware upgrade on one, it is best to perform the upgrade on all of the others. The Zone Set scope is not supported by this policy.

**Each fabric may have a maximum of x zones.**

Checks whether the number of zone definitions in the fabric is larger than the number that you entered. In large fabrics, too large a number of zone definitions can become a problem. Fabric zone definitions are controlled by one of the switches in that fabric, and limiting their number ensures that the switch's zoning tables do not run out of space. The Zone Set scope is not supported by this policy. You can enter up to a maximum of 9999 zones.

**Each zone may have a maximum of x zone members.**

Checks whether the number of zone members in a zone is larger than the number that you entered. In large fabrics, too large a number of zone members can become a problem. Fabric zone members are controlled by one of the switches in that fabric, and limiting their number ensures that the switch's zoning tables do not run out of space. You can enter up to a maximum of 9999 zones.

**Replication Plan is intact with respect to the SRG(s) and the replication session associated during planning through SAN Planner.**

Determines whether SRGs that have associated resiliency profiles are intact with respect to their members and their replication relationships.

**All the source volumes involved in Metro Mirror Failover/Failback sessions are conforming to 1:4 primary to secondary LSS for a failback direction scenario.**

Metro Mirror (Failover/Failback) can be directional, and up to 4 LSS secondaries can be connected to a primary LSS.

**Inter/intra site connectivity is valid for replication plan deployments.**

Checks whether connectivity either direct or through fiber channel fabric exists for resiliency session deployments.

8. To specify how often to run the analysis, scroll to **Scheduling**.
9. In the **How often to run** area, schedule how often you want the job to run. Choose from the following actions:

**Run Now**

Run the job immediately.

**Run Once at**

Run the job once at a specified date and time. Use the list boxes to specify the month, day, and year. Type the hour and minutes over the existing defaults. Click AM or PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start

time. This ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

### Run Repeatedly

Run the job repeatedly according to a schedule that you specify:

- Indicate when to begin the job. Use the list boxes to specify the month, day, and year. Type the hour and minutes over the existing defaults. Click AM or PM.
  - Indicate how often to run the job. Select one of the following:
    - In the **Repeat Every** field, click the desired number of minutes, hours, days, weeks, or months.
    - In the **Run on these days** field, click to display a check mark next to the desired days.
10. In the **How to handle time zones** area, indicate the time zone to be used when scheduling and running the policy. Click one of the following:

#### Use the time zone that the server runs in

Select this option to use the time zone of the location where the Data server resides.

#### Use this time zone

Select this option to indicate a specific time zone for when to run the job. From the list box, select the time zone.

11. From the menu bar, select **File > Save**. The Save As pop-up opens.
12. Type a name for the analyzer and click **OK**. The Notice pop-up displays **Analyzer submitted**.
13. Click **OK** to begin the job. To display the newly named analyzer job in the Navigation tree pane, expand **IBM Tivoli Storage Productivity Center > Analytics > Configuration Analysis**. The format of the name is *creator.analyzer*, where *creator* is the name that is displayed on the Create Analyzer window and *analyzer* is name that you assigned in step 12 (for example *db2admin.analyzer2*).
14. Expand the job to view information about the run. The information includes the number of times that the job was run, and the date and time of the run. The color of the type indicates the status:
- Blue indicates that the run is in progress.
  - Green indicates that the run is finished.
- To refresh the status, right-click the job and click **Update Job Status**.
15. Click the run to view information about it. On a page titled with the name of the job and run number, the following information is displayed:

**Run** Number of the run

**Status** The status of the run (Success or Failed), not whether policy violations occurred

#### Start Time

The time at which the run started

#### Finish Time

The time at which the run ended

**# Jobs** The number of jobs

#### # failed

The number of jobs that failed

**Computer**

The IP address of the computer on which the job was run

**Status** The status of the run

**Start Time**

The time at which the run started

**Finish Time**

The time at which the run ended

**Log File Name**

The complete path name of the log file

16. To view whether a policy violation occurred, click . The Job log file page displays the following information:
- Scope of the run (all fabrics, one fabric, or one zone set)
  - Policies that were checked
  - Total violations
  - Breakdown of violations per policy
  - Whether the run completed successfully or the errors it encountered

**Note:** To avoid overloading the Topology Viewer, the analysis job stores and displays the first 50 policy violations only. You must resolve these violations and run the job again to view any remaining violations, or you can change this policy violation limit by using the `setdscfg` command. The attribute to set is `MaxPolicyViolationsStored`.

17. To view one or more alerts generated by policy violations, in the Navigation tree expand **IBM Tivoli Storage Productivity Center > Alerting > Alert Log > Configuration Analysis**. The Alert History - All Policy Violations page displays a log of job runs that generated alerts for policy violations. A policy violation alert is generated for each policy that was violated during a run. A policy might be violated several times, but only one alert is generated. The text in the alert indicates the number of times the policy was violated. The Alert History - All Policy Violations page includes the following information:

Column	Description
	When clicked, this provides details about the alert.
	When clicked, this makes the Clear and Delete buttons active. When double-clicked, provides details about the alert.
Computer	Not applicable (N/A)
Configuration Analysis	The name of the configuration analysis job
Alert Type	The type of alert generated during the run
First Triggered	The date and time of when the first alert was generated
Last Triggered	The date and time of when the last alert was generated
# Times	The number of times that an alert was generated for a run
Alert Creator	The userid of the person who created the run
Alert Name	The official name of the alert

Column	Description
Script	Not applicable (N/A)

For more information about the alert log, see “Viewing alert logs” on page 403.

18. To view details about each alert, in the Alert History - All Policy Violations page click the run that you want, then click  or double-click . The Detail for Alert page displays the following information:

Field	Description
Configuration Analysis	The name and scope of the analyzer job.
Run	The number of run in which the alert occurred.
Alert Type	The type of alert (Policy Violation).
State	The status of the alert. An <i>active</i> (unresolved) state displays a red exclamation mark  ; an <i>acknowledged</i> (resolved) state displays a green check mark 
Timestamp	The date and time that the alert was created. Expressed as the month, day, year, hour, minute, second, and AM or PM.
Alert Creator	The userid of the person who created the analyzer job.
Alert Name	The name of the alert.
Alert Text	A description of the policy that was violated and the number of times that it was violated during that analyzer run.

You can also use the topology viewer to view alerts about policy violations. To launch the viewer, click **Topology**. For more information, see “Viewing alerts” on page 399.

### Resolving policy violations

When you click the Alert tab in the topology viewer and expand the entries in the table view, information displays about each configuration analysis policy violation. To verify and fix the policy violation, use the information in the following table.

Configuration Analysis Policy	Enclosing Entity	Affected Entity	How to Verify and Fix the Policy Violation
Policy 1. Each connected computer and storage subsystem port must be in at least one zone in the specified zone sets.	Computer, Subsystem, or Other	Port	In the zone tab within the L2:Fabric view, verify that the port is not a member of the zone set. Fix the violation by adding the port to the appropriate zone within the zone set.
	Fabric	Zone set	

Configuration Analysis Policy	Enclosing Entity	Affected Entity	How to Verify and Fix the Policy Violation
Policy 2. Each HBA accesses storage subsystem ports or tape ports, but not both.	Computer	HBA	In the zone tab within the L2:Computer view, verify that HBA ports are accessing both the disk and tape subsystems. Fix the violation by configuring the computer access to disk and tape in two separate zone sets, and ensuring that only one of these is active at a given time.
Policy 3. Each volume is accessed only by computers running the same type and version of operating system.	Subsystem	Volume	In L1:Computers view, one can see that the computers accessing the volume do not have the same OS type and version. This violation can be fixed by mapping or assigning the volume only to the computers with same OS type and version.
	Computer	Port	
	Computer	Port	
Policy 4. Each zone contains only HBAs from a single vendor.	Fabric	Zone	In the zone tab within the L2:Fabric view, find the computers in the zone. Open the respective L2:Computer views and select the HBA tab in the table view to view the vendor of the HBAs on those computers. Fix the violation by editing the zone definition and ensuring that all the HBAs in the zone are from the same vendor.
Policy 5. Each zone contains only a single model of storage subsystem.	Fabric	Zone	In the L2:Fabric view, verify that the models of the subsystems in the zone are different. Fix the violation by editing the zone definition and ensuring that all the subsystems in the zone have the same model.
	Subsystem	Port	
Policy 6. Each zone is part of a zone set.	Fabric	Zone	In the zone tab within the L2:Fabric view, verify that the zone does not belong to any of the zone sets and is listed under Orphan Zones. Fix the violation by adding the zone to a zone set or by deleting the zone.
Policy 7. Each host must be zoned so that it can access all of its assigned volumes.	Computer or Other	Port	None of the zones in the L2:Computer or L2:Subsystem views has both the computer and subsystem port. Fix the violation by adding or editing the zone definition, and by ensuring that both the computer and subsystem port are in the same zone.
	Subsystem	Port	
	Subsystem	Volume	
Policy 8. Each computer has only HBAs of the same model and firmware version.	Computer	Computer	Open the L2:Computer view and select the HBA tab in the table view to verify that the model and firmware version for the HBAs on that computer are different. Fix the violation by installing the HBAs of the same model or upgrading the firmware version of the HBA on that computer.

Configuration Analysis Policy	Enclosing Entity	Affected Entity	How to Verify and Fix the Policy Violation
Policy 9. For each host type and operating system, every HBA of a given model must have the same firmware version.	Computer	HBA	Open the respective L2:Computer views and select the HBA tab in the table view to verify that the firmware and driver version for the HBAs on those computers are different. Fix the violation by upgrading the firmware and driver versions of the HBAs on those computers.
	Computer	HBA	
Policy 10. Every SAN switch of a given model must have the same firmware version.	Switch	Switch	Open the L1:Switches view and select the switch tab to verify that the firmware versions on those switches are different. Fix the violation by upgrading the firmware versions on those switches.
	Switch	Switch	
Policy 11. Every storage subsystem of a given model must have the same firmware version.	Subsystem	Subsystem	Open the L1:Subsystems view and select the subsystem tab to verify that the firmware versions on those subsystems are different. Fix the violation by upgrading the firmware versions on those subsystems.
	Subsystem	Subsystem	
Policy 12. Each fabric may have a maximum of $x$ zones.	Fabric	Fabric	In the zone tab within the L2:Fabric view, verify that the number of zones present in the fabric is greater than $x$ (the value entered by the user in this policy). Fix the violation by reducing the number of zones to a value less than $x$ .
Policy 13. Each zone may have a maximum of $x$ zone members.	Fabric	Zone	Search for the zone in the zone tab in the L2:Fabric view. Verify that the number of zone members present in that zone is greater than $x$ (the value entered by the user in this policy). Fix the violation by reducing the number of zone members to a value less than $x$ .
Policy 14. Replication Plan is intact with respect to the SRG(s) and the replication session associated during planning through SAN Planner.	Storage Resource Group (SRG)	Replication session	In the alert tab in the L0:Storage Resource Groups view, verify that the numbers of source and target volumes in the SRG are not equal or that the volumes are not in a replication relationship. Fix the violation by running the SAN Planner again and provisioning additional volumes or provisioning resiliency for the existing volumes.
	SRG	Volume	

Configuration Analysis Policy	Enclosing Entity	Affected Entity	How to Verify and Fix the Policy Violation
Policy 15. All the source volumes involved in Metro Mirror Failover/Failback sessions are conforming to 1:4 primary to secondary LSS for a failback direction scenario.	SRG	Logical Subsystem (LSS)	IBM Tivoli Storage Productivity Center does not have an LSS view, but in the L2:Storage view, you can verify the details of the LSSs responsible for the violation. This violation only occurs if the copy session is created incorrectly in IBM Tivoli Storage Productivity Center for Replication. Fix the violation by changing the session details in Tivoli Storage Productivity Center for Replication to conform with the policy.
Policy 16. Inter/intra site connectivity is valid for replication plan deployments.	SRG	Replication session	In the alert tab in the L0:Storage Resource Groups view, verify that there is no connectivity between source and target volumes. Fix the violation by manually providing a common fibre channel fabric or direct connection.

---

## Planning and modifying storage configurations

This section describes SAN Planner and how to use it to plan and modify changes to the system configuration.

### Configuring a provisioning plan by using SAN Planner

Use SAN Planner to select configuration information for a provisioning plan and to modify a configuration.

You must run a fabric, disk, and data discovery, and system and fabric configuration probes on the storage controllers that you want to use for planning purposes. You must also run a performance monitor on the storage controllers. You can use the following storage products with SAN Planner:

- TotalStorage Enterprise Storage Server
- System Storage DS6000
- System Storage DS8000
- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified
- The XIV system

For other storage products, SAN Planner works with the **Space Only** workload profile.

To obtain host information that is used in volume assignments, you must use a Storage Resource agent. To obtain fabric information, you can do so from another Storage Resource agent in the same fabric, from an out-of-band agent, or through the CIM object manager (CIMOM) that manages the switch. If you do not run a Storage Resource agent, and the storage controller does not have information about the host operating system, an asterisk is displayed next to the host port. The

operating system imposes limits on the number of volumes that you can access. Ensure that you do not exceed these limits.

1. Expand the **IBM Tivoli Storage Productivity Center > Analytics or Disk Manager** node in the navigation tree.
2. Right-click **SAN Planner** and select **Create Plan**. The SAN Planner wizard is displayed. The wizard provides the interface for user input to put together a plan for volume, path, zone, and replication planning. It also provides configuration recommendations based on the current storage configurations and the user inputs.

**Note:** Clicking a saved plan (located under the **SAN Planner** node in the navigation tree) opens the wizard with the Edit Plan *TPCuserid.plan\_name* pane instead of the Create Plan pane, where *TPCuserid* is the Tivoli Storage Productivity Center user ID and *plan\_name* is the name the plan was given when it was previously saved.

3. To move to the next page in the wizard, click **Next**.

### **SAN Planner wizard: Selecting the planning task**

Select the type of storage provisioning plan that you want to create. The type of plan that you select determines the content of the remaining pages in the SAN Planner Wizard.

1. Select the type of provisioning plan from the following options:

**Provision storage only, including optional multipath and zone considerations**

Click to create a plan for provisioning new storage. The plan does not include provisioning for storage replication.

**Provision storage with replication, including optional multipath and zone considerations on the source resources**

Click to create a plan for provisioning new storage and storage replication.

**Provision replication to existing storage**

Click to create a plan for provisioning replication for existing storage (provision target volumes for existing source volumes).

**Configure multipathing or zoning only**

Click to create a plan for provisioning multipathing and zoning for existing storage.

2. To move to the next page in the wizard, click **Next**.

### **SAN Planner wizard: Selecting the provision plan details**

Select the type of storage that you want to provision: volumes or virtual disks. You can also select whether you want to include multipath and zoning provisioning in the SAN plan.

1. To specify the type of storage that you want to provision, click **Volumes** or **Virtual Disks**. If you are provisioning storage for IBM System Storage SAN Volume Controller, you must select **Virtual Disks**.
2. Click **Include multipath planning in the plan** to enable multipath provisioning later in the wizard. This option is unavailable if you selected **Provision replication to existing storage** on the previous page of the wizard.
3. Click **Include fabric rezoning for host planning in the plan** to enable zoning provisioning later in the wizard. This option is unavailable if you selected **Provision replication to existing storage** on the previous page of the wizard.
4. To move to the next page in the wizard, click **Next**.

## SAN Planner wizard: Specifying the plan content

Select the input resources that you want to use in your Storage Area Network (SAN) plan. Input resources can be storage systems, volumes, hosts, or a storage resource group (SRG).

If you plan to use an SRG, you can select the SRG when you add the input resources at the top of this page, or you can select a candidate SRG from the **Use a candidate SRG** at the bottom of this page.

A candidate SRG is an SRG grouping storage resources together. By providing an SRG as a candidate SRG to SAN Planner, you are instructing SAN Planner to consider storage resources from this SRG when doing the capacity planning. Using a candidate SRG provides you with a means of separating your application data from your pool of unused resources.

You can create SRGs using the Storage Resource Group Management panel.

1. To specify the type of storage that you want to provision, click **Add**. The Topology Viewer in the Planner Selection window is opened. The Topology Viewer provides a topology view of the current system configuration.
2. Double-click the box title for a storage item in the topology viewer to expand the storage view into the L0 level view of the available systems. Before selecting systems, you might want to view the relationship between the systems and switch connectivity. To view relationships, double-click a specific system at the L0 Storage tab view. The L1 Subsystems view is opened, which displays the Subsystems and the Connectivity (Switches) boxes. Double-clicking a specific system displays the L2 view of that system and everything the system is connected to.
3. In the L0, L1 or L2 view, first expand the system using the + or – buttons in the upper right corner of the icon for the system. Then you must click the system itself to activate the >> button to include the system in the plan. Click each SAN Planner supported element in the same manner, that you want to include in the SAN plan. To select multiple elements, press and hold the **Ctrl** key and click each element icon.
4. Click  to move the selected elements into the **Selected Elements** pane.

### Tips:

- The **Selected Elements** pane lists the storage resource groups, fabrics, computers, storage systems, pools, and volumes that are selected. When using the **Selected Elements** pane, the subsystem selections are not required to be in the same fabric. The **Fabrics** section lists the fabrics (by WWN) and the corresponding selected systems and selected hosts within each fabric. If a system has been configured in different fabrics, it is listed multiple times. The **Subsystems** section contains the selected storage systems. The number of fabrics to which the system belongs is shown next to each system. Selected pools are listed under their storage systems. Selected volumes are listed under their pools. The **Computers** section lists the selected hosts and the number of fabrics the host belongs to. The hosts are used in path planning and zone planning if **Include multipath planning in the plan** and **Include fabric rezoning for host planning in the plan** are selected in the Select Planning Tasks page.
- To remove an element from the **Selected Elements** pane, select the element and click **Remove**.

5. Click **OK** to save your selections and return to the Specify Plan Content page where the storage elements that you selected are displayed. If an SRG is selected as an input resource, the name of the associated provisioning profile, if any, is displayed.
6. To use a candidate SRG as a pool of storage resources from which to provision new storage, click **Use a candidate SRG**. Select the SRG that you want to use from the **Candidate SRG** list. If you select a candidate SRG, existing unassigned volumes belonging to the candidate SRG are used or new volumes are created from a candidate SRG. The name of the candidate SRG is displayed. Unassigned volumes in the SRGs selected as input resources in the **Selected Elements** pane are not used and new volumes are not created from the input SRG.
7. If you have selected a candidate SRG, click **View SRG** to view the SRG details.
8. To move to the next page in the wizard, click **Next**.

**Related tasks:**

“Working with storage resource groups” on page 489

Use storage resource groups to organize logically related storage entities into named groups. For example, a storage resource group that represents a business critical email application might include all the hosts that participate in the email application cluster, the storage subsystems that provide storage to the application, and the switches and fabrics through which the application’s data is configured to travel.

**SAN Planner wizard: Specifying selected volume assignments for input resources**

Select how the SAN Planner uses any individual unassigned volumes contained in the plan input resources.

If one or more of the volumes in your plan input resources is assigned to hosts, but not all of them are, then you can decide how to assign them.

1. Select the type of volume assignment for your input resources from the following options:

**Use these volumes as candidates for capacity planning**

Click to use the unassigned volumes as candidates for provisioning storage on the Specify Capacity Plan page.

**Assign these volumes to the hosts and skip capacity planning**

Click to omit the Specify Capacity Plan page and continue on with the next steps in the planner. You can view the volume assignment on the Review User Selections page.

**Ignore these volumes in the capacity planning**

Click to remove the volumes from consideration in the plan. If there are no storage pools or storage systems in the input resources, then no capacity planning can be done.

2. To move to the next page in the wizard, click **Next**.

**SAN Planner wizard: Specifying selected volume assignments for an SRG**

Select how the SAN Planner uses any unassigned volumes contained in a candidate storage resource group (SRG).

If one or more of the volumes in your plan candidate SRG is assigned to hosts, but not all of them are, then you can decide how to assign them.

1. Select the type of volume assignment for your candidate SRG from the following options:

**Assign these volumes to the hosts**

Click to assign the volumes to all the hosts and continue to the Specify Capacity Plan page. You can view the volume assignment on the Review User Selections page.

**Ignore these volumes in the capacity planning**

Click to remove the volumes from consideration in the plan and continue to the Specify Capacity Plan page.

2. To move to the next page in the wizard, click **Next**.

### **SAN Planner wizard: Specifying capacity plan**

Create and configure new storage volumes or virtual disks specified in your SAN plan.

- If you want to select any predefined workload profile other than **Space only**, you must have run a performance monitor on the storage controller.
- If you want to select a user-defined workload profile, you must first create a workload profile using the Workload Profiles panel.

Some of the field names that are displayed on the Specify Capacity Plan page differ depending on the type of storage (volumes or virtual disks) that you selected on the Select Provision Plan Details page.

1. In the **Total Capacity** field, enter the total capacity of the volumes or virtual disks that are to be used for provisioning storage in GB. The Topology Viewer in the Planner Selection window is opened. The Topology Viewer provides a topology view of the current system configuration.
2. In the **Number of Volumes** or **Number of Virtual Disks** field, enter the number of volumes or virtual disks that you want to create.
3. In the **RAID level** field, select an Array of Independent Disks (RAID) level for the volume or virtual disk.
4. In the **Volume Name Prefix** or **Virtual Disk Name Prefix** field, enter the prefix to be used in the volume or virtual disk name. If the prefix is longer than 14 characters, a warning prompt is displayed. On the plan recommendation page, if the SAN Planner determines that the prefix length exceeds the naming limitation of the storage system, you are prompted to change the prefix. The following values represent the maximum volume name length for IBM storage systems. The maximum volume name length includes the prefix that you enter + the volume name.

*Table 38. Maximum volume name lengths for storage systems*

Storage system	Maximum volume name length (in characters)*
ESS	8
DS4000, DS5000	30
DS6000, DS8000	16
XIV	63
SAN Volume Controller 5.1 and earlier	15
SAN Volume Controller 6.1	60

Table 38. Maximum volume name lengths for storage systems (continued)

Storage system	Maximum volume name length (in characters)*
<p><b>Note:</b> Tivoli Storage Productivity Center adds one or more characters to the volume name depending upon how many volumes you are creating. For example, if 1-9 volumes are created, one character is added; if 10-99 volumes are created, two characters are added, and so on.</p>	

5. In the **Workload Profile** field, select a workload profile for the volume or virtual disk. All predefined profiles other than Space only are supported by IBM System Storage DS8000, IBM System Storage DS6000, SAN Volume Controller, and IBM TotalStorage Enterprise Storage Server only.
6. For **The recommended provisioning will be based on the performance data collected between** section, enter a **Start Date** and **End Date** for the collection of performance data that you want to use in planning.
7. Click **Use unassigned volumes not involved in copy relationship** if you want to use existing unassigned volumes. Unassigned volumes that are in a copy relationship are excluded. Exception: The following unassigned volumes are excluded regardless of their copy relationship:
  - Unassigned volumes on IBM storage systems that have copy relationships that were not created in IBM Tivoli Storage Productivity Center or IBM Tivoli Storage Productivity Center for Replication.
8. To move to the next page in the wizard, click **Next**.

### **SAN Planner wizard: Specifying advanced capacity plan**

Select additional options for creating and configuring new storage volumes or virtual disks specified in your SAN plan.

1. To create thin volumes or virtual disks for IBM System Storage SAN Volume Controller, IBM System Storage DS8000, or IBM XIV Storage System, select one of the predefined profiles from the **Thin Provisioning Profile** field. You can also create a profile in the Thin Provisioning Profiles panel. The predefined options are as follows:

#### **Ignore thin provisioning**

A thin provisioning profile is not used.

#### **Standard**

This profile sets the over allocation limit for a pool at 200%. This percentage sets the virtual capacity at up to two times the real capacity.

#### **Conservative**

This profile sets the over allocation limit for a pool at 150%. This percentage sets the virtual capacity at up to one and a half times the real capacity.

#### **Aggressive**

This profile sets the over allocation limit for a pool at 300%. This percentage sets the virtual capacity at up to three times the real capacity.

2. To specify whether you want to use or exclude solid-state disks from provisioning, click one of the following options from the **Solid State Disks** field:

#### **Use Solid State Disks**

Click to use only solid-state disks for provisioning.

#### **Do not use Solid State Disks**

Click to exclude solid-state disks from provisioning,

3. To create new volumes on extent pools that belong to an encryption group, select a value from the **Encryption Group** list. If there are no encryption groups available, **<none selected>** is displayed in this box.
4. Click **Show Recommended Pools** to show the pools to be used for provisioning. The recommended pools are displayed under the corresponding storage systems in the **The following resources are selected for planning** box.
5. Optional: To remove pools from the provisioning process, select a pool or pools from the **The following resources are selected for planning** box and click **Remove Pool**.
6. To move to the next page in the wizard, click **Next**.

**Related tasks:**

“Thin provisioning profiles” on page 549

Learn how to create, modify, and delete thin provisioning profiles.

### **SAN Planner wizard: Specifying path plan**

Set multipath options for provisioning in your SAN plan.

The supported multipath driver on a host is the IBM Subsystem Device Driver (SDD). For Linux-based hosts starting with Red Hat Enterprise Linux Version 5 and SUSE Linux Enterprise Server Version 10, only the DM\_Multipath driver is available. The SDD driver is no longer supported on HP, starting with HP-UX 11i v3 with Itanium®. HP-UX 11i v3 provides a native multipathing feature which is supported by SAN Planner.

1. To specify how the driver uses the paths between the host and the storage system, select one of the following options from the **Multipath Option** field:

**Load Balancing**

Sends input/output on all paths.

**Round Robin**

Sends input/output on one path until a time interval that is set in an SDD setting at the host expires, then switches to another path.

**Fail-Over**

Sends input/output on one path until a failure occurs, then switches to another path.

On HP-UX 11i v3 with Itanium®, the multipath options used by the SAN Planner are as follows:

**Load Balancing**

If you select this option for HP-UX 11i v3, the option implemented is Least Command Load. This option selects the path with the least number of pending I/O requests for the next I/O operation.

**Round Robin**

On HP-UX 11i v3, this policy distributes the I/O load equally across all active paths irrespective of the current load on each path.

**Fail-Over**

If you select this option for HP-UX 11i v3, the policy implemented is Preferred Path. For this policy, you specify a path to an optimized controller. This path is preferred for I/O transfers. The preferred path must be set manually.

2. Select the **Specify number of paths** check box and enter the number of paths that you want to configure between the host and storage system. If you do not specify the number of paths in this field, the default is two paths (**<auto>**)

3. To use the paths from host to storage systems through a minimum of two fabrics, select **Use fully redundant paths (requires at least 2 fabrics)**.
4. To move to the next page in the wizard, click **Next**.

### **SAN Planner wizard: Specifying zone plan**

Use SAN Planner to specify zoning between ports on the hosts and systems in a fabric.

The supported multipath driver on a host is the IBM Subsystem Device Driver (SDD). For Linux-based hosts starting with Red Hat Enterprise Linux Version 5 and SUSE Linux Enterprise Server Version 10, only the DM\_Multipath driver is available. The SDD driver is no longer supported on HP, starting with HP-UX 11i v3 with Itanium®. HP-UX 11i v3 provides a native multipathing feature which is supported by SAN Planner.

1. To specify how the zones are created, select one of the following options from the **Automatically Create Zone** field:

**<auto-zone>**

The plan generates using the maximum number of zones without grouping the data paths based on hosts, host ports, or host bus adapters (HBAs).

**...for each host**

Creates a zone for each host.

**...for each HBA**

Creates a zone for each host bus adapter.

**...for each port**

Creates a zone for each port.

2. Optional: Select the **Specify maximum number of zones** check box and enter the maximum number of zones that you want to create between the host and storage system.
3. Optional: Select the **Maximum zone members per zone** check box and enter the maximum number of zone members for each zone.
4. Optional: If you do not want two controllers with different types to be used in the same zone, select the **No two controllers with different types should be used in the same zone** check box.
5. Optional: If you want to apply updates to the active zone set, select the **Use active zone set** check box. This action applies changes to the inactive zone set that has the same name as the active zone set and then the zone set is activated. Before using this option, ensure that the zones and zone members in the active zone set matches the zones and zone members in the inactive zone set with the same name.
6. Optional: If you want to append a zone prefix to each zone name, select the **Append zone name prefix** check box and enter a prefix.
7. To move to the next page in the wizard, click **Next**.

### **SAN Planner wizard: Selecting replication sessions**

Create a replication session for the storage being provisioned, or, if one is available, use an existing replication session.

This task is available if you have selected either **Provision storage with replication, including optional multipath and zone considerations on the source resources** or **Provision replication to existing storage provisioning plans** on the Select Planning Task page.

1. To create a replication session for the storage being provisioned, click **Create a new replication session for the storage being protected**.
2. If an existing replication session is available, click **Use an existing replication session for the storage being protected** and select the session that you want. An existing session is listed here only if the input contains a storage resource group and that storage resource group has a replication session associated with it.
3. To move to the next page in the wizard, click **Next**.

### **SAN Planner wizard: Specifying replication session properties**

Provide a name for the replication session and select the type of session to create.

This task is available if you have selected either **Provision storage with replication, including optional multipath and zone considerations on the source resources** or **Provision replication to existing storage** provisioning plans on the Select Planning Task page.

1. In the **Session Name** field, enter a name for the replication session.
2. Select a value from the **Session Type** list that displays those replication session types applicable to the kind of planning you have chosen. For example, if you selected **Volumes** on the Select Provision Plan Details page, only the session types pertaining to volume planning are shown. To filter the **Session Type** list, select a value from the **Filter by Copy Technology** list. The value that you select here combined with the value in the **Location** list determines the replication sessions that are shown in the **Session Type** list. The options are:

#### **No filtering**

No filtering is performed.

#### **Point-in-time Copy**

The replication session FlashCopy is displayed in the **Session Type** list.

#### **Continuous Copy**

The replication sessions that are displayed in the **Session Type** list perform continuous replication and depend on the value in the **Location** list.

3. Select a location for the target volumes or virtual disks from the **Location** list. This list is disabled if you selected **No filtering** or **Point-in-time Copy** for filtering. The options are: **Same Region**, **Across Regions**, and **Same and Across Regions**
4. Select the **Use practice volume** check box to include a practice volume in the plan. If you want to practice what you would do in the event of a disaster, without interrupting current data replication, you can use a practice volume. Practice volumes are available in Metro Mirror, Global Mirror, and Metro Global Mirror replication sessions.
5. Click the replication session type that you want to create. The copy type that is associated with the session determines the actions that can be performed against all copy sets in the session, the number of volumes or virtual disks in each copy set, and the role that each volume or virtual disk plays. The options are:
  - FlashCopy
  - VDisk Mirroring
  - Metro Mirror Failover/Failback
  - Metro Mirror Failover/Failback with Practice
  - Metro Mirror Single Direction

- Global Mirror Either Direction with Two Site Practice
- Global Mirror Failover/Failback
- Global Mirror Failover/Failback with Practice
- Global Mirror Single Direction
- Metro Global Mirror with Practice
- Metro Global Mirror

When you select a session type, a session image is displayed. The image is a visual aid to help you create your session. It shows how many roles there are in the session, and how the roles are distributed between the sites. The arrows indicate the type of copy between roles:

- Straight arrows = synchronous Metro Mirror copies
- Zigzag arrows = asynchronous Global Copy relationships
- Lightning bolts = FlashCopy relationships

**Note:** For Global Mirror sessions on IBM(r) System Storage(tm) devices, SAN Planner might report a successful creation and start of the session, but the actual session start might take much longer. Verify the session using IBM Tivoli Storage Productivity Center for Replication.

6. From the **Copy Synchronization Rate**, select the rate that data is copied from the source virtual disk to the target virtual disk. This check box is enabled only if **VDisk Mirroring** is selected in the **Session Type** list.
7. To move to the next page in the wizard, click **Next**.

### **SAN Planner wizard: Specifying a secondary location**

Specify a secondary location for creating target volumes and virtual disks. You can use an existing storage resource group (SRG), create an SRG, or use a candidate SRG. You can also select a provisioning profile for the secondary SRG.

This task is available if you have selected either **Provision storage with replication, including optional multipath and zone considerations on the source resources** or **Provision replication to existing storage** provisioning plans on the Select Planning Task page. If you did not specify an SRG in the input for the source volumes in the Specifying the Plan Content page, the secondary SRG inputs are disabled here. The list of SRGs displayed contains SRGs that are not part of any existing replication sessions. If all SRGs are part of replication sessions, these input fields are disabled.

1. To specify a secondary location, select from the following options:

#### **Secondary Candidate SRG**

Click to select the candidate SRG that you want to use. Click **View SRG** to view the candidate SRG. The secondary candidate SRG is used as the secondary source for the volume creation.

#### **Create a new storage resource group**

Click to create an SRG. Enter the name for the SRG in the **Name** field. This secondary SRG is where the replication target volume will be placed after the replication plan is executed.

#### **Use existing storage resource group**

Click to use an existing SRG. Select the SRG and click **View SRG** to view. This secondary SRG is where the replication target volume will be placed after the replication plan is executed.

2. To select a provisioning profile for the secondary SRG, select from the following options:

#### **Use the source storage resource group profile**

Click to select the provisioning profile that is associated with the source SRG.

#### **Use existing provisioning profile**

Click to use the existing provisioning profile.

3. To move to the next page in the wizard, click **Next**.

### **SAN Planner wizard: Specifying a tertiary location**

Specify a tertiary location for creating target volumes and virtual disks. You can use an existing storage resource group (SRG), create an SRG, or use a candidate SRG. You can also select a provisioning profile for the tertiary SRG.

This task is available if you have selected either **Provision storage with replication, including optional multipath and zone considerations on the source resources** or **Provision replication to existing storage** provisioning plans on the Select Planning Task page, and Metro Global Mirror session as the replication session type. If you did not specify an SRG in the input for the source volumes in the Specifying the Plan Content page, the tertiary SRG inputs are disabled here. The list of SRGs displayed contains SRGs that are not part of any existing replication sessions. If all SRGs are part of replication sessions, these input fields are disabled.

1. To specify a tertiary location, select from the following options:

#### **Tertiary Candidate SRG**

Click to select the candidate SRG that you want to use. Click **View SRG** to view the candidate SRG. The tertiary candidate SRG is used as the tertiary source for the volume creation.

#### **Create a new storage resource group**

Click to create an SRG. Enter the name for the SRG in the **Name** field. This tertiary SRG is where the replication target volume will be placed after the replication plan is executed.

#### **Use existing storage resource group**

Click to use an existing SRG. Select the SRG and click **View SRG** to view. This tertiary SRG is where the replication target volume will be placed after the replication plan is executed.

2. To select a provisioning profile for the tertiary SRG, select from the following options:

#### **Use the source storage resource group profile**

Click to select the provisioning profile that is associated with the source SRG.

#### **Use existing provisioning profile**

Click to use the existing provisioning profile.

3. To move to the next page in the wizard, click **Next**.

### **SAN Planner wizard: Reviewing user selections**

Review your selections in the SAN Planner wizard.

Review your selections in the wizard. If you want to change any settings, click **Back**, and make your changes. Click **Next** to generate the plan. The Getting Recommendation dialog box is displayed while the settings in the wizard are validated and the planning is performed. If the process runs without errors, the Execute Plan page is opened showing the recommended storage configuration plan. If an error occurs, a message that explains the error is displayed.

## SAN Planner wizard: Executing the plan

View the SAN Planner recommended storage configuration. Execute the plan as a job.

1. In the "Plan involves the following changes" pane, review the configuration changes that the SAN Planner job can make.
2. Click **Show Plan Topology** to look at a more detailed view of the planned storage configuration.
3. To accept the configuration changes, click one of the following options to specify when you want the job to run:

### Run now

Click to run the job immediately.

### Run Once at

Click to specify a date and time to run the job and select the appropriate date and time.

4. To specify the time zone that you want to use, click one of the following options:

### Use the time zone that the server runs in

Click to use the time zone where the IBM Tivoli Storage Productivity Center server runs.

### Use this time zone

Select the time zone from the list.

5. Click **Execute Plan** to save the plan and run the job. The job is run at the date, time, and time zone specified by the **When to run** and **How to handle time zones** settings. The plan is saved under the **SAN Planner** node in the Tivoli Storage Productivity Center navigation tree.

**Note:** For Global Mirror sessions on IBM(r) System Storage(tm) devices, SAN Planner might report a successful creation and start of the session, but the actual session start might take much longer. Verify the session using IBM Tivoli Storage Productivity Center for Replication.

## SAN Planner wizard: Editing the plan

Use the Edit panel to edit the plan that was created using the SAN Planner wizard or to change the run time configuration for a plan.

1. Expand the **Disk Manager** node in the navigation tree. Right-click **SAN Planner** and select a saved plan to open the wizard with the Edit Plan *TPCuserid.plan\_name* panel, where *TPCuserid* is the Tivoli Storage Productivity Center user ID and *plan\_name* is the name the plan was given when it was previously saved.
2. Click **View Job History** to view a detailed history of job runs for the plan. The Job Management panel is displayed.
3. In the **Plan involves the following changes** pane, review the configuration changes that the SAN Planner job can make.
4. Click **Show Plan Topology** to look at a more detailed view of the planned storage configuration.
5. In the **When to run pane** pane, click one of the following options to specify when you want the job to run. This pane is disabled if **Run now** is selected for the plan.

### Run now

Click to run the job immediately.

**Run Once at**

Click to specify a date and time to run the job and select the appropriate date and time.

6. To specify the time zone that you want to use, click one of the following options in the **How to handle timezones** pane. This pane is disabled if **Run now** is selected for the plan.

**Use the time zone that the server runs in**

Click to use the time zone where the IBM Tivoli Storage Productivity Center server runs.

**Use this time zone**

Select the time zone from the list.

7. Click **Open Plan Wizard** to open the SAN Planner wizard where you can view or edit the contents of the plan.
8. Click **Save** to save the changes to the plan that you have made on this panel. This option is disabled if the **When to run** and **How to handle time zone** panes are disabled.
9. Click **Execute Plan** to run the plan immediately. This option is disabled if the **When to run** and **How to handle time zone** panes are disabled. settings.
10. Click **Cancel** to cancel the edits that you have made on this panel.

## Working with storage resource group sessions

This topic describes viewing and deleting replication sessions that are created in the SAN Planner wizard for a storage resource group.

You can delete the replication session from IBM Tivoli Storage Productivity Center and optionally also from IBM Tivoli Storage Productivity Center for Replication.

1. In the navigation tree pane, expand **Replication Manager > Storage Resource Group Sessions**. A table of the currently defined storage resource group sessions is displayed in the content pane.
2. To select a storage resource group session to delete, click a row in the table. You can use Ctrl+click and Shift+click to select multiple sessions simultaneously.
3. Click **Delete Storage Resource Group Session**. Tivoli Storage Productivity Center does not automatically delete the replication session from Tivoli Storage Productivity Center for Replication. A dialog box opens enabling you to specify how you want to delete the session. You can select from the following options:
  - Click **Yes** to remove the selected replication session from the Tivoli Storage Productivity Center database and the Tivoli Storage Productivity Center for Replication database.
  - Click **No** to remove the selected replication session from the Tivoli Storage Productivity Center database only.
  - Click **Cancel** to close the dialog box without deleting the selected replication session from the Tivoli Storage Productivity Center database or Tivoli Storage Productivity Center for Replication database.

---

## Optimizing storage configurations

Use the Storage Optimizer to analyze storage subsystems to identify performance bottlenecks and to help you improve subsystem performance. You can also use the report for migration and consolidation recommendations. You can optimize the tiered storage of your system by using the recommendations of the tiering policy analysis to efficiently manage the different storage tiers.

### Storage Optimizer overview

The Storage Optimizer uses data in the IBM Tivoli Storage Productivity Center database to analyze your storage subsystems to identify performance bottlenecks, and recommend changes to improve performance. This topic lists the supported subsystems and describes the general steps for using Storage Optimizer.

The Storage Optimizer helps you develop storage migration or storage consolidation plans, and helps you plan for the growth of your storage infrastructure. For example, you can use the Storage Optimizer to create a weekly report that provides details on the performance of your storage subsystems and makes recommendations for how to improve performance.

**Note:** The Storage Optimizer does not actually perform any migrations or modify subsystem configurations. Its primary purpose is to provide you with a performance analysis and optimization recommendations that you can choose to implement at your discretion.

**Important:** Storage Optimizer does not take into account any established replication relationships or sessions. Follow migration recommendations with care to ensure continuity of all replication relationships.

To use the Storage Optimizer, you must have an IBM Tivoli Storage Productivity Center Advanced license.

The following IBM storage subsystems or applications are supported:

- DS8000
- DS6000
- DS5000
- DS4000
- TotalStorage Enterprise Storage Server
- SAN Volume Controller
- Storwize V7000
- IBM Storwize V7000 Unified block level support
- The XIV system
- IBM SONAS

Before running Storage Optimizer, you must set up performance monitors to collect performance data at least once a day for all storage subsystems that you want Storage Optimizer to analyze. You must also collect performance monitoring data for the back-end subsystems for SAN Volume Controller or Storwize V7000. The performance data for the subsystems produce the most accurate Storage Optimizer analysis.

The analysis is less accurate if there are any gaps in the data collection for the time interval being analyzed. It is recommended that you collect at least one week's

worth of performance monitoring data before using Storage Optimizer. Providing a longer time interval for data collection increases the accuracy of the Storage Optimizer analysis and recommendations. For more information, see “Creating storage subsystem performance monitor” on page 379.

You must provide the Storage Optimizer with the following input:

- Configuration and performance data that you collect for the supported storage subsystems before running the Storage Optimizer
- One or more selected storage subsystems that you specify as input to the Storage Optimizer.
- Connected fabric topology and zoning information is used in the analysis if it is available.

The Storage Optimizer produces the following output:

- An analysis report that displays performance heat maps and tables that graphically illustrate the performance utilization of the storage subsystems that you specified as input.
- An optimization report that provides migration and consolidation recommendations for improving performance.

The Storage Optimizer produces more accurate results if you provide both the required and optional input data requested by the Storage Optimizer, and if you collect storage subsystem performance monitoring data over a longer time interval before using the Storage Optimizer.

**Note:** Since running the Storage Optimizer is a processor-intensive task for the IBM Tivoli Storage Productivity Center server, schedule a time to run the Storage Optimizer when processor demand on the IBM Tivoli Storage Productivity Center server is expected to be at a minimum.

The general steps for using the Storage Optimizer are as follows:

1. In the Create Analysis window, enter information in the required fields and choose **File > Save** to submit the analysis report job. For more information, see “Creating an analysis report” on page 434.
2. Review the Storage Optimizer analysis report. For more information, see “Viewing an analysis report” on page 435.
3. Create an optimization report based on this analysis. For more information, see “Creating an optimization report” on page 437.
4. View the optimization report. For more information, see “Viewing an optimization report” on page 438.
5. At your discretion, implement the recommendations suggested in the optimization report, or rerun the analysis using different inputs.

## Using the Storage Optimizer

This topic describes how to use the Storage Optimizer to analyze storage subsystem performance and create an optimization report that includes recommendations to improve performance.

Before running Storage Optimizer, you must set up performance monitors and collect performance monitoring data for all storage subsystems that you want Storage Optimizer to analyze. Storage Optimizer analyzes performance monitoring data for the time interval you specify. The analysis will be less accurate if there are any gaps in the data collection for the time interval being analyzed. For best

results, collect at least one week's worth of performance monitoring data before using Storage Optimizer. Providing a longer time interval for data collection will increase the accuracy of the Storage Optimizer analysis and recommendations. See "Creating storage subsystem performance monitor" on page 379 for more information.

**Tip:** The Storage Optimizer does not make any modifications to subsystem configurations. Its primary purpose is to provide you with a performance analysis and optimization recommendations that you can choose to implement at your discretion.

## Creating an analysis report

Creating a performance analysis report is the first step in using Storage Optimizer.

When you specify a start time for using performance monitor data in an optimization plan, the start time might not coincide with the start of a performance monitor data collection interval. If the requested start time is after the start of a data collection interval and the duration of the data collection interval is long enough so that it ends at or after the requested start time, Tivoli Storage Productivity Center includes all data from the collection interval that began before the requested start time. This might include data collected before the start time that you specified. This processing ensures that the maximum amount of available performance data is utilized. For example, if a performance monitor collects data every 20 minutes starting at 01:00, but you request performance data starting at 1:15, Tivoli Storage Productivity Center still analyzes performance data starting at 01:00 that has a duration of 20 minutes.

To create the analysis, complete the following steps:

1. Navigate to one of the following nodes:
  - **IBM Tivoli Storage Productivity Center > Analytics > Storage Optimizer**
  - **Disk Manager > Storage Optimizer.**
2. Right-click **Storage Optimizer** and select **Create Analysis** to open the Create Analysis panel. Use this panel to specify the storage subsystems that you want to analyze.
3. Optional: In the **Create Analysis** panel, enter a short description of the analysis job in the **Description** field.
4. The **Select Storage** pane lists the storage subsystems that you want to include in the analysis. Use the **Add** button to add elements to the plan:
  - a. Click **Add**. The **Optimizer Selection** panel opens. This provides a topology view of the current system configuration. Select the storage subsystems that you want to include in the analysis.

**Tip:** The Topology Viewer pane displays the configuration from which selections are made. The Select Elements pane displays the selections that will be used in the analysis.

**Note:** When using the Select Elements pane, the subsystem selections do not need to be in the same fabric.

- b. Double-click the Storage box title to expand the storage view into the L0 level view of the available subsystems.
- c. Click an element to select it. To select multiple elements, press and hold the **CTRL** key and click on each element icon.

- d. Click >> to move the selected elements into the **Select Elements** pane. If you decide to remove the selected elements from the **Select Elements** pane, click <<.
  - e. When you are satisfied with all your selections, click **OK**. You return to the Storage Optimizer Create Analysis panel with the selections displayed in the **Select Storage** pane.
5. Optional: select an element to remove it by clicking **Remove**.
  6. In the **Performance Time Interval** section, for **Data Type**, choose Daily to get average performance data for each 24 hour period, or choose Sample/Hourly to analyze a specific time period each day. Select the **Start Date** and **End Date** to define the date interval that the Storage Optimizer uses to extract performance monitoring data from the IBM Tivoli Storage Productivity Center database. Performance monitoring data must exist in the database for the entire interval you specify. The default date interval is the start and end date of the current date. If you choose Sample/Hourly, specify the **Start Time** and **End Time** of the daily time period that you want to analyze. For example, if you choose Sample/Hourly with November 1 as the start date, November 15 as the end date, and 6 PM as the start time and 8 PM as the end time, then data will be analyzed between 6 PM and 8 PM only for days between November 1 and November 15.
  7. Click **Run Now** to begin the analysis as soon as you save the analysis job using **File > Save**. Alternatively, click **Run Once at** to begin the analysis at a time you specify. When you save the analysis job using **File > Save**, the analysis job appears under the **Storage Optimizer** node in the navigation tree, but the job status is not displayed until the job has started running.
  8. For **How to handle time zones**, specify which time zone to use.
  9. Click **File > Save** to save and submit the analysis report job. After the analysis report job starts, you can view the analysis job status under the **Storage Optimizer** node in the navigation tree.
  10. When the analysis report job is complete, select it to view the analysis report.

## Viewing an analysis report

The analysis report displays a performance analysis for storage systems, and lets you generate an optimization report that lists storage migration and consolidation recommendations. You can experiment with different migration and consolidation scenarios to help you achieve the desired performance improvements for your storage infrastructure.

To view the analysis report:

1. Navigate to one of the following nodes:
  - **IBM Tivoli Storage Productivity Center > Analytics > Storage Optimizer**
  - **Disk Manager > Storage Optimizer**.
2. Expand the **Storage Optimizer** node and select a completed (green) analysis job to display the analysis report. By default, the heat maps display the performance utilization of all components.
3. To display the performance utilization for a specific component, select the component from the **Heat map based on** list.
4. Drag the **Performance Threshold** slider to change the performance threshold for all the selected subsystems. The heat maps are automatically updated to reflect changes in the performance threshold. This allows you to see the performance threshold at which different subsystems or components become bottlenecked.

There is one heat map for each storage subsystem included in the analysis. The heat map uses different colors to represent the actual performance of a storage subsystem, as measured against the default performance threshold of 80%. If you change the performance threshold, the heat maps are automatically updated to display the changes.

Each cell represents a storage pool. If there aren't enough storage pools to fill an entire row, the remaining cells in that row will be gray. Select a cell to display more information about that storage pool. Right-click a cell and choose **show optimizer view** to display performance metrics for volumes in the selected pool.

Green, blue, yellow, orange, and red cells indicate storage pool performance as follows:

**Green** storage pools that are performing at less than or equal to 25% of the performance threshold.

**Blue** storage pools that are performing at less than or equal to 50% of the performance threshold.

**Yellow** storage pools that are performing at less than or equal to 75% of the performance threshold.

**Orange** storage pools that are performing at less than or equal to 100% of the performance threshold.

**Red** storage pools that exceed the performance threshold.

The Performance tables represent the same information that is displayed in each heat map, but in more detail. There is one table for each storage subsystem. Each row represents a storage pool. You can sort the table by clicking a column. Column descriptions are as follows:

**Pool Name**  
the name of the storage pool.

**Utilization**  
the aggregated performance utilization of all components, as measured against the performance threshold.

**Host Adaptor**  
the performance utilization of the host adapter ports on the storage subsystem.

**Hard Disk**  
the performance utilization of the disk arrays.

**Controller**  
processor and memory performance utilization.

**Device Adapter**  
the performance utilization of the device adapter which connects the controller to the disk arrays.

**Space** The physical disk space utilization.

## Creating an optimization report

You can create an optimization report that lists storage migration and consolidation recommendations. You can experiment with different migration and consolidation scenarios to help you achieve the desired performance improvements for your storage infrastructure.

To create the optimization report, follow these steps:

1. Navigate to one of the following nodes:
  - **IBM Tivoli Storage Productivity Center > Analytics > Storage Optimizer**
  - **Disk ManagerStorage Optimizer.**
2. Select a completed analysis job to display the analysis report.
3. To include a storage pool or storage subsystem as a source entity that you want to migrate or consolidate to improve performance:
  - a. In the heat map or table, select a storage pool or storage subsystem. Select **Select all pools for storage subsystem** to select all storage pools in a storage subsystem so that you can include them as source entities.
  - b. Click >> for **Source Entities** to add the selected item to the source entities. The same storage pool cannot be added as both a source and target entity.
  - c. For the list of source entities, if you select **Make retirement recommendations for the selected entity**, the optimization report will make retirement recommendations for all source entities.
  - d. To remove an item from the list of source entities, select it and click <<.

**Note:** The values in the optimization report are estimates and could be influenced by data activity on the selected entity

The Storage Optimizer does not support Easy Tier (mixed pools) as source in a migration or consolidation plan. However, Easy Tier pools are displayed in the Performance Heat Maps and Performance Tables when you create an optimization report. These pools are marked with the text **E.T.** and cannot be selected.

4. To include a storage pool or storage subsystem as a target entity that you want to keep after storage migration and consolidation:
  - a. In the heat map or table, select a storage pool or storage subsystem. Select **Select all pools for storage subsystem** to select all storage pools in a storage subsystem so that you can include them as target entities.
  - b. Click >> for **Target Entities** to add the selected item to the target entities. The same storage pool cannot be added as both a source and target entity.
  - c. To remove an item from the list of target entities, select it and click <<.

When the Storage Optimizer considers potential pools as targets of a migration, it takes into consideration whether the source and target pools have the same RAID level, format (CKD or FB), and whether or not the potential target has enough available capacity. The Storage Optimizer does not support Easy Tier (mixed pools) as target entities in a migration or consolidation plan.

5. Choose when to run the optimization report using one of the following options:
  - **Run Now:** creates the optimization report as soon as you save your report settings by clicking **File > Save**. After the report job begins, you can view the report and job status under the **View Previously Run Optimization Reports** pane.

- **Run Once at:** begins the report job at a specified date and time. When you save the report job by clicking **File > Save**, the report job is displayed under the **View Previously Run Optimization Reports** pane, but the job status will not appear until the job has started running.
6. Drag the **Performance Threshold** slider to change the performance threshold for the selected subsystems and pools. The heat maps are automatically updated to reflect changes in the performance threshold. This allows you to see the performance threshold at which different subsystems and pools become bottlenecked. Keep in mind that if you select the **Make retirement recommendations for the selected entity** option, the threshold you choose using the **Performance Threshold** slider determines if the move to the target subsystem will keep the target subsystem under the chosen threshold.
  7. Click **File > Save** to save and submit the optimization report job.
  8. To update the job status for all optimization reports, click **Refresh Job Status**.
  9. To view a completed optimization report, click  .
  10. To see how the optimization recommendations change if you use a different performance threshold, select a different performance threshold and run another optimization report. You can continue creating optimization reports using different performance thresholds until you achieve the expected performance improvements.

## Viewing an optimization report

The optimization report displays a storage migration and consolidation report that lists recommendations for improving storage subsystem performance.

The Storage Optimizer does not actually perform any migrations or make any modifications to subsystem configurations. Its primary purpose is to provide you with recommendations that you can choose to implement at your discretion.

**Important:** Storage Optimizer does not take into account any established replication relationships or sessions. Migration recommendations should be followed with care to ensure continuity of all replication relationships.

To view the optimization report:

1. Navigate to one of the following nodes:
  - **IBM Tivoli Storage Productivity Center > Analytics > Storage Optimizer**
  - **Disk ManagerStorage Optimizer**.
2. Select a completed analysis job.
3. Optional: Under the **View Previously Run Optimization Reports** pane, click **Refresh Job Status** to update the job status for all optimization reports.
4. Click  to open an optimization report.
5. To view the results of implementing only some of the recommendations, remove the check mark next to **Select all recommendations** and select a subset of the recommendations from the table of recommendations. Only the selected recommendations will be included in the printed report.
6. To display the performance utilization for a specific component, select the component next to **Heat map based on**.
7. To print the report, click the **Print** button in the optimization report. If a PDF printer driver is installed, you can print the report to a PDF file. Alternatively,

you can print the report to a printer. The printed report includes an explanation of each recommendation, and sample migration scripts for the SAN Volume Controller.

The optimization recommendations include the following information:

**Recommendation number**

The sequential number associated with the recommendation.

**Source subsystem**

The name of the source subsystem.

**Target subsystem**

The name of the target subsystem.

**Source volume**

The name of the source volume.

**Target volume**

The name of the target volume.

**Source pool**

The name of the source pool.

**Target pool**

The name of the target pool.

**Reason**

The reason why the storage pool utilization has exceeded the performance threshold.

**Port information**

The recommendation on which ports need to be configured on the target subsystem for the target volume. This information only appears in the printed report.

**Zone information**

The recommended zoning changes necessary so that the target volume is visible to the host. This information only appears in the printed report.

**SVC pseudoscript**

The sample migration script that serves as a guide to the commands that you must enter using the SAN Volume Controller command-line interface. This information only appears in the printed report.

After you implement the recommendations, if you want to verify that you have achieved the expected performance improvements, you must first collect more performance monitoring data before running the Storage Optimizer again.

## Deleting analysis jobs

You can delete analysis job definitions or individual analysis jobs if you no longer need them.

To delete an analysis job definition or job run:

1. Navigate to one of the following nodes:
  - **IBM Tivoli Storage Productivity Center > Analytics > Storage Optimizer**
  - **Disk ManagerStorage Optimizer> Disk Manager.**
2. Expand the **Storage Optimizer** node.
3. Right-click an analysis job definition or an analysis job.
4. Click **Delete**.

Keep in mind that deleting an analysis job definition also deletes all analysis jobs and optimization reports that are associated with that job definition. If you delete an analysis job, all optimization reports associated with that job are also deleted.

## Deleting an optimization report

You can delete optimization reports if you no longer need them.

To delete an optimization report job:

1. Navigate to one of the following nodes:
  - **IBM Tivoli Storage Productivity Center > Analytics > Storage Optimizer**
  - **Disk ManagerStorage Optimizer.**
2. Expand the **Storage Optimizer** node.
3. Select a completed analysis job to display the list of optimization reports that are associated with that analysis job.
4. Under **View Previously Run Optimization Reports**, right-click a completed report and choose **Delete**.

## Retrieving an optimization report job definition

You can retrieve the report job definition that was used to generate an optimization report.

To retrieve the optimization report job definition associated with an optimization report:

1. Navigate to one of the following nodes:
  - **IBM Tivoli Storage Productivity Center > Analytics > Storage Optimizer**
  - **Disk ManagerStorage Optimizer.**
2. Expand the **Storage Optimizer** node.
3. Select a completed analysis job to display the list of optimization reports that are associated with that analysis job under **View Previously Run Optimization Reports**.
4. Right-click an optimization report and choose **Retrieve**.

The **Generate Optimization Report** pane displays the inputs that were used to create the selected optimization report.

## Understanding zoning recommendations

This topic describes the zoning recommendations provided by Storage Optimizer in the printed optimization report.

**Note:** Storage Optimizer only provides zoning recommendations in the printed optimization report. The report lists the zoning recommendations for all volumes under each volume.

Where possible, Storage Optimizer provides zoning recommendations for each migration recommendation. The zoning recommendations will be to put the target subsystem's port(s) into the same zones as that of the source subsystem's ports, regardless of which zones the host is also a member of.

For example, suppose you want Storage Optimizer to provide zoning recommendations using the following source and target subsystems.

Source subsystem A includes the following:

- Port 1 (member of zones: host1\_zone, host2\_zone, host3\_zone)

- Port 2 (member of zones: host4\_zone, host5\_zone, host6\_zone)
- Volume X (mapped to host1 using Port 1)
- Volume Y (mapped to host4 using Port 2)

Target subsystem B includes the following:

- Port 1
- Port 2

Suppose that Storage Optimizer recommends migrating Volume X from Source subsystem A to Target subsystem B. The zoning recommendations that accompany this migration recommendation will be to add Target subsystem B's Port 1 to zones host1\_zone, host2\_zone, and host3\_zone.

## Optimizing tiered storage

You can optimize the tiered storage of your system by defining storage tiering policies that specify criteria that determine when volumes should be moved from one storage pool to another. Using the recommendations of the tiering policy analysis, you can ensure that the different storage tiers are efficiently managed.

You can optimize the tiered storage on SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified storage systems.

For example, you might have three different storage tiers with the first tier having the highest performance capacity and being the most expensive storage. You can manage each storage tier, especially the high performing storage, to meet the performance and access goals of your system. To help you achieve this goal, you can use the CLI tiering policy commands.

By creating storage tiering policies and running the tiering policy analysis, you can use the analysis information to ensure that storage volumes are in the appropriate storage tier. The tiering policy analysis compares recent performance data and file system usage data with policy conditions that you specify for the tiering policies. This comparison determines whether volumes are in an incorrect storage tier.

The tiering policy analysis recommends the appropriate storage pools to which volumes should be migrated. You can then move the volumes to the appropriate storage tier. For example, you might want to move infrequently accessed volumes from a high-performance storage tier to a lower-performance storage tier, which is, correspondingly, less expensive. The tiering policy analysis does not migrate the volumes.

In addition, you can use the Volume Migration Recommendation Report to help you analyze tiering policies and to improve your storage utilization.

### Related reference:

“Volume Migration Recommendation Report” on page 1271

The Volume Migration Recommendation Report, shows the volumes that comply with the criteria for migrating volumes to a pool in another storage resource group. Use the report to identify volumes that might require migration based on the conditions that are set in tiering policies.

## Storage tiering policies

You can define storage tiering policies and specify criteria for volumes to be migrated from one storage resource group to another. Using the information that is

provided by the tiering policy analysis, you can optimize the usage of the different storage tiers by ensuring that volumes are moved to the correct tier.

Use CLI commands to specify storage tiering policies. For example, in a typical scenario, you create, analyze, and modify tiering policies:

- Create a tiering policy that is associated with specific storage resource groups by using the **mktp** command.
- Add conditions to the tiering policy by using the **addtpcondition** command.
- Evaluate tiering policies by using the **analyzetsp** command, which recommends which storage entities to migrate.
- Change the attributes of the tiering policy by using the **modifytsp** command.
- Modify the conditions of the tiering policy by using the **rmtptconditions** command and then the **addtpcondition** command.
- Verify the changes to the tiering policy by using the **lstsp** command.
- Retrieve the results of the most recent tiering policy analysis by using the **gettprec** command.
- Remove the tiering policy by using the **rmtsp** command.

You add conditions to a tiering policy that are used during the tiering policy analysis to determine which storage entities to recommend for migration. For example, you can add any of the following conditions:

- Specify that the candidate volumes should be moved by using the **force** condition type.
- Exclude volumes from consideration by subsequent policies for being moved by using the **ignore** condition type.
- Compare the percentage of files with last accessed times that are less or greater than an age that you specify to a percentage you specify by using the **age** condition type.
- Compare the measured I/O rate per GB of a volume to the I/O rate that you specify by using the **iodensity** condition type.

The tiering policy analysis does not migrate volumes; it recommends which volumes to migrate based on the tiering policy conditions that you specify.

Volumes must meet the qualifying criteria before they can be recommended for migration, for example:

- The volumes must be in an online storage pool.
- There must be online storage pools in the destination storage resource groups that are on the same storage system and that have sufficient space.
- Both the current and destination storage pools must be in a non-error state.

When there are no suitable destination pools, the tiering policy analysis cannot make recommendations. Therefore, it is possible that only some or none of the volumes in the source storage resource group are recommended if the destination storage resource group does not have sufficient space.

You can also use the Volume Migration Recommendation Report to help you analyze tiering policies. This report provides migration recommendations by tiering policy.

**Related concepts:**

“Optimizing tiered storage” on page 441

You can optimize the tiered storage of your system by defining storage tiering policies that specify criteria that determine when volumes should be moved from one storage pool to another. Using the recommendations of the tiering policy analysis, you can ensure that the different storage tiers are efficiently managed.

**Related reference:**

“Volume Migration Recommendation Report” on page 1271

The Volume Migration Recommendation Report, shows the volumes that comply with the criteria for migrating volumes to a pool in another storage resource group. Use the report to identify volumes that might require migration based on the conditions that are set in tiering policies.

## Enforcing storage policies

Enforcing policies for storage usage can be critical to ensuring the proper and most cost-effective use of storage devices. Policies are enforced when conditions that you defined are detected by a monitoring job. Use quotas, constraints, and scheduled actions to manage and enforce your storage policies.

Use the **Policy Management** node in Data Manager and Data Manager for Databases to manage and enforce storage policies.

For example, if you want to enforce a policy that limits the amount of space a group of users can consume on the network, use a Data Manager quota. That quota will be triggered: 1) after a scan is run and 2) the scan detected that a group of users is consuming more storage space than was indicated in the quota.

The following table describes the jobs you can use to enforce policies for storage usage in your environment:

Table 39. Descriptions of policy types and their triggering conditions

Policy Type / Manager	What can I do with this job?	What conditions can trigger an alert?
<b>Quotas</b> (Data Manager, Data Manager for Databases) <ul style="list-style-type: none"> <li>• <b>Policy Management &gt; Quotas &gt; User</b></li> <li>• <b>Policy Management &gt; Quotas &gt; OS User Group</b></li> </ul>	Use quotas to define limits on and monitor the amount of storage that a user or a group of users can consume. You can set quotas to specify limits for storage usage at different levels, which enables you to control precisely how much storage a user can consume on specific storage entities: <ul style="list-style-type: none"> <li>• Define quotas in Data Manager to set limits on the amount of storage that a user or a group of users can consume at a network, filesystem, or computer level.</li> <li>• Define quotas in Data Manager for Databases to set limits on the amount of storage that a user or a group of users can consume at a network, instance, database, or tablespace level.</li> </ul> Monitoring job that detects conditions in quotas: scan	<b>User consumes more than <math>n</math></b> , where $n$ represents a number measured in kilobytes, megabytes, or gigabytes.  <b>OS User Group consumes more than <math>n</math></b> , where $n$ represents a number measured in kilobytes, megabytes, or gigabytes.

Table 39. Descriptions of policy types and their triggering conditions (continued)

Policy Type / Manager	What can I do with this job?	What conditions can trigger an alert?
<p><b>Network Appliance Quotas</b> (Data Manager)</p> <ul style="list-style-type: none"> <li>• Policy Management &gt; Network Appliance Quotas &gt; Schedules</li> <li>• Policy Management &gt; Network Appliance Quotas &gt; Imported User Quotas</li> <li>• Policy Management &gt; Network Appliance Quotas &gt; Imported OS User Group Quotas</li> </ul>	<p>Use Network Appliance Quotas to import, view, and report on the NetApp Quotas defined on NAS filers.</p> <p>Monitoring job that detects conditions in Network Appliance quotas: scan</p>	<p><b>% of hard limit</b>, where <i>n</i> represents a percentage of the hard limit defined in the NetApp Quota.</p>
<p><b>Constraints</b> (Data Manager)</p> <p><b>Policy Management &gt; Constraints</b></p>	<p>Use constraints to:</p> <ul style="list-style-type: none"> <li>• define the acceptable and unacceptable file types, file sizes, and file owners for computers in your environment. For example, you can use constraints to alert you when users store certain files (such as MP3 or .avi files) on a monitored computer.</li> <li>• Request an IBM Tivoli Storage Productivity Center archive and backup of the largest violating files identified by a constraint. IBM Tivoli Storage Manager protects your organization's data from hardware failures and other errors by storing backup and archive copies of data on offline storage.</li> </ul> <p>Monitoring job that detects conditions in constraints: scan</p>	<p><b>Violating files consume more than n</b>, where <i>n</i> represents a number measured in kilobytes, megabytes, or gigabytes.</p>

## Setting storage usage quotas

Use quotas to set limits on the amount of storage space that a user or group of users can consume. You can use Data Manager and Data Manager for Databases to set quotas at the filesystem, computer, network, database, tablespace, and instance levels.

Use quotas in the to set limits on the amount of storage that a user or a group of users can consume.

The following steps provide an overview of how quotas work:

1. A scan gathers extensive information about the storage resources within an enterprise. This information is stored in the database repository.
2. When a quota job runs, it checks the information in the repository to determine if any quota violations exist.
3. If there are any violations, an alert is triggered and the appropriate action is taken.

**Note:** Because the information analyzed by quotas is provided by scans, you should schedule a quota to run after the scan to collect that information. This ensures that quotas are using the latest information about an enterprise to determine violations.

You can define two different kinds of quotas: User and OS User Group.

- **User Quota.** Select users and groups of users for a quota that have been defined within Data Manager or Data Manager for Databases.
- **OS User Group Quota.** Select OS User Groups for a quota. OS User Groups are groups of users that have been defined in the operating system outside of Data Manager. You can create Groups that contain many OS User Groups. When creating a quota of this type, you can select individual OS User Groups and groups that consist of multiple OS User Groups.

By providing you with the ability to define quotas at different levels, you can control precisely how much storage a user or user group can consume on specific filesystems, computers, network, databases, tablespaces, and instances:

### Filesystem

Set storage usage limits on specific filesystems and groups of filesystems that are monitored by Data Manager. This means that you will be alerted if a user or group of users has exceeded the storage usage limit you defined for the specific filesystem or groups of filesystems in the quota.

### Computer

Set storage usage limits on specific computers and groups of computers that are monitored by Data Manager. This means that you will be alerted if a user or group of users has exceeded the storage usage limit you defined for the specific computers or groups of computers in the quota.

### Database-Tablespace

Set storage usage limits on specific databases, tablespaces, groups of databases, and groups of tablespaces that are monitored by Data Manager for Databases. This means that you will be alerted if a user or group of users has exceeded the storage usage limit you defined for those storage resources in the quota.

### Instance

Set storage usage limits on specific instances, computers, and groups of

computers that are monitored by Data Manager for Databases. This means that you will be alerted if a user or group of users has exceeded the storage usage limit you defined for the specific instances, computers, and groups of computers in the quota.

### Network

Set network-level storage usage limits for *multiple* computers, groups of computers, filesystems, databases, and tablespaces within your network that are monitored by Data Manager and Data Manager for Databases.

## Creating a network-wide quota

Learn how to create a quota that generates an alert when a user or group of users consumes more than a specified amount of storage space across the filesystems and computers on a network.

To create a network-wide quota, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager > Policy Management > Quotas**.
2. Expand the **User** or **OS User Group** node depending upon which entity you want to apply a quota.
3. Select the level at which you want to apply the quota by right-clicking **Network**.
4. Select **Create Quota** from the pop-up menu. The Create Quota window opens.
5. In the **Description** field, type a brief description of the quota.
6. Select a profile from the **Profile** selection list to control which storage usage statistics are used when checking for quota violations. You can select any of the GROUP\_BY\_OWNER type profiles shown. Make sure that the selected profile is used in scans of all the filesystems chosen on the **Filesystems** tab. This ensures that the quota is fairly enforced for all users.
7. Select users or user groups against which you want to apply the quota:
  - a. In the **Available** field, click the users or groups of users against which you want to apply the quota.
  - b. Click . The users or groups are moved to the **Current Selections** field.
8. Click the **Filesystems** tab; the Filesystems page opens.
9. Select filesystems, filesystem groups, computers, and computers groups on which you want to limit the storage usage of users and user groups.
  - a. In the **Available** field, click the storage resources to which you want to apply the quota. The groups displayed in this field were created using **Data Manager > Monitoring > Groups**.
  - b. Click . The resources are moved to the **Current Selections** field.
10. Click the **When to Run** tab; the When to Run page opens.
11. In the **How often to run** area, schedule how often you want the quota to be checked. You can choose from the following actions:

#### Run Now

Check the quota immediately.

#### Run Once at

Check the quota once at a specified time and date. You can use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start time. This ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

### Run Repeatedly

Check the quota repeatedly according to a schedule you specify. You can:

- Use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM when the job should begin running.
- Indicate how often the job should run. You can use the drop-down lists to specify the number of minutes, hours, days, weeks, or months.
- Indicate which days on which run the job. A check mark is displayed next to the days you select.

12. In the **How to Handle Time Zones** area, indicate the time zone to be used when scheduling and running the policy. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:
  - a. 9:00 AM of the time zone where the Data server resides
  - b. 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

### Use the timezone that the server runs in

Select this option to use the time zone of the location where the Data server resides.

### Use this timezone

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

13. Click the **Alert** tab; the Alert page opens.
14. In the **Triggering Condition** area, specify the event that will trigger the alert:
  - a. In the **Condition** field, the default setting is **User Consumes More Than *n***, where *n* represents a value that you define in the **Value** field. No other conditions are available.
  - b. In the **Value** field, type a numeric value that represents the storage usage limit for the quota. If the storage entities selected for the quota (for example, users and user groups) exceed this limit, the quota is triggered.
  - c. In the **Value Units** field, select the unit of measurement: kilobytes, megabytes, or gigabytes.
15. In the **Triggered Actions** area, select the actions that occur as a result of the triggering condition You can choose from the following actions:

### SNMP trap

An SNMP trap is sent to any NMS, console, or terminal when the condition occurs.

### TEC / OMNIBus Event

A IBM Tivoli Enterprise Console event is sent when the condition occurs. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze Tivoli Storage Productivity Center events according to the event definitions specified in the tivoliSRM.baroc file (provided with the product). It also

performs responses such as sending further notification, creating or updating trouble tickets, running programs, and so on.

**Login notification**

The alert is sent to a Tivoli Storage Productivity Center user. The user receives the alert upon logging in to Tivoli Storage Productivity Center. In the **Login ID** field, type the user ID.

**Login ID**

The ID of the user who receives alert notification upon logging in to the system.

**Windows Event Log, UNIX Syslog**

The ID of the user who receives alert notification upon logging in to the system.

**Event Type (Windows Event Log only)**

The type of event that is recorded to the OS log.

**Facility (UNIX Syslog only)**

The location where the UNIX Syslog is sent. You can select User or Local.

**Level (UNIX Syslog only)**

The level of UNIX Syslog event. You can select Informational, Notice, Warning, Error, Critical, or Alert.

**Run script**

A script is run when the condition occurs. Click **Define** to specify the script that is run when the triggering condition occurs. The parameters listed in the **Specify Script** window are passed to the script when the alert is triggered

**E-mail** An e-mail is sent. Click **Add** or **Delete** to edit the list of e-mail addresses to which an e-mail is sent. Click **Edit e-mail** to change the actual e-mail message.

16. Save the quota:
  - a. Click **File > Save**. The Save As window opens.
  - b. In the **Specify Quota name** field, type a name for the quota and click **OK**. The quota is displayed in the navigation tree pane

## Creating a network-wide quota for databases

Learn how to create a quota that generates an alert when a user or group of users consumes more than a specified amount of RDBMS storage space across the databases, tablespaces, groups of database-tablespaces, computers, and groups of computers on a network.

To create a network-wide quota, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager for Databases > Policy Management > Quotas**.
2. Select the level at which you want to apply the quota by right-clicking **Network**.
3. Select **Create Quota** from the pop-up menu. The Create Quota window opens.
4. In the **Description** field, type a brief description of the quota.
5. Select a profile from the **Profile** selection list to control which storage usage statistics are used when checking for quota violations. You can select any of the GROUP\_BY\_OWNER type profiles shown. Make sure that the selected

profile is used in scans of all the databases and tablespaces chosen on the **Databases-Tablespaces** tab. This ensures that the quota is fairly enforced for all users.

6. Select users or user groups against which you want to apply the quota:
  - a. In the **Available** field, click the users or groups of users against which you want to apply the quota.
  - b. Click . The users or groups are moved to the **Current Selections** field.
7. Click the **Databases-Tablespaces** tab; the Databases-Tablespaces page opens.
8. Select the databases, tablespaces, database-tablespaces groups, computers, and computer groups on which you want to limit the storage usage of users and user groups.
  - a. In the **Available** field, click the storage resources to which you want to apply the quota. The groups displayed in this field were created using **Data Manager for Databases > Monitoring > Groups**.
  - b. Click . The resources are moved to the **Current Selections** field.
9. Click the **When to Run** tab; the When to Run page opens.
10. In the **How often to run** area, schedule how often you want the quota to be checked. You can choose from the following actions:

#### **Run Now**

Check the quota immediately.

#### **Run Once at**

Check the quota once at a specified time and date. You can use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start time. This ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

#### **Run Repeatedly**

Check the quota repeatedly according to a schedule you specify. You can:

- Use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM when the job should begin running.
- Indicate how often the job should run. You can use the drop-down lists to specify the number of minutes, hours, days, weeks, or months.
- Indicate which days on which run the job. A check mark is displayed next to the days you select.

11. In the **How to Handle Time Zones** area, indicate the time zone to be used when scheduling and running the policy. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:
  - a. 9:00 AM of the time zone where the Data server resides
  - b. 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

**Use the timezone that the server runs in**

Select this option to use the time zone of the location where the Data server resides.

**Use this timezone**

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

12. Click the **Alert** tab; the Alert page opens.
13. In the **Triggering Condition** area, specify the event that will trigger the alert:
  - a. In the **Condition** field, the default setting is **User Consumes More Than *n***, where *n* represents a value that you define in the **Value** field. No other conditions are available.
  - b. In the **Value** field, type a numeric value that represents the storage usage limit for the quota. If the storage entities selected for the quota (for example, users and user groups) exceed this limit, the quota is triggered.
  - c. In the **Value Units** field, select the unit of measurement: kilobytes, megabytes, or gigabytes.
14. In the **Triggered Actions** area, select the actions that occur as a result of the triggering condition. You can choose from the following actions:

**SNMP trap**

An SNMP trap is sent to any NMS, console, or terminal when the condition occurs.

**TEC / OMNIbus Event**

A IBM Tivoli Enterprise Console event is sent when the condition occurs. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze Tivoli Storage Productivity Center events according to the event definitions specified in the tivoliSRM.baroc file (provided with the product). It also performs responses such as sending further notification, creating or updating trouble tickets, running programs, and so on.

**Login notification**

The alert is sent to a Tivoli Storage Productivity Center user. The user receives the alert upon logging in to Tivoli Storage Productivity Center. In the **Login ID** field, type the user ID.

**Login ID**

The ID of the user who receives alert notification upon logging in to the system.

**Windows Event Log, UNIX Syslog**

The ID of the user who receives alert notification upon logging in to the system.

**Event Type (Windows Event Log only)**

The type of event that is recorded to the OS log.

**Facility (UNIX Syslog only)**

The location where the UNIX Syslog is sent. You can select User or Local.

**Level (UNIX Syslog only)**

The level of UNIX Syslog event. You can select Informational, Notice, Warning, Error, Critical, or Alert.

### Run script

A script is run when the condition occurs. Click **Define** to specify the script that is run when the triggering condition occurs. The parameters listed in the **Specify Script** window are passed to the script when the alert is triggered

**E-mail** An e-mail is sent. Click **Add** or **Delete** to edit the list of e-mail addresses to which an e-mail is sent. Click **Edit e-mail** to change the actual e-mail message.

15. Save the quota:
  - a. Click **File > Save**. The Save As window opens.
  - b. In the **Specify Quota name** field, type a name for the quota and click **OK**. The quota is displayed in the navigation tree pane

### Creating a computer quota

Learn how to create a quota that generates an alert when a user or group of users consumes more than a specified amount of storage space across computers and groups of computers.

To create a computer quota, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager > Policy Management > Quotas**.
2. In the **Description** field, type a brief description of the job.
3. Expand the **User** or **OS User Group** node depending upon which entity you want to apply a quota.
4. Select the level at which you want to apply the quota by right-clicking **Computer**.
5. Select **Create Quota** from the pop-up menu. The Create Quota window opens.
6. In the **Description** field, type a brief description of the quota.
7. Select a profile from the **Profile** selection list to control which storage usage statistics are used when checking for quota violations. You can select any of the GROUP\_BY\_OWNER type profiles shown.
8. Select users or user groups against which you want to apply the quota:
  - a. In the **Available** field, click the users or groups of users against which you want to apply the quota.
  - b. Click . The users or groups are moved to the **Current Selections** field.
9. Click the **Computers** tab; the Computers page opens.
10. Select computers and computers groups on which you want to limit the storage usage of users and user groups.
  - a. In the **Available** field, click the computers and computers groups to which you want to apply the quota. The groups displayed in this field were created using **Data Manager > Monitoring > Groups**.
  - b. Click . The resources are moved to the **Current Selections** field.
11. Click the **When to Run** tab; the When to Run page opens.
12. In the **How often to run** area, schedule how often you want the quota to be checked You can choose from the following actions:

### Run Now

Check the quota immediately.

### Run Once at

Check the quota once at a specified time and date. You can use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start time. This ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

### Run Repeatedly

Check the quota repeatedly according to a schedule you specify. You can:

- Use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM when the job should begin running.
  - Indicate how often the job should run. You can use the drop-down lists to specify the number of minutes, hours, days, weeks, or months.
  - Indicate which days on which run the job. A check mark is displayed next to the days you select.
13. In the **How to Handle Time Zones** area, indicate the time zone to be used when scheduling and running the policy. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:
- a. 9:00 AM of the time zone where the Data server resides
  - b. 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

### Use the timezone that the server runs in

Select this option to use the time zone of the location where the Data server resides.

### Use this timezone

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

14. Click the **Alert** tab; the Alert page opens.
15. In the **Triggering Condition** area, specify the event that will trigger the alert:
- a. In the **Condition** field, the default setting is **User Consumes More Than *n***, where *n* represents a value that you define in the **Value** field. No other conditions are available.
  - b. In the **Value** field, type a numeric value that represents the storage usage limit for the quota. If the storage entities selected for the quota (for example, users and user groups) exceed this limit, the quota is triggered.
  - c. In the **Value Units** field, select the unit of measurement: kilobytes, megabytes, or gigabytes.
16. In the **Triggered Actions** area, select the actions that occur as a result of the triggering condition You can choose from the following actions:

### SNMP trap

An SNMP trap is sent to any NMS, console, or terminal when the condition occurs.

### **TEC / OMNIbus Event**

A IBM Tivoli Enterprise Console event is sent when the condition occurs. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze Tivoli Storage Productivity Center events according to the event definitions specified in the tivoliSRM.baroc file (provided with the product). It also performs responses such as sending further notification, creating or updating trouble tickets, running programs, and so on.

### **Login notification**

The alert is sent to a Tivoli Storage Productivity Center user. The user receives the alert upon logging in to Tivoli Storage Productivity Center. In the **Login ID** field, type the user ID.

### **Login ID**

The ID of the user who receives alert notification upon logging in to the system.

### **Windows Event Log, UNIX Syslog**

The ID of the user who receives alert notification upon logging in to the system.

### **Event Type (Windows Event Log only)**

The type of event that is recorded to the OS log.

### **Facility (UNIX Syslog only)**

The location where the UNIX Syslog is sent. You can select User or Local.

### **Level (UNIX Syslog only)**

The level of UNIX Syslog event. You can select Informational, Notice, Warning, Error, Critical, or Alert.

### **Run script**

A script is run when the condition occurs. Click **Define** to specify the script that is run when the triggering condition occurs. The parameters listed in the **Specify Script** window are passed to the script when the alert is triggered.

**E-mail** An e-mail is sent. Click **Add** or **Delete** to edit the list of e-mail addresses to which an e-mail is sent. Click **Edit e-mail** to change the actual e-mail message.

17. Save the quota:
  - a. Click **File > Save**. The Save As window opens.
  - b. In the **Specify Quota name** field, type a name for the quota and click **OK**. The quota is displayed in the navigation tree pane.

## **Creating a filesystem quota**

Learn how to create a quota that generates an alert when a user or group of users consumes more than a specified amount of storage space across filesystems, groups of filesystems, computers, and groups of computers.

To create a filesystem quota, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager > Policy Management > Quotas**.
2. Expand the **User** or **OS User Group** node depending upon which entity you want to apply a quota.
3. Select the level at which you want to apply the quota by right-clicking **Filesystem**.

4. Select **Create Quota** from the pop-up menu. The Create Quota window opens.
5. In the **Description** field, type a brief description of the job.
6. Select a profile from the **Profile** selection list to control which storage usage statistics are used when checking for quota violations. You can select any of the GROUP\_BY\_OWNER type profiles shown. Make sure that the selected profile is used in scans of all the filesystems chosen on the **Filesystems** tab. This ensures that the quota is fairly enforced for all users.
7. Select users or user groups against which you want to apply the quota:
  - a. In the **Available** field, click the users or groups of users against which you want to apply the quota.
  - b. Click . The users or groups are moved to the **Current Selections** field.
8. Click the **Filesystems** tab; the Filesystems page opens.
9. Select filesystems, filesystems, computers, and computer groups on which you want to limit the storage usage of users and user groups.
  - a. In the **Available** field, click the storage resources to which you want to apply the quota. The groups displayed in this field were created using **Data Manager > Monitoring > Groups**.
  - b. Click . The resources are moved to the **Current Selections** field.
10. Click the **When to Run** tab; the When to Run page opens.
11. In the **How often to run** area, schedule how often you want the quota to be checked. You can choose from the following actions:

#### **Run Now**

Check the quota immediately.

#### **Run Once at**

Check the quota once at a specified time and date. You can use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start time. This ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

#### **Run Repeatedly**

Check the quota repeatedly according to a schedule you specify. You can:

- Use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM when the job should begin running.
- Indicate how often the job should run. You can use the drop-down lists to specify the number of minutes, hours, days, weeks, or months.
- Indicate which days on which run the job. A check mark is displayed next to the days you select.

12. In the **How to Handle Time Zones** area, indicate the time zone to be used when scheduling and running the policy. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:
  - a. 9:00 AM of the time zone where the Data server resides

- b. 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

**Use the timezone that the server runs in**

Select this option to use the time zone of the location where the Data server resides.

**Use this timezone**

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

13. Click the **Alert** tab; the Alert page opens.
14. In the **Triggering Condition** area, specify the event that will trigger the alert:
  - a. In the **Condition** field, the default setting is **User Consumes More Than *n***, where *n* represents a value that you define in the **Value** field. No other conditions are available.
  - b. In the **Value** field, type a numeric value that represents the storage usage limit for the quota. If the storage entities selected for the quota (for example, users and user groups) exceed this limit, the quota is triggered.
  - c. In the **Value Units** field, select the unit of measurement: kilobytes, megabytes, or gigabytes.
15. In the **Triggered Actions** area, select the actions that occur as a result of the triggering condition You can choose from the following actions:

**SNMP trap**

An SNMP trap is sent to any NMS, console, or terminal when the condition occurs.

**TEC / OMNIbus Event**

A IBM Tivoli Enterprise Console event is sent when the condition occurs. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze Tivoli Storage Productivity Center events according to the event definitions specified in the tivoliSRM.baroc file (provided with the product). It also performs responses such as sending further notification, creating or updating trouble tickets, running programs, and so on.

**Login notification**

The alert is sent to a Tivoli Storage Productivity Center user. The user receives the alert upon logging in to Tivoli Storage Productivity Center. In the **Login ID** field, type the user ID.

**Login ID**

The ID of the user who receives alert notification upon logging in to the system.

**Windows Event Log, UNIX Syslog**

The ID of the user who receives alert notification upon logging in to the system.

**Event Type (Windows Event Log only)**

The type of event that is recorded to the OS log.

**Facility (UNIX Syslog only)**

The location where the UNIX Syslog is sent. You can select User or Local.

### Level (UNIX Syslog only)

The level of UNIX Syslog event. You can select Informational, Notice, Warning, Error, Critical, or Alert.

### Run script

A script is run when the condition occurs. Click **Define** to specify the script that is run when the triggering condition occurs. The parameters listed in the **Specify Script** window are passed to the script when the alert is triggered

**E-mail** An e-mail is sent. Click **Add** or **Delete** to edit the list of e-mail addresses to which an e-mail is sent. Click **Edit e-mail** to change the actual e-mail message.

16. Save the quota:
  - a. Click **File > Save**. The Save As window opens.
  - b. In the **Specify Quota name** field, type a name for the quota and click **OK**. The quota is displayed in the navigation tree pane

## Creating an instance quota

Learn how to create a quota that generates an alert when a user or group of users consumes more than a specified amount of RDBMS storage space across instances, computers, and groups of computers.

To create an instance quota, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager for Databases > Policy Management > Quotas**.
2. Select the level at which you want to apply the quota by right-clicking **Instance**.
3. Select **Create Quota** from the pop-up menu. The Create Quota window opens.
4. In the **Description** field, type a brief description of the quota.
5. Select a profile from the **Profile** selection list to control which storage usage statistics are used when checking for quota violations. You can select any of the GROUP\_BY\_OWNER type profiles shown.
6. Select users or user groups against which you want to apply the quota:
  - a. In the **Available** field, click the users or groups of users against which you want to apply the quota.
  - b. Click . The users or groups are moved to the **Current Selections** field.
7. Click the **Instances** tab; the Instances page opens.
8. Select the instances, computers, and computer groups on which you want to limit the storage usage of users and user groups.
  - a. In the **Available** field, click the storage resources to which you want to apply the quota. The groups displayed in this field were created using **Data Manager for Databases > Monitoring > Groups**.
  - b. Click . The resources are moved to the **Current Selections** field.
9. Click the **When to Run** tab; the When to Run page opens.
10. In the **How often to run** area, schedule how often you want the quota to be checked. You can choose from the following actions:

### Run Now

Check the quota immediately.

### Run Once at

Check the quota once at a specified time and date. You can use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start time. This ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

### Run Repeatedly

Check the quota repeatedly according to a schedule you specify. You can:

- Use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM when the job should begin running.
- Indicate how often the job should run. You can use the drop-down lists to specify the number of minutes, hours, days, weeks, or months.
- Indicate which days on which run the job. A check mark is displayed next to the days you select.

11. In the **How to Handle Time Zones** area, indicate the time zone to be used when scheduling and running the policy. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:
  - a. 9:00 AM of the time zone where the Data server resides
  - b. 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

### Use the timezone that the server runs in

Select this option to use the time zone of the location where the Data server resides.

### Use this timezone

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

12. Click the **Alert** tab; the Alert page opens.
13. In the **Triggering Condition** area, specify the event that will trigger the alert:
  - a. In the **Condition** field, the default setting is **User Consumes More Than *n***, where *n* represents a value that you define in the **Value** field. No other conditions are available.
  - b. In the **Value** field, type a numeric value that represents the storage usage limit for the quota. If the storage entities selected for the quota (for example, users and user groups) exceed this limit, the quota is triggered.
  - c. In the **Value Units** field, select the unit of measurement: kilobytes, megabytes, or gigabytes.
14. In the **Triggered Actions** area, select the actions that occur as a result of the triggering condition You can choose from the following actions:

### SNMP trap

An SNMP trap is sent to any NMS, console, or terminal when the condition occurs.

### **TEC / OMNIbus Event**

A IBM Tivoli Enterprise Console event is sent when the condition occurs. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze Tivoli Storage Productivity Center events according to the event definitions specified in the tivoliSRM.baroc file (provided with the product). It also performs responses such as sending further notification, creating or updating trouble tickets, running programs, and so on.

### **Login notification**

The alert is sent to a Tivoli Storage Productivity Center user. The user receives the alert upon logging in to Tivoli Storage Productivity Center. In the **Login ID** field, type the user ID.

### **Login ID**

The ID of the user who receives alert notification upon logging in to the system.

### **Windows Event Log, UNIX Syslog**

The ID of the user who receives alert notification upon logging in to the system.

### **Event Type (Windows Event Log only)**

The type of event that is recorded to the OS log.

### **Facility (UNIX Syslog only)**

The location where the UNIX Syslog is sent. You can select User or Local.

### **Level (UNIX Syslog only)**

The level of UNIX Syslog event. You can select Informational, Notice, Warning, Error, Critical, or Alert.

### **Run script**

A script is run when the condition occurs. Click **Define** to specify the script that is run when the triggering condition occurs. The parameters listed in the **Specify Script** window are passed to the script when the alert is triggered.

**E-mail** An e-mail is sent. Click **Add** or **Delete** to edit the list of e-mail addresses to which an e-mail is sent. Click **Edit e-mail** to change the actual e-mail message.

15. Save the quota:
  - a. Click **File > Save**. The Save As window opens.
  - b. In the **Specify Quota name** field, type a name for the quota and click **OK**. The quota is displayed in the navigation tree pane.

## **Creating a database-tablespace quota**

Learn how to create a quota that generates an alert when a user or group of users consumes more than a specified amount of RDBMS storage space across databases, tablespaces, groups of databases, and groups of tablespaces.

To create a databases-tablespaces quota, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager for Databases > Policy Management > Quotas**.
2. Select the level at which you want to apply the quota by right-clicking **Databases-Tablespaces**.
3. Select **Create Quota** from the pop-up menu. The Create Quota window opens.

4. In the **Description** field, type a brief description of the quota.
5. Select a profile from the **Profile** selection list to control which storage usage statistics are used when checking for quota violations. You can select any of the GROUP\_BY\_OWNER type profiles shown. Make sure that the selected profile is used in scans of all the databases and tablespaces chosen on the **Databases-Tablespaces** tab. This ensures that the quota is fairly enforced for all users.
6. Select users or user groups against which you want to apply the quota:
  - a. In the **Available** field, click the users or groups of users against which you want to apply the quota.
  - b. Click . The users or groups are moved to the **Current Selections** field.
7. Click the **Databases-Tablespaces** tab; the Databases-Tablespaces page opens.
8. Select the databases, tablespaces, database-tablespaces groups, computers, and computer groups on which you want to limit the storage usage of users and user groups.
  - a. In the **Available** field, click the storage resources to which you want to apply the quota. The groups displayed in this field were created using **Data Manager for Databases > Monitoring > Groups**.
  - b. Click . The resources are moved to the **Current Selections** field.
9. Click the **When to Run** tab; the When to Run page opens.
10. In the **How often to run** area, schedule how often you want the quota to be checked. You can choose from the following actions:

**Run Now**

Check the quota immediately.

**Run Once at**

Check the quota once at a specified time and date. You can use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start time. This ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

**Run Repeatedly**

Check the quota repeatedly according to a schedule you specify. You can:

- Use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM when the job should begin running.
- Indicate how often the job should run. You can use the drop-down lists to specify the number of minutes, hours, days, weeks, or months.
- Indicate which days on which run the job. A check mark is displayed next to the days you select.

11. In the **How to Handle Time Zones** area, indicate the time zone to be used when scheduling and running the policy. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:
  - a. 9:00 AM of the time zone where the Data server resides

- b. 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

**Use the timezone that the server runs in**

Select this option to use the time zone of the location where the Data server resides.

**Use this timezone**

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

12. Click the **Alert** tab; the Alert page opens.
13. In the **Triggering Condition** area, specify the event that will trigger the alert:
  - a. In the **Condition** field, the default setting is **User Consumes More Than *n***, where *n* represents a value that you define in the **Value** field. No other conditions are available.
  - b. In the **Value** field, type a numeric value that represents the storage usage limit for the quota. If the storage entities selected for the quota (for example, users and user groups) exceed this limit, the quota is triggered.
  - c. In the **Value Units** field, select the unit of measurement: kilobytes, megabytes, or gigabytes.
14. In the **Triggered Actions** area, select the actions that occur as a result of the triggering condition You can choose from the following actions:

**SNMP trap**

An SNMP trap is sent to any NMS, console, or terminal when the condition occurs.

**TEC / OMNIbus Event**

A IBM Tivoli Enterprise Console event is sent when the condition occurs. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze Tivoli Storage Productivity Center events according to the event definitions specified in the tivoliSRM.baroc file (provided with the product). It also performs responses such as sending further notification, creating or updating trouble tickets, running programs, and so on.

**Login notification**

The alert is sent to a Tivoli Storage Productivity Center user. The user receives the alert upon logging in to Tivoli Storage Productivity Center. In the **Login ID** field, type the user ID.

**Login ID**

The ID of the user who receives alert notification upon logging in to the system.

**Windows Event Log, UNIX Syslog**

The ID of the user who receives alert notification upon logging in to the system.

**Event Type (Windows Event Log only)**

The type of event that is recorded to the OS log.

**Facility (UNIX Syslog only)**

The location where the UNIX Syslog is sent. You can select User or Local.

### Level (UNIX Syslog only)

The level of UNIX Syslog event. You can select Informational, Notice, Warning, Error, Critical, or Alert.

### Run script

A script is run when the condition occurs. Click **Define** to specify the script that is run when the triggering condition occurs. The parameters listed in the **Specify Script** window are passed to the script when the alert is triggered

**E-mail** An e-mail is sent. Click **Add** or **Delete** to edit the list of e-mail addresses to which an e-mail is sent. Click **Edit e-mail** to change the actual e-mail message.

15. Save the quota:
  - a. Click **File > Save**. The Save As window opens.
  - b. In the **Specify Quota name** field, type a name for the quota and click **OK**. The quota is displayed in the navigation tree pane

## Editing a storage usage quota

Learn how to change the settings for a quota, including the users or user groups to which the quota applies, the resources on which the quota is set, and the amount set as the limit for storage usage.

To edit a quota, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager > Policy Management > Quotas**.
2. Expand the **User** or **OS User Group** node depending upon the type of quota you want to edit.
3. Expand the level of the quota you want to edit. For example, if you want to edit a computer quota, expand the **Computer** node.
4. Select the quota you want to edit. Information about the quota you want to edit appears in the right-hand content pane.
5. In the **Description** field, type a brief description of the quota.
6. Select a profile from the **Profile** selection list to control which storage usage statistics are used when checking for quota violations. You can select any of the GROUP\_BY\_OWNER type profiles shown.
7. Select additional users or user groups against which you want to apply the quota:
  - a. In the **Available** field, click the users or groups of users against which you want to apply the quota. The groups displayed in this field were created using **Data Manager > Monitoring > Groups**
  - b. Click . The users or groups are moved to the **Current Selections** field.
8. Remove users or user groups previously included in the quota:
  - a. In the **Current Selections** field, click the users or groups of users that you want to remove from the quota.
  - b. Click . The users or groups are moved back to the **Available** field.
9. Click the **Computers** or **Filesystems** tab depending on quota you are editing; the Computers or Filesystems page opens.

10. Select additional filesystems, filesystem groups, computers, or computers groups on which you want to limit the storage usage of users and user groups.
  - a. In the **Available** field, click the storage resources to which you want to apply the quota. The groups displayed in this field were created using **Data Manager > Monitoring > Groups**.
  - b. Click . The resources are moved to the **Current Selections** field.
11. Remove any filesystems, filesystem groups, computers, or computers groups that you do not want included in the quota.
  - a. In the **Current Selections** field, click the storage resources to remove.
  - b. Click . The resources are moved to the **Current Selections** field.
12. Click the **When to Run** tab; the When to Run page opens.
13. In the **How often to run** area, schedule how often you want the quota to be checked. You can choose from the following actions:

**Run Now**

Check the quota immediately.

**Run Once at**

Check the quota once at a specified time and date. You can use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start time. This ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

**Run Repeatedly**

Check the quota repeatedly according to a schedule you specify. You can:

- Use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM when the job should begin running.
- Indicate how often the job should run. You can use the drop-down lists to specify the number of minutes, hours, days, weeks, or months.
- Indicate which days on which run the job. A check mark is displayed next to the days you select.

14. In the **How to Handle Time Zones** area, indicate the time zone to be used when scheduling and running the policy. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:
  - a. 9:00 AM of the time zone where the Data server resides
  - b. 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

**Use the timezone that the server runs in**

Select this option to use the time zone of the location where the Data server resides.

**Use this timezone**

Select this option to indicate a specific time zone for when to run the

job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

15. Click the **Alert** tab; the Alert page opens.
16. In the **Triggering Condition** area, specify the event that will trigger the alert:
  - a. In the **Condition** field, the default setting is **User Consumes More Than *n***, where *n* represents a value that you define in the **Value** field. No other conditions are available.
  - b. In the **Value** field, type a numeric value that represents the storage usage limit for the quota. If the storage entities selected for the quota (for example, users and user groups) exceed this limit, the quota is triggered.
  - c. In the **Value Units** field, select the unit of measurement: kilobytes, megabytes, or gigabytes.
17. Click **File > Save** to save your changes.

### Editing a storage usage quota for databases

Learn how to change the settings for a quota, including the users or user groups to which the quota applies, the resources on which the quota is set, and the amount set as the limit for storage usage.

To edit a quota, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager for Databases > Policy Management > Quotas**.
2. Expand the level of the quota you want to edit. For example, if you want to edit a instance quota, expand the **Instance** node.
3. Click the quota you want to edit. Information about the quota you want to edit appears in the right-hand content pane.
4. In the **Description** field, type a brief description of the quota.
5. Select a profile from the **Profile** selection list to control which storage usage statistics are used when checking for quota violations. You can select any of the GROUP\_BY\_OWNER type profiles shown.
6. Select additional users or user groups against which you want to apply the quota:
  - a. In the **Available** field, click the users or groups of users against which you want to apply the quota. The groups displayed in this field were created using **Data Manager > Monitoring > Groups**
  - b. Click . The users or groups are moved to the **Current Selections** field.
7. Remove users or user groups previously included in the quota:
  - a. In the **Current Selections** field, click the users or groups of users that you want to remove from the quota.
  - b. Click . The users or groups are moved back to the **Available** field.
8. Click the **Databases-Tablespaces** or **Instances** tab depending on quota you are editing; the Databases-Tablespaces or Instances page opens.
9. Select additional databases, tablespaces, instances, computers, or computers groups on which you want to limit the storage usage of users and user groups.
  - a. In the **Available** field, click the storage resources to which you want to apply the quota. The groups displayed in this field were created using **Data Manager for Databases > Monitoring > Groups**.

- b. Click . The resources are moved to the **Current Selections** field.
10. Remove any databases, tablespaces, instances, computers, or computers groups that you do not want included in the quota.
  - a. In the **Current Selections** field, click the storage resources to remove.
    - b. Click . The resources are moved to the **Current Selections** field.
11. Click the **When to Run** tab; the When to Run page opens.
12. In the **How often to run** area, schedule how often you want the quota to be checked. You can choose from the following actions:

#### Run Now

Check the quota immediately.

#### Run Once at

Check the quota once at a specified time and date. You can use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start time. This ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

#### Run Repeatedly

Check the quota repeatedly according to a schedule you specify. You can:

- Use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM when the job should begin running.
  - Indicate how often the job should run. You can use the drop-down lists to specify the number of minutes, hours, days, weeks, or months.
  - Indicate which days on which run the job. A check mark is displayed next to the days you select.
13. In the **How to Handle Time Zones** area, indicate the time zone to be used when scheduling and running the policy. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:
    - a. 9:00 AM of the time zone where the Data server resides
    - b. 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

#### Use the timezone that the server runs in

Select this option to use the time zone of the location where the Data server resides.

#### Use this timezone

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

14. Click the **Alert** tab; the Alert page opens.
15. In the **Triggering Condition** area, specify the event that will trigger the alert:
  - a. In the **Condition** field, the default setting is **User Consumes More Than *n***, where *n* represents a value that you define in the **Value** field. No other conditions are available.

- b. In the **Value** field, type a numeric value that represents the storage usage limit for the quota. If the storage entities selected for the quota (for example, users and user groups) exceed this limit, the quota is triggered.
  - c. In the **Value Units** field, select the unit of measurement: kilobytes, megabytes, or gigabytes.
16. Click **File** > **Save** to save your changes.

## Storage usage for Network Appliance quotas

Use Network Appliance quotas to import quotas from Network Appliance file servers and determine how and when you will be alerted to the hard limits defined in those quotas.

**Restriction:** You can only import quotas if the NetApp device is configured as a file server. It is not available if the NetApp device was added only as a CIMOM.

You can use the NAS support within IBM Tivoli Storage Productivity Center to work with quotas defined using the software provided with Network Appliance (NetApp) File Servers. Using the **Network Appliance** node under **Policy Management**, you can do the following:

- Use the **Schedules** node to define a Data Manager quota that will import NetApp quotas and alert you to when those quotas are close to being exceeded.
- Use the **Imported User Quotas** node to view the definitions of User quotas stored on the NetApp file servers against which you ran a Data Manager quota (defined in the **Schedules** node).
- Use the **Imported OS User Group Quotas** node to view the definitions of OS User Group quotas stored on the NetApp file servers against which you ran a Data Manager quota (defined in the **Schedules** node).

For example, you can define to be alerted when:

- A user or user group is close to reaching the hard limit defined within the corresponding NetApp Quota
- The space consumed on a QTree is approaching the hard limit defined within the corresponding NetApp Quota

Specifically, the Data Manager NAS component enables you to work with the following types of Network Appliance quotas:

- Quotas that limit the space that QTree directories can consume on a volume
- Quotas that limit the space consumed by specific users on a volume
- Quotas that limit the space consumed by specific user groups on a volume

### Quick Steps for Working with Network Appliance quotas

The following describes the general steps you must perform to work with Network Appliance Quotas:

1. Run a Data Manager scan against the Network Appliance file servers whose quotas you want to check. This ensures that Data Manager is using the latest statistics when determining quota violations.
2. Expand **Policy Management** > **Network Appliance Quotas**.
3. Right click the **Schedules** node and select **Create NetApp Quota Job** to define a quota job. The NetApp Quota window appears.
4. Use the tabs in the NetApp Quota window to specify:
  - the Network Appliance file servers whose quotas you want to import

- when and how often to run the quota
  - the condition (% of hard limit) that will trigger an alert for the Network Appliance quotas and how you will be notified of that alert. For example, if you enter 90% for the alert condition, Data Manager will notify you whenever any of the quotas you are importing are within 10% of being violated.
5. Run the quota job from the **Schedules** node to import the Network Appliance quota definitions from the target NAS filer. When quotas are imported, the following occurs:
    - any User or OS User Group quotas violations are shown in the Quota Violation reports
    - any directory quota (Qtree) violations and definitions are displayed in **Alert Log >> Directory**.

## Creating a Network Appliance storage usage quota

Learn how to create a Network Appliance storage usage quota that imports Network Appliance quotas from filers and alert you to violations of those quotas.

Complete the following steps to:

- define the NetApp filers whose quotas you want to import
  - determine when and how often to run the quota that checks for user-defined violations (% of hard limit) of NetApp Quotas
  - specify the condition (% of hard limit) that will trigger an alert violation for a quota and how you will be notified of that alert
1. In the Navigation tree pane, expand **Data Manager > Policy Management > Network Appliance Quotas**.
  2. Right click the **Schedules** node.
  3. Select **New NetApp Quota Job** from the pop-up menu. The content pane displays the What to PROBE page.
  4. In the **Description** field, type a brief description of the quota.
  5. Select the NetApp filers against which you want to run the quota job:
    - a. In the **Available** field, click the NetApp filers or NetApp filer groups against which you want to apply the quota.
    - b. Click . The NetApp filers or NetApp filer groups are moved to the **Current Selections** field.
  6. Click the **When to Run** tab; the When to Run page opens.
  7. In the **How often to run** area, schedule how often you want the quota to be checked. You can choose from the following actions:

### Run Now

Check the quota immediately.

### Run Once at

Check the quota once at a specified time and date. You can use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start time. This ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

### Run Repeatedly

Check the quota repeatedly according to a schedule you specify. You can:

- Use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM when the job should begin running.
  - Indicate how often the job should run. You can use the drop-down lists to specify the number of minutes, hours, days, weeks, or months.
  - Indicate which days on which run the job. A check mark is displayed next to the days you select.
8. In the **How to Handle Time Zones** area, indicate the time zone to be used when scheduling and running the policy. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:
- a. 9:00 AM of the time zone where the Data server resides
  - b. 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

### Use the timezone that the server runs in

Select this option to use the time zone of the location where the Data server resides.

### Use this timezone

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

9. Click the **Alert** tab; the Alert page opens.
10. In the **Triggering Condition** area, specify the event that will trigger the alert:
- a. In the **Condition** field, the default setting is **User Consumes More Than *n***, where *n* represents a value that you define in the **Value** field. No other conditions are available.
  - b. In the **Value** field, enter the value that represents the percentage of a NetApp's hard limit at which the alert is triggered. The hard limit represents the most amount of space a user or directory (Qtree) can consume on a NAS filer. For example, if the hard limit defined within a NetApp Quota for a user group is 150 MB, and you enter **90** in the **Value** field, the Data Manager quota will report a violation when that user group consumes 135 or more megabytes.
  - c. In the **Value Units** field, the only value units available is the % of Hard Limit.
11. In the **Triggered Actions** area, select the actions that occur as a result of the triggering condition You can choose from the following actions:

### SNMP trap

An SNMP trap is sent to any NMS, console, or terminal when the condition occurs.

### TEC / OMNIBus Event

A IBM Tivoli Enterprise Console event is sent when the condition occurs. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze Tivoli Storage Productivity Center events according to the event definitions specified in the tivoliSRM.baroc file (provided with the product). It also performs responses such as sending further notification, creating or updating trouble tickets, running programs, and so on.

**Login notification**

The alert is sent to a Tivoli Storage Productivity Center user. The user receives the alert upon logging in to Tivoli Storage Productivity Center. In the **Login ID** field, type the user ID.

**Login ID**

The ID of the user who receives alert notification upon logging in to the system.

**Windows Event Log, UNIX Syslog**

The ID of the user who receives alert notification upon logging in to the system.

**Event Type (Windows Event Log only)**

The type of event that is recorded to the OS log.

**Facility (UNIX Syslog only)**

The location where the UNIX Syslog is sent. You can select User or Local.

**Level (UNIX Syslog only)**

The level of UNIX Syslog event. You can select Informational, Notice, Warning, Error, Critical, or Alert.

**Run script**

A script is run when the condition occurs. Click **Define** to specify the script that is run when the triggering condition occurs. The parameters listed in the **Specify Script** window are passed to the script when the alert is triggered

**E-mail** An e-mail is sent. Click **Add** or **Delete** to edit the list of e-mail addresses to which an e-mail is sent. Click **Edit e-mail** to change the actual e-mail message.

12. Save the quota:
  - a. Click **File > Save**. The Save As window opens.
  - b. In the **Specify NetApp Quota job name** field, type a name for the quota and click **OK**. The quota is displayed in the Navigation Tree pane

**Viewing user quotas imported from Network Appliance filers**

Learn how to view the definitions of user quotas stored on the NetApp filers against which you ran a Data Manager quota.

Before you can import Network Appliance user quotas and view them through **Data Manager > Policy Management > Network Appliance Quotas > Imported User Quotas**, you must:

1. Run a scan against the Network Appliance filers whose user quotas you want to import.
2. Use **Policy Management > Network Appliance Quotas > Schedules** to define and run a quota checking job against the NetApp filers whose user quotas you want to import.

Complete the following steps to view imported Network Appliance user quotas:

1. In the Navigation tree pane, expand **Data Manager > Policy Management > Network Appliance Quotas > Imported User Quotas**.
2. Click the NetApp Quota whose definition you want to view. The content pane displays information about the NetApp user quota.
3. In the Users page of the Edit *quota\_name* window, view the following information about imported Network Appliance user quotas:

### Hard Limit

The hard limit for used space defined within the NetApp quota.

### Current Selections

The users against which the NetApp quota applies.

4. In the Filesystems page of the Edit *quota\_name* window, view the filesystems to which the NetApp Quota applies.

## Viewing OS user quotas imported from Network Appliance filers

Learn how to view the definitions of OS User Quotas stored on the NetApp filers against which you ran a Data Manager quota.

Before you can import Network Appliance OS user quotas and view them through **Data Manager > Policy Management > Network Appliance Quotas > Imported OS User Group Quotas**, you must:

1. Run a scan against the Network Appliance filers whose OS user quotas you want to import.
2. Use **Policy Management > Network Appliance Quotas > Schedules** to define and run a quota checking job against the NetApp filers whose OS user quotas you want to import.

Complete the following steps to view imported Network Appliance OS user quotas:

1. In the Navigation tree pane, expand **Data Manager > Policy Management > Network Appliance Quotas > Imported OS User Quotas**.
2. Click the NetApp Quota whose definition you want to view. The content pane displays information about the NetApp OS user quota.
3. In the OS Users page of the Edit *quota\_name* window, view the following information about imported Network Appliance OS user quotas:

### Hard Limit

The hard limit for used space defined within the NetApp quota.

### Current Selections

The OS users against which the NetApp quota applies.

4. In the Filesystems page of the Edit *quota\_name* window, view the filesystems to which the NetApp Quota applies.

## Viewing directory (QTree) quotas and violations

Learn how to view the definitions of user quotas stored on the Network Appliance filers against which you ran a Data Manager quota.

Before you can view QTree quotas and violations, perform the following steps:

1. Use **Policy Management > Network Appliance Quotas > Schedules** to define and run a quota checking job against the Network Appliance filers containing the QTree quotas you want to import.
2. Create and run a scan job that includes the following objects:
  - the NetApp filers containing the QTrees whose quotas you want to import
  - the directory group named TPCUser.NetApp QTree Group
3. Use **Policy Management > Network Appliance Quotas > Schedules** to rerun the quota checking job you defined in step 1.

Complete the following steps to view a QTree quota violation and definition:

1. In the Navigation tree pane, expand **Alerting > Alert Log**.

2. Click the **Directory** node. The Alert History — All Directories window appears. This window lists all the alerts triggered by directory and QTree quota violations.
3. To view details about a violation you can do either of the following:
  - Double click the entry representing the QTree violation to view details about that violation and the QTree quota definition.
  - Right click the entry representing the QTree violation and select **Edit Definition** from the pop-up menu to view the QTree quota definition.

**Note:** You cannot edit a QTree quota definition using Data Manager. To edit a QTree quota definition you must use the software provided with your Network Appliance filer.

## Setting file constraints

Use constraints to define the acceptable and unacceptable file types, file sizes, and file owners for a NAS filer or a set of NAS filers in your environment. You can also use constraints to request an IBM Tivoli Storage Manager archive and backup of the largest violating files identified by a constraint.

### Creating a file constraint

Learn how to create a constraint that defines the acceptable and unacceptable file types, file sizes, and file owners for a computer or a set of computers in your environment.

To create a constraint, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager > Policy Management**.
2. Right-click **Constraints**, and click **Create Constraint**. The Create Constraint window opens.
3. In the **Description** field, type a brief description of the job.
4. Select file systems, file system groups, computers, and computer groups against which to apply the constraint:
  - a. In the **Available** field, click the storage resources against which you want to apply the constraint. Select individual filesystems and computers, as well as file system and computer groups that you have previously defined using the group facility. Note that cluster resource groups in a PowerHA or MSCS clustered environment are listed as computers.
  - b. Click . The storage resources are moved to the **Current Selections** field.
5. Click the **File Types** tab; the File Types page opens. Use this page to select the file types that you want to allow or forbid.
6. Click one of the following:
 

**Forbid file matching these patterns**  
Do *not* allow files of the specified type on the storage resources selected on the Filesystems page.

**Allow ONLY file matching these patterns**  
Allow files *only* of the specified type on the storage resources selected on the Filesystems page.
7. Click the file types that you would like to allow or forbid in the **Choose a file type** list box. The file types listed in this box are predefined in the system.
  - a. In the **Choose a file type:** field, click the file types that you would like to allow or forbid.

- b. Click . The file types are moved to the **Forbidden files** field.
- 8. Optionally, create a custom file type:
  - a. Enter the pattern in the **Or enter a pattern** field.
  - b. Click . The file type is moved to the **Forbidden files** field.
- 9. Click the **Users** tab; the Users page opens. Use this page to allow or forbid files owned by specific users
- 10. Click one of the following:

**Forbid file owned by selected users**

Do *not* allow files owned by the specified users.

**Allow ONLY file owned by the specified owner**

Allow files owned by the specified users only.

- 11. Select the users whose files you want to allow or forbid:
  - a. In the **Available Users** field, click the users you want to include.
  - b. Click . The users are moved to the **Forbidden Users** field.
- 12. Click the **Options** tab; the Options page opens. Use this page to define alerts for files based on characteristics other than file type and file owner, and to view a where clause that will be used as a filter for locating files that violate the constraint definition. This page contains the following information:

**Violating File Limits**

Indicate the maximum number of violating filenames that should be kept per agent.

**number of days since last access greater than**

Click this box and enter a length of time (in days) in which files have not been accessed. When a constraint job locates a file that has not been accessed in the length of time you indicated in this field, an alert is triggered.

**bigger than ##**

Check this box and enter a file size that should trigger an alert. When a constraint job locates a file of the size (or greater) that you indicated in this field, an alert is triggered. Select the unit of measurement for the value you entered in the list box. The valid choices are: bytes, **KB** (kilobytes)**MB** (megabytes), **GB** (gigabytes), and **TB** (terabytes).

**set-UID root**

Check this box trigger alerts on files that have the SET-UID root bit on (because this can be a security consideration).

**not backed up (Windows only) and number of days since last modification greater than**

Click this box and enter the number of days since a file was last modified and not backed up. When the constraint job locates a file that was modified and not backed up in the amount of days that you indicate in this field, an alert is triggered.

**File Filter text**

This section displays a *where* clause that will be used as a filter for locating files that violate the Constraint definition. The choices you make on this tab and the choices you made on the Users and File Types pages are reflected in the content of this *where* clause. To edit

the *where* clause filter text, click **Edit Filter**. This will allow you to create new where conditions and groupings using the where clause interface.

13. Click the **Alert** tab; the Alert page opens. Use the Alert tab to define the alerting criteria for a constraint.
14. In the **Triggering Condition** area, specify the event that will trigger the constraint alert:
  - a. In the **Condition** field, the default setting is **User Consumes More Than *n***, where *n* represents a value that you define in the **Value** field. No other conditions are available.
  - b. In the **Value** field, type a numeric value that represents the amount of space a file must consume to violate the constraint.
  - c. In the **Value Units** field, select the unit of measurement: kilobytes, megabytes, or gigabytes.

Once Data Manager has found enough files that violate the condition (i.e., that exceed the total size amount you specified in this section), the constraint is considered violated and the alert is triggered. When the alert is triggered, the actions that you specify in the **Triggered Actions** section are taken.

15. In the **Triggered Actions** area, select the actions that occur as a result of the triggering condition You can choose from the following actions:

**SNMP trap**

An SNMP trap is sent to any NMS, console, or terminal when the condition occurs.

**TEC / OMNIbus Event**

A IBM Tivoli Enterprise Console event is sent when the condition occurs. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze Tivoli Storage Productivity Center events according to the event definitions specified in the tivoliSRM.baroc file (provided with the product). It also performs responses such as sending further notification, creating or updating trouble tickets, running programs, and so on.

**Login notification**

The alert is sent to a Tivoli Storage Productivity Center user. The user receives the alert upon logging in to Tivoli Storage Productivity Center. In the **Login ID** field, type the user ID.

**Login ID**

The ID of the user who receives alert notification upon logging in to the system.

**Windows Event Log, UNIX Syslog**

The ID of the user who receives alert notification upon logging in to the system.

**Event Type (Windows Event Log only)**

The type of event that is recorded to the OS log.

**Facility (UNIX Syslog only)**

The location where the UNIX Syslog is sent. You can select User or Local.

**Level (UNIX Syslog only)**

The level of UNIX Syslog event. You can select Informational, Notice, Warning, Error, Critical, or Alert.

### Run script

A script is run when the condition occurs. Click **Define** to specify the script that is run when the triggering condition occurs. The parameters listed in the **Specify Script** window are passed to the script when the alert is triggered

**E-mail** An e-mail is sent. Click **Add** or **Delete** to edit the list of e-mail addresses to which an e-mail is sent. Click **Edit e-mail** to change the actual e-mail message.

16. Save the constraint:

- a. Click **File > Save**. The Save As window opens.
- b. In the **Specify Constraint name** field, type a name for the constraint and click **OK**. The constraint is displayed in the navigation tree pane. The constraint is automatically checked whenever an appropriate scan job is run.

### Editing a constraint

Edit a constraint to: change the acceptable and unacceptable file types, file sizes, and file owners, add or remove users and user groups to which the constraint applies, edit the constraint options, and change the alert settings.

To edit a constraint, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager > Policy Management > Constraints**.
2. Click the constraint you want to edit. Information about the constraint you want to edit appears in the content pane.
3. Add or remove the filesystems, filesystem groups, computers, and computer groups against which to apply the constraint:
  - a. In the **Available** field, click the storage resources that you want add. Click . The users or groups are moved to the **Current Selections** field.
  - b. In the **Current Selections** field, click the storage resources that you want remove from the constraint. Click . The users or groups are moved to the **Available** field.
4. Click the **File Types** tab; the File Types page opens. Use this page to edit the file types that you want to allow or forbid.
5. Click one of the following:

#### Forbid file matching these patterns

Do *not* allow files of the specified type on the storage resources selected on the Filesystems page.

#### Allow ONLY file matching these patterns

Allow files *only* of the specified type on the storage resources selected on the Filesystems page.

6. Click the file types that you would like to allow or forbid in the **Choose a file type** list box. The file types listed in this box are predefined in the system.
  - a. In the **Choose a file type:** field, click the file types that you would like to allow or forbid.
  - b. Click . The file types are moved to the **Forbidden files** field.
7. Optionally, create a custom file type:
  - a. Enter the pattern in the **Or enter a pattern** field.

- b. Click . The file type is moved to the **Forbidden files** field.
8. Click the **Users** tab; the Users page opens. Use this page to allow or forbid files owned by specific users
9. Click one of the following:
  - Forbid file owned by selected users**  
Do *not* allow files owned by the specified users.
  - Allow ONLY file owned by the specified owner**  
Allow files owned by the specified users only.
10. Select the users whose files you want to allow or forbid:
  - a. In the **Available Users** field, click the users you want to include.
  - b. Click . The users are moved to the **Forbidden Users** field.
11. Click the **Options** tab; the Options page opens. Use this page to edit alerts for files based on characteristics other than file type and file owner, and to view a where clause that will be used as a filter for locating files that violate the constraint definition. This page contains the following information:
  - Violating File Limits**  
Indicate the maximum number of violating filenames that should be kept per agent.
  - number of days since last access greater than**  
Click this box and enter a length of time (in days) in which files have not been accessed. When a constraint job locates a file that has not been accessed in the length of time you indicated in this field, an alert is triggered.
  - bigger than ##**  
Check this box and enter a file size that should trigger an alert. When a constraint job locates a file of the size (or greater) that you indicated in this field, an alert is triggered. Select the unit of measurement for the value you entered in the list box. The valid choices are: bytes, **KB** (kilobytes), **MB** (megabytes), **GB** (gigabytes), and **TB** (terabytes).
  - set-UID root**  
Check this box trigger alerts on files that have the SET-UID root bit on (because this can be a security consideration).
  - not backed up (Windows only) and number of days since last modification greater than**  
Click this box and enter the number of days since a file was last modified and not backed up. When the constraint job locates a file that was modified and not backed up in the amount of days that you indicate in this field, an alert is triggered.
  - File Filter text**  
This section displays a *where* clause that will be used as a filter for locating files that violate the Constraint definition. The choices you make on this tab and the choices you made on the Users and File Types pages are reflected in the content of this *where* clause. To edit the *where* clause filter text, click **Edit Filter**. This will allow you to create new where conditions and groupings using the where clause interface.
12. Click the **Alert** tab; the Alert page opens. Use the Alert tab to define the alerting criteria for a constraint.

13. In the **Triggering Condition** area, specify the event that will trigger the constraint alert:
  - a. In the **Condition** field, the default setting is **User Consumes More Than *n***, where *n* represents a value that you define in the **Value** field. No other conditions are available.
  - b. In the **Value** field, type a numeric value that represents the amount of space a file must consume to violate the constraint.
  - c. In the **Value Units** field, select the unit of measurement: kilobytes, megabytes, or gigabytes.

Once Data Manager has found enough files that violate the condition (i.e., that exceed the total size amount you specified in this section), the constraint is considered violated and the alert is triggered. When the alert is triggered, the actions that you specify in the **Triggered Actions** section are taken.

14. In the **Triggered Actions** area, select the actions that occur as a result of the triggering condition. You can choose from the following actions:

**SNMP trap**

An SNMP trap is sent to any NMS, console, or terminal when the condition occurs.

**TEC / OMNIbus Event**

A IBM Tivoli Enterprise Console event is sent when the condition occurs. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze Tivoli Storage Productivity Center events according to the event definitions specified in the tivoliSRM.baroc file (provided with the product). It also performs responses such as sending further notification, creating or updating trouble tickets, running programs, and so on.

**Login notification**

The alert is sent to a Tivoli Storage Productivity Center user. The user receives the alert upon logging in to Tivoli Storage Productivity Center. In the **Login ID** field, type the user ID.

**Login ID**

The ID of the user who receives alert notification upon logging in to the system.

**Windows Event Log, UNIX Syslog**

The ID of the user who receives alert notification upon logging in to the system.

**Event Type (Windows Event Log only)**

The type of event that is recorded to the OS log.

**Facility (UNIX Syslog only)**

The location where the UNIX Syslog is sent. You can select User or Local.

**Level (UNIX Syslog only)**

The level of UNIX Syslog event. You can select Informational, Notice, Warning, Error, Critical, or Alert.

**Run script**

A script is run when the condition occurs. Click **Define** to specify the script that is run when the triggering condition occurs. The parameters listed in the **Specify Script** window are passed to the script when the alert is triggered.

**E-mail** An e-mail is sent. Click **Add** or **Delete** to edit the list of e-mail addresses to which an e-mail is sent. Click **Edit e-mail** to change the actual e-mail message.

15. Click **File** > **Save** to save your changes.

### **Requesting an archive or backup**

Request an IBM Tivoli Storage Manager archive and backup of the largest violating files identified by a constraint. Tivoli Storage Manager protects your data from hardware failures and other errors by storing backup and archive copies of data on auxiliary storage.

Data Manager provides a method within the alerting function of a constraint where you can automatically start a Tivoli Storage Manager archive or backup to run against the files that violate that constraint. For example, you can do the following actions:

- Define a constraint to identify the .vbs files within your organization that are larger than 2 megabytes. Other file types include .avi, .dll, .doc, .exe, .gif, .jpg, .mp3, .rtf, .txt, .wsh, and .zip. You can also define a pattern to use when identifying files that need to be archived or backed up.
- Define a constraint that runs Tivoli Storage Manager to archive and then delete those files

### **Before you begin**

Before you can use the Tivoli Storage Manager archive and backup functions with Data Manager constraints, you must ensure that the following conditions are met:

- Your user ID has Administrator authority within Tivoli Storage Productivity Center.
- Tivoli Storage Manager client software is installed on each of the hosts where a Data agent or Storage Resource agent is used to perform archive and backup functions.
- (For SAN attached storage only) Tivoli Storage Manager client software must be installed on a host computer where a Data agent or Storage Resource agent is configured to act as the scanning agent for NAS storage.
- A Tivoli Storage Manager client must be configured to run without a password. This condition is typically done by either including the password in the client options (dsm.opt) file, or using the options `PASSWORDACCESS = GENERATE` in the client options file.
- The Tivoli Storage Manager client must be version 5.1 or higher

### **Defining an archive or backup in a constraint:**

Learn how to request an IBM Tivoli Storage Manager archive and backup of the largest violating files identified by a constraint. Request a Tivoli Storage Manager archive and backup on the alert page of a constraint definition.

### **Create a new constraint:**

1. In the Navigation tree pane, expand **Data Manager** > **Policy Management**.
2. Right-click **Constraints**, and click **Create Constraint**. The Create Constraint window opens.
3. Select filesystems, filesystem groups, computers, and computer groups against which to apply the constraint:

- a. In the **Available** field, click the storage resources against which you want to apply the constraint. Select individual filesystems and computers, as well as file system and computer groups that you have previously defined using the group facility. Note that cluster resource groups in a PowerHA or MSCS clustered environment are listed as computers.
  - b. Click . The users or groups are moved to the **Current Selections** field.
4. Click the **File Types** tab; the File Types page opens. Use this page to select the file types that you want to allow or forbid.
  5. Click one of the following:

**Forbid file matching these patterns**

Do *not* allow files of the specified type on the storage resources selected on the Filesystems page.

**Allow ONLY file matching these patterns**

Allow files *only* of the specified type on the storage resources selected on the Filesystems page.

6. Click the file types that you would like to allow or forbid in the **Choose a file type** list box. The file types listed in this box are predefined in the system.
  - a. In the **Choose a file type:** field, click the file types that you would like to allow or forbid.
  - b. Click . The file types are moved to the **Forbidden files** field.
7. Optionally, create a custom file type:
  - a. Enter the pattern in the **Or enter a pattern** field.
  - b. Click . The file type is moved to the **Forbidden files** field.
8. Click the **Users** tab; the Users page opens. Use this page to allow or forbid files owned by specific users
9. Click one of the following:

**Forbid file owned by selected users**

Do *not* allow files owned by the specified users.

**Allow ONLY file owned by the specified owner**

Allow files owned by the specified users only.

10. Select the users whose files you want to allow or forbid:
  - a. In the **Available Users** field, click the users you want to include.
  - b. Click . The users are moved to the **Forbidden Users** field.
11. Click the **Options** tab; the Options page opens. Use this page to define alerts for files based on characteristics other than file type and file owner, and to view a where clause that will be used as a filter for locating files that violate the constraint definition. This page contains the following information:

**Violating File Limits**

Indicate the maximum number of violating filenames that should be kept per agent.

**number of days since last access greater than**

Click this box and enter a length of time (in days) in which files have not been accessed. When a constraint job locates a file that has not been accessed in the length of time you indicated in this field, an alert is triggered.

**bigger than ##**

Check this box and enter a file size that should trigger an alert. When a constraint job locates a file of the size (or greater) that you indicated in this field, an alert is triggered. Select the unit of measurement for the value you entered in the list box. The valid choices are: bytes, **KB** (kilobytes), **MB** (megabytes), **GB** (gigabytes), and **TB** (terabytes).

**set-UID root**

Check this box trigger alerts on files that have the SET-UID root bit on (because this can be a security consideration).

**not backed up (Windows only) and number of days since last modification greater than**

Click this box and enter the number of days since a file was last modified and not backed up. When the constraint job locates a file that was modified and not backed up in the amount of days that you indicate in this field, an alert is triggered.

**File Filter text**

This section displays a *where* clause that will be used as a filter for locating files that violate the Constraint definition. The choices you make on this tab and the choices you made on the Users and File Types pages are reflected in the content of this *where* clause. To edit the *where* clause filter text, click **Edit Filter**. This will allow you to create new where conditions and groupings using the where clause interface.

12. Click the **Alert** tab; the Alert page opens. Use the Alert tab to define the alerting criteria for a constraint.
13. In the **Triggering Condition** area, specify the event that will trigger the constraint alert:
  - a. In the **Condition** field, the default setting is **User Consumes More Than *n***, where *n* represents a value that you define in the **Value** field. No other conditions are available.
  - b. In the **Value** field, type a numeric value that represents the amount of space a file must consume to violate the constraint.
  - c. In the **Value Units** field, select the unit of measurement: kilobytes, megabytes, or gigabytes.

Once Data Manager has found enough files that violate the condition (i.e., that exceed the total size amount you specified in this section), the constraint is considered violated and the alert is triggered. When the alert is triggered, the actions that you specify in the **Triggered Actions** section are taken.

14. In the **Triggered Actions** area, select **Archive/Backup** and click **Define**. The Archive / Backup Options window appears. Click one of the following:

**Archive**

Perform an archive on the files that violate a constraint. Archives are copies of data from online storage copies to offline storage. If you select the Archive option, you can also check the **Delete After Successful Archival** box to automatically delete the files that violated the constraint after the files have been successfully archived.

**Selective Backup**

Perform a selective backup of the files that violate a constraint. A selective backup enables you to back up specified files. These files are

not excluded in the include-exclude list and meet the requirement for serialization in the backup copy group of the management class assigned to each file.

### **Incremental Backup**

Perform an incremental backup of the files that violate a constraint. An incremental backup enables you to back up new or changed files or directories from a client domain or from specified directories or files. These directories or files are not excluded in the include-exclude list and meet the requirements for frequency, mode, and serialization as defined by a backup copy group of the management class assigned to each file.

### **Tivoli Storage Manager Command Options**

Enter additional that will be passed on to the Tivoli Storage Manager `dsmc` command. You can enter up to 512 bytes of text.

15. Save the constraint:
  - a. Click **File > Save**. The Save As window opens.
  - b. In the **Specify Constraint name** field, type a name for the constraint and click **OK**. The constraint is displayed in the navigation tree pane. The constraint is automatically checked whenever an appropriate scan job is run.

See the *IBM Tivoli Storage Manager Client User's Guide* for more information about each of the TSM actions you can select when defining triggered actions for a constraint.

## **Scheduling script-based actions**

Use scheduled actions to run user-defined scripts against selected computers and computer groups.

You can access the scheduled actions facility using either Data Manager or Data Manager for Chargeback. The actions that you schedule to run are based on user-defined scripts, allowing you to use any third-party tools for actions, such as recovery or provisioning. You can schedule scripts to run:

- Immediately
- Once at a specified time and date
- Repeatedly according to a schedule you specify

Select the option you want and then edit the time and date information accordingly. You can also select the time zone for the schedule you specify. You can either select the time zone that the Data server is in or any other time zone.

**Note:** Scheduled actions should not be confused with triggered actions. Triggered actions enable you to run scripts based upon conditions and alerts that are detected within your storage environment. Scheduled actions enable you to run scripts according to the schedule that you define, without having to associate the script with an alert.

### **Running scripts using scheduled actions**

Use the scheduled action facility to run a script according to a schedule that you define. The scheduled action facility is available in Data Manager and Data Manager for Databases.

Use scheduled actions to run scripts against selected computers and computer groups. The scheduled actions facility is script-based, so you can use any third-party tools for actions, such as recovery, or provisioning. You can schedule scripts to run:

- Immediately
- Once at a specified time and date
- Repeatedly according to a schedule you specify

Scheduled actions are different from triggered actions. Use triggered actions to run scripts based upon conditions and alerts that are detected within your storage environment. Use scheduled actions to run scripts according to the schedule that you define, without having to associate the script with an alert.

To create a scheduled action, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager > Policy Management > Scheduled Actions** or **Data Manager for Databases > Policy Management > Scheduled Actions**.
2. Right-click **Scripts**, and click **Create Script**. The Create Script panel opens.
3. In the **Description** field, type a brief description of the job.
4. Select computers and computer groups against which to run the action:
  - a. In the **Available** field, click the computers and computer groups against which you want to run the action. You can select individual computers as well as computer groups that you have previously defined using the group facility. Cluster resource groups in a PowerHA or MSCS clustered environment are listed as computers.
  - b. Click . The computers and computer groups are moved to the **Current Selections** field.
5. Click the **Script Options** tab; the Script Options page opens. Use this page to select the script that you want to run against the selected computers and computer groups.
6. Select a script from **Script Name**. The scripts that appear in **Script Name** are stored in the `\<TPC_installation_directory>\scripts` directory on the Data server. The default installation directory where scripts are located is:
  - Windows: C:\Program Files\IBM\TPC\data\scripts
  - UNIX, Linux: /opt/IBM/TPC/data/scripts or /usr/IBM/TPC/data/scripts

**Note:** The scripts that appear in the Script Name list are stored on the computer where the Data server component is located. If you want to run a script that is stored on a Storage Resource agent or Data agent, you must type the name of that script in the Script Name field.

7. Click the **When to Run** tab; the When to Run page opens. Use the When to Run page to specify when the scheduled action is run.
8. In the **How often to run** area, schedule how often you want to run the script associated with the action. You can choose from the following options:

#### **Run Now**

Run the script immediately.

#### **Run Once at**

Run the script once at a specified time and date. You can use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start time. This process ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

### Run Repeatedly

Run the script repeatedly according to a schedule you specify. You can:

- Use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM when the job should begin running.
  - Indicate how often the job should run. You can use the drop-down lists to specify the number of minutes, hours, days, weeks, or months.
  - Indicate which days on which run the job. A check mark is displayed next to the days that you select.
9. In the **How to Handle Time Zones** area, indicate the time zone to be used when scheduling and running the policy. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:
    - a. 9:00 AM of the time zone where the Data server resides
    - b. 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

### Use the timezone that the server runs in

Select this option to use the time zone of the location where the Data server resides.

### Use this timezone

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

10. Click the **Alert** tab; the Alert page opens. Use the Alert page to define the alerting criteria for a scheduled action.
11. In the **Triggering Condition** area, the only condition is **Script Failed**. An alert is automatically triggered if the scheduled action fails to run.
12. In the **Triggered-Actions** pane, select the actions that occur as a result of the triggering condition. For an explanation of triggered actions, see “Triggered actions for alerts” on page 1453.
13. Save the scheduled action:
  - a. Click **File > Save**. The Save As window opens.
  - b. In the **Specify Script name** field, type a name for the job and click **OK**. The scheduled action is displayed in the navigation tree pane.

## Editing a scheduled action

Edit a scheduled action to change: the computers and groups against which the action is run, the script that is run, when the script is run, and the alerting conditions if the action fails to run.

To edit a scheduled action, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager > Policy Management > Scheduled Actions > Scripts** or **Data Manager for Databases > Policy Management > Scheduled Actions > Scripts**.

2. Select the scheduled action that you want to edit. Information about the action appears in the right-hand content pane.
3. In the **Description** field, type a brief description of the job.
4. Select computers and computer groups against which to run the action:
  - a. In the **Available** field, click the computers and computer groups against which you want to run the action. Select individual computers, as well as computer groups that you have previously defined using the group facility. Note that cluster resource groups in a PowerHA or MSCS clustered environment are listed as computers.
  - b. Click . The computers and computer groups are moved to the **Current Selections** field.
5. Click the **Script Options** tab; the Script Options page opens. Use this page to change the script you want to run against the selected computers and computer groups.
6. Select a script from **Script Name**. The scripts that appear in **Script Name** are stored in the `\<TPC_installation_directory>\scripts` directory on the Data server. The default installation directory where scripts are located is:
  - Windows: C:\Program Files\IBM\TPC\data\scripts
  - UNIX, Linux: /opt/IBM/TPC/data/scripts or /usr/IBM/TPC/data/scripts

**Note:** The scripts that appear in the Script Name list are stored on the computer where the Data server component is located. If you want to run a script that is stored on a Storage Resource agent or Data agent, you must type the name of that script in the Script Name field.

7. Click the **When to Run** tab; the When to Run page opens. Use this page to change when the scheduled action is set to run.
8. In the **How often to run** area, schedule how often you want to run the script associated with the action. You can choose from the following options:

#### **Run Now**

Run the script immediately.

#### **Run Once at**

Run the script once at a specified time and date. You can use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start time. This process ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

#### **Run Repeatedly**

Run the script repeatedly according to a schedule you specify. You can:

- Use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM when the job should begin running.
- Indicate how often the job should run. You can use the drop-down lists to specify the number of minutes, hours, days, weeks, or months.
- Indicate which days on which run the job. A check mark is displayed next to the days that you select.

9. In the **How to Handle Time Zones** area, indicate the time zone to be used when scheduling and running the policy. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:
  - a. 9:00 AM of the time zone where the Data server resides
  - b. 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

**Use the timezone that the server runs in**

Select this option to use the time zone of the location where the Data server resides.

**Use this timezone**

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

10. Click the **Alert** tab; the Alert page opens. Use the Alert tab to change the alerting criteria for a scheduled action.
11. In the **Triggering Condition** area, the only condition is **Script Failed**. This indicates that an alert will automatically be triggered if the scheduled action fails to run.
12. In the **Triggered Actions** area, select the actions that occur as a result of the triggering condition You can choose from the following actions:

**SNMP trap**

An SNMP trap is sent to any NMS, console, or terminal when the condition occurs.

**TEC / OMNIBus Event**

A IBM Tivoli Enterprise Console event is sent when the condition occurs. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze Tivoli Storage Productivity Center events according to the event definitions specified in the tivoliSRM.baroc file (provided with the product). It also performs responses such as sending further notification, creating or updating trouble tickets, running programs, and so on.

**Login notification**

The alert is sent to a Tivoli Storage Productivity Center user. The user receives the alert upon logging in to Tivoli Storage Productivity Center. In the **Login ID** field, type the user ID.

**Login ID**

The ID of the user who receives alert notification upon logging in to the system.

**Windows Event Log, UNIX Syslog**

The ID of the user who receives alert notification upon logging in to the system.

**Event Type (Windows Event Log only)**

The type of event that is recorded to the OS log.

**Facility (UNIX Syslog only)**

The location where the UNIX Syslog is sent. You can select User or Local.

**Level (UNIX Syslog only)**

The level of UNIX Syslog event. You can select Informational, Notice, Warning, Error, Critical, or Alert.

**Run script**

A script is run when the condition occurs. Click **Define** to specify the script that is run when the triggering condition occurs. The parameters listed in the **Specify Script** window are passed to the script when the alert is triggered

**E-mail** An e-mail is sent. Click **Add** or **Delete** to edit the list of e-mail addresses to which an e-mail is sent. Click **Edit e-mail** to change the actual e-mail message.

13. Click **File > Save** to save your changes.

## Archive and backup functions

Data Manager provides a method within the alerting function of a constraint by which you can automatically invoke a IBM Tivoli Storage Manager archive or backup to run against the files that violate that constraint.

An archive is a "snapshot in time". Each time an archive is done, a new "snapshot" is taken. When an archive is performed, everything that has been specified is captured. So, for example, if an archive was performed on a C: drive, everything on C: will be archived. If, the next day, another archive of C: was performed, everything on the C: drive would be archived again. Files and file systems that have been archived as part of the Archive/Backup job can be deleted after archiving, but you must select **Delete After Successful Archival** specifically.

Lets say that, as a result of running a report, you find a large number of files that haven't been accessed in over two years. Looking at the cumulative sizes of these files you determine they are taking up space that would be better utilized elsewhere. You can archive and delete these files to reclaim that space. If, at some time in the future those files are needed, they can be retrieved from the archive. The result of the archive job is more free space without data loss.

A backup can be incremental (**Selective Backup**) or full. Usually a full backup is done first and subsequent backups are incremental. For example, say that a backup is performed on C: drive. All the files on the C: drive are then backed up, which is the full backup operation. The next day we need to back up C: drive again. Usually, this will be an incremental backup since a full backup was done the day before. In the incremental backup, only the files that have changed on the drive since the last backup will be backed up.

The archived or backed up files are sent to the Tivoli Storage Manager server and are stored on that machine. Files are put into storage groups that are controlled through a Tivoli Storage Manager policy that the Tivoli Storage Manager server administrator usually creates.

## Constraints

Data Manager provides a method within the alerting function of a constraint by which you can automatically invoke a Tivoli Storage Manager archive or backup to run against files that violate constraints you have defined. You can do the following:

- Define a constraint that will invoke Tivoli Storage Manager to archive and (if that option is selected) delete those files
- Define a constraint to run an incremental or full backup

See the scenario *Archive and delete files* to see an example of how constraints are developed.

## Before you begin

Before you can use the Tivoli Storage Manager archive/backup functionality with Data Manager constraints, you must ensure the following:

- Your user ID has Administrator authority within IBM Tivoli Storage Productivity Center.
- Tivoli Storage Manager client software is installed on each of the hosts where a Storage Resource agent or Data agent is used to perform archive and backup functions.
- (for SAN attached storage only) Tivoli Storage Manager client software must be installed on the Storage Resource agent or Data agent host computer that is configured to act as the scanning agent for NAS storage.
- A Tivoli Storage Manager client must be configured to run without a password. This is typically done by either including the password in the client options (dsm.opt) file, or using the options `PASSWORDACCESS= GENERATE` in the client options file.
- The Tivoli Storage Manager client must be version 5.1 or higher.

## Create an archive/backup job

Create a IBM Tivoli Storage Manager archive/backup job for files in a report

You follow these general steps when you create an archive or backup.

1. Make sure you have followed the prerequisite steps
2. Decide whether to create a new constraint or use one of the default constraints
3. Generate the report using the constraint you decided to use
4. Create an archive or backup job from files in the report

To create an Archive/Backup job on files from a report, complete the following steps:

1. Generate and view a Largest Files, Most Obsolete Files, Orphan Files, Duplicate Files, Most At Risk, Constraint Violations report, or a report that you have created.
2. Click on the files you want to include in the archive or backup job. Use ctrl + click to select multiple, non-consecutive files; use shift + click to select multiple, consecutive files.
3. Right click on the reports and select **Create a new archive/backup job** from the pop-up menu. The **Create File Archive/Backup Action** window is displayed.
4. In the **Description** field, type a brief description of the job.
5. In the **Archive/Backup Options** tab, select the type of the job and its TSM command options, if any:

### Archive

Use this option to archive the files that violate a constraint. Archives are copies of data from online storage copies to offline storage.

### Delete After Successful Archival

Automatically delete the files that violated the constraint after they have been successfully archived. See the *IBM Tivoli Storage Manager Client User's Guide* for more information about Tivoli Storage Productivity Center archives.

**Note:** Tivoli Storage Productivity Center administrators (Productivity Center Administrator role) have the ability to delete files even if they do not have the required authority on the systems where the files are stored. This authority is provided by the Tivoli Storage Productivity Center agents which run as root on UNIX systems or with administrator privileges on Windows computers.

### **Selective Backup**

Select this option to perform a selective backup of the files that violate a constraint. A selective backup enables you to back up specified files. These files are not excluded in the include-exclude list and meet the requirement for serialization in the backup copy group of the management class assigned to each file. See the *IBM Tivoli Storage Manager Client User's Guide* for more information about selective backups.

### **Incremental Backup**

Select this option to perform an incremental backup of the files that violate a constraint. An incremental backup enables you to back up new or changed files or directories from a client domain or from specified directories or files. These directories or files are not excluded in the include-exclude list and meet the requirements for frequency, mode, and serialization as defined by a backup copy group of the management class assigned to each file. See the *IBM Tivoli Storage Manager Client User's Guide* for more information about incremental backups.

### **IBM Tivoli Storage Manager Command Options**

Enter additional Tivoli Storage Manager command line options in this field that will be passed on to the Tivoli Storage Manager `dsmc` command. You can enter up to 512 bytes of text. See the *IBM Tivoli Storage Manager Client User's Guide* for more information about valid Tivoli Storage Manager command-line options.

6. Click the **Files** tab; the **Files** page opens. Use this page to view or remove the files included in an archive/backup job.
7. Click the **When to Run** tab. Use the **How often to run** area to specify when the archive or backup job runs.
8. In the **How often to run** area, schedule how often you want the quota to be checked. You can choose from the following actions:

#### **Run Now**

Check the quota immediately.

#### **Run Once at**

Check the quota once at a specified time and date. You can use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start time. This ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

9. In the **How to Handle Time Zones** area, indicate the time zone to be used when scheduling and running the policy. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:

- a. 9:00 AM of the time zone where the Data server resides
- b. 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

**Use the timezone that the server runs in**

Select this option to use the time zone of the location where the Data server resides.

**Use this timezone**

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

10. Click the **Alert** tab; the Alert page opens. Use the Alert page to define the alerting criteria for an archive or backup job.
  - a. In the **Triggering Condition** area, the only condition is **File Archive/Backup Failed**. This condition indicates that an alert is triggered automatically if the archive or backup fails to run.
  - b. In the **Triggered Actions** area, select the actions that occur as a result of the triggering condition. You can choose from the following actions:

**SNMP trap**

An SNMP trap is sent to any NMS, console, or terminal when the condition occurs.

**TEC / OMNibus Event**

A IBM Tivoli Enterprise Console event is sent when the condition occurs. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze Tivoli Storage Productivity Center events according to the event definitions specified in the tivoliSRM.baroc file (provided with the product). It also performs responses such as sending further notification, creating or updating trouble tickets, running programs, and so on.

**Login notification**

The alert is sent to a Tivoli Storage Productivity Center user. The user receives the alert upon logging in to Tivoli Storage Productivity Center. In the **Login ID** field, type the user ID.

**Login ID**

The ID of the user who receives alert notification upon logging on to the system.

**Windows Event Log, UNIX Syslog**

The ID of the user who receives alert notification upon logging on to the system.

**Event Type (Windows Event Log only)**

The type of event that is recorded to the OS log.

**Facility (UNIX Syslog only)**

The location where the UNIX Syslog is sent. You can select User or Local.

**Level (UNIX Syslog only)**

The level of UNIX Syslog event. You can select Informational, Notice, Warning, Error, Critical, or Alert.

**Run script**

A script is run when the condition occurs. Click **Define** to specify

the script that is run when the triggering condition occurs. The parameters listed in the **Specify Script** window are passed to the script when the alert is triggered

**E-mail** An e-mail is sent. Click **Add** or **Delete** to edit the list of e-mail addresses to which an e-mail is sent. Click **Edit e-mail** to change the actual e-mail message.

11. Save the archive or backup:
  - a. Click **File > Save**. The **Save As** window opens.
  - b. In the **Specify File Archive/Backup Action name** field, type a name for the job and click **OK**. The new job is listed in **Data Manager > Policy Management > Archive/Backup** as **<creator>.<job name>**.

### **View and edit an Archive/Backup job**

Learn how to edit IBM Tivoli Storage Manager archive and backup jobs that were defined to run against the files selected from Data Manager reports or from reports you have generated yourself.

Each archive and backup that you have created appears as a node under **Archive/Backup**.

To view and edit a Tivoli Storage Manager archive or backup job, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager > Policy Management > Archive/Backup**. Select the archive or backup job that you want to edit. Information about the job appears in the content pane. All the user-defined information can be edited.
2. Change the description for the archive/backup job.
3. In the **Options** tab, you can select the Archive/Backup options. You can change whether the job is an archive or a backup, and add or change any additional Tivoli Storage Manager commands that should be run with the job.
4. In the **Files** tab the files that were included in the job are listed.
5. In the **When to Run** tab, select how often to run and how to handle time zones. You can change the **How often to run** and **How to handle time zones** settings.
6. In the **Alert** tab, **File Archive/Backup Failed** is the only **Triggering-Condition**. In **Triggered-Actions**, change the action you wish to occur if the job fails. You do not need to select any of the actions. Notification will be written to the error log by default.
7. Select **File > Save**. Name the Archive/Backup job. After you save a the job, an entry for it will appear under the **Data Manager > Policy Management > Archive/Backup > <Creator>.<Name>**.

### **Add additional files to an archive/backup job**

Add files to an existing IBM Tivoli Storage Manager archive or backup job from a report.

To add files to an existing Archive/Backup job, complete the following steps:

1. Add files to an existing Tivoli Storage Manager archive or backup job from a report
2. Click on the files you want to add to an archive or backup job. Use ctrl + click to select multiple, non-consecutive files; use shift + click to select multiple, consecutive files.

3. Right click on the report and select **Add to an existing archive/backup job** from the pop-up menu. The Archive/Backup Job Selection window appears.
4. Select the archive or backup job to which you want to add the files from the list box.
5. Click **OK** to add the files. The Archive/Backup - Files window appears and shows the file(s) you added to the selected job.

---

## Working with storage resource groups

Use storage resource groups to organize logically related storage entities into named groups. For example, a storage resource group that represents a business critical email application might include all the hosts that participate in the email application cluster, the storage subsystems that provide storage to the application, and the switches and fabrics through which the application's data is configured to travel.

You can use storage resource groups as input to the SAN Planner for planning and provisioning considerations. For example, if a storage resource group represents a business critical email application, you can use that group as input into the SAN planner to help consistently determine when and where to add capacity to the application while minimizing the manual entry of storage entities.

### Storage resource group management

Use the storage resource group management list panel to view, create, and delete storage resource groups.

This panel contains the following information about each storage resource group:

**Storage resource group name**

Specifies a user-defined name of the storage resource group.

**State** Specifies the state of the storage resource group:

**Normal**

The storage resource group is operating normally.

**Warning**

At least one part of the storage resource group is not operating or has serious problems.

**Critical**

The storage resource group is either not operating or has serious problems.

**Missing**

The storage resource group was previously discovered by IBM Tivoli Storage Productivity Center, but was not detected in the most recent discovery.

**Unknown**

The storage resource group was discovered but is not recognized by IBM Tivoli Storage Productivity Center.

**Note:** The state of a storage resource group might display as **Unknown** after it is created. This occurs because the status of a new storage resource group might not yet be updated when the Storage Resource Group Management panel is redisplayed. To resolve this issue, exit the Storage Resource Group Management

panel, wait for the processing of the group to complete, and open the Storage Resource Group Management panel again to view the updated **State**.

**Type** The type of storage resource group. Two types are available:

**General**

A storage resource group made up of a combination of storage entities such as storage subsystems, switches, fabrics, and other entities. These storage entities can be a logical grouping based on a particular application or usage, such as accounting-related storage entities.

**Cloud Capacity Pool**

A storage resource group used specifically for cloud automation. This type of storage resource group is used by applications that provide cloud automation services.

**Description (optional)**

Displays the user-defined description for the storage resource group.

**Create** Creates a storage resource group that you selected.

**Delete**

Deletes a storage resource group that you selected.

**Refresh Table**

Refreshes the storage resource group management table with the most recent changes.

## Create or Edit a Storage Resource Group

Use the Create or Edit Storage Resource group panel to create or modify storage resource groups.

To create a storage resource group:

- In the navigation tree, expand **IBM Tivoli Storage Productivity Center**, click **Storage Resource Group Management**, then click **Create...** in the content pane.
- In the navigation tree, expand **IBM Tivoli Storage Productivity Center > Topology**, click a node that represents a storage entity, right-click an entity that appears in the content pane, and select **Add to new Storage Resource Group...** from the drop-down menu.

To edit a storage resource group:

- In the navigation tree, expand **IBM Tivoli Storage Productivity Center**, click **Storage Resource Group Management**, then click the magnifying glass icon next to the storage resource group you want to edit.
- In the navigation tree, expand **IBM Tivoli Storage Productivity Center > Topology**, click **Storage Resource Groups**, right-click the storage resource group you want to edit in the content pane, and select **Launch Detail Panel** from the drop down menu.

### Field Descriptions

**Creator**

Displays the user name of the creator.

**Name** Displays the name of the storage resource group or unnamed, if it is not yet named.

**Description**

Optional: Displays the user-defined description for the storage resource group.

**Selected Elements**

Lists the elements selected to be members of this storage resource group.

**Add** Adds one or more selected elements to the list.

The Storage resource group element selection panel is displayed.

**Remove**

Removes one or more selected elements from the Selected Elements list.

**Group Type**

Specifies the type of storage resource group to create.

**General**

A storage resource group comprised of a combination of storage entities such as storage subsystems, switches, fabrics, and other entities. These storage entities can be a logical grouping based on a particular application or usage, such as accounting-related storage entities.

**Cloud Capacity Pool**

A storage resource group used specifically for cloud automation. This type of storage resource group is used by applications that provide cloud automation services.

**Default Provisioning Profile**

Lists the available provisioning profiles which can be associated with storage resource groups. The list also includes None. If this storage resource group is used as input to the SAN Planner, the settings defined in this profile will be used to pre-populate the planner inputs.

**Create a New Profile**

Opens the Provisioning Profile creation wizard. When you complete the wizard, the **Provisioning Profile** list is updated.

**User-defined property 1 (UDP1)**

Specifies any user-defined properties that will be used by the topology viewer to provide custom groupings.

**User-defined property 2 (UDP2)**

Specifies any user-defined properties that will be used by the topology viewer to provide custom groupings.

**User-defined property 3 (UDP3)**

Specifies any user-defined properties that will be used by the topology viewer to provide custom groupings.

**Storage Resource Group Element Selection**

Use the Storage Resource Group Element Selection panel to select the storage entities that you want to include in a storage resource group. The storage entities that you can select are displayed in the topology viewer.

**Available elements section**

Displays the storage entities that you can include in a storage resource group. Use the topology viewer to select storage entities. See Overview of Topology Viewer for more information about the topology viewer.

### Topology viewer

Use the topology viewer to select the storage entities that you want to include in a storage resource group. To do this, perform the following steps.

1. Open a detailed view of a storage entity type on the topology viewer's **Overview** page.
2. Expand the storage entity type to view the storage entities that are part of that type.
3. Select the storage entities you want to include in the storage resource group.
4. Click >>.

### Selected elements section

- >> Click >> to move the selected subsystems into the **Selected Elements** pane.
- << Click << to remove the selected subsystems from the **Selected Elements** pane.

### Selected Elements

Displays the storage entities that are included in a storage resource group. You can include the following entities in a storage resource group:

- computer (vm, physical or hypervisor)
- computer disk (including vm disks)
- fabric
- switch
- other entities
- storage subsystem
- storage pool
- subsystem disk
- subsystem volume
- tape drive
- tape library
- tape media changer
- other storage resource groups

**Restriction:** For storage resource groups that are defined as a Cloud Capacity Pool type, you can only include IBM SONAS and Storwize V7000 Unified systems.

- OK** Click **OK** when you are satisfied with all your selections. The Create Storage Resource Group panel displays with your selections.

### Cancel

Click **Cancel** if you do not want to add storage entities to a storage resource group. The Create Storage Resource Group panel displays. No data is saved.

### Working with storage resource group sessions

This topic describes viewing and deleting replication sessions that are created in the SAN Planner wizard for a storage resource group.

You can delete the replication session from IBM Tivoli Storage Productivity Center and optionally also from IBM Tivoli Storage Productivity Center for Replication.

1. In the navigation tree pane, expand **Replication Manager > Storage Resource Group Sessions**. A table of the currently defined storage resource group sessions is displayed in the content pane.
2. To select a storage resource group session to delete, click a row in the table. You can use Ctrl+click and Shift+click to select multiple sessions simultaneously.
3. Click **Delete Storage Resource Group Session**. Tivoli Storage Productivity Center does not automatically delete the replication session from Tivoli Storage Productivity Center for Replication. A dialog box opens enabling you to specify how you want to delete the session. You can select from the following options:
  - Click **Yes** to remove the selected replication session from the Tivoli Storage Productivity Center database and the Tivoli Storage Productivity Center for Replication database.
  - Click **No** to remove the selected replication session from the Tivoli Storage Productivity Center database only.
  - Click **Cancel** to close the dialog box without deleting the selected replication session from the Tivoli Storage Productivity Center database or Tivoli Storage Productivity Center for Replication database.

---

## Working with scripts

Use the triggered action facility to run scripts based upon conditions/alerts that are detected within your storage environment. Use the scheduled action facility to run scripts according to the schedule that you define, without having to associate the script with an alert.

Both the triggered action and scheduled action facilities are script-based, allowing you to use any third-party tools for actions, such as recovery and provisioning.

## Running scripts with alerts

Monitoring, alerting, and policy management jobs enable you to use the triggered action facility to run scripts based on storage events that you define.

The triggered action facility allows you to define thresholds and constraints that result in notification or action. A script can be run when a job fails, an alert condition is detected in a storage resource, a constraint is violated (Data Manager only), or a quota is exceeded (Data Manager only). The triggered action facility is script-based, allowing you to use any third-party tools for actions such as recovery or provisioning.

Perform the following steps to run a script in response to a condition in a job:

1. Create or edit a monitoring, alerting, or policy management job. For example, the following jobs enable you to define a condition that triggers a script:
  - Data Manager:
    - **Monitoring > <all\_monitoring\_jobs>**
    - **Alerting > <all\_alert\_jobs>**
    - **Policy Management > Constraints**
    - **Policy Management > Quotas**
    - **Policy Management > Scheduled Actions**

- Data Manager for Databases:
    - **Monitoring** > <all\_monitoring\_jobs>
    - **Alerting** > <all\_alert\_jobs>
    - **Policy Management** > **Quotas**
    - **Policy Management** > **Scheduled Actions**
  - Disk Manager:
    - **Monitoring** > **Subsystem Performance Monitors**
    - **Alerting** > **Storage Subsystem Alerts**
  - Fabric Manager:
    - **Monitoring** > **Switch Performance Monitors**
    - **Alerting** > <all\_alert\_jobs>
2. Check **Run Script** on the **Alert** page for the job.
  3. Click **Define**. The **Specify Script** dialog box displays.
  4. Enter the name of the script in the **Script Name** field. This script name is used to tell the server what script to send to the agent. If the script sent by the server is run by the agent, the name of the script will not be the name you specify in the **Script Name** field. Instead, the agent names the script as temporary file, runs it, then deletes it after the script has run. Because of this, you should not have code in your script that depends on this script name.
  5. Specify where you want the script to run in the **Where to Run** field. You can select a specific agent, or the triggering computer. For example, if a file system alert is triggered on a on a specific computer, you would typically want the script to run on the computer that triggered the alert. (For some types of alerts such as *Job Failed*, you will not have the option to run the script on the triggering computer. Here you can run the script on any agent you choose.)
  6. The **Script Parameters** section displays what parameters will be passed to the script when it is run. Each triggering condition passes different parameters. The parameters will be passed in the order specified on the dialog box.
  7. Click **OK**.

## Running scripts using scheduled actions

Use the scheduled action facility to run a script according to a schedule that you define. The scheduled action facility is available in Data Manager and Data Manager for Databases.

Use scheduled actions to run scripts against selected computers and computer groups. The scheduled actions facility is script-based, so you can use any third-party tools for actions, such as recovery, or provisioning. You can schedule scripts to run:

- Immediately
- Once at a specified time and date
- Repeatedly according to a schedule you specify

Scheduled actions are different from triggered actions. Use triggered actions to run scripts based upon conditions and alerts that are detected within your storage environment. Use scheduled actions to run scripts according to the schedule that you define, without having to associate the script with an alert.

To create a scheduled action, complete the following steps:

1. In the Navigation tree pane, expand **Data Manager > Policy Management > Scheduled Actions** or **Data Manager for Databases > Policy Management > Scheduled Actions**.
2. Right-click **Scripts**, and click **Create Script**. The Create Script panel opens.
3. In the **Description** field, type a brief description of the job.
4. Select computers and computer groups against which to run the action:
  - a. In the **Available** field, click the computers and computer groups against which you want to run the action. You can select individual computers as well as computer groups that you have previously defined using the group facility. Cluster resource groups in a PowerHA or MSCS clustered environment are listed as computers.
  - b. Click . The computers and computer groups are moved to the **Current Selections** field.
5. Click the **Script Options** tab; the Script Options page opens. Use this page to select the script that you want to run against the selected computers and computer groups.
6. Select a script from **Script Name**. The scripts that appear in **Script Name** are stored in the `\<TPC_installation_directory>\scripts` directory on the Data server. The default installation directory where scripts are located is:
  - Windows: `C:\Program Files\IBM\TPC\data\scripts`
  - UNIX, Linux: `/opt/IBM/TPC/data/scripts` or `/usr/IBM/TPC/data/scripts`

**Note:** The scripts that appear in the Script Name list are stored on the computer where the Data server component is located. If you want to run a script that is stored on a Storage Resource agent or Data agent, you must type the name of that script in the Script Name field.
7. Click the **When to Run** tab; the When to Run page opens. Use the When to Run page to specify when the scheduled action is run.
8. In the **How often to run** area, schedule how often you want to run the script associated with the action. You can choose from the following options:

#### **Run Now**

Run the script immediately.

#### **Run Once at**

Run the script once at a specified time and date. You can use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM.

**Note:** The Tivoli Storage Productivity Center framework that starts the Tivoli Storage Productivity Center jobs finds all jobs in an interval between one minute to the scheduled time and the scheduled start time. This process ensures that if many jobs are planned to run at a certain time, they will not all start after the scheduled start time.

#### **Run Repeatedly**

Run the script repeatedly according to a schedule you specify. You can:

- Use the drop-down lists to specify the month, day year, and the hour, minute, and AM/PM when the job should begin running.
- Indicate how often the job should run. You can use the drop-down lists to specify the number of minutes, hours, days, weeks, or months.

- Indicate which days on which run the job. A check mark is displayed next to the days that you select.
9. In the **How to Handle Time Zones** area, indicate the time zone to be used when scheduling and running the policy. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run it at:
    - a. 9:00 AM of the time zone where the Data server resides
    - b. 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the job will run at 7:00 AM on an agent located in the PST time zone.

**Use the timezone that the server runs in**

Select this option to use the time zone of the location where the Data server resides.

**Use this timezone**

Select this option to indicate a specific time zone for when to run the job. When you select this option, a drop-down list is activated. Select the timezone from this drop-down list.

10. Click the **Alert** tab; the Alert page opens. Use the Alert page to define the alerting criteria for a scheduled action.
11. In the **Triggering Condition** area, the only condition is **Script Failed**. An alert is automatically triggered if the scheduled action fails to run.
12. In the **Triggered-Actions** pane, select the actions that occur as a result of the triggering condition. For an explanation of triggered actions, see “Triggered actions for alerts” on page 1453.
13. Save the scheduled action:
  - a. Click **File > Save**. The Save As window opens.
  - b. In the **Specify Script name** field, type a name for the job and click **OK**. The scheduled action is displayed in the navigation tree pane.

## How scripts are run

Scripts can be run from the Data server, Data agents, or Tivoli Storage Productivity Centers.

During installation, IBM Tivoli Storage Productivity Center creates a directory on every server and agent computer called: `\<install_directory>\scripts`, where `<install_directory>` represents the directory where the agent or server is installed. The default installation directory is:

- (Windows Data agents) `C:\Program Files\IBM\TPC\ca\subagents\TPC\Data\scripts`
- (UNIX, Linux Data agents) `/opt/IBM/TPC/ca/subagents/TPC/Data/scripts` or `/usr/tivoli/ep/subagents/TPC/Data/scripts`
- (Windows Storage Resource agents) `C:\Program Files\IBM\TPC\agent\scripts`
- (UNIX, Linux Storage Resource agents) `/opt/IBM/TPC/agent/scripts` or `/usr/tivoli/ep/subagents/TPC/Data/scripts`
- (Windows Data server) `C:\Program Files\IBM\TPC\Data\scripts`
- (UNIX, Linux Data server) `/opt/IBM/TPC/Data/scripts` or `/usr/IBM/TPC/Data/scripts`

When a script is run:

1. The Agent looks in the agent's local `\scripts` directory; if the Agent can resolve that script name, it is executed from that location.

2. Otherwise, (if the agent cannot resolve the script name) and the Agent is configured to accept scripts from the server, the server looks in the local \scripts directory. If the server can resolve that script name, it loads that script and sends it to the agent where you designated the script to be run.

When running a script against a NAS filer, the script is run from the agent assigned to the file system where the triggering condition occurred.

3. The Agent receives the script, names it as a temporary file, and runs it.
4. After the Agent has finished running the script, the temporary file is deleted. Because the script is handled in this way, any script which is written to redirect any output must specify a fully-qualified unique directory path for that output.

**There are two main reasons to run a script:**

- In response to an alert
- For batch reports

**There are two reasons why a script might not run when sent by the server:**

- The script exists in an agent's \scripts directory. In this case, the agent ignores the script sent by the server and run its local version.
- If you did not check the **Agent may run scripts sent by server** option in the installation parameters screen, the agent ignores the script sent by the server.

If you selected the **Agent may run scripts sent by server** option in the installation parameters screen, the agent runs scripts sent by the server.

The advantage of selecting this option is you need only store one copy of the script in the \scripts directory for the server and do not have to keep a copy of the script on every agent computer. When a script must be run on a particular agent, the server accesses the script from the local \scripts directory and sends it to the agent to be run.

**Note:**

- You can change this option by editing the honorSentScripts parameter in the agent.config file. The agent.config file exists in every installation directory for the agent. See *IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication Installation and Configuration Guide* for information about the agent.config file.
- After a Storage Resource agent is deployed, you can change the script configuration in the user interface. In the navigation tree, expand **Administrative Services > Data Sources > Data/Storage Resource Agents**. Select the target Storage Resource agent from the list, then open the **Select Action** menu and select the **Enable Scripts** or **Disable Scripts** option as appropriate.

When the script is deployed to the agent, it is named as a temporary file. After the agent has finished running the script, the temporary file is deleted.

If the **Agent may run scripts sent by server** option is cleared, you must make sure that the script is stored in every \scripts directory for the agent. If the **Agent may run scripts sent by server** option is checked, the server deploys the script to the agent computer that has the low free space condition. In this case, you must ensure that the script exists in the \scripts directory for the server, and not on any of the \scripts directory for the agents.

**Note:**

- A good practice is to store the scripts you want to run globally (across all your agents) on the server. Store the scripts you want to run locally on the agent computers where you want them to run.
- When running a script for Data agents (4.1.1 and earlier), the job is immediately indicated as successfully run. Tivoli Storage Productivity Center does not wait for the script results. If there are any script errors, the errors are not reflected in the job status.

## How the server and agent resolve script names

An IBM Tivoli Storage Productivity Center server processes requests for agents running under UNIX, Linux, and Windows.

When associating and running scripts with triggered and scheduled actions, the Tivoli Storage Productivity Center server resolves the names of those scripts based on the following criteria:

- The OS under which an agent is running
- How the script name is specified on the Specify Script dialog box

### Agent and Operating System

The operating system under which an agent runs determines the scripts that can be run by that agent:

#### UNIX, Linux operating systems

An agent running under a UNIX or Linux operating system will not run or receive (from the server) scripts that have an extension. Agents running under UNIX or Linux only accept and run script files that do not contain an extension within their name. The first line in a script file determines what interpreter is needed to run the script.

#### Windows operating systems

An agent running under a Windows operating system will only run or receive (from the server) scripts that have an extension. The extension of a script file determines what interpreter is needed to run the script.

### Specifying a Script Name

Use the Specify Script dialog box when associating a script with a triggered or scheduled action. Enter the name of a script on the **Script Name** field to associate that script with the action you want to perform.

The name of the script you enter might or might not contain an extension (including an extension is optional). Depending on the agent that receives the script, the following occurs after a triggered or scheduled action that contains a script is run:

#### Agent running under UNIX or Linux operating systems

If the specified script name contains an extension, the agent ignores the extension and searches for a file of the same name (without an extension). For example, if you enter backup.vbs in the **Script Name** field, a UNIX or Linux agent will search for a file with the name backup. If the script exists, UNIX or Linux will read the first line of the script and use the appropriate interpreter to run the script. If the file does not exist, the triggered or scheduled action will not run the script.

#### Agent running under Windows operating systems

If the specified script name contains an extension, the agent will search for

a file of the same name/extension. For example, if you enter `backup.vbs` in the **Script Name** field, an agent will search for a file with the name `backup.vbs`. If the script does exist, the agent will determine what interpreter is needed to run the script based on its extension. If the file does not exist, the triggered or scheduled action will not run the script. If the specified script name does not contain an extension, an agent will look for the file name in the following order (based on its extension): `.com`, `.exe`, `.bat`, `.cmd`, `.vbs`, `.vbe`, `.js`, `.jse`

The process for script name resolving enables you to run scripts with the same name across multiple operating systems. To run a script on both a UNIX or Linux and Windows operating systems, you must have two versions of that file on either the server or the agent. For example, if you want to run a provisioning script against a UNIX or Linux and Windows agent, you must have two versions of that file (`provision.bat` and `provision`) stored in the `\scripts` directory on either the server or agent.

---

## Using the topology viewer

This topic describes how to use the topology viewer to view detailed information about your storage environment and monitor entities and groups of entities.

You can view health status, performance, and other details about switches, computers, storage subsystem servers, fabrics, and other entities. To launch the topology viewer, expand **IBM Tivoli Storage Productivity Center Topology** in the Navigation Tree pane.

To display detailed information about an entity (for example, the host name of a computer, the used and unused capacity of a storage subsystem), right-click the entity and select **Launch Detail Panel**.

To select an entity in the graphical view, click the entity image. In the table view, click the name of the entity. To make multiple selections, press CTRL and click.

### Note:

- The availability of certain action items depends on the entity class and view level.
- When you right-click an object in the graphical view, a context menu is displayed. The action items in this menu are identical to the action items displayed when you right-click the corresponding object in the table view and click the arrow in the **Action** field.
- If the discovery process is not completed and there are entities in the environment that have not been rendered into the current view, the view will build dynamically as entities are discovered.
- Some columns and fields displayed within the Topology Viewer might not be populated with data for the storage resources that you are monitoring. Columns and fields appear empty if you have not configured Tivoli Storage Productivity Center to discover or collect the information intended for those columns and fields. Use discovery, probe, ping, or scan schedules to ensure that you collect information for all the columns and fields that appear in the Topology Viewer.

## The topology viewer

This topic describes how the topology viewer provides a graphical representation of the physical and logical resources that have been discovered in your storage environment by IBM Tivoli Storage Productivity Center.

The information displayed by the topology viewer is collected by discovery, probing, performance data collection, and alerting. The topology viewer consists of two views, a graphical view and a table view, organized vertically with the graphical view over of the table view. The table view shows the same information as the graphical view, but in a tabular format.

The topology viewer supports four levels of detail, from a high-level overview of the entire storage environment to detailed information about individual entities. This allows you to view as much or as little detail as you need.

### Overview

A global, highly aggregated view of the entire storage environment. This is the default view when you expand **IBM Tivoli Storage Productivity Center > Topology**.

### Groups level (L0)

This level focuses on groups of a particular type. The default groups are:

- **Computers:** All discovered computer groups in your storage environment
- **Fabrics:** All fabric groups in your storage environment. A *fabric* is a network of entities that are attached through one or more switches. The topology viewer also displays Virtual SANs (VSANs) and Logical SANs (LSANs).
- **Switches:** All switches in your environment.
- **Storage:** All storage subsystems and tape libraries in your environment.
- **Other:** All entities that are discovered in your environment but that do not fit in either the computer, fabric or storage classes.

The groups level is the default level upon launching the topology viewer by clicking either **Computers**, **Fabrics**, **Switches**, **Storage** or **Other** under the **Topology** node. The groups level shows one or more groups of entities that correspond to the topology class that you selected. Information in the graphical view at this level can include any individually pinned entities.

### Group level (L1)

This level focuses on one selected group and its related entities (for example, a group of computers). At L1, individual entities can be shown by expanding the group box. You can also display lines representing connections between entities or between entities and groups.

### Detail level (L2)

This level focuses on individual entities (for example, a single computer, switch, subsystem, or tape library) and the paths to associated logical and physical entities. This level shows details all the way to the port level.

Figure 39. Topology overview

In addition, the topology viewer depicts the relationships among resources (for example, the disks comprising a particular storage subsystem). Detailed, tabular information (for example, attributes of a disk) is also provided. With all the information that the topology viewer provides, you can more quickly and easily monitor and troubleshoot your storage environment and perform critical storage-management tasks.

### Topology viewer interface controls

Progressive information disclosure reduces the visual complexity of a system. In the topology viewer, this means that you can identify and focus on entities in your storage environment that are of particular interest and hide other entities from view.

The tabs displayed in the tabular view represent classes of entities (a physical device or logical resource discovered by IBM Tivoli Storage Productivity Center). Individual entities (for example, a computer named *accounting1*, a tape library named *tapelib4*) are listed in their corresponding tabs. Entity attributes (for example, the operating system of a computer) are organized into table columns. The classes entities are assigned to are Computers, Fabrics, Storage Subsystems, and Other.

**Note:** The Other class contains entities discovered by Tivoli Storage Productivity Center but for which the type cannot be determined.

Changes to the graphical view or the tabular view are automatically applied to the other view, keeping both views synchronized. For example, if an entity is selected in the graphical view, it is also highlighted in the table view.

As more of your resources are discovered and displayed in the topology viewer, it is not possible to see all the discovered resources in a single topology window. To make it easier for you to find the resources you want to view, Tivoli Storage Productivity Center provides a tool called the *minimap*. The minimap allows you to shift the focus of the topology viewer to different areas within a particular view. The minimap is a small window within the topology view.

**Linux/AIX users:** you must use SHIFT+ALT+mouse drag to reposition the minimap.

*Figure 40. Minimap.* You can click the shortcuts to launch Data Path Explorer or to view or change topology settings.

The minimap provides a miniature representation of the current topology view. Clicking on the minimap displays a multidirectional cursor that allows you to move the focus of the current topology view in any direction. As you drag the cursor around the minimap, the topology view will move accordingly. This makes navigating around complex topologies much easier.

The minimap uses the following colors to indicate the aggregated health status of groups:

- Green (normal): All entities in the group are operating normally.
- Yellow (warning): At least one entity is operating normally, and one or more entities have a health status of warning, critical, unknown, or missing.
- Red (critical): The status of all entities is either critical or warning.
- Gray (unknown): None of the entities in the group has an known health status.
- Black (missing): All of the entities of the group are missing.

In the Configuration History page, the minimap uses the following colors to indicate the aggregated change status of groups:

- Blue (changed): One or more entities in the group changed (an addition or deletion of an entity is considered a change).
- Gray (unchanged): All entities in the group are unchanged.

Included in the minimap are shortcuts that you can click to launch the Data Path Explorer or to view or change the topology settings:

- To launch the Data Path Explorer, select one or more hosts, subsystems, disks, volumes, or Mdisks and click the Data Path Explorer shortcut.

**Note:** The shortcut to Data Path Explorer is not available in the Configuration History topology view.

- To view or change the topology settings, click the Topology Settings shortcut. The Settings window displays for you to specify the type of overlays to display, the type of filtering to perform, whether connections between topology objects should display, and whether the Zone tab should display in the table view.

### The graphical view:

This topic describes how the topology viewer groups entities that share certain characteristics. A collapsed group consisting of many entities or subgroups takes up much less space in the graphical view than the individual entities or subgroups would.

In the topology viewer, you can expand or collapse a group or subgroup by clicking the plus (+) character or minus (-) character, respectively, located in the group box.

**Note:** Pinned entities within a group remain visible, even when the group is collapsed.

By default, the topology viewer groups entities by class (computers, fabrics, switches, storage subsystems, and other entities). However, you can create additional groups (but not additional classes) using your own criteria. These custom groups can provide new perspectives on and important information about your storage environment. For example, you can create a special group belonging to the computer class that consists of computers that use the same operating system or storage subsystems of a particular model.

The following figure shows an expanded computer group representation in the graphical view:

Figure 41. Computer group

The title bar of the group box shows the following:

- An icon indicating the health status of the group (for example, normal).
- An icon indicating the types of entities contained in the group.
- The class of group (for example, computers).
- The grouping criterion (for example, Windows).
- The total number of entities in the group. If filtering is turned on, the number in the brackets is the ratio of displayed entities to total entities. For example, 5/10 indicates that 5 entities are shown out of 10 total entities.

The topology viewer provides the following default groups. These groups are accessible, if they exist in your topology, in the overview or by expanding the primary default groups (**Computers**, **Fabrics**, **Switches**, **Storage** and **Other**) that are displayed when you first launch the topology viewer.

Table 40. Group locations in the topology viewer

Type of group	Description	Path to group in topology viewer
Computers	All the computers that are discovered in your environment or a group of computers associated with a particular fabric or switch	<b>Computers</b>
Fabrics	All the fabrics and virtual fabrics that are discovered in your environment	<b>Fabrics</b>
Storage	All the storage-related devices that are discovered in your environment	<b>Storage</b>
Other	All the entities that are discovered in an environment but that do not fit in either the computer, fabric, or storage categories	<b>Other</b>
Fabric	All entities (for example, switches) that belong to or are related to a fabric	<b>Fabrics &gt; Fabric</b>
Virtual Fabric	All entities that belong to a virtual fabric	<b>Fabrics &gt; Fabric</b>
Switches	A set of switches	<b>Fabrics &gt; Fabric</b>
Subsystems	A set of subsystems	<b>Storage &gt; Subsystems</b>
Tape libraries	A set of tape libraries	<b>Storage &gt; Tape Libraries</b>
Device	Devices associated with a particular entity (for example, a computer)	<b>Computers &gt; Computers</b>
Volumes	A set of volumes that are associated with an entity	Different types of volumes groups exist at the L2 level of each of the four main categories: <b>Computers, Fabrics, Storage, Other</b>
HBA	A set of HBAs that are associated with an entity	<b>Computers &gt; Computers &gt; Computer</b>
Disks	A set of disks that are associated with an entity	<b>Storage &gt; Subsystems &gt; Subsystem</b>
Pools	A set of pools that are associated with an entity	<b>Storage &gt; Subsystems &gt; Subsystem</b>
FC Ports	A set of FC ports that belong to an entity	<b>Fabrics &gt; Fabric &gt; Switch</b>
Media	All media attached to an entity	<b>Storage &gt; Tape Libraries &gt; Tape Library</b>
Media Changers	All media changers attached to an entity	<b>Storage &gt; Tape Libraries &gt; Tape Library</b>
Tape Drives	All tape drives attached to an entity	<b>Storage &gt; Tape Libraries &gt; Tape Library</b>
Tape Drive	All ports on a tape drive attached to an entity	<b>Storage &gt; Tape Libraries &gt; Tape Library</b>
Switch	All ports on a switch. Due to the large number of ports on some switches, ports are shown as FC port groups within the switch	<b>Fabrics &gt; Fabric &gt; Switch</b>

As shown by the tabs of the graphical panel (**L0:Computers**, **L1:Computers**, and **L2:Computers**), other views have been opened but are hidden by the overview. The topology tab in the table view displays information about the entities in the groups. You can use the minimap to shift the focus in the view.

Right-click the object and select **Open Detail View** to view entities in a more detailed view. For example, at a high level an object representing a storage subsystem is depicted as an icon with a label. In a more detailed view, the same storage subsystem can be rendered as a box containing sub-entities representing disks, with the corresponding table view showing attributes of each individual disk. At yet another detail level, the ports of the storage subsystem might be shown as well as status information for each port.

*GUI Topology Viewer has new L0 and L1 Switches views:*

The IBM Tivoli Storage Productivity Center GUI has a Switches node under the Topology node. The Switches node opens the new L0 Switches view, from which you can also access the new L1 Switches view.

### **Overview**

The Overview panel now shows a box with the number of switches present in your environment.

### **L0 Switches**

The L0 Switches view shows all switches in your environment.

If you right-click on a Switches group, then click **Group By**, you will get a dialog box for group settings. You can choose to group by a single group or you can group by multiple categories:

- ByHealth
- ByUDP1
- ByUDP2
- ByUDP3
- ByFabric
- ByGroupSize

Click OK to close the dialog box and update the group settings.

### **L1 Switches**

The L1 Switches view shows information on a group of switches in your environment that you selected to display. This also includes connectivity information: what entities this group is connected to.

### **L2 Switch**

This view shows one switch, with all detailed port and connectivity information. You can access this view by double-clicking a single switch icon in either the L0 or L1 Switches view, or through the other Topology Viewer views.

### **The table view:**

This topic describes how tabs in the table view provide detailed information about the entities (for example, computers, subsystems, and fabrics) that are relevant in the current view.

The following is a list of all the tabs available in the topology viewer. Not all tabs are visible in all views.

**Topology**

Detailed information about all the entities in the topology grouped by class of the entity (computers, fabric, storage, and other).

**Computer**

Detailed information about any computer in the computer group or groups in the current topology view.

**Fabric** Detailed information about fabric groups and virtual fabric groups in the current topology view.

**Switch**

Detailed information about switch groups and switch entities in the current topology view.

**Subsystem**

Detailed information about volume groups and volume entities in the current topology view.

**Disk** Detailed information about disk groups and disk entities in the current topology view.

**Pool** Detailed information about pool groups and pool entities in the current topology view.

**Note:** One of the columns in the tabular view refers to whether a storage pool is primordial. A primordial pool represents unallocated storage capacity on a storage device. Storage capacity can be allocated from primordial pools to create storage pools. This means that primordial pools are disk/device sources for allocation of storage pools.

**Volume**

Detailed information about volume groups and volume entities in the current topology view.

**Tape Library**

Detailed information about tape-library groups and tape-library entities in the current topology view.

**Media Changer**

Detailed information about media-changer groups and media-changer entities in the current topology view.

**Tape Drive**

Detailed information about tape-drive groups and tape-drive entities in the current topology view.

**Other/Unknown**

Detailed information about objects in your environment other than computers, switches, subsystems, and tape libraries in the current topology view.

**FC Port**

Detailed information about port groups and port entities in the current topology view.

**Connection**

Detailed information about all relationships between objects in the current topology view.

**Alert** Detailed information about all alerts that are associated with entities in the current view of the topology.

**Zone** Detailed information about any of the following groups or entities in a zone. By default, the **Zone** tab is disabled.

- Fabric groups
- Zone-set groups
- Zone groups
- Computer entities
- Switch entities
- Subsystem entities
- Tape library entities

**Cluster**

Detailed information about clusters in the current topology view.

**Node** Detailed information about nodes in the current topology view.

**File Pool**

Detailed information about file pools in the current topology view.

**Filesystem**

Detailed information about file systems in the current topology view.

**Network Shared Disk**

Detailed information in Network Shared Disks in the current topology view.

**Export or Share**

Detailed information about exports or shares in the current topology view.

**File Set**

Detailed information about files sets in the current topology view.

**Identifying storage resources using icons:**

This topic describes how the topology viewer displays entities and groups of entities with an appropriate icon based on the entity class.

The storage resource icons can help you quickly and easily identify storage resources. For example, an entity of class "computer" is displayed in the graphical view with an icon that resembles a computer.

The following table shows the icons for individual resources and for resource groups.

Topology Object	Icon	Group Icon
Computer		
Computer HBA		
Fabric		

Topology Object	Icon	Group Icon
Switch		
Switch port		
Storage subsystem		
Storage subsystem port		
Storage virtualizer (for example, SAN Volume Controller, HDS Tagmastore)		
Tape library		
Tape library media changer		
Database volume		
File system volume		
Storage volume		
Other volume		
Storage disk		
Storage backend disk		n/a
Storage pool		
Unknown		

**Note:** *Unknown* entities are entities that are discovered by IBM Tivoli Storage Productivity Center but that do not have an agent installed or the agent is not working.

### Identifying icons for storage resources that contain full disk encryption disks

The icons in the following table identify whether a storage system contains encrypted or encryptable disks. The group icon for encrypted storage disks, pools, and volumes is the same as the group icons that are shown in the first table.

For more information on supported systems that provide full disk encryption, see “Supported storage systems providing full disk encryption and solid-state drives” on page 1427.

Topology Object	Encrypted Icon	Encryptable Icon
Storage disk		
Storage pool		
Storage volume		

### Identifying icons for storage resources that contain solid state drives

A solid-state drive is a storage device that stores persistent data on solid-state flash memory. The icons in the following table identify whether a storage system contains solid-state drives. The group icons for storage disk, pool, and volume in the following table are the same as the group icons that are shown in the first table.

For more information on supported systems that provide solid-state drives, see “Supported storage systems providing full disk encryption and solid-state drives” on page 1427.

Topology Object	Icon
Solid-state drive storage disk	
Solid-state drive storage pool	

### The topology viewer and virtual SANs:

This topic describes how Cisco switches support virtual SANs (VSANs), which is the logical partitioning of a fabric into multiple fabrics. The overall network is referred to as the physical infrastructure, and the logical fabrics are the VSANs.

SNMP queries to a Cisco switch collect information about the Cisco physical infrastructure and about any VSANs in that infrastructure. Storage Resource agents or In-band fabric agents can also collect information about the VSANs but are unable to collect information about the physical infrastructure. The status of Cisco physical infrastructures shown in the topology view is determined based on the status propagated from the VSANs in the infrastructure and the status of the infrastructure itself. If the status of the physical infrastructure is missing but the status of all or some of the VSANs in the infrastructure is normal, infrastructure

information can no longer be collected. This typically indicates that the out-of-band agent is no longer working properly or that SNMP queries to the Cisco switches are no longer configured because the switch has been removed from the list of agents in the **Out of Band Fabric** node.

The consequences of this situation are illustrated in the following scenario: A fabric includes a Cisco switch with a VSAN on it. An out-of-band agent on the switch collects physical infrastructure and VSAN information, and an in-band Fabric agent collects information about the VSAN. If the out-of-band agent is removed or Fabric Manager is no longer able to communicate with the agent, IBM Tivoli Storage Productivity Center still detects the VSAN through Storage Resource agents or in-band agents, but physical infrastructure information can no longer be collected. As result, in the fabric topology view, the status of the physical infrastructure box is shown as missing, while the status of one or more VSANs in the infrastructure shows as normal. To correct this situation ensure that the out-of-band agent is configured for the Cisco switch.

### **The topology viewer and VMware:**

This topic describes what the topology viewer displays for VMware support.

The Overview view of the topology viewer displays a count of hypervisors and virtual machines in the Computers summary.

The L0: Computers view displays the hypervisors and virtual machines in addition to other computers and includes the grouping By Virtualizer.

The L1: Computer view for a hypervisor displays volumes that were assigned to the hypervisor and the connectivity to fabrics.

The L1: Computer view for a virtual machine displays volumes that were assigned to the hypervisor and have been mapped to the VMware computer (virtual machine) as raw disks.

The L2: Computer view for a hypervisor includes a mapping of virtual machines and shows the virtual machine disk to physical disk relationship.

The L2: Computer view for a virtual machine displays the physical disk (what the virtual machine recognizes as a physical disk) to virtual machine disk relationship and hypervisor connectivity.

**Note:** IBM Tivoli Storage Productivity Center supports the mapping of storage between the storage system volume and ESX Server corresponding disk. This mapping is supported for the ESX Server 3.5 or VirtualCenter 2.5 or later. Previous versions of ESX Server or VirtualCenter are not supported for the mapping of storage to the storage system.

### **Viewing large environments in the Topology Viewer:**

In environments where you are monitoring a large number of storage entities, IBM Tivoli Storage Productivity Center might not be able to display all of those entities within the Topology Viewer. To avoid this issue, there are some tasks you can perform to improve overall scalability and performance of the user interface.

If the Topology Viewer is unable to display all the entities in your environment, the user interface generates javacore and heapdump files in its installation

directory. It is recommended that you check this directory to determine if this display problem is occurring in your environment. To do this, perform the following steps:

1. View the contents of the installation directory where Tivoli Storage Productivity Center's user interface is installed. The default installation directories are as follows:
  - Windows: C:\Program Files\IBM\TPC\gui\
  - UNIX/Linux: /<usr or opt>/IBM/TPC/gui/
2. Determine if javacore and heapdump files appear in the installation directory. You can identify these files by searching for files that begin with the word **javacore** or **heapdump** and have a **.txt** or **.phd** extension. For example: javacore.20080605.151906.8088.txt and heapdump.20080605.151903.8088.phd.

If these files appear in the installation directory, it might indicate that the display problem is occurring when you use the Topology Viewer.

There are two methods for working around this issue:

- Reducing the number of open topology views and disable unneeded overlays (such as the alert, performance, and zoning overlays). The number of topology views that are open and overlays that are enabled can affect how many storage entities are able to be displayed in the Topology Viewer.
- Increasing the memory allocation for IBM Tivoli Storage Productivity Center's user interface component. If reducing the number of open topology views and disabling unneeded overlays does not correct the problem, you can increase the amount of memory that is allocated to the user interface to help resolve the issue.

*Reducing the number of open topology views and disabling unneeded overlays:*

Perform these tasks to help improve the scalability of the Topology Viewer.

The number of topology views that are open can affect how many storage entities are able to be displayed within those views. The more views (tabs) that are open in the Topology Viewer, the more memory is used by the user interface. If the user interface requires more memory than is available to display all the entities within the open views of the Topology Viewer, some of the entities are not displayed. To work around this problem, close any views that you no longer need to view and refresh the content of the views that you leave open.

The number of overlays that are enabled in the Topology Viewer can also affect how many storage entities are able to be displayed. The topology viewer uses color and icons to indicate the status of objects in the topology and tabular views. Overlays are colors and icons that used to indicate health, performance, change, and alerts. To disable overlays that you do not need, complete the following steps:

1. Right-click on any blank space within a topology view.
2. Select **Global Settings...** from the pop-up menu.
3. Uncheck the overlays you do not need to view. For example, clear the **Performance** and **Alert** check boxes.
4. Click **OK** to accept the changes. The content of the open views within the Topology Viewer are automatically refreshed according to your changes.

*Increasing the memory allocation for the user interface:*

Perform this task to allocate more system memory to the IBM Tivoli Storage Productivity Center user interface.

Increasing the amount of allocated memory might enable the user interface to correctly display a large number of storage entities in the Topology Viewer. This task is generally recommended and encouraged in larger environments.

To do this, perform the following steps:

1. Close any current sessions of the Tivoli Storage Productivity Center user interface.
2. Locate the batch or script file that is used to start the user interface. This file is located in the Tivoli Storage Productivity Center installation directory on the computer where the user interface is installed. The default file names and installation directories are as follows:
  - Windows: C:\Program Files\IBM\TPC\gui\tpc.bat
  - UNIX/Linux: /<usr or opt>/IBM/TPC/gui/TPCD.sh
3. Open the tpc.bat or TPCD.sh file in a text editor and locate both occurrences of the parameter that defines how much memory is allocated to the GUI component:
  - Windows parameter: **-mx256M**. The default setting for Windows is 256 megabytes.
  - UNIX/Linux parameter: **-xmx512M**. The default setting for UNIX and Linux is 512 megabytes.
4. Increase the value for all occurrences of this parameter. For example:
  - Windows: change **-mx256M** to **-mx1024M**
  - UNIX/LINUX: change **-xmx512M** to **-xmx1024M**

**Note:** Make sure that the computer on which the user interface is installed has enough memory to support the setting that you define.

5. Save the batch or script file and restart the user interface.
6. Check the Topology Viewer to ensure that all the monitored storage entities are displayed as a result of increasing the amount of memory allocated to the user interface. If you still experience this display problem, repeat steps 1-5 and further increase the value for the parameter in the startup file.

Contact an IBM service representative if changing the memory allocation for the user interface does not help resolve the issue.

## Arranging entities in a group

This topic describes how to arrange entities in an expanded group.

You can arrange entities within the group box by health status or by entity label if an expanded group contains many entities. With either type of arrangement, you can specify ascending or descending order. To arrange entities, follow this procedure:

1. Right-click the graphical view and select **Arrange By**.
2. Select one of the following:
  - **Label (ascending)**
  - **Label (descending)**
  - **Health (ascending)**

- Health (descending)

## Checking the status of entities and groups

This topic describes how the topology viewer uses icons to indicate the health, performance, and operational status for entities.

To quickly check the health, performance, operational, change, and alert status of entities or groups of entities, look for the following icons associated with a particular entity or group in the topology. Position the cursor over these icons to see the health string in text format:

Table 41. Topology status indicators and their icons

Indicator	Icon
Health - Normal	
Health - Warning	
Health - Critical	
Health - Unknown	
Health - Missing	
Operational - Running	
Operational - Upgrading	
Operational - Missing	
Performance - Normal	
Performance - Unknown	
Performance - Warning	
Performance - Critical	
Performance - Missing	
Change - Objects did not exist at the two specified time periods	Objects in light gray with no icon
Change - Objects changed between the two specified time periods	
Change - Objects did not change between the two specified time periods	
Change - Objects were created between the two specified time periods	
Change - Objects were deleted between the two specified time periods	

Table 41. Topology status indicators and their icons (continued)

Indicator	Icon
Alert - Critical, Warning, or Informational	

The operational status icons (running, upgrading, missing) are displayed by default and cannot be hidden. However, you can specify whether to display health, performance, or alert icons. To display these icons, follow this procedure:

1. Right-click a blank space in the background of the graphical panel and select **Global Settings**.
2. In the Settings window, select **Health, Performance, or Alert**. Click **OK**.

### Health status

This topic describes how the topology viewer displays the health status of entities.

The health of an entity falls into one of the following categories:

- Normal: The entity is operating normally.
- Warning: At least one part of the entity is not operating or has serious problems.
- Critical: The entity is either not operating or has serious problems.
- Unknown: The entity was discovered but is not recognized by IBM Tivoli Storage Productivity Center.
- Missing: The entity was previously discovered by Tivoli Storage Productivity Center, but was not detected in the most recent discovery.

The health of a group falls into one of the following four categories:

- Normal: All the entities in the group are operating normally.
- Warning: At least one entity in the group has normal status.
- Critical: All entities are either in critical or warning states.
- Unknown: None of the entities in the group have a known health status.

Health indicators for some entities, such as ports, are only normal and critical. In certain situations, the health of an entity might not be available. This happens, for example, when the entity is identified as missing. In the graphical view, missing entities are shown with a semitransparent light gray layer over an existing icon.

Level-indicator buttons on the graphical view (for example, **L0:Computers**) display icons for health.

Multiple states from single entities are aggregated into group states or states of entities, using the following rules:

- If all entities are in the same state, the aggregated state will represent this state.
- You will get an aggregated critical state (red) if:
  - One entity is in the missing state and at least one other entity shows a critical state.
  - One entity is in the critical state and at least one other entity shows a missing state.
- You will get an aggregated normal state if:
  - One entity is in the normal state and all others are in normal or undefined state.

- One entity is in the undefined state and all others are in normal or undefined state.
- All other combinations will aggregate to warning state (yellow).
- States displayed within the tabs of the topology view will be aggregated according to the focus of the specific entity class.
  - For Computers and Storage, only the states of these entities are used for aggregation.
  - For Fabric, only the switch status is used for aggregation.
  - For level 1 and 0, the states of all displayed entities are used for aggregation.

See “How status is determined for individual resources” for more information about how the status of individual entities are displayed in the topology viewer.

At the Overview level, the health status indicated by the icon on **Overview** for the graphical view indicates the aggregated status of all the groups inside the graphical view (**Computers, Fabrics, Switches, Storage and Other**). At the L0 level, the health status indicated by the icon on the **L0** tab of the graphical view indicates the aggregated status of all the groups inside that particular L0 graphical view (for example, the health status for the L0:Computers view would aggregate the health status of all discovered computers, including those that are missing, computers whose health status is critical, computers whose health status is warning). At the L1 level, the health status indicated by the icon on the **L1** tab of the graphical view indicates the status of the particular group that is the focus of the view. (The status of the group is based on the aggregated status of the entities within the group.) The health status for the group is also indicated in the table view. At the L2 level, the health status indicated by the icon on the **L2** tab of the graphical view is the same as the status of the particular entity that is the focus of the view. The health status for the entity is also indicated in the table view.

**Note:**

- At the L1:Fabric level the health status indicated by the icon on the **L1:Fabric** tab of the graphical view might not be the same as the overall health of the group, based upon the aggregated status of all the entities within the group.
- At the L2:Subsystem level, the status of the volume group is the aggregated status of all the volumes that comprise the group and not the status of the host that owns those volumes.
- The number of computers that are displayed in the Computers view of the topology viewer might be more than the number of Tivoli Storage Productivity Center agents that are deployed in the environment. These additional nodes are displayed with an "unknown" status. For example, if Tivoli Storage Productivity Center determines that a node in a fabric is an HBA, that node is displayed in the Computers view (rather than in the Other view). This situation occurs because during a probe, inband fabric agents can identify nodes in the topology viewer as HBAs in computers.

To update nodes that have an unknown status in the Computers view, deploy an Storage Resource agent on the computer that has the HBA whose WWN is shown in the topology viewer.

**How status is determined for individual resources:**

The topology viewer shows the status for individual resources and for groups of resources. The status of an individual resource is determined by its consolidated status and the propagated status of its internal resources.

The following statuses are possible for individual resources:

-  Normal: The resource is operating normally.
-  Warning: At least one part of the resource is not operating or has potential problems.
-  Missing: The resource was previously discovered by Tivoli Storage Productivity Center, but was not detected in the most recent discovery.
-  Critical: The resource is either not operating or has serious problems.
-  Unknown: The resource was discovered but is not recognized by Tivoli Storage Productivity Center.

Tivoli Storage Productivity Center determines the status of a resource by using its consolidated status and the propagated status of its internal components:

- A consolidated status is the status that is reported by the top-level resource for its own hardware. For example, if the cooling fans in a storage system are stopped and the internal temperature is too high, that status is reported to Tivoli Storage Productivity Center.
- A propagated status is the combined statuses of the monitored, internal resources for a top-level resource. For example, if a Warning status is detected on a volume in a storage system, that Warning status is used to determine the overall status of the storage system.

The statuses of the following internal resources are used to calculate the status of top-level resources.

*Table 42. Internal resources that are used to determine the status of top-level resources*

Top-level resource	Internal resources that are used to determine the status of a top-level resource
Fabric 	 ,  Blades, and ports on blades  Ports that are not blades  Switches
Hypervisor 	 Controllers  Ports on controllers  Virtual machines
Server 	 ,  Controllers, and ports on controllers  Volume groups  Monitored directories

Table 42. Internal resources that are used to determine the status of top-level resources (continued)

Top-level resource	Internal resources that are used to determine the status of a top-level resource
<p>Storage system</p> 	<ul style="list-style-type: none"> <li> Clusters</li> <li> Controllers</li> <li> Disks</li> <li> External disks</li> <li> Modules</li> <li> Network shared disks</li> <li> Nodes</li> <li> Pools, and the internal resources that are associated with pools: <ul style="list-style-type: none"> <li> Volumes</li> <li> RAID arrays</li> <li> Managed disks</li> </ul> </li> <li> Ports</li> </ul>
<p>Switch</p> 	<ul style="list-style-type: none"> <li> Blades</li> <li> Logical switches</li> <li> Ports</li> </ul>

Internal resources for a top-level resource might have different statuses. Tivoli Storage Productivity Center uses the most severe status of an internal resource when determining the overall status for a top-level resource. For example, in a storage system, a port might have a Critical status, a pool might have a Warning status, and a number of controllers might have an Unknown status. In this case, the overall status for the storage system is Critical because it is the most severe status that was detected on the internal resources.

Statuses for internal resources are propagated in the following way to determine the status of a top-level resource:

- If an internal resource has a Critical status, then the related top-level resource has a Critical status.
- If an internal resource has a Missing status, and no other internal resources have a Critical status, the related top-level resource has a Missing status.
- If an internal resource has a Warning status, and no other internal resources have a Critical or Missing status, the related top-level resource has a Warning status.
- If an internal resource has a Normal status, and no other internal resources have a Critical, Missing, or Warning status, the related top-level resources has a Normal status.

- If an internal resource has an Unknown status, and no other internal resources have a Critical, Missing, Warning, or Normal status, the related top-level resource has an Unknown status.

The following table shows some of the possible combinations of statuses and their resulting, propagated status.

Table 43. Propagation of the statuses for internal resources in the stand-alone GUI

Critical 	Missing 	Warning 	Normal 	Unknown 	Resulting status for top-level resource
				X	 Unknown
			X		 Normal
			X	X	 Normal
		X			 Warning
		X		X	 Warning
		X	X	X	 Warning
	X				 Missing
	X			X	 Missing
	X		X	X	 Missing
	X	X	X	X	 Missing
X					 Critical
X				X	 Critical
X			X	X	 Critical
X		X	X	X	 Critical
X	X	X	X	X	 Critical

## Operational status

This topic describes how the topology viewer has three categories of operational status for entities.

The operational status of most entities falls into one of the following three categories:

Table 44. Categories of operational status for storage entities

Status	Description
Running	The entity is running.
Upgrading	The entity is upgrading.
Missing	The entity was not discovered during the last refresh cycle.

However, some entities display additional operational status. For example, switches can display a status of **OK**, **Error**, **Stopped**, and other types of status.

**Note:** When IBM Tivoli Storage Productivity Center no longer detects an entity that was previously displayed in the Topology viewer, the operational status of

that entity remains as the last known status before it went missing. This means that the operational status of an entity is not cleared or reset if that entity is not found in subsequent data collection jobs.

## Performance status

This topic describes performance status details collected for entities.

Performance information is collected for entities in the L2:Switch and L2:Subsystem views. You can see the performance indicators for individual switches and subsystems in these two views by turning on the performance feature in the Global Settings window. This feature is not enabled by default.

The performance status of an entity falls into one of the following five categories:

- Normal: The entity is performing at the expected level.
- Warning: At least one part of the entity is not operating at the expected performance level.
- Critical: The entity is not operating at the expected performance level.
- Unknown: The performance of the entity is not known.
- Missing: The entity was not found during the last refresh cycle and the performance status is not available.

The performance status does not get carried up to the L0 and L1 views. It is only available in the L2:Switch and L2:Subsystem views.

Performance status of an entity is not propagated upwards to its parent entity. For example, a SAN Volume Controller can cross several critical or warning stress thresholds (and show as yellow or red in the topology viewer) even though the underlying pools, disks or volumes do not have a degraded performance status.

After performance has been enabled, you will see a performance status indicator for any entity in these views that has performance data available. Position the cursor over a performance icon to see a list of performance metrics for that entity.

To enable the collection of performance information, perform the following steps:

1. Right-click a blank space in the background of the graphical panel and select **Global Settings**.
2. In the Settings window, select **Performance** and click **OK**.

## Change status

This topic describes how the Configuration History topology view displays the status of entities over time.

The Configuration History feature uses the icons and colors of the change overlay to indicate historical changes in a SAN configuration's entities. The same icons and colors are used in the graphical view, table view, and snapshot selection panel. The following table lists the five possible states of an entity and shows the associated icons and colors.

State of an entity	Change overlay icon	Change overlay color indicator
Entity changed between the time that the snapshot was taken and the time that a later snapshot was taken.	 Yellow pencil	Blue background

State of an entity	Change overlay icon	Change overlay color indicator
Entity did not change between the time that the snapshot was taken and the time that a later snapshot was taken.	 Light gray circle	Dark gray background
Entity was created or added between the time that the snapshot was taken and the time that a later snapshot was taken.	 Green cross	Green background
Entity was deleted or removed between the time that the snapshot was taken and the time that a later snapshot was taken.	 Red minus sign	Red background
Entity did not exist at the time that the snapshot was taken or at the time that a later snapshot was taken.	Not applicable	Light gray background

Level-indicator buttons in the graphical view (for example, **L0:Computers**) display the change icons.

For groups and other collections, the change overlay provides only aggregated status. That is, the change status for a group of entities is either “changed” or “unchanged.” Details for the group as a whole are not provided. Aggregated status displays in the minimap. In the Configuration History page, the minimap uses the following colors to indicate the aggregated change status of groups:

- Blue (changed): One or more entities in the group changed (an addition or deletion of an entity is considered a change).
- Gray (unchanged): All entities in the group are unchanged.

An object that is moved from one group to another group appears only once in the new group in the graphical view. For example, if the health status of a computer has changed from Normal to Warning, the Configuration History page displays the computer as changed in the Warning health group (and no longer displays the computer in the Normal health group).

**Important:** If you manually deleted a missing entity from the Tivoli Storage Productivity Center, the configuration history function rediscovers and displays the entity in the configuration history viewer as both Missing and in a Normal state. For example, Entity A (with ID 12) is missing and you decide to manually delete it by using the Remove From Database option from the pop-up menu for Entity A in the topology viewer or configuration history viewer. Later, the Tivoli Storage Productivity Center rediscovers Entity A and assigns it a new ID (ID 22). The configuration history function treats the same Entity A (with ID 12 and ID 22) as two different entities and displays them in both Missing and Normal states in the configuration history viewer. This scenario can also occur if a missing entity is removed by the Tivoli Storage Productivity Center removed resource retention function and is rediscovered by the Tivoli Storage Productivity Center again at a later time.

To display a summary of change for the entire row, hover over the changed row. The summary displays the title of the column. It also displays the old and new value for each cell or tab that changed. For example, if a group contains one new entity but everything else in the group is unchanged, the group as a whole displays as “changed.” If you click the group, the one new entity displays as “created” and all other entities display as “unchanged.”

The Change column in the table view also indicates changed entities.

## Alert status

This topic describes how the topology viewer displays alert status for all entities in the current view.

The alert status of an entity falls into one of the following categories:

- Warning: At least one part of the entity is not operating or has serious problems.
- Critical: The entity is either not operating or has serious problems.
- Informational: Related data about the entity is supplied to aid you in decision making.

When enabled, in the topology viewer the alert overlay is located next to entity icons, near the pinning indicator. The icon for the alert overlay is a red exclamation

mark  for the presence of alerts. In the title bar of groups and tabs, the alert icon is similarly located near the entity label. The alert overlay is disabled in the Configuration History page.

To find alerts that are associated with an entity in the table view, click the alert overlay indicator to go to the corresponding alert on the Alert tab. Or, right-click the entity to display a pop-up menu and click **Show Alerts in Tabular View** to go to the Alert tab and any corresponding alerts that are associated with that entity. The corresponding alerts are highlighted in purple. When you select an alert in the Alert tab, the entities that are associated with that alert are highlighted in purple in the graphical view. Note that more than one entity may become highlighted. An alert icon for a collapsed group indicates that alerts exist within the collapsed group.

The alert overlay provides rollup, similar to pinning. If alerts are inside a collapsed group, the number of alerts within that group are aggregated and indicated in the collapsed group. All alerts are aggregated into one count, independent of type or entity involved. Hover over the alert indicator for a tab or group to determine the total number of alerts that are rolled up into that indicator and the time stamp of the newest alert.

In the table view, click the Alert tab to view all alerts associated with entities in the current view of the topology. The Alert tab contains alerts as a hierarchical list. For configuration analysis alerts, the highest level provides information about which policy was violated during a particular analyzer run. The next level indicates the number of times that the policy was violated. This list contains one node for each policy violation. The Alert tab only lists the policy violations that contain at least one of the affected entities that are displayed in the graphical view. The remaining policy violations are filtered. The only exception is the Overview panel where the Alert tab lists all of the policy violations. Click each violation to view a list of affected entities. The parent entities for these affected entities are displayed in a separate column. You can resort the alert list by clicking the headers in the table. For instance, by clicking on the header for the entity the alert table is reorganized into a hierarchical list sorted by entity, then by alert type. If no alert was generated for an entity, the Alert column is blank.

To find an entity associated with an alert in the graphical view, click the alert on the Alert tab. The corresponding entity and any associated entities are highlighted (but not selected) in the graphical view. The highlighting is purple.

For more information, see “Viewing alerts” on page 399.

## Creating custom groups

This topic describes how custom groups can be created based on criteria that is useful and relevant to you.

Custom groups are visible in both the graphical view and the table view. You can create custom groups using any of the following criteria. The grouping criterion is displayed in parentheses in the title bar of the group box.

For example, using the topology viewer, you can organize a collection of computers into groups based on the type of operating system (for example, Windows, Linux and so on). Using a UDP, you could also create subgroups for each operating system-based group of computers (for example, the Windows group could contain subgroups for Windows 2000 and Windows NT). Organization into groups can also be based on physical location of associated devices; for example, devices in Lab A could be organized in one group, devices in Lab B could be organized in another group, and so on. To create these types of groups, use UDPs (for example, a text string of "Lab A"). To set UDPs use the pop-up menu item, Launch Detail Panel.

If you specify grouping by UDP, the groups are sorted in alphanumeric order in the graphical view. If the grouping is by health status, groups are sorted in the following order: missing, critical, warning, normal and unknown. You can also specify the arrangement of entities within a group box based on health status and label.

To group entities, follow this procedure:

1. Right-click a group and select **Group By**.
2. Select a group-by option. Options differ depending upon the class of the group.

### **Single Group**

All entities are included in one group.

### **Health**

Groups are based on health status (for example, normal or warning).

**Model** The model of the storage subsystems server (for example, DS8000). This option is available for subsystem groups only.

### **OS Type**

Groups are based on operating systems. This option is available for computer groups only.

### **RAID level**

Groups are based on RAID level. This option is available only for pool groups at the **L2:Subsystems** level.

**Fabric** This option is available for switch groups only.

### **User-defined properties (UDPs)**

UDPs are characteristics that you define for an entity. For example, you could create a UDP for several entities using the text string "new installation." All the entities with that UDP would be grouped together. The topology viewer provides three UDPs so that you can group resources in three different ways, depending on your needs. UDPs are not available for fabric groups.

## Defining properties for grouping entities

This topic describes how User-defined properties (UDPs) are useful for describing specific properties of an entity or a set of entities.

You can also use UDPs to group entities with similar characteristics. The topology viewer lets you define three UDPs for an entity. UDPs are not available for fabric groups. To define one or more UDPs for an entity, follow this procedure:

1. Right-click an entity and select **Launch Detail Panel**.
2. Type a property in the **User Defined Property 1** field (for example, a specific operating system, location of computers, and so on).
3. Optional: Type additional properties in the **User Defined Property 2** and **User Defined Property 3** fields, and then click **Set**.
4. Type a description of the element manager and click **OK**.
5. Click **Launch**.

## Displaying data paths from one endpoint in the topology to another

This topic describes how to view connectivity for selected entities in the topology using Data Path Explorer.

### Data Path Explorer Overview

The Data Path Explorer allows you to follow connectivity between a host disk or computer and a storage subsystem. The Data Path Explorer also provides SAN Volume Controller support. Using Data Path Explorer you can follow the connectivity from a computer to SAN Volume Controller, and from an SAN Volume Controller to a storage subsystem.

Viewing a single data path allows you to monitor performance status and pinpoint weaknesses without navigating the many entities typically seen in Topology Viewer.

Data Path Explorer shows only those entities that are part of the selected data path, and only certain types of entities, such as host, switch, host bus adapter (HBA), port, storage subsystem, and storage volume.

Data Path Explorer functions like the rest of the Topology Viewer, with key variations.

**Note:** The shortcut to Data Path Explorer is not available in the Configuration History topology view.

### Before Using Data Path Explorer

Different amounts of information can be shown by the Data Path Explorer, depending on which agents are deployed throughout the fabric.

To use Data Path Explorer for debugging performance problems, follow these steps to ensure that the information displayed in the Data Path Explorer view is current:

1. Enable Performance overlays. To see the overlays, go to topology **Global Settings > Active Overlays**: and select the **Performance** checkbox.
2. Ensure I/O is running on the host machine.
3. Create a threshold alert (see “Creating a performance threshold within an alert” on page 148).

4. Create and run performance monitors on the switches and storage subsystems of interest. See “Monitoring switch performance” on page 377 or “Monitoring storage-subsystem performance” on page 378 for detailed descriptions on creating and running performance monitors.
5. Run a discovery job for the CIM agents and Storage Resource agents or Data agents.
6. Run a probe job for the subsystem, fabric, and Storage Resource agents or Data agents.
7. Run a performance monitoring job for the subsystem and switches if you want to see performance information.

See the section about planning for the Data Path Explorer view in the *IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication Installation and Configuration Guide* for more information on configuring data path explorer.

## Graphical View

When you open a data path view, three tiles display in the graphical view: Initiator Entities, Fabrics, and Target Entities. These contain all the entities in all the data paths related to the selected host or storage entity.

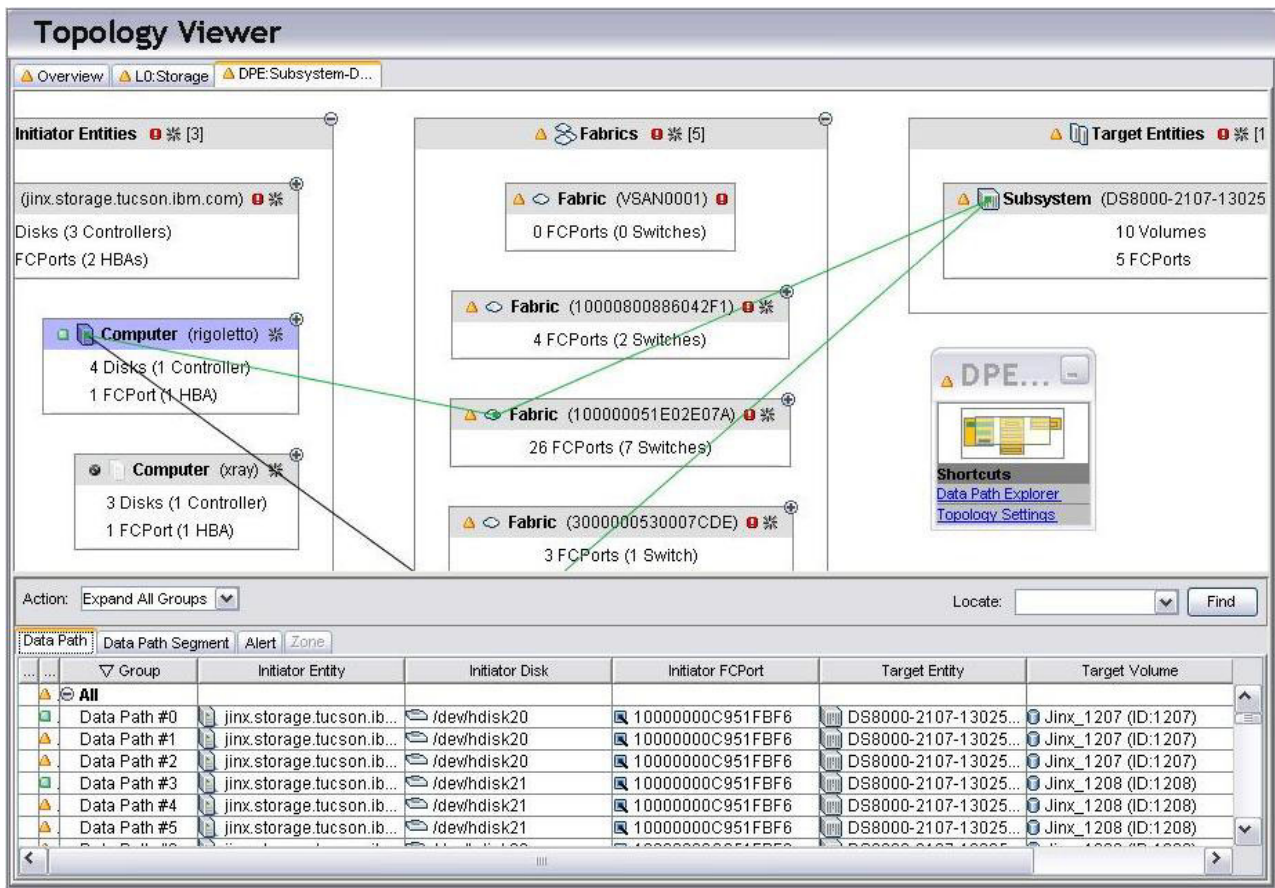

Figure 42. Data Path Explorer view

- Selecting an entity in any of the tile groups at any level displays connector lines showing the data paths the entity is involved in.

- Each tile behaves like an active topology viewer tab, allows grouping and regrouping, expanding and collapsing of groups and so forth. Each tile can be expanded to view the lower-level details such as the disks, ports and volumes involved in a data path.

### **Initiator Entities**

The Initiator Entities tile contains the computers and related volumes, disks, and HBA ports that have valid data paths to the storage system. Expanded computer tiles display each computer, its health status icons, and a count of the entities within the computer that are part of the valid data paths. Expanded computer tiles show the controllers and disks, HBA ports, and volumes on the computer that are part of valid data paths. The initiator entities tile can also contain SAN Volume Controllers. An SAN Volume Controller is a storage virtualization device and can act as an initiator entity. Expanded SAN Volume Controller tiles show the SAN Volume Controller managed disks and ports that are part of valid data paths.

### **Fabrics**

The Fabrics tile contains the fabrics entities, mainly switches and ports, through which valid data paths for the selected endpoint traverse. A count of the switches and switch ports with health status icons and labels are shown in the group title. Expanded Fabric tiles display a view of the switches to the port level. Only switches and ports with valid data paths traversing through them are displayed.

### **Target Entities**

The Target Entities tile contains the endpoint storage systems in data paths for the selected endpoint. Expanded Target tiles display each storage subsystem, its status icons, a count of entities, and the number of subsystem front-end ports and volumes involved. When these are expanded, the associated port and volume tiles display. These can also be expanded to show individual entities.

### **Table View**

The data path table displays under the graphical view. Each row in the table view shows a valid data path for the selected endpoint.

Display a single data path in the graphical view by selecting a row in the data path table.

The data path table has two tabs: Data Path and Data Path Segment.

#### **Data Path tab**

This is the default view. This tab shows each data path associated with the entity for which the data path was opened.

- Select an entity in the graphical view to display individual data paths in the table.
- The health status shown for each data path is aggregated.
- The data path table can be sorted by any of the column headers.

See “Columns in Data Path tab” on page 528.

#### **Data Path Segment tab**

This tab displays the segments in a data path. One segment is listed per row.

There are two ways to populate the Data Path Segment table:

- Select a data path in the Data Path tab. The Segment tab then lists the segments in the selected data path.
- Click an entity in the graphical view. The Segment tab lists the segments in all of the data paths the entity is involved in. These are identified by data path number (0, 1, 4, and so on).

See “Columns in Data Path Segment tab” on page 528.

**Related reference:**

“Opening a Data Path View”

Data Path Explorer provides an end-to-end topology view of the storage environment from a host disk to a storage volume. It displays the different data paths (SAN access paths or I/O paths) for each host disk.

“Displaying an entity's data paths” on page 527

You can view the data paths associated with any entity by selecting the entity in the graphical view. Lines connect the related entities in the data path or paths.

“Example use cases for Data Path Explorer” on page 529

The following examples show some of the use scenarios for Data Path Explorer:

**Opening a Data Path View**

Data Path Explorer provides an end-to-end topology view of the storage environment from a host disk to a storage volume. It displays the different data paths (SAN access paths or I/O paths) for each host disk.

You can open a data path view on any of the following endpoints:

**host** The host (computer) must have at least one disk that is assigned from a subsystem.

**subsystem**

The subsystem must have at least one volume assigned to a host.

**volume**

The volume must be assigned to a computer, and the fabric must be zoned so that the computer can see the volume.

**disk** The disk must be from a subsystem. Note that the disk can be host disk or SAN Volume Controller managed disk.

Open a data path explorer view in one of the following ways:

- Right click on an endpoint, and then select Open Data path view.
- Select an endpoint, and then select Open Data path view from the Action menu.
- Select an endpoint, and then select the Data Path Explorer shortcut in the minimap
- For multiple entities: Select one or more endpoints of the same type (for example, one or more storage volumes), and then select Open Data Path View. The data paths display for all of the endpoints selected. If you select an SAN Volume Controller entity, all other entities you select must be SAN Volume Controller entities.

**Note:**

1. Opening the Data Path Explorer view for a subsystem (including an SAN Volume Controller) that has several associated data paths can consume extensive system resources. Select volumes or disks instead, and then open the Data Path Explorer view.
2. If the endpoint is an SAN Volume Controller, two data path views are opened because the SAN Volume Controller can act as both a initiator and target entity.

The first view displays the data paths associated with the SAN Volume Controller acting as a storage subsystem or a target entity. The second view displays the data paths associated with the SAN Volume Controller acting as an initiator entity.

When a data path view is opened, three tiles display: the Initiator Entities, Fabric, and Target Entities tiles. These tiles contain all the associated entities in the data paths. Select an entity within one of the tiles to see the data paths associated with it. You may need to further expand the tiles.

If you select an entity or a group of entities that do not have a valid data path, a dialog box displays with the following message: "No available DataPath for the selected entities."

The Data Path Table lists each data path (one per row).

To return to a normal topology view, right-click an entity in the graphical or table view and select **Open Detail View** from the pop-up menu.

### **Displaying an entity's data paths**

You can view the data paths associated with any entity by selecting the entity in the graphical view. Lines connect the related entities in the data path or paths.

- In the table view-Data Path tab, the selected entity's data paths are highlighted.
- The table view-Data Path Segment tab displays the data paths belonging to the selected entity and the individual segments that make up the data path.

### **Multiple paths**

IBM Tivoli Storage Productivity Center shows the multiple paths from the disks to the storage subsystem volumes in the Data Path Explorer view. IBM Subsystem Device Driver (SDD) software allows the operating system to use multiple paths (that is, different initiator and target port pairs) through the SAN for storage access. On the L2 Computer View and the Data Path Explorer view, the disks with multiple paths managed by SDD are grouped in a controller representing the SDD driver.

For a Windows computer with multiple paths managed by SDD to subsystem volumes, a controller representing the SDD driver is displayed, and this controller contains the disks managed by the SDD.

For a non-Windows computer with multiple paths managed by SDD to subsystem volumes, Data Path Explorer displays a controller representing the SDD driver, and this controller contains the vpath disks. A separate disk (for example, hdisk on AIX) is created by the operating system on the non-Windows computer for each path to the storage volume. These disks are grouped by the controller that contains the initiator port present in the path.

The Linux SDD driver is no longer available. Starting with Red Hat Enterprise Linux Version 5 and SUSE Linux Enterprise Server Version 10, only the DM\_Multipath is available. The DM\_Multipath is supported by SAN Planner. The SDD driver is no longer supported on HP, starting with HP-UX 11i v3 with Itanium®. HP-UX 11i v3 provides a native multipathing feature which is supported by SAN Planner.

**Related reference:**

“Columns in Data Path tab”

When an entity in the Data Path Explorer graphical view is selected, its data paths display in the Data Path tab.

“Columns in Data Path Segment tab”

The Data Path Explorer Segment tab shows each segment in a data path.

**Columns in Data Path tab**

When an entity in the Data Path Explorer graphical view is selected, its data paths display in the Data Path tab.

The Data Path tab columns display the following information:

**Located**

This column is associated with the Locate function in the Topology Viewer. If search text is present in a row, the Locate column displays a magnifier icon.

**Health (status)**

The aggregated status of the data path.

**Group** The number of the data path.

**Initiator Entity**

The name of the computer or SAN Volume Controller in the data path.

**Initiator Disk**

The computer disk or SAN Volume Controller managed disk in the data path.

**Initiator FCPort**

The computer Fibre Channel port in the data path. Data in this column comes from the HBA port entity in the Computer tile. If an SAN Volume Controller is the initiator entity, this column contains the SAN Volume Controller fibre channel port in the data path.

**Target Entity**

The storage subsystem in the data path.

**Target Volume**

The storage volume in the data path. An asterisk indicates that this is a space-efficient volume or vdisk.

**Target FCPort**

The storage Fibre Channel port in the data path.

**Columns in Data Path Segment tab**

The Data Path Explorer Segment tab shows each segment in a data path.

Each segment has two endpoints: the beginning device and the ending device connected by a communication link. Each endpoint resides in a parent entity, which can be a computer, fabric, or subsystem.

The Data Path Segment tab columns display the following information:

**Located**

This column is associated with the Locate function in the Topology Viewer. If search text is present in a row, the Locate column displays a magnifier icon.

**Segment Health**

The health status of the segment is an aggregation of From Endpoint Health, To Endpoint Health, From Entity Health, To Entity Health, and Connection Health.

**Label** The number of the data path and its segments. The data path number corresponds to the numbering on the Data Path tab. Segment numbering advances from computer tile through fabric tile to subsystem tile.

**From Entity Health**

The health status of the parent entity beginning the segment.

**From Entity Performance**

The performance status of the parent entity that begins the segment. This column is displayed only when the performance overlay is enabled.

**From Entity**

The name of the computer, fabric, or subsystem that is the parent of the beginning device (endpoint) in the segment.

**From Endpoint Health**

The health status of the endpoint device that begins the segment.

**From Endpoint Performance**

The performance status of the endpoint device that begins the segment. This column is displayed only when the performance overlay is enabled.

**From Endpoint**

The name of the endpoint device that begins the segment.

**To Entity Health**

The health status of the parent entity that ends a segment.

**To Entity Performance**

The performance status of the parent entity that ends the segment. This column is displayed only when the performance overlay is enabled.

**To Entity**

The name of the computer, fabric, or subsystem that is the parent of the ending device (endpoint) in the segment.

**To Endpoint Health**

The health status of the endpoint device that ends the segment.

**To Endpoint Performance**

The performance status of the endpoint device that ends the segment. This column is displayed only when the performance overlay is enabled.

**To Endpoint**

The name of the endpoint device that ends the segment.

**Connection Health**

The health status of the connection between the endpoint device that begins the segment (From Endpoint) and the endpoint device that ends the segment (To Endpoint). The Connection Health is displayed as N/A if the health status data for the connection is not available.

**Example use cases for Data Path Explorer**

The following examples show some of the use scenarios for Data Path Explorer:

- An application on a host is running slowly, which causes you to question the health of the I/O path for that application. Are there component level performance problems that might cause the slow application response?

- Disk utilization on the storage subsystem is high, triggering performance alerts. You decide to see which hosts or applications, residing on separate host disks, are causing the problem.
- You suspect that the I/O paths for two applications (on separate host disks) are in conflict with each other. They could be sharing a common component (such as a switch). After viewing the I/O paths for these two applications, you make the required zoning or connectivity change to alleviate the problem.
- I/O path information can be used do load balancing and storage planning. For example, a host adapter port on a host has I/O from three host disks passing through it, but a second port has I/O from ten host disks (and has more I/O). This information can be used to provision a new host disk using the first host adapter port.

**Note:** Application to host disk mapping is not shown in the Topology Viewer. This mapping must be done outside IBM Tivoli Storage Productivity Center. However, Tivoli Storage Productivity Center can provide mapping from database applications to host disks if configured to do so.

### Planning for Data Path Explorer view

This topic provides information on planning for the Data Path Explorer view in the topology viewer.

The Data Path Explorer is a new type of view in the topology viewer. Data path explorer combines several of the usual topology views into a visualization that allows users to follow connectivity from one end point in the topology view to another. Storage administrators can use this view to debug connectivity and performance problems in the storage environment. Data Path Explorer displays the different data paths (SAN access paths or I/O paths) for each host disk. This allows you to use the Data Path Explorer to check the health and performance statistics of the storage components along the I/O path.

To use Data Path Explorer for debugging performance problems, follow these steps to ensure that the information displayed in the Data Path Explorer view is current:

1. Enable Performance overlays. To see the overlays, go to topology **Global Settings > Active Overlays**: and select the **Performance** checkbox.
2. Ensure I/O is running on the host machine.
3. Create a threshold alert (see “Creating a performance threshold within an alert” on page 148).
4. Create and run performance monitors on the switches and storage subsystems of interest. See “Monitoring switch performance” on page 377 or “Monitoring storage-subsystem performance” on page 378 for detailed descriptions on creating and running performance monitors.
5. Run a discovery job for the CIM agents and Storage Resource agents or Data agents.
6. Run a probe job for the subsystem, fabric, and Storage Resource agents or Data agents.
7. Run a performance monitoring job for the subsystem and switches if you want to see performance information.

Different agents play different roles when discovering information and affect what can be shown in the Topology Viewer. The Data Path Explorer view is also subject to those limitations. Different amounts of information can be shown by the Data Path Explorer view depending on the agents deployed throughout the fabric.

To display data paths from a host to a subsystem in this view, it is necessary to have the following agents installed and configured:

- CIM agent to monitor the storage subsystem
- Data agent to monitor the host
- In-band Fabric agent to monitor the fabric. Also a CIM agent for the fabric to collect fabric performance information.

To show the host disk assignment from a given storage subsystem, IBM Tivoli Storage Productivity Center Data Server needs access to the subsystem's CIM agents (SMI-S agent). In the case of the subsystem, the data path for the subsystem is defined by the host masking or mapping information maintained by the CIM agent.

Analysis on data paths involving SAN Volume Controllers requires one or more CIM agents pointing to the SAN Volume Controller and the back-end system.

To show accurate information, it is important to have the most current information from the CIM agents, Fabric agents, and Data agents. You must probe all the components within the data path (or a set of agents strategically placed throughout the fabric) before using the Data Path Explorer.

To show physical fabric connectivity, you must have an in-band Fabric agent, out-of-band Fabric agent, or a CIM agent for the fabric.

To show performance overlay in the Data Path Explorer view, you must first create and run performance monitors on the switches and storage subsystems of interest. To see the overlays you must also go to **Topology > Global Settings > ActiveOverlays** and select the **Performance** check box. See “Collecting performance data” on page 377 for detailed descriptions on creating and running performance monitors.

To show zone overlay, you need an in-band Fabric agent connected to the fabric along the data paths defined or a CIM agent for the fabric. To see the overlays you must also go to topology Global Settings and select Show zone tab check box. **Topology > Global Settings** and select the **Show zone tab** check box.

If you want to launch the Data Path Explorer view for a host, that host must have a Data agent running on it.

These are the general setup requirements for using the Data Path Explorer:

1. Install and configure the SMI-S agents (CIM agents) for the subsystems (including SAN Volume Controllers) and fabric to collect subsystem and fabric data. Contact your vendor for information on installing and configuring the CIM agent for the subsystem or fabric.
2. Install and configure the in-band Fabric agent, or out-of-band Fabric agent to monitor a given fabric.
3. Install the Data agent on the hosts.

## Displaying membership in zones and zone sets

This topic describes how the topology viewer allows you to examine zones and zone sets.

Zone information is shown in the **Zone** tab in the table view. The **Zone** tab is disabled by default. Selecting a zone or zone set in the **Zone** tab highlights zone

and zone set members in the graphical view. Ports and entities that are members of the selected zone or zone set are indicated in the graphical view by highlighting. You can select highlighted entities to show details (for example, connections).

The entities listed in the **Zone** tab are only those entities that are in the current view. However, zone or zone-set selections apply to all currently open views in the topology viewer. Therefore, switching to another view might indicate other entities in the selected zone.

**Note:** You cannot use the **Zone** tab to change membership status of entities.

To activate the **Zone** tab, follow this procedure:

1. Right-click in the graphical view and select **Global Settings**.
2. In the Settings window, select **Show zone tab** and click **OK**.

## Displaying detailed information about entities

This topic describes how to view detailed information about entities using the topology viewer.

There are two ways to display information about entities:

1. Right-click the entity and select **Launch Detail Panel** to display detailed information about an entity (for example, the operating system of a computer, the used and unused capacity of a storage subsystem)
2. Right-click the entity or entities and select **Reports**. From the dialog displayed, you can choose which report to create. The reports you can choose depend on which entities you selected. Asset reports are available only if you selected a single entity. Select a report and click **Create Report**

## Displaying storage resource connections

This topic describes how physical and logical connections among entities in the environment can be displayed using the topology viewer.

Connections are shown in both the graphical and table views. In the graphical view, connections are represented by lines between entities or groups. In the table view, a **Connections** tab lists both ends of a connection.

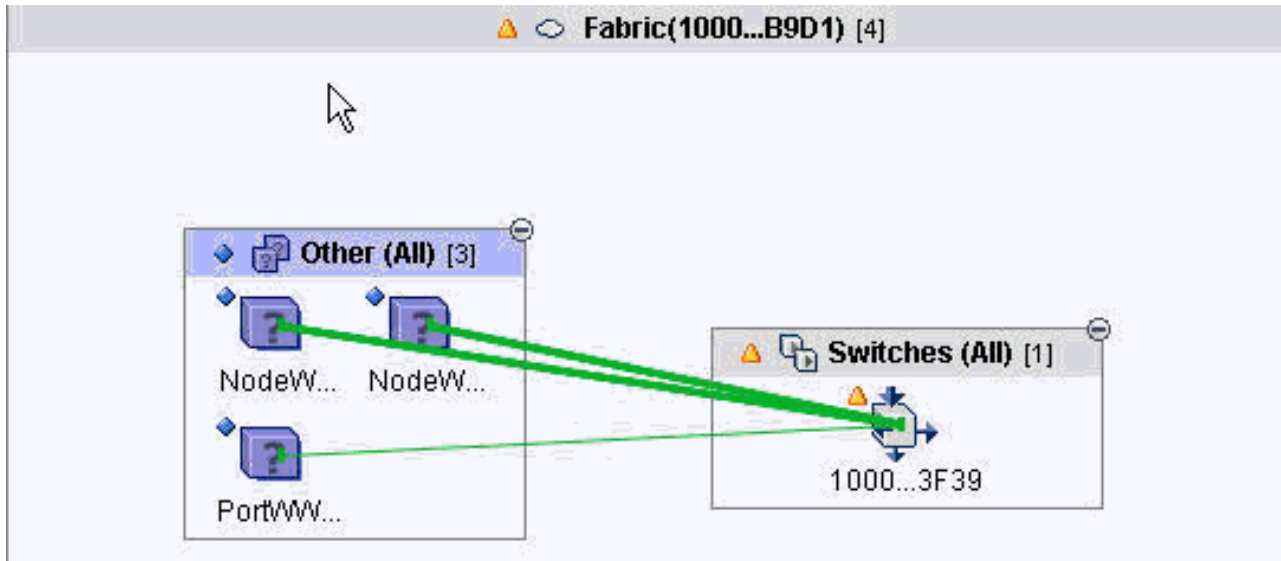

Figure 43. Connections

In the graphical view, the color of a connecting line between entities indicates the status of a connection. The color of the line between groups, individual entities, or between an individual entity and a group can be green (normal), yellow (warning), red (critical), black (missing), or grey (status unavailable).

**Note:** When you have a host with two HBAs or FC ports that are both in the same switch and you switch the ports between them, the connection will be shown with two yellow (warning) lines. This is because you have not reset the history retention setting. Until the settings are reset, the connecting lines will remain yellow.

Connections between two individual entities are represented by a thin line. Connections between groups or between a group and an individual entity are represented by a thick line. A connection to a collapsed group can represent either a single connection or several connections.

To show connections, follow this procedure:

1. Right-click a blank space in background of the graphical view and select **Global Settings**.
2. In the Settings window, select **Show Connections** and click **OK**.

## Filtering entities based on health status

This topic describes how to quickly narrow the health status of normal or non-normal entities in your environment.

In views with many entities and connections, the display can become very cluttered and can make it difficult to determine where problems are occurring. You can filter entities to display only those entities whose health status is non-normal (critical, warning, missing, or unknown).

When you apply filtering, you can also choose to display entities with a health status of normal but that are connected to entities whose health status is either critical or warning. To filter entities by health status:

1. Right-click in the background area of the graphical view and select **Global Settings**.

2. In the Settings window, select **Hide Normal Entities** and, optionally, **Unless connected to non-normal**, and click **OK**.

## Labeling entities

This topic describes how you can specify or change label entities.

In both the graphical and table views, entities are identified by labels (for example, the name of a computer). You can specify or change these labels. To specify or change the existing label for an entity, follow this procedure:

1. Right-click the entity and select **Launch Detail Panel**.
2. Type a label for the entity in the **Label** field.
3. Click the save icon in the menu bar to save the label, and then close the window.

## Starting element managers

This topic describes how to start element managers for the entities that are defined in IBM Tivoli Storage Productivity Center.

If element managers on a system, tape library, switch, or other entity are defined, you can start the element managers to access vendor-provided management tools.

To start an element manager for an entity, right-click the entity. A menu that contains launch options is displayed. The options that are displayed depend on the element managers that you configured on the Element Manager page of the Configuration Utility. The following options are displayed on this menu:

- **Launch in context defined application.** This menu item is displayed for each application that is defined by a launch descriptor file. Tivoli Storage Productivity Center provides launch descriptor files for the following applications:
  - System Storage DS8000 Storage Manager
  - The management console for the storage systems that are listed under **Management GUI**.
  - Tivoli Storage Productivity Center for Replication

If the corresponding launch descriptor files are found for the applications, the following menu items are displayed:

### **DS8000 Storage Manager**

Click this menu item to start DS8000 Storage Manager.

### **Management GUI**

Click this menu item to start the management console for the following storage systems:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified
- IBM SONAS

### **Replication Storage Systems Overview**

Click this menu item to start Tivoli Storage Productivity Center for Replication. The window that is opened in the Tivoli Storage Productivity Center for Replication GUI depends on the context for the entity that you selected. For example, if you right-click a storage device on the **Element Manager** tab of the Configuration Utility and click

**Replication Storage Systems Overview**, the Tivoli Storage Productivity Center for Replication Storage Systems window opens.

If the launch descriptor file cannot be found, the **Launch file items error** menu item is displayed. Click this item to view a description of the problem. The **Launch file items error** menu item is also displayed in situations such as the IBM Tivoli Integrated Portal server is not installed or is not accessible, the Tivoli Storage Productivity Center Data server is not accessible, or another system error occurred.

- **External Tools.** This menu item shows any external tools that are defined in the Configuration Utility. Examples of external tools include Web-based user interfaces and local executable files. For example, you might add the address of a website that you frequently access or an application that you often use such as a text editor or a spreadsheet.
- **Element Manager.** This menu item shows any element managers discovered for the device by a Storage Management Initiative Specification (SMI-S) query. To avoid menu item duplication, this item is not displayed when the associated element manager is defined by a launch descriptor file. In this situation, the element manager is displayed as a separate menu item.
- **User Defined Tools.** This menu item shows any user-defined element managers that are defined in the Configuration Utility. These element managers differ from the element managers in the Element Manager menu because they are user-defined and are not discovered by an SMI-S query.

If the selected entity has no element manager, these options are not available in the menu.

## Launching SAN Planner

This topic describes how to launch the SAN Planner wizard for an entity from the topology viewer. SAN Planner assists end-to-end planning for SAN components.

Right-click a computer, fabric, or storage subsystem and select **SAN Planner > New Plan**. A new SAN Planner wizard introduction page is displayed. When you have made your selections on the Select Planning Task and Select Provision Plan Details pages, the element you selected is added to input resources on the Specify Plan Content page. To provision replication for an existing session associated with a storage resource group, right-click the storage resource group, select **SAN Planner**, and then select the session you want to work with.

## Starting Storage Optimizer

This topic describes how to start the Storage Optimizer from the topology viewer. The Storage Optimizer uses data in the Tivoli Storage Productivity Center database to analyze your storage subsystems to identify performance bottlenecks, and recommend changes to improve performance.

Right-click one or more storage subsystems and select **Launch Optimizer**. A new Storage Optimizer analysis definition is created, and the storage subsystems you selected are added to the **Select Storage** pane.

#### Related concepts:

“Storage Optimizer overview” on page 432

The Storage Optimizer uses data in the IBM Tivoli Storage Productivity Center database to analyze your storage subsystems to identify performance bottlenecks, and recommend changes to improve performance. This topic lists the supported subsystems and describes the general steps for using Storage Optimizer.

## Locating storage resources in the topology

This topic describes how you can search for a particular entity using the entity name or a keyword (for example, a host name or operating system).

The open view (for example, L0:Other) will be searched for the string you enter. The results of a locate action are shown by highlighting.

Figure 44. Highlighted entity

To locate an entity, type a search string in the **Locate** field in the table view and click **Find**. The current view (for example, L0:Other) will be searched for the string you enter. The locate function does not search the entire topology, only the currently open view.

When the entity is found, it will be displayed in both the graphical and table views. If the located entity is inside a collapsed group in the topology, you will not be able to see that entity until you expand that group. However, the entity will be highlighted in the table view. If the entity is in a collapsed group in the table view, that group will automatically be expanded and the highlighted table entry will receive focus. You can then click on that table entry to see the located entity in the topology view.

If you specify a Locate criterion that applies to more than one entity in a view, all the applicable entities are displayed.

## Managing Storage Subsystems

This topic describes how to display the Storage Subsystems page, where you can perform storage-subsystem management tasks.

Right-click a storage subsystem and select **Manage Storage Subsystems**.

## Managing Zone Control

This topic describes how to display the Fabric page, where you can perform zone-control tasks.

Right-click a fabric and select **Manage Zone Control**.

## Pinning entities

This topic describes how pinning entities is an easy way to identify selected entities for future reference or quick access.

Pinned entities display a small flag next to the entity. This flag is propagated to all views that contain that entity. This is useful for marking entities for various reasons, such as a reminder to look at this entity later and for upward propagation. For example, the user may pin a computer in an L0 or L1 Computers view and then quickly wish to see which fabric it belongs to by opening an L0 Fabrics view and looking at which fabric group contains the pinned entity - indicated by the small flag. Pinned objects remain visible as you change views in the topology viewer and when you log off and log back in. Pin lists are stored on a per user basis. This means that different users can have separate pin lists. Pinned objects are indicated by a pin icon in the **Pinned** column of a table or by a flag icon next to the entity in the graphical view.

Figure 45. Pinned entity

To pin an entity, right-click the entity in the graphical view and select **Pin**. To unpin an entity, right-click the entity in the graphical view and select **Unpin**. The same function is available in the **Action** list in the table view.

Pinned entities are visible in groups at all levels and in all views regardless whether the group is expanded or collapsed. You can only pin individual entities; you cannot pin groups (for example, a group of computers).

## Printing information from the topology viewer

You can print information displayed in the topology viewer on a single page for reference.

Printing capability is available for the graphical view but is not available in the tabular view. To print the information displayed in the topology viewer, right-click the graphical view and select **Print** or **Print Preview**. The content is scaled to fit onto one page if necessary.

## Refreshing views

This topic describes how you can refresh the topology viewer to view the most up-to-date details about your environment.

To provide you with the most up-to-date information, the topology viewer automatically refreshes all open views, including graphics and tables, every five minutes from the IBM Tivoli Storage Productivity Center database. You can also refresh views manually or change the default refresh rate. Opening a new view automatically shows the most current information. To manually refresh views or change the refresh rate, right-click in the graphical view or click the arrow in the **Action** field in the table view and choose one of the following options:

- **Refresh View:** Updates the view that is currently displayed.
- **Refresh All Views:** Updates all views that are currently open. You can also use this option to remove the alert indicators from the devices in the topology view.
- **Refresh Settings:** Opens the **Refresh Rate Settings** window, in which you can select a new automatic refresh rate (specified in minutes).

## Removing entities from the database

Computers in the missing state were once in the topology viewer, but were not discovered by IBM Tivoli Storage Productivity Center during the latest refresh cycle. You might want to remove them from the view and the database in order to make it easier to work with other resources.

To remove a computer from the topology viewer (both graphical and tabular views) and the database, you first need to uninstall the agents on that system.

**Note:** This action is available only for entities that are in the missing state.

1. See *Uninstalling the agents* in the *IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication Installation and Configuration Guide* for instructions on uninstalling the agents.
2. In the topology viewer *graphical* view, right-click the computer entity and select **Remove From Database..**
3. In the topology viewer *tabular* view, right-click the computer entity and select **Remove From Database.**

## Removing deleted entities

When a discovered entity (fabric, subsystem, switch, or volume) is deleted using another application, such as an element manager or other management application, the next discovery or probe of the topology viewer displays a missing entity. The status of missing entities is aggregated and propagated up through the device hierarchy.

It can be difficult to determine if there are other lower-level entities that have "missing" status, but have not been intentionally removed by a management application. The Removed Resource Retention setting in the topology viewer can be set to a low value, such as 0 or 1 day to remove the missing entity from the display. This removes the missing entities from the display the next time the Removed Resource Retention process runs.

You can also remove deleted entities from the topology viewer using the following procedure:

1. Highlight the intentionally deleted entities in the topology view and select **Remove Resource** in the **Action** list in the tabular view.

**Note:** Not all entity classes can be removed from the topology using the **Action** list. For those entities, use the Removed Resource Retention setting.

2. A prompt asks you if you are sure you want to remove the resource from the database. Click **Yes**.
3. To refresh the view, click **Refresh View** in the **Action** list. The missing entities will no longer be displayed in the topology viewer.

## Selecting entities in graphical and table views

This topic describes how to select entities in the graphical and table views of the topology viewer.

To select an entity in the graphical view, click the entity image. In the table view, click the name of the entity. To make multiple selections, press CTRL and click.

## Showing Alerts

This topic describes how to display alert logs for entities in the topology viewer.

You can display alert logs for:

- computers
- fabrics
- storage subsystems
- tape libraries
- switches

All alerts for the entity-type you select will be displayed, even if no alerts exist for the entity.

Right-click an entity and select **Show <entity type> Alerts**.

For example:

Right-click a computer and select **Show Computer Alerts**.

## Showing the monitoring status of entities

View how Tivoli Storage Productivity Center is monitoring a storage entity that is displayed in the topology viewer.

Display all the data collection schedules, runs, and jobs that are related to a storage entity in the topology viewer.

To view monitoring status, right-click an entity and select **Show Monitoring Status**. For example, right-click a computer and select **Show Monitoring Status**.

When you select this action, the Job Management panel is displayed. Use this panel to view information about how a storage entity is monitored by Tivoli Storage Productivity Center. For storage resource groups, when you click this option the schedules for all the storage entities in that group are displayed.

### Related reference:

“Managing schedules, jobs, and runs” on page 297

Use the Job Management panel to view and manage all the schedules, runs, and jobs related to the storage devices that are monitored by IBM Tivoli Storage Productivity Center.

## Working with tape libraries in the topology viewer

Perform storage management functions on your tape library using the topology viewer.

The topology viewer displays information about the discovered tape libraries and tape library groups. The topology viewer has two views:

- Topology view
- Tabular view

Each view shows information about the discovered storage devices in your enterprise. Changes to one view are automatically displayed in the other view, so that both views are always synchronized.

To see tape library information in the topology viewer, click the **Storage** node in the **IBM Tivoli Storage Productivity Center > Topology** node in the console. The level zero (L0) view of the storage topology view is displayed. The view includes the tape libraries and tape library groups that have been discovered.

## Viewing tape libraries in the topology view

This topic describes how you can see information about your tape libraries and tape library groups in the topology view.

Clicking a tape library icon in the topology view highlights (selects) that tape library in both the topology view and the tabular view. Right-click a tape library to display a pop-up menu that lists actions that you can perform on the library, as well as other general actions that you can perform. The actions specific to tape libraries are:

### Open Detail View

Opens the next level of detail for the selected topology object. For tape libraries, the view hierarchy is

- L0:Storage- overall view of the discovered storage subsystems and tape libraries
- L1:Tape Libraries- tape library groups
- L2:Tape Library- view of an individual tape library and its related devices and connections

### Launch Detail Panel

Displays the detail panel for the tape library. The detail panel shows detailed information about the tape library, such as the name of the tape library vendor, the serial number, status, owner/administrator contact information, and properties that can be defined by the user. It also has **Launch** button that will launch the element manager for the tape library.

### Launch Element Manager

Launches the element manager application for the selected tape library. The element manager is an application or Web site provided by the tape library vendor for performing management tasks for the selected tape library. For example, the element manager for an IBM 3584 tape library is the IBM Tivoli Storage UltraScalable Tape Library Specialist.

**Pin** Pins the selected tape library. When a topology object is pinned, it remains visible even after its respective group or view level has been collapsed. A small blue flag icon by the object's icon indicates that the object is pinned. Once an object has been pinned, this action will change to **Unpin** in the pop-up menu for the object.

As you add more storage devices to your enterprise, your topology view can become very crowded and increasingly difficult to navigate. You can use the **minimap** in the topology view to quickly move around the view and locate the objects you need to work with.

## Viewing tape libraries in the tabular view

This topic describes how you can see information about your tape libraries and tape library groups in a tabular view.

The tabular view presents the same information as the topology view. Changes to the tabular view are immediately reflected in the topology view, so that both views are always synchronized.

The tabular view contains the following fields:

### Action

Lists the actions that can be performed on the selected object in the table, as well as the more general actions, such as Expand All Groups, that can be performed. These actions are the same ones that appear in the context menu for a selected object.

**Locate** Allows you to find objects in the tabular view. This is very useful when your tabular view has many entries.

The columns in the tabular view change as you select different objects in the topology. For example, the columns available for objects in the L1:Tape Libraries view are different than the columns in the L2:Tape Library view. These columns show information about the tape libraries, such as the operational status, vendor name, and number of drives in the library.

---

## Managing disk storage

This section describes managing storage subsystems, virtual disks, volumes, and creating and managing alerts.

### Working with workload profiles

This topic describes creating, modifying, and deleting workload profiles.

Only storage subsystems that have been discovered and had performance data successfully collected can be used with the Volume Planner function of the SAN Planner. You can use the following products with SAN Planner:

- TotalStorage Enterprise Storage Server
- DS6000
- DS8000
- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified block level support
- The XIV system

For information about storage subsystem discovery, see “Discover storage subsystem, tape library, and fabric information with CIM agents” on page 333. For information about the Volume Planner, see “Configuring a provisioning plan by using SAN Planner” on page 419.

### Creating a workload profile

In SAN Planner, you can create or reuse volumes based on a workload profile. Create a workload profile from the performance information of the selected storage-system volumes.

1. In the navigation tree pane, expand **Disk Manager > Profile Management > Workload Profiles**. In the content pane, the currently defined workload profiles are displayed.
2. Click **Create**; the Workload Profile wizard starts.
3. On the Welcome to the Workload Profile Wizard page, click **Next**.
4. On the Creation Method page, select the basis for the new workload profile. Click one of the following choices:

**Create profile from volume performance data**

Base the new profile on the volume-performance data that you provide.

**Create from an existing profile**

Base the new profile on an existing workload profile. In the **Profile Name** field, select the workload profile.

Click **Next**. If you clicked **Create from existing profile**, go to step 6. Otherwise, the Name and Description page opens.

5. On the Name and Description page, provide information about the new workload profile:
  - a. In the **Name** field, type the name of the workload profile.
  - b. Optional: In the **Description** field, type a description of the workload profile.
  - c. Click **Next**.
6. On the Select Volumes page, specify the volumes whose performance data will be used as the basis for the workload profile.
  - a. In the **Available volumes** field, select the volumes, and then move them to the **Selected volumes** field.
  - b. Click **Next**.
7. On the Peak Activity periods page, specify the time period for the performance data:
  - a. To use all available performance data, click **Use all available performance data**, and go to step 8.
  - Note:** Analyzing all performance data might be a lengthy process.
  - b. To use performance data for a specified time period, specify the time period. In the **Start date** field, select the month, day, and year. In the **End date** field, select the month, day, and year. By default, the time period is set to the previous month. In the **Time reference** field, select one of the following options:
    - Client Time**
    - Server Time**
    - GMT**
    - Device Time**
  - c. To specify that performance data is collected only during specified hours, click **Use only a portion of each day**. In the **Start time** field, select the hour and minutes. In the **End time** field, select the hour and minutes.
  - d. Click **Next**.
8. On the Review Profile Results page, review the following performance data:

### Data quality

Lists a data-quality rating. This rating is based on the percentage of volumes that had valid data:

- Good (100% - 67%)
- Fair (66% - 33%)
- Poor (32% - 0%)

### I/O Demand

#### I/O rate per GB per sec

The data-transfer rate in gigabytes per seconds (GBps).

#### Avg. transfer size (KB)

Default size for data transfer in kilobytes (KB). You can edit this value.

### Read / Write

#### Sequential reads (%)

Percentage of read/write activity that was sequential reads.

#### Sequential writes (%)

Percentage of read/write activity that was sequential writes.

#### Random reads (%)

Percentage of read/write activity that was random reads.

#### Random writes (%)

Percentage of read/write activity that was random writes.

#### Total (% , must be 100)

Total of the preceding percentages. This value must equal 100%. If it does not, you cannot continue with the wizard.

### Cache

#### Random read cache hits (%)

Percentage of cache activity that was random hits to read cache.

#### Random write destage (%)

Percentage of cache activity that consisted of moving data from cache to nonvolatile storage.

9. Click **Finish**.

## Deleting a workload profile

This topic describes how to delete a workload profile.

Only user-defined workload profiles can be deleted.

1. In the navigation tree pane, expand **Disk Manager > Profile Management > Workload Profiles**. A list of the currently defined workload profiles is displayed in the content pane.
2. Select the workload profile you want to delete.
3. Click **Delete**.

## Modifying a workload profile

This topic describes how to modify a workload profile.

Only user-defined workload profiles can be modified.

1. In the left-hand pane, expand **Disk Manager > Profile Management > Workload Profiles**. A list of the currently defined workload profiles is displayed in the right-hand pane.
2. Select a workload profile and click **Details**. The Workload Profile Properties window displays.
3. Click the **General** tab to view the name and description of the workload profile. You can modify only the description of the workload profile.
4. Click the **Performance** tab to view I/O demand, read/write, and cache performance data for the workload profile. You can modify any of the performance data for the workload profile.

### Viewing a workload profile

This topic describes how to view a workload profile.

1. In the navigation tree pane, expand **Disk Manager > Profile Management > Workload Profiles**.
2. In the content pane, select a workload profile and click **Details**. The Workload Profile Properties window displays.
3. Click the **General** tab to view the name and description of the workload profile.
4. Click the **Performance** tab to view I/O demand, read/write, and cache performance data for the workload profile.
5. Click the **Activity** tab to view peak activity settings for the workload profile. To view all data collected during a period of time, select **Use all available performance data** and specify a time reference (options are Client Time, Server Time, GMT, and Device Time) and start and end dates. To view only the data collected during a portion of each day, select **Use only a portion of each day** and specify start and end times. Click **OK** to view the peak activity.

## Working with provisioning profiles

This topic describes creating, modifying, and deleting provisioning profiles.

Only storage subsystems that have been discovered and had performance data successfully collected can be used with the storage provisioning function of the SAN Planner. SAN Planner and storage provisioning are only available for the following systems:

- TotalStorage Enterprise Storage Server
- SAN Volume Controller
- DS6000
- DS8000
- Storwize V7000
- Storwize V7000 Unified block-level support

For information about storage subsystem discovery, see “Discover storage subsystem, tape library, and fabric information with CIM agents” on page 333. For information about SAN Planner, see “Configuring a provisioning plan by using SAN Planner” on page 419

### Creating a provisioning profile

This topic describes how to create a provisioning profile. Provisioning profiles are used by SAN Planner, and in general, by features that require a model for volume, multipathing, and zoning requirements.

1. In the navigation tree pane, expand **Disk Manager > Profile Management > Provisioning Profiles**. In the content pane, the currently defined provisioning profiles display.
2. Click **Create**. The Provisioning Profile wizard starts.
3. On the Welcome to the Provisioning Profile Wizard page, provide information about the new provisioning profile.
  - a. In the **Profile Name** field, type the name of the provisioning profile.
  - b. Optional: In the **Profile Description** field, type a description of the provisioning profile.
4. In the Creation Method section, choose the method that you want to use to create the profile. Select one of the following options:

**Create profile from scratch.**

Click to create the profile without using an existing profile.

**Create from an existing profile.**

Click to create the profile by using an existing provisioning profile as a template. Select the profile from the **Profile name** list.

Click **Next**.

5. If you want to include volume planning in the provisioning profile, use the Volume Settings page to configure and create volumes or virtual disks.
  - a. Select **Specify how the storage will be allocated and the storage performance characteristics** to enable the options on this page.
  - b. Select one of the following options:
    - **Provision Volumes**. Click to use volumes for provisioning.
    - **Provision Virtual Disks**. Click to use virtual disks for provisioning.
  - c. In the **Total Capacity** field, enter the total capacity of the volumes or virtual disks that are to be used for provisioning storage in GB.
  - d. Enter the number of volumes or virtual disks that you want to create in the **Number of Volumes/Virtual Disks** field.
  - e. From the **RAID level** list, select one of the following Redundant Array of Independent Disks (RAID) levels for the volume or virtual disk:
    - **<system selected>**. The best possible RAID level of the volume is selected based on user input and the available performance and capacity of the underlying storage systems.
    - **RAID 1**. The format type of the volume will be RAID 1 format.
    - **RAID 5**. The format type of the volume will be RAID 5 format.
    - **RAID 6**. The format type of the volume will be RAID 6 format.
    - **RAID 10**. The format type of the volume will be RAID 10 format.
  - f. In the **Volume/Virtual Disk Name Prefix** field, type in a prefix to be used in the volume or virtual disk name. This value is used as the prefix for all volumes or virtual disks that are created.
  - g. From the **Workload Profile** list, select a workload profile for the volume or virtual disk. You can use one of the following predefined profiles or you can create a profile from the Workload Profiles panel. A performance monitor must have been run on the storage controller to select any predefined workload profile other than **Space only**.
    - **OLTP Standard**. Use for typical online transaction processing.
    - **OLTP High**. Use for very active online transaction processing.

- **Data Warehouse.** Use for applications with inquires into large data warehouses.
  - **Batch Sequential.** Use for batch applications involving large volumes of data.
  - **Document Archival.** Use for document archival applications.
  - **Space only.** Use to select pools based on pool space information rather than storage controller performance. Use for a storage system that has not been monitored for a performance data collection.
- h. From the **Thin Provisioning Profile** list, select a thin provisioning profile if you want to create thin volumes or virtual disks for IBM System Storage SAN Volume Controller, IBM System Storage DS8000, or IBM XIV Storage System. You can use one of the following predefined profiles or you can create a profile from the Thin Provisioning Profiles panel.
- **Ignore thin provisioning.** A thin provisioning profile is not used.
  - **Standard.** This profile sets the over-allocation limit for a pool at 200%. This percentage sets the virtual capacity to as much as two times the real capacity.
  - **Conservative.** This profile sets the over-allocation limit for a pool at 150%. This percentage sets the virtual capacity to as much as one and a half times the real capacity.
  - **Aggressive.** This profile sets the over-allocation limit for a pool at 300%. This percentage sets the virtual capacity to as much as three times the real capacity.

The over-allocation value identifies the limit on the virtual capacity allocated for a pool. A smaller over-allocation percentage is considered conservative because the virtual capacity is closer to the real capacity. A greater over-allocation percentage is considered aggressive because the virtual capacity is farther from the real capacity. For example, the over-allocation limit that is set in the Aggressive profile is 300%. Pools that contain volumes or virtual disks that are created using this profile will be allocated to as much as three times the real capacity. If you use the Aggressive profile and the pool size is 15 GB, the virtual capacity allocated for the pool can be as much as 45 GB.

- i. Select one of the **Solid State Disks** options to specify whether you want to use or exclude solid-state disks from provisioning:
- **Do not use Solid State Disks.** Click to exclude solid-state disks from provisioning.
  - **Use Solid State Disks.** Click to use only solid-state disks for provisioning.
- These options are disabled if you clicked **Provision virtual disks**.
- j. From the **Encryption Group** list, select an encryption group if you want new volumes to be created on extent pools that belong to that encryption group. If there are no encryption groups available, **<none selected>** is displayed in this box. This box is disabled if you clicked **Provision virtual disks**.
- k. Select **Use unassigned volumes not involved in copy relationship** if you want to use existing unassigned volumes. Unassigned volumes that are in a copy relationship are not used. If this check box is selected, the following volumes are excluded:
- Unassigned volumes on non-IBM storage systems.
  - Unassigned volumes on IBM storage systems that have copy relationships that were not created in IBM Tivoli Storage Productivity Center or IBM Tivoli Storage Productivity Center for Replication.

- l. Enter the number of days of performance data that you want to use for planning in the **Planning will be based on the performance data collected in the last x days** field.

Click **Next**.

6. If you want to include path planning in the provisioning profile, use this page to set multipath options. The supported multipath driver on a host is the IBM Subsystem Device Driver (SDD). The Linux SDD driver is no longer available. Starting with Red Hat Enterprise Linux Version 5 and SUSE Linux Enterprise Server Version 10, only the DM\_Multipath is available. The DM\_Multipath is supported by SAN Planner. The SDD driver is no longer supported on HP, starting with HP-UX 11i v3 with Itanium<sup>®</sup>. HP-UX 11i v3 provides a native multipathing feature which is supported by SAN Planner.
  - a. To set up the multipath options, click **Setup multipath options (if supported by the host drivers)**.
  - b. From the **Multipath Option** list, select one of the following options to specify how the driver uses the paths between the host and the storage system.
    - **Load Balancing** sends input/output on all paths.
    - **Round Robin** sends input/output on one path until a time interval that is set in an SDD setting at the host expires, then switches to another path.
    - **Fail-Over** Sends input/output on one path until a failure occurs, then switches to another path.

On HP-UX 11i v3 with Itanium<sup>®</sup>, the multipath options used by the SAN Planner are as follows:

    - **Load Balancing** on HP-UX 11i v3, is implemented as Least Command Load. This option selects the path with the least number of pending I/O requests for the next I/O operation.
    - **Round Robin** on HP-UX 11i v3, distributes the I/O load equally across all active paths irrespective of the current load on each path.
    - **Fail-Over** on HP-UX 11i v3, is implemented as Preferred Path. For this policy, you specify a path to an optimized controller. This path is preferred for I/O transfers. The preferred path must be set manually.
  - c. Select the **Specify number of paths** check box and enter the number of paths that you want to configure between the host and storage system. If you do not specify the number of paths in this field, the default is two paths.
  - d. Select **Use fully redundant paths (requires at least 2 fabrics)** to use the paths from host to storage systems through a minimum of two fabrics.

Click **Next**.

7. Use the Security Settings section to specify zoning between ports on the hosts and systems in a fabric.
  - a. Select **Automatically change zoning to ensure hosts can see the new storage** to enable the options on this page.
  - b. Select from the **Automatically create zone** list to specify how the zones will be created. The predefined options are:

**<auto-zone>**

This option is the default. The plan generates using the maximum number of zones without grouping the data paths based on hosts, host ports, or host bus adapters (HBAs).

**...for each host**

Creates a zone for each host.

**...for each HBA**

Creates a zone for each host bus adapter.

**...for each host port**

Creates a zone for each host port.

- c. Select the **Specify maximum number of zones** check box and enter the maximum number of zones.
  - d. Select the **Maximum zone members per zone** check box and enter the maximum number of zone members per zone.
  - e. Select **No two controllers with different types should be used in the same zone** if you do not want two controllers with different types to be used in the same zone.
  - f. Select **Use active zone set** if you want any zone set that is available to be selected.
  - g. Select the **Append zone name prefix** check box and enter a prefix to be used in the zone name.
8. Click **Finish**.

## Deleting a provisioning profile

This topic describes how to delete a provisioning profile.

Only user-defined provisioning profiles can be deleted.

1. In the navigation tree pane, expand **Disk Manager > Profile Management > Provisioning Profiles**. A list of the currently defined provisioning profiles is displayed in the content pane.
2. Select the provisioning profile you want to delete.
3. Click **Delete**.

## Modifying and viewing a provisioning profile

This topic describes how to modify and view a provisioning profile.

Only user-defined provisioning profiles can be modified.

1. In the left-hand pane, expand **Disk Manager > Profile Management > Provisioning Profiles**. A list of the currently defined provisioning profiles is displayed in the right-hand pane.
2. Select a provisioning profile and click **Details**. The Provisioning Profile Properties window displays.
3. Click the **General** tab to view the name and description of the provisioning profile. You can modify only the description of the provisioning profile.
4. Click the **Volume Settings** tab to view or modify the volumes or virtual disks in the provisioning profile. You can modify any of the volume settings for the provisioning profile.
5. Click the **Path Settings** tab to view or modify multipath planning in the provisioning profile. You can modify any of the multipath settings for the provisioning profile.
6. Click the **Security Settings** tab to view or modify zoning between ports on the hosts and systems in a fabric. You can modify any of the security settings for the provisioning profile.

## Thin provisioning profiles

Learn how to create, modify, and delete thin provisioning profiles.

Only storage subsystems that have been discovered and had performance data successfully collected can be used with the volume planning function of SAN Planner. SAN Planner and the volume planning option are only available for the following systems:

- TotalStorage Enterprise Storage Server
- SAN Volume Controller
- DS6000
- DS8000
- Storwize V7000
- Storwize V7000 Unified block-level support

For information about storage subsystem discovery, see “Discover storage subsystem, tape library, and fabric information with CIM agents” on page 333. For information about the volume planning option, see “Configuring a provisioning plan by using SAN Planner” on page 419

### Creating a thin provisioning profile

Learn how to create a thin provisioning profile. Thin provisioning profiles serve as templates for specifying the parameters for thin provisioned volumes to be created through SAN Planner.

1. In the navigation tree pane, expand **Disk Manager > Profile Management > Thin Provisioning Profiles**. In the content pane, the currently defined thin provisioning profiles display.
2. Click **Create**. The Thin Provisioning Profile window opens.
3. On the Thin Provisioning Profile page, provide information about the new thin provisioning profile.
  - a. In the **Profile Name** field, type the name of the provisioning profile.
  - b. Optional: In the **Profile Description** field, type a description of the provisioning profile.
  - c. In the **Overallocation Limit (%)** field, type the over-allocation limit percentage. Specify this value as an integer. The over-allocation value identifies the limit on the virtual capacity that is allocated for a pool. A smaller over-allocation percentage is considered conservative because the virtual capacity is closer to the real capacity. A greater over-allocation percentage is considered aggressive because the virtual capacity is farther from the real capacity. For example, the over-allocation limit that is set in the Aggressive profile is 300%. Pools that contain volumes or virtual disks that are created using this profile will be allocated to as much as three times the real capacity. If you use the Aggressive profile and the pool size is 15 GB, the virtual capacity allocated for the pool can be as much as 45 GB.
4. In the **DS8000 Settings** section, specify the parameters for creating a thin provisioning profile for IBM System Storage DS8000.

#### Specify DS8000

Select the **Specify DS8000** check box to create a thin provisioning profile for System Storage DS8000.

#### Space-Efficiency Type

Specify the type of thin provisioning to use for System Storage DS8000. The options are:

### **Extent Space Efficient (ESE)**

An ESE logical volume has a set of virtual extents that are not associated with a repository. The logical volume is dynamically allocated and deallocated from the extent pool.

### **Track Space Efficient (TSE)**

A TSE logical volume has a set of virtual extents and is associated with a repository.

5. In the **SVC Settings** section, specify the parameters for creating a thin provisioning profile for IBM System Storage SAN Volume Controller.

#### **Specify SVC**

Select the **Specify SVC** check box to create a thin provisioning profile for SAN Volume Controller.

#### **Real Size (%)**

Enter the percentage of disk space to be allocated for the space-efficient copy of the selected VDisk. Setting the real space for a space-efficient copy protects the copy from going offline when its managed disk (MDisk) group runs out of space.

#### **Auto Expand**

Select a value to specify whether the thin provisioning profile volumes automatically expand their real capacities by allocating new extents from their MDisk group.

#### **Grain Size (KB)**

Select the grain size in KB for a space-efficient copy of the VDisk.

#### **Warning Level (%)**

Enter a threshold to send a warning message for the VDisk copy when the capacity that is used exceeds the specified percentage level.

6. In the **XIV Settings** section, specify the parameters for creating a thin provisioning profile for the XIV system.

#### **Specify XIV**

Select the **Specify XIV** check box to create a thin provisioning profile for the XIV system.

#### **Locking Behavior**

Select the **Locking Behavior** required if the thin provisioned pool runs out of space:

##### **Read Only**

If the thin provisioned pool has run out of capacity, all the volumes in the pool are locked and no write commands are allowed. This option is the default.

**No IO** If the thin provisioned pool has run out of capacity, no write or read commands are allowed.

7. Click **Apply** to save your changes. To exit without adding a thin provisioning profile, click **Cancel**.

## **Deleting a thin provisioning profile**

Learn how to delete a thin provisioning profile.

You can only delete user-defined thin provisioning profiles.

1. In the navigation tree pane, expand **Disk Manager > Profile Management > Thin Provisioning Profiles**. A list of the currently defined thin provisioning profiles is displayed in the content pane.

2. Select the thin provisioning profile you want to delete.
3. Click **Delete**.

## Modifying and viewing a thin provisioning profile

Learn how to modify and view a thin provisioning profile.

You can only modify user-defined thin provisioning profiles.

1. In the left-hand pane, expand **Disk Manager > Profile Management > Thin Provisioning Profiles**. A list of the currently defined thin provisioning profiles is displayed in the right-hand pane.
2. Click the magnifying glass icon next to a thin provisioning profile. The Thin Provisioning Profile Properties window displays.
3. View the details of the thin provisioning profile. You can modify any of the profile settings except for the **Profile Name**.
4. Click **Apply** to save your changes. To exit without modifying a thin provisioning profile, click **Cancel**.

## Managing storage subsystems

This topic contains information about storage-subsystem management tasks.

### Grouping storage subsystems

A storage-subsystem group is a user-defined set of storage subsystems. You might want to group storage subsystems in order to make it easier to run monitoring or reporting jobs.

**Note:** A storage subsystem can belong to only one storage-subsystem monitoring group, but can belong to multiple storage subsystem reporting groups.

### Creating a storage subsystem group:

This topic describes how to create a storage subsystem group.

1. In the navigation tree pane, expand **Disk Manager > Monitoring > Groups**.
2. Right-click **Storage Subsystem** and then click **Create Storage Subsystem Group**. In the content pane, the Create Storage Subsystem Group window opens.
3. In the **Description** field, type a short description of the group.
4. In the **Available** field, click the storage subsystems that you want to add to the group, and then click . The storage subsystems are added to the **Current Selections** field.
5. Click **File > Save**. A window opens requesting a name for the storage-subsystem group.
6. Type the name of the storage-subsystem group and click **OK**.

### Deleting a storage-subsystem group:

This topic describes how to delete a storage-subsystem group.

1. In the left-hand pane, expand **Disk Manager > Monitoring > Groups > Storage Subsystems**. All existing storage-subsystem groups are listed.
2. Right-click the storage-subsystem group that you want to delete.
3. Click **Delete**. A window opens, asking if you are sure that you want to delete this group.

4. Click **Yes**.

#### **Editing a storage-subsystem group:**

This topic describes how to edit a storage-subsystem group.

1. In the left-hand pane, expand **Disk Manager > Monitoring > Groups > Storage Subsystem**. All existing storage-subsystem groups are listed.
2. Click the storage-subsystem group that you want to edit. The **Edit Storage Subsystem Group** window opens.
3. Make any necessary changes.
4. Click **File > Save**.

#### **Defining element managers**

Element managers are programs that you can use to configure and manage your storage devices. An example of an element manager is DS8000 Storage Manager, which is the default element manager that is provided with IBM System Storage DS8000.

Element managers are managed in Tivoli Storage Productivity Center using the Configuration Utility. You can access the Configuration Utility from a storage system that is visible in the Storage Subsystems page of Tivoli Storage Productivity Center as shown in the following steps:

1. Expand **Disk Manager > Storage Subsystems** in the navigation tree. The Storage Subsystems page is displayed.
2. In the **Storage Subsystems** table, double-click a storage subsystem. The Details dialog page is displayed.
3. Click **Element Management**. The **Element Manager** tab in the Configuration Utility is displayed.

#### **Related concepts:**

“Managing DS8000 storage systems using element managers” on page 585  
Use the Configuration Utility in IBM Tivoli Storage Productivity Center to add and manage element managers for IBM System Storage DS8000. *Element managers* are applications that are used to configure and manage a storage device. You can add and manage connections to the element manager that is provided with DS8000, DS8000 Storage Manager, or you can specify other element managers for a device.

“Managing other storage systems using element managers” on page 592  
Use the Configuration Utility in IBM Tivoli Storage Productivity Center to add and manage element managers for storage devices other than IBM System Storage DS8000. *Element managers* are applications that are used to configure and manage a storage device. You manage connections to the element managers that are provided with the storage device or you can specify other element managers for a device.

#### **Starting element managers**

You can start element managers from a storage system that is visible on the Storage Subsystems page of Tivoli Storage Productivity Center. You can also start element managers from other points in Tivoli Storage Productivity Center as described in other areas of this documentation.

To start an element manager from the Storage Subsystem page, complete the following steps:

1. Expand **Disk Manager > Storage Subsystems** in the navigation tree. The Storage Subsystems page is displayed.
2. In the **Storage Subsystems** table, select a storage system.

3. Use one of the following methods to start the element manager:
  - To start the default element manager for the storage system, select **Launch Element Manager**.
  - To start another element manager for the storage system, right-click the system and click **Launch Element Manager**. Select the element manager that you want to start from the menu.

If the connection information for an element manager is valid, the element manager is started. If unsuccessful, an error message is displayed. The error messages that you receive describes one of the following problems:

- that the element manager at the specified IP address could not be started
- that the required connection information for the element manager has not been provided.
- that the element manager is not installed and configured correctly (for local element manager installations such as XIV Storage Manager)

If you are prompted to enter additional information such as an ID and password for the element manager, complete the following steps:

1. Click **OK** in the message dialog box. The Modify Element Manager dialog box is displayed.
2. Enter the required information for the element manager and click **Save**.

### Removing a storage subsystem

This topic describes how to remove a storage subsystem.

1. In the navigation tree pane, expand **Disk Manager** and click **Storage Subsystems**. In the content pane, the Storage Subsystems page is displayed.
2. In the **Storage Subsystem** table, click a storage subsystem, and then click **Remove**. The Remove Storage Subsystem window opens.
3. Click **Yes**.

**Note:** You can also remove a storage subsystem using the following method: “Removing a storage system” on page 294.

### Removing a storage subsystem

This topic describes how to remove a storage subsystem.

1. In the navigation tree pane, expand **Disk Manager** and click **Storage Subsystems**. In the content pane, the Storage Subsystems page is displayed.
2. In the **Storage Subsystem** table, click a storage subsystem, and then click **Remove**. The Remove Storage Subsystem window opens.
3. Click **Yes**.

**Note:** You can also remove a storage subsystem using the following method: “Removing a storage system” on page 294.

### Setting user-defined properties

This topic describes how to set properties for storage subsystems. You can define a name and up to three properties for each storage subsystem.

1. In the navigation tree, expand **Disk Manager** and click **Storage Subsystems**. In the content pane, the Storage Subsystems page is displayed.
2. In the **Storage Subsystem** table, double-click a storage subsystem. The Storage-Subsystem Details page opens.

Storage Subsystems		DS8000-2107-1300361-IBM Details

Figure 46. Storage-Subsystem Details page

3. Set the user-defined properties:
  - a. In the **Label** field, type a name for the storage subsystem.
  - b. In the **User-defined properties** fields, type information that you want to associate with the storage subsystem.
4. Click **File > Save**.

## Viewing storage subsystem information

You can view information about the storage subsystems that are in your environment. You can view general information about all storage subsystems or you can view detailed information about a specific storage subsystem. This information includes the available and used space for the subsystem.

### Viewing general information about a storage subsystem

You can view general information about a storage subsystem.

In the navigation tree, expand **Disk Manager** and click **Storage Subsystems**. On the Storage Subsystems Page, the **Storage Subsystems** table contains the following information about each storage subsystem:

#### Subsystem

A system ID that is in the following format:

*Type-Model-ID-Vendor*

*Type* The type of the storage system, for example, TotalStorage Enterprise Storage Server or SAN Volume Controller.

*Model* The model number, for example, 2105 or 2145.

*ID* The serial number or cluster name. Cluster names are used only for storage systems such as SAN Volume Controller and Storwize V7000.

*Vendor* The manufacturer of the storage system, for example, IBM.

**Label** A user-defined name for the storage system or the ID of the storage system.

**Type** The type of system:

- DS4000
- DS5000
- DS6000
- DS8000
- EMC
- ESS
- Hitachi
- Storwize V7000
- Storwize V7000U
- SONAS
- SVC
- XIV
- Other

**Model** The model of the storage system.

**Status** The status of the system:

- Normal
- Critical
- Warning
- Unreachable

**Available Space (GB)**

The total storage capacity that is not formatted in volumes or virtual disks and that is assigned to hosts.

For the following storage systems, this value represents managed disk space that is not allocated to virtual disk space within the managed disk groups and managed disk space that is not defined to a managed disk group:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

**Tip:** For space-efficient volumes, this value is the amount of storage space requested for these volumes, not the actual allocated amount. This can result in discrepancies in the overall storage space reported for a storage system using space-efficient volumes. This also applies to other space calculations, such as the calculations for the storage system's Consumable (Available) Volume Space and FlashCopy Target Volume Space.

**Consumed Space (GB)**

The total storage capacity that is formatted in volumes or virtual disks and assigned to hosts.

For the following storage systems, this value represents all space that is allocated from MDisk groups to VDisks (space that is consumed by volumes):

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

**Configured Capacity Limit (GB)**

The total amount of real available and formatted storage space in the storage pools that are associated with the storage system.

**Remaining Configured Capacity (GB)**

The amount of real storage space available to allocate to volumes in the storage pools that are associated with the storage system.

**Tiers** Indicates the tiers that are used by the storage system. Each tier is delimited by a semi-colon (;). Possible values are: generic\_hdd and generic\_ssd.

Information about tiers is available only for the following storage systems:

- SAN Volume Controller 6.1 or later
- Storwize V7000
- Storwize V7000 Unified

The value N/A is displayed in tier-related columns for other storage systems.

**Tier Capacities (GB)**

The total storage capacity of each tier that is used by the storage system. The capacity of each tier is delimited by a semi-colon (;).

**Tier Free Capacities (GB)**

The free storage capacity (available space) of each tier that is used by the storage system. The free capacity of each tier is delimited by a semi-colon (;).

**Viewing detailed storage subsystem information**

You can view detailed information about a specific storage subsystem. This information includes the available and used space for the subsystem.

To view detailed information about a specific storage subsystem, click the storage

subsystem, and then click the magnifying glass icon (  ).

The tab that you can view is determined by the type of storage subsystem that you selected:

- The Storage-Subsystems Details tab shows detailed information for storage systems such as System Storage DS4000, System Storage DS8000, or XIV system.
- The SAN Volume Controller, Storwize V7000, or Storwize V7000 Unified Details tab shows detailed information for those storage subsystems.
- The Storwize V7000 File Module Details tab shows detailed information about a Storwize V7000 File Module storage system.
- The IBM SONAS Details tab shows detailed information about an IBM SONAS system.

**Tip:** The contents of the Storage-Subsystem Details tab is determined by the type of storage subsystem that you selected.

### **Storage-Subsystems Details tab**

The Storage-Subsystem Details tab contains the following information:

#### **Storage Subsystem**

The storage system identifier.

**Label** The user-defined name of the storage system. You can edit this field.

**Status** The status of the storage system:

- Normal
- Critical
- Warning
- Unreachable

#### **Vendor**

The manufacturer of the storage system.

**Type** The type of storage system:

- DS4000
- DS5000
- DS6000
- DS8000
- EMC
- ESS
- Hitachi
- XIV
- Other

**Model** The model of the storage system.

#### **Available Space (GB)**

The total storage capacity that is not formatted in volumes or virtual disks and assigned to hosts.

**Tip:** For space-efficient volumes, this value is the amount of storage space requested for these volumes, not the actual allocated amount. This can result in discrepancies in the overall storage space reported for a storage system using space-efficient volumes. This also applies to other space calculations, such as the calculations for the storage system's Consumable (Available) Volume Space and FlashCopy Target Volume Space.

#### **Consumed Space (GB)**

The total storage capacity that is formatted in volumes or virtual disks and assigned to hosts.

#### **Serial Number**

The serial number.

#### **Revision**

The revision number.

#### **User-defined property 1 (UDP1)**

A user-defined property. You can edit this field.

#### **User-defined property 2 (UDP2)**

A user-defined property. You can edit this field.

**User-defined property 3 (UDP3)**

A user-defined property. You can edit this field.

**IP Address**

The IP address of the element manager.

**Element Manager**

Identifies the element manager. This value can be a URL, the fully qualified name of the executable file that starts the element manager, or the short name for the XIV system.

**Element Management**

Opens the Configuration Utility. Use the Configuration Utility to modify the element manager information.

**Replication Information**

If the storage system is not configured for replication, one of the following messages is displayed:

- The device is not supported.
- The replication information for the device is unavailable.
- The device is not configured for replication.

If the storage system is configured for replication, the following information that is specific to the device type and connection type is displayed:

**IP Address/Domain Name**

Identifies the IP address or host name of the storage system. If the IP address was not defined, this field is blank.

**Port** Identifies the port number of the storage system. If the port number was not defined, this field is blank. This field is not applicable for storage systems that use the HMC connection method.

**Username**

Identifies the user name to access the storage system. If the user name was not defined, this field is blank.

**Connection Type**

Identifies the connection method.

**SAN Volume Controller, Storwize V7000, or Storwize V7000 Unified Details tab**

This tab contains the following information:

**Storage Subsystem**

The storage system identifier.

**Label** The user-defined name of the storage system. You can edit this field.

**Status** The status of the storage system:

- Normal
- Critical
- Warning
- Unreachable

**Vendor**

The manufacturer of the storage system.

**Type** The type of storage system:

- Storwize V7000

- Storwize V7000U
- SVC

**Model** The model of the storage system.

**Available Space (GB)**

The total storage capacity that is not formatted in volumes or virtual disks and assigned to hosts.

For these types of storage systems, this value represents managed disk space that is not allocated to virtual disk space within the managed disk groups and managed disk space that is not defined to a managed disk group.

**Tip:** For space-efficient volumes, this value is the amount of storage space requested for these volumes, not the actual allocated amount. This can result in discrepancies in the overall storage space reported for a storage system using space-efficient volumes. This also applies to other space calculations, such as the calculations for the storage system's Consumable (Available) Volume Space and FlashCopy Target Volume Space.

**Consumed Space (GB)**

The total storage capacity that is formatted in volumes or virtual disks and assigned to hosts.

For these types of storage systems, this value represents all space that is allocated from MDisk groups to VDIs (space that is consumed by volumes).

**Tiers** Indicates the tier levels that are used by the storage system. Each tier is displayed as a row in a table. Information about tiers is available only for these types of storage systems.

**Tier** Indicates a tier level that is used by the storage system. Possible values are: generic\_hdd and generic\_ssd.

**Tier Capacity (GB)**

Total storage capacity of a tier.

**Tier Free Capacity (GB)**

Free storage capacity (available space) of a tier.

**Serial Number**

The serial number.

**Revision**

The revision number.

**User-defined property 1 (UDP1)**

A user-defined property. You can edit this field.

**User-defined property 2 (UDP2)**

A user-defined property. You can edit this field.

**User-defined property 3 (UDP3)**

A user-defined property. You can edit this field.

**IP Address**

The IP address of the element manager.

**Element Manager**

Identifies the element manager. This value can be a URL or the fully qualified name of the executable file that starts the element manager.

### **Element Management**

Opens the Configuration Utility. Use the Configuration Utility to modify the element manager information.

### **Replication Information**

If the storage system is not configured for replication, one of the following messages is displayed:

- The device is not supported.
- The replication information for the device is unavailable.
- The device is not configured for replication.

If the storage system is configured for replication, the following information that is specific to the device type and connection type is displayed:

#### **IP Address/Domain Name**

Identifies the IP address or host name of the storage system. If the IP address was not defined, this field is blank.

**Port** Identifies the port number of the storage system. If the port number was not defined, this field is blank. This field is not applicable for storage systems that use the HMC connection method.

#### **Username**

Identifies the user name to access the storage system. If the user name was not defined, this field is blank.

#### **Connection Type**

Identifies the connection method.

### **Storwize V7000 File Module Details tab**

The Storwize V7000 File Module Details tab contains the following information:

#### **Available FileSystem Space**

The amount of available file system space for the file module.

#### **Consumed FileSystem Space**

The amount of used file system space for the file module.

#### **Version**

The version of the file module.

### **IBM SONAS Details tab**

The IBM SONAS Details tab contains the following information:

#### **Storage Subsystem**

The storage system identifier.

**Label** The user-defined name of the storage system. You can edit this field.

**Status** The status of the storage system:

- Normal
- Critical
- Warning
- Unreachable

#### **Vendor**

The manufacturer of the storage system.

**Type** The type of storage system: IBM SONAS.

**Model** The model of the storage system.

**Available FileSystem Space**

The total amount of unique file system storage space that is not used or available to the computers where a Data agent or Storage Resource agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this field:

- File systems that become missing after a probe
- File systems that are mounted remotely and are not identified to a network-attached storage server
- File systems that are not mounted

**Consumed FileSystem Space**

The total amount of unique file system storage space that is used or consumed by the computers where a Data agent or Storage Resource agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this field:

- File systems that become missing after a probe
- File systems on discovered hypervisors that are assigned to virtual machines where an agent is installed
- File systems on virtual machines where an agent is installed, but the hypervisors for the virtual machines have not been discovered and the total used space exceeds the capacity of the total file system capacity
- File systems that are mounted remotely and are not identified to a network-attached storage server
- File systems that are not mounted

**Version**

The version number.

**User-defined property 1 (UDP1)**

A user-defined property. You can edit this field.

**User-defined property 2 (UDP2)**

A user-defined property. You can edit this field.

**User-defined property 3 (UDP3)**

A user-defined property. You can edit this field.

**IP Address**

The IP address of the element manager.

**Element Manager**

Identifies the element manager. This value can be a URL, the fully qualified name of the executable file that starts the element manager, or the short name for the IBM SONAS.

**Element Management**

Opens the Configuration Utility. Use the Configuration Utility to modify the element manager information.

**Replication Information**

You cannot use IBM SONAS for replication.

## Managing virtual disks

This topic contains information about managing virtual disks.

## Adding a managed disk to a managed-disk group

This topic describes how to add a managed disk to a managed-disk group.

**Attention:** If you add a managed disk that contains existing data to a managed disk group, you will lose the data that it contains. The *image mode* is the only mode that will preserve this data.

1. In the navigation tree pane, expand **Disk Manager** and click **Storage Subsystems**. In the content pane, the Storage Subsystems page is displayed.
2. In the **Storage Subsystems** table, click a SAN Volume Controller.
3. Click **Create Virtual Disk**. The Create Virtual Disk wizard starts and the "Define the virtual disks" page opens.
4. In the **Managed-disk group** field, select the managed-disk group to which you want to add a managed disk.
5. Click **Add Managed Disk**. The "Add managed disk" window opens.
6. Select the managed disk, and then click **OK**.

## Assigning host ports

This topic describes how to assign host ports to a virtual disk. You also can make host-port assignments when you create a virtual disk.

**Note:** When you assign a host port to a virtual disk, all host ports defined on the SAN Volume Controller model are assigned to the virtual disk. If you want to assign only one host port to a virtual disk, you must define the host with only one host port on the SAN Volume Controller.

1. In the navigation tree pane, expand **Disk Manager** and click **Storage Subsystems**. In the content pane, the Storage Subsystems window is displayed.
2. In the **Storage Subsystems** table, click the SAN Volume Controller with which you want to work.
3. Click **Virtual Disks**. The Virtual Disks page is displayed.
4. Click either **Filter by MDisk group** or **Filter by host port**, and then select the specific filtering condition.
5. Click **Go**. A list of virtual disks associated with the selected SAN Volume Controller is displayed.
6. In the **Virtual Disks** table, select the virtual disk, and then click **Assign Host Ports**. The Assign Host Ports wizard starts. A virtual disk that is marked with an asterisk (\*) indicates that the virtual disk is a space-efficient volume. The \* is not part of the actual virtual disk name.
7. On the "Assign the virtual disk to host ports" page, assign or unassign host ports:
  - a. Optional: In the **Available ports** field, select the ports that you want to assign to the virtual disks, and then click .
  - b. Optional: In the **Assigned ports** field, select any ports that you want to unassign from the virtual disks, and then click .
  - c. Click **Next**.
8. (This page only is displayed if Fabric Manager is installed, and you have Fabric administrator authority.) On the "Zone actions" page, perform one of the following zone actions:

### Create a new zone

Click **Create new Zone**. In the Zone name field, type the name of the zone. The ports listed on the page are added to the new zone.

### Update an existing zone

Click **Update existing zone**, and then select a zone. The ports listed on the page are added to the selected zone.

### Leave the zone configuration as it is

Click **Do neither** to avoid performing any fabric-control tasks. The ports listed on the page cannot communicate with the subsystem on this fabric.

9. Click **Next**. The "Review settings" page opens.
10. Review the settings that you made earlier in the wizard, and then click **Finish**.

## Creating virtual disks

This topic describes how to create virtual disks.

1. Expand the **Disk Manager** node in the navigation tree and click **Storage Subsystems**. In the right pane, the Storage Subsystems page is displayed.
2. In the **Storage Subsystem** table, click a IBM System Storage SAN Volume Controller, and then click **Create Virtual Disk**. The Create Virtual Disk wizard starts.
3. On the Define the virtual disks page, specify the attributes for the virtual disks:
  - a. In the **Type** field, select one of the following values:
    - Striped
    - Sequential
  - b. In the **Number of virtual disks** field, select the number of virtual disks that you want to create. Each available input/output (I/O) group can contain 1024 virtual disks.
  - c. In the **Virtual-disk size** field, select the size of the virtual disks to be created.
  - d. In the **Units** field, select one of the following units of measurement for the size of the virtual disks:
    - Bytes (byte)
    - GB (gigabyte)
    - KB (kilobyte)
    - MB (megabyte)
    - PB (petabyte)
    - TB (terabyte)
  - e. In the **Name** field, enter a string to identify the virtual disk.
    - For SAN Volume Controller 4.x and 5.x, the following naming conventions apply:
      - The maximum length of the name is 14 characters. The number of virtual disks also determines the maximum length of the name. For example, if the number of virtual disks is 10 - 99, the maximum length of the name is 13 characters. If the number of virtual disks is 100 - 999, the maximum length of the name is 12 characters, and so on.
      - Permissible characters include uppercase letters (A-Z), lowercase letters (a-z), numerals (0-9), hyphens (-), and underscores (\_).
    - For SAN Volume Controller 6.1 and Storwize V7000, and Storwize V7000 Unified block-level support, the following rules apply:

- Specify a single virtual-disk name that is no longer than 63 characters. The number of virtual disks also determines the maximum length of the name. For example, if the number of virtual disks is 2 - 9, the maximum length of the name is 62 characters. If the number of virtual disks is 10 - 99, the maximum length of the name is 61 characters. If the number of virtual disks is 100 - 999, the maximum length of the name is 60 characters.
- Specify a name that includes only the following characters:
  - uppercase letters (A-Z)
  - lowercase letters (a-z)
  - numerals (0 - 9)
  - hyphen (-)
  - underscore (\_)
  - blank space
  - period (.)
- Names must begin with a letter or an underscore. The first character cannot be a number, hyphen (-), blank space, or period(.
- Names cannot begin with text or abbreviations commonly used to specify the object type, for example, the name cannot begin with VDisk, VDISK, vdisk, or virtual disk.
- Names cannot end with a space.
- Object names must be unique within an object type. For example, it is acceptable to have a vdisk named "XYZ" and an mdisk named "XYZ", but not acceptable to have two vdisks named "XYZ".

If you leave this field blank, a name is generated automatically. If you create multiple virtual disks, the name is used as a prefix.

- f. In the **I/O group** field, select the I/O group. By default, **Let the system choose** is selected. Other options are the actual I/O groups on the cluster.
- g. In the **Space-efficient properties** pane, use the following options to specify the space-efficient properties of the virtual disk. This pane is disabled if the SAN Volume Controller does not support the creation of space-efficient virtual disks:
  - 1) **Space efficient** check box (precedes the **Real size** field). Select this check box to specify that the virtual disk will be space efficient. Selecting this check box activates the other fields in this section.
  - 2) **Real size** Specify the actual allocated size of the virtual disk at creation time. This size is the initial allocated disk size that can be increased as needed by the SAN Volume Controller when the applications using the VDisk need more storage. The real size of the disk cannot exceed the managed free space that is currently available. Use the dropdown list to specify the size of the allocation unit.
  - 3) **Summary** This field displays a summary of the space-efficient properties for this virtual disk.
  - 4) **Define** Click this button to open the Define Space Efficient Properties window.
- h. Select the **Show solid state based Managed Disk Groups only** check box if you want only managed disk groups that are on solid-state drives to be displayed in the **Managed-disk group** field. Solid-state drives are available in SAN Volume Controller 5.1 and later.

- i. In the **Managed-disk group** field, select the managed disk group. The managed disk groups are listed using the following convention:  
MDisk-group name (*N*)

where *N* is the available capacity. After you select the managed disk group, the managed disks in the managed disk group are displayed.

To add a managed disk to the managed disk group, click **Add Managed Disk**.

- j. This check box is available only for sequential virtual disks. If you are creating more than one sequential virtual disk, select the **Round robin sequential assignment to managed disks** check box to ensure that the virtual disks are assigned to the managed disks in a round-robin manner. If selected, the number of virtual disks must equal the number of managed disks selected in the managed disk table.

Clear the **Round robin sequential assignment to managed disks** check box to ensure that all virtual disks are created on a single managed disk. If the check box is cleared, there must be *only* one managed disk selected in the managed-disk table.

- k. Select the **Format virtual disks** check box to ensure that the virtual disks are formatted (written with zeros) after they are created.
- l. Click **Next**.
4. On the Assign the virtual disk to host ports page, assign host ports:
  - a. Optional: In the **Available ports** field, select the ports that you want to assign to the virtual disks, and then click .
  - b. Click **Next**.
5. On the Zone actions page, perform one of the following zone actions. The Zone actions page is displayed only if Fabric Manager is installed, and you have Fabric administrator authority.

#### Create a new zone

Click **Create new Zone**. In the **Zone name** field, type the name of the zone. The ports that are listed are added to the new zone.

#### Update an existing zone

Click **Update existing zone**, and then select a zone. The ports that are listed are added to the selected zone.

#### Leave the zone configuration as it is

Click **Do neither** to avoid performing any fabric-control tasks. The ports that are listed are not able to communicate with the subsystem on this fabric.

6. Click **Next**.
7. On the Summary page, review the selections that you made earlier in the wizard.
8. Click **Finish** to create the virtual disks.

### Deleting a virtual disk

This topic describes how to delete a virtual disk.

1. In the navigation tree pane, expand **Disk Manager** and click **Storage Subsystems**. In the content pane, the Storage Subsystems window is displayed.
2. In the **Storage Subsystems** table, click a SAN Volume Controller, and then click **Virtual Disks**. The Virtual Disks page opens.

3. Click either **Filter by MDisk group** or **Filter by host ports**, and then select the specific filtering condition.
4. Click **Go**. A list of virtual disks associated with the selected SAN Volume Controller is displayed.

Figure 47. Virtual Disks page

5. In the **VDisk** table, click the virtual disk that you want to delete, and then click **Delete**.
6. When prompted to confirm that you want to delete the virtual disk, click **Yes**.

### Viewing virtual-disk information

This topic describes how to view information about the virtual disks in your environment.

1. Expand the **Disk Manager** node in the navigation tree and click **Storage Subsystems**. In the content pane, the Storage Subsystems page is displayed.
2. In the **Storage Subsystems** table, click a SAN Volume Controller, and then click **Virtual Disks**. The Virtual Disks page opens.
3. Click either **Filter by MDisk group** or **Filter by host ports**, and then select the specific filtering condition.
4. Click **Go**. A list of virtual disks associated with the selected SAN Volume Controllers is displayed. The **VDisk** table contains the following information about each virtual disk:

**Name** Name of the virtual disk or mirror copy.

**I/O Group**

Name of the I/O group that is associated with the virtual disk or mirror copy.

**Status** Status of the virtual disk or mirror copy:

- Offline
- Online
- Degraded

### Copy Type

Indicates the type of the virtual disk. Valid values for this column include the following:

- **Standard:** Indicates standard VDIs (from pre-SAN Volume Controller 4.3 systems)
- **Primary:** Indicates VDIs from SAN Volume Controller 4.3 or newer systems.
- **Copy:** Indicates a mirror copy (not the primary copy) of a VDI.

**Note:** You can assign virtual disks to hosts if those disks have a **Copy Type** of **Standard** or **Primary**.

### Copy ID

Indicates the ID of a mirror copy for a virtual disk. Depending on the configuration history, a single mirror copy might have an ID of either 0 or 1.

**Note:** The value N/A appears in this column for virtual disks.

### MDisk Group Name

Name of the managed-disk groups to which the virtual disk or mirror copy belongs.

### Capacity (MB)

Capacity of the virtual disk or mirror copy in MB. This value is rounded to 0.1 MB.

**Type** Type of virtual disk or mirror copy:

- Image
- Sequential
- Striped

### FlashCopy Name

Name of the FlashCopy mapping to which the virtual disk belongs.

### MM Name

Name of the Metro Mirror relationship to which the virtual disk belongs.

5. To view detailed information about a specific virtual disk, click the virtual disk, and then click . The Virtual-Disk Details page opens.

VDisks		my Details
<b>VDisk ID</b>		my
<b>Name</b>		39
<b>I/O group ID</b>		37004
<b>I/O group name</b>		io_grp0
<b>Status</b>		Degraded
<b>MDisk group ID</b>		37077
<b>MDisk Group Name</b>		mdiskgrp4
<b>Capacity (MB)</b>		0.95
<b>Type</b>		Striped
<b>Formatted</b>		No
<b>MDisk ID</b>		
<b>MDisk name</b>		
<b>Flash Copy ID</b>		
<b>FlashCopy name</b>		
<b>Metro mirror ID</b>		
<b>Metro mirror Name</b>		
<b>I/O throttling rate</b>		0
<b>Preferred node for I/O</b>		1
<b>Mapped to a host</b>		No
<b>Fast-write state</b>		Empty
<b>UID</b>		

Figure 48. Virtual-Disk Details page

The Virtual-Disk Details page contains the following information:

**VDisk ID**

ID of the virtual disk.

**Name** Name of the virtual disk. A virtual disk that is marked with an asterisk (\*) indicates that the virtual disk is a space-efficient volume. The \* is not part of the actual virtual disk name.

**I/O group ID**

ID of the I/O group.

**I/O group name**

Name of the I/O group.

**Status** Status of a virtual disk:

- Offline
- Online
- Degraded

**MDisk group name**

Name of the managed-disk group.

**Capacity (MB)**

Capacity of a virtual disk in MB. This value is rounded to 0.1 MB.

**Easy Tier**

Indicates the enablement of tiering. Possible values are: auto, on, off.

Information about virtual disk tiers is available for SAN Volume Controller 6.1 and Storwize V7000 only. The fields related to tiers are not displayed for other storage systems.

**Easy Tier Status**

Indicates the status of tiering. Possible values are: active, inactive.

**Tiers** Indicates the tier levels used by the virtual disk. Each tier is displayed as a row in a table. Possible values are: generic\_hdd, generic\_ssd.

**Tier Capacity**

Total storage capacity of a tier.

**Type** Type of a virtual disk:

- Image
- Sequential
- Striped

**Formatted**

Indicates if a virtual disk is formatted.

**MDisk ID**

IDs of the MDisks that a virtual disk is using.

**MDisk name**

Names of the MDisks that a virtual disk is using.

**FlashCopy**

Indicates if the virtual disk is in a FlashCopy (FC) relationship and whether it is an FC source or FC target. Virtual disks that are not in an FC relationship are displayed with a None value whether or not the virtual disk is on a system that supports FC.

**Note:**

- This value is available for virtual disks of the following systems only: IBM TotalStorage Enterprise Storage Server, IBM System Storage DS6000, IBM System Storage DS8000, and SAN Volume Controller.
- TotalStorage Enterprise Storage Server systems must have at least the following microcode levels: ess800mincodelevel = 2.4.3.56, essf20mincodelevel = 2.3.3.89. IBM Tivoli Storage Productivity Center does not report FC information if the TotalStorage Enterprise Storage Server systems do not meet this requirement.

**FlashCopy ID**

ID of the FlashCopy mapping to which the virtual disk belongs.

**FlashCopy name**

Name of the FlashCopy mapping to which the virtual disk belongs.

**Metro mirror ID**

ID of the Metro Mirror relationship to which the virtual disk belongs.

**Metro mirror name**

Name of the Metro Mirror relationship to which the virtual disk belongs.

**I/O throttling rate**

Maximum rate at which an I/O transaction is accepted for a virtual disk.

**Preferred node for I/O**

IP address of the node to be used for I/O operations.

**Mapped to a host**

Yes or No.

**Fast-write state**

Yes or No. This value indicates whether the virtual disk has data in the cache.

UID Unique ID.

## Managing volumes

This topic contains information about managing volumes.

### Assigning host ports

This topic describes how to assign host ports to volumes. You also can make host-port assignments when you create volumes.

1. In the navigation tree pane, expand **Disk Manager** and click **Storage Subsystems**. In the content pane, the Storage Subsystems window is displayed.
2. In the **Storage Subsystems** table, click the storage subsystem with which you want to work.
3. Click **Volumes**. The Volumes page is displayed.

**Volumes** FSVT\_1000 Details

Create Assign Host Ports Delete

A volume job is in progress. To view the job status, click Monitoring --> Jobs.

Volume view:

Filter by extent pool 2107.1301901-vs0

Filter by host port

Volumes (2107.1301901):

Volume	Subsystem	Subsystem Name	LCU	Type	Size	Unit

FSVT_1005	DS8000-2107-1301901-IBM	2107.1301901	16	FB	5 GB	
FSVT_1006	DS8000-2107-1301901-IBM	2107.1301901	16	FB	5 GB	
FSVT_1007	DS8000-2107-1301901-IBM	2107.1301901	16	FB	5 GB	

Figure 49. Volumes page

4. Select a filtering condition, and then click **Go**. A list of volumes is displayed.
5. In the **Volumes** table, select the volume, and then click **Assign Host Ports**. The Assign Host Ports wizard starts.
6. On the "Assign the volume to host ports" page, assign or unassign host ports:
  - a. Optional: In the **Available ports** field, select the ports that you want to assign to the virtual disks, and then click .
  - b. Optional: In the **Assigned ports** field, select any ports that you want to unassign from the virtual disks, and then click . To avoid lost or inconsistent data, make sure that the volume is unmounted before unassigning.

**Note:** if a host (agent) with multiple host ports is defined to a storage subsystem, assigning a volume to the host ports will create a single host definition with all of those ports.

If a host (agent) with multiple host ports is **not** defined to a storage subsystem on the same fabric, assigning a volume to the host ports will create a separate host definition for each port (multiple host definitions, each with a single port).

- c. Click **Next**.
7. On the "Assign the volume to subsystem ports" page, assign the volumes to specific subsystem ports.
  - a. Optional: In the **Available ports** list, select subsystem ports and click >> to assign them to the volumes. The ports are identified using the following convention: <Worldwide port name> (<host name>).
  - b. Click **Next**.
8. (This page only is displayed if Fabric Manager is installed, and you have Fabric administrator authority.) On the "Zone actions" page, perform one of the following zone actions:
  - Create a new zone**  
Click **Create new Zone**. In the Zone name field, type the name of the zone. The ports listed on the page are added to the new zone.
  - Update an existing zone**  
Click **Update existing zone**, and then select a zone. The ports listed on the page are added to the selected zone.
  - Leave the zone configuration as it is**  
Click **Do neither** to avoid performing any fabric-control tasks. The ports listed on the page will not be able to communicate with the subsystem on this fabric.
9. Click **Next**. The "Review settings" page opens.
10. Review the selections that you made earlier in the wizard, and then click **Finish**.

## Creating volumes and assigning volumes to a host

This task describes how to create volumes and assign the volumes to a host storage system. This task also describes how to perform zone configuration tasks if Fabric Manager is installed, and you have Fabric administrator authority

The performance of a volume creation job and the general performance of a CIM object manager (CIMOM) might decrease if you create many volumes on a system at the same time that a performance monitor is collecting data about that system. To avoid this issue, create volumes on a system when a performance monitoring job is not running or is not scheduled to run on the target system.

The following steps describe how to create volumes, assign the volumes to a storage system. Some fields described in these steps are dependent on the type of storage system that you have selected.

1. Expand **Disk Manager** and click **Storage Subsystems**.
2. In the **Storage Subsystem** table, select a storage system, and click **Create Volume**. The Create Volume wizard is started.
3. On the Define the volumes page, specify the attributes for the volumes:
  - a. In the **RAID level** field, select one of the following Redundant Array of Independent Disks (RAID) levels, based on the type of storage system:
    - IBM System Storage DS6000 and IBM System Storage DS8000: RAID 5, RAID 6 (DS8000 only), RAID 10, or Mixed. RAID 5 is the default setting.

- IBM TotalStorage Enterprise Storage Server: RAID 5 or RAID 10. RAID 5 is the default setting.
  - IBM System Storage FASTT/DS4000 and IBM System Storage DS5000 Storage Manager: RAID 0, RAID 1, RAID 3, or RAID 5. RAID 0 is the default setting.
- b. In the **Encryption group** field, select an encryption group if you want the new volumes to be created on extent pools that use full disk encryption. If an encryption group is selected, only pools that belong to the selected encryption group are displayed in the **Available extent pools** field. If there are no encryption groups available, **No selection** is displayed in the **Encryption group** field.
  - c. Select the **Solid state based pools only** check box if you want the new volumes to be created on extent pools that are on solid-state drives. If this check box is selected, only pools on solid-state drives are displayed in the **Available extent pools** field. If there are no solid-state drives available, the **Solid state based pools only** check box is disabled.
  - d. In the **Available extent pools** field, select an extent pool from the list of extent pools with the specified RAID level. These extent pools are identified using the following convention: *Device-specific extent pool name (free space GB)*. This field is displayed if the system is DS6000 or DS8000. Only extent pools with fixed-block (FB) tracks are listed.
  - e. In the **Available arrays** field, select an array from the list of arrays with the specified RAID level. These arrays are identified using the following convention: *Device-specific array name (free space GB)*. This field is displayed if the system is neither DS6000 nor DS8000.
  - f. In the **Number of volumes** field, select the number of volumes that you want to create. The default is 1. For an TotalStorage Enterprise Storage Server system, the maximum is 255.
  - g. In the **Volume size** field, select the size of the volumes to be created. The maximum and minimum size depends on the type of storage system.
  - h. In the **Units** field, select one of the following units of measurement for the size of the volumes:
    - KB
    - MB
    - GB
  - i. In the **Name** field, type a name for the volume. If you are creating multiple volumes, this string is used as a prefix. The string cannot be longer than 15 characters. This field is disabled for TotalStorage Enterprise Storage Server systems. TotalStorage Enterprise Storage Server volume names are determined by TotalStorage Enterprise Storage Server.
  - j. Click **Next**.
4. On the Assign the volume to host ports page, assign the volume to specific host ports:
    - a. In the **Available ports** list, select host ports and click  to assign the ports to the volumes. The ports are identified using the following convention: *Worldwide port name (host name)*.
    - b. Click **Next**.
  5. On the Restrict access to subsystem ports page, you can restrict the host access to specific system ports:

- a. Optional: In the **Unassigned ports** list, select system ports and click  to remove the ports from the list of ports assigned to the volume. The ports are identified using the following convention: *Worldwide port name (host name)*. To avoid lost or inconsistent data, make sure that the volume is unmounted before you unassign ports.
  - b. Click **Next**.
6. On the Zone actions page, perform one of the following zone actions. This page is displayed only if Fabric Manager is installed, and you have Fabric administrator authority.

Use a Zone Action if you want to apply updates to the active zone set. This action applies changes to the inactive zone set that has the same name as the active zone set and then the zone set is activated. Before using this option, ensure that the zones and zone members in the active zone set matches the zones and zone members in the inactive zone set with the same name.

#### **Create a new zone**

Click **Create new Zone**. In the Zone name field, type the name of the zone. The ports that are listed are added to the new zone.

#### **Update an existing zone**

Click **Update existing zone**, and then select a zone. The ports that are listed are added to the selected zone.

#### **Leave the zone configuration as it is**

Click **Do neither** to avoid performing any fabric-control tasks. The ports listed that are listed are not able to communicate with the subsystem on this fabric.

Click **Next**.

7. On the Summary page, review the selections that you made earlier in the wizard.
8. Click **Finish**.

## **Deleting volumes**

This topic describes how to delete volumes.

Note that volumes that are part of a replication session cannot be deleted.

1. In the navigation tree pane, expand **Disk Manager** and click **Storage Subsystems**. In the content pane, the Storage Subsystems page is displayed.
2. In the **Storage Subsystems** table, click a storage subsystem, and then click **Volumes**. The Volumes page is displayed.
3. On the Volumes page, select the specific filtering condition, and then click **Go**. A list of volumes on the selected storage subsystem is displayed.
4. In the **Volumes** table, select the volume that you want to delete, and then click **Delete**. You can select one volume at a time only. You cannot delete TotalStorage Enterprise Storage Server volumes from within IBM Tivoli Storage Productivity Center.
5. When prompted to confirm that you want to delete the volume, click **Yes**. The volume is deleted automatically when you click Yes. You can reuse the volume name immediately after the volume is deleted.

**Note:** For SAN Volume Controller (SVC), if you choose to delete a volume using the SVC console rather than the IBM Tivoli Storage Productivity Center

user interface, that volume is retained for 14 days before being deleted. You cannot reuse the volume name during that time.

## Viewing volume information

This topic describes how to view information about the volumes in your environment.

**Note:** If a probe is run against a CIM object manager (CIMOM) that is not available, the volumes defined on the storage system are not displayed in the IBM Tivoli Storage Productivity Center graphical user interface (GUI). Check that probes run successfully and consider configuring an alert to ensure that you are notified when a scheduled probe fails.

1. Expand the **Disk Manager** node in the navigation tree and click **Storage Subsystems**. In the content pane, the Storage Subsystems page is displayed.
2. In the **Storage Subsystems** table, click a storage system, and then click **Volumes**. The Volumes page opens.
3. Select the specific filtering condition, and then click **Go**. A list of volumes associated with the selected storage system is displayed. The **Volume** table contains the following information about each volume:

### Volume

Volume ID.

### Subsystem

A system ID in the following format:

*Type-Model-ID-Vendor*

- *Type* is the type of the storage system, for example, TotalStorage Enterprise Storage Server or SAN Volume Controller.
- *Model* is the model number, for example, 2105 or 2145.
- *ID* is the serial number or cluster name. Cluster names only are used for SAN Volume Controllers.
- *Vendor* is the manufacturer of the storage system, for example, IBM.

### Subsystem Label

A user-defined name or the system ID.

**LCU** Logical control unit (LCU), which can have one of the following values:

- DS6000, DS8000, and TotalStorage Enterprise Storage Server -- logical system (LSS) ID
- SAN Volume Controller --1

**Type** Type of volume, either fixed-block (FB) or count-key data (CKD).

### Volume Space

Size of the volume.

**Unit** GB for fixed-block (FB) volumes and cyl for count-key data (CKD) volumes.

4. To view detailed information about a specific volume, click the volume, and

then click . The Volume Details page is opened. The Volume Details page contains the following information:

### Volume

Volume ID.

### Volume size

Volume size.

**Volume real space**

Physical allocated space of the volume. For normal volumes, this value is equal to the volume space. For space efficient/thin provisioned volumes, this value is equal to the real space allocated when data is written to the volume. If IBM Tivoli Storage Productivity Center detects that a volume is thin provisioned but cannot retrieve the Volume real space value, N/A is displayed.

**Array** Array on which the volume is created.

**RAID level**

Redundant Array of Independent Disks (RAID) level of the volume.

**FlashCopy**

Indicates if the volume is in a FlashCopy (FC) relationship and whether it is an FC source or FC target. Volumes that are not in an FC relationship are displayed with a **None** value whether or not the volume is on a system that supports FC.

**Note:**

- This value is available for volumes of the following systems only: IBM TotalStorage Enterprise Storage Server (TotalStorage Enterprise Storage Server), IBM System Storage DS6000, IBM System Storage DS8000, and IBM System Storage SAN Volume Controller.
- TotalStorage Enterprise Storage Server systems must have at least the following microcode levels: `ess800mincodelevel = 2.4.3.56`, `essf20mincodelevel = 2.3.3.89`. IBM Tivoli Storage Productivity Center does not report FC information if the TotalStorage Enterprise Storage Server systems do not meet this requirement.

**Subsystem**

A system ID in the following format:

*Type-Model-ID-Vendor*

where:

- *Type* is the type of the storage system, for example, TotalStorage Enterprise Storage Server or SAN Volume Controller.
- *Model* is the model number, for example, 2105 or 2145.
- *ID* is the serial number or cluster name. Cluster names only are used in for SAN Volume Controllers.
- *Vendor* is the manufacturer of the storage system, for example, IBM.

**Subsystem Label**

This value can be either a user-defined name or the system ID.

**Is Encryptable**

Indicates **Yes** when the volume is encryptable and **No** when the volume is not encryptable.

**Is Encrypted**

Indicates **Yes** when the volume is encrypted and **No** when the volume is not encrypted.

**Assigned host ports**

Host ports to which the volume is assigned.

**Subsystem ports**

System ports to which the volume is assigned.

---

## Managing fabrics

This section describes operations available for directly manipulating the zone configuration in a fabric.

Zone control functions are also integrated in the Storage Provisioning function (see “Provisioning planner” on page 109) and the SAN Planner functions.

For further information, see “Planning and modifying storage configurations” on page 419).

### Note:

- After you click **Change** to begin your zone configuration changes and before you click **Update and Activate** or **Update Only** to conclude your changes, it is possible that other users might have made zoning changes to the same fabric. This situation might have happened through a switch element manager or switch CLI, as some switch vendors and models lack zone control session locking across the fabric. This lack of zone control session locking might allow overwrite conditions of the changes to the active zoneset for the fabric and to the set of inactive zonesets.
- If the zoning on a fabric has an active configuration and you use a switch element manager to delete the inactive copy of the active zoneset, Tivoli Storage Productivity Center still displays the inactive copy of the active zoneset on the Fabric Manager > Fabrics > Zone Configuration panels. Tivoli Storage Productivity Center displays the inactive copy even though it does not exist in the fabric zone configuration so that you can edit the active zoneset.

The contents of this inactive copy of zoneset displayed is identical to contents of the active copy of the zoneset. If you use Tivoli Storage Productivity Center to make any subsequent zoning changes for the fabric, the inactive copy of the active zoneset is created in the fabric zone configuration.

## Working with zones

This topic describes how to create, change, duplicate, activate or deactivate, and delete zones.

### Creating zones

When you add zones, you assign assets to the zone and specify the zone set or sets to which the zone belongs.

To create a zone:

1. In the navigation pane, expand the **Fabric Manager** node and click **Fabrics**.
2. Click a fabric in the list and click **Zone Configuration**.
3. In the **Zone Configuration** area, click **Change**.
4. In the **Zones** area, click **Add**.
5. In the Zone Configuration window enter the name of the zone and, optionally, a description. The zone name must be unique in the fabric. Click **Next**.
6. In the next Zone Configuration window, select the assets (switches, devices, aliases) that you want to include in the zone, move them from the **Available Assets** column to the **Selected Assets** column, and click **Next**.

If the fabric is set on Interop Mode, you can select only the port WWN number and the device port number from the **Available Assets** column.

7. In the next Zone Configuration window, select one or more zone sets, move them from the **Available Zone Sets** column to the **Selected Zone Sets** column, and click **Finish**.

## Adding storage to a server and setting up a zone

To add storage to a server and set up a zone, do the following:

1. **Add the CIMOM**
  - a. Expand **Administrative Services** → **Data Sources** → **CIMOM Agents** .
  - b. Click **Add CIMOM** in the content pane.
  - c. In the **Add CIMOM** window, enter the required values and click **Save**.
2. **Run a CIMOM discovery**
  - a. Expand **Administrative Services** → **Discovery**.
  - b. Right-click **CIMOM** and select **Run Now**.
  - c. Right-click **CIMOM** and select **Refresh Job List** for the submitted job to appear in the list of discovery jobs. The date and time of the job is displayed in the navigation tree pane. To see the latest status of the job, right-click **CIMOM** and select **Update Job Status**.
3. **Run a probe**

When the discovery has completed successfully, perform the following steps:

  - a. Expand **IBM Tivoli Storage Productivity Center** → **Monitoring** .
  - b. Right-click **Probes** and select **Create Probe**.
  - c. Make your selections and click **Save** to submit the job.
  - d. Right-click **Probes** and select **Refresh Job List** to display the job in the list of probes. The date and time of the job will be displayed in the navigation tree pane. To see the latest status of the job, right-click **Probes** and select **Update Job Status**.
4. In the navigation tree pane, expand **Data Manager** and click **Storage Subsystems**. In the content pane, the Storage Subsystems window opens.
5. In the **Storage Subsystems** table, click the storage subsystem with which you want to work.
6. Click **Volumes**.
7. In the Volumes page select a filtering condition, and click **Go**.
8. In the **Volumes** table, select the volume, and then click **Assign Host Ports**. The Assign Host Ports wizard starts.
9. On the "Assign the volume to host ports" page, you can assign and unassign host ports:
  - a. In the **Available ports** field, select the ports that you want to assign to the virtual disks, and then click  .
  - b. In the **Assigned ports** field, select any ports that you want to unassign from the virtual disks, and then click  .
  - c. Click **Next**.
10. On the "Assign the volume to subsystem ports" page, assign the volumes to specific subsystem ports.
  - a. Optional: In the **Available ports** list, select subsystem ports and click  to assign them to the volumes. The ports are identified using the following convention: *<Worldwide port name>* (*<host name>*).
  - b. Click **Next**.

11. "Zone actions" page is displayed only if Fabric Manager is installed, and you have Fabric administrator authority. Perform one of the following zone actions:

**Create a new zone**

Click **Create new Zone**. In the Zone name field, type the name of the zone. The ports listed on the page are added to the new zone.

**Update an existing zone**

Click **Update existing zone**, and then select a zone. The ports listed on the page are added to the selected zone.

**Leave the zone configuration as it is**

Click **Do neither** to avoid performing any fabric-control tasks. The ports listed on the page will not be able to communicate with the subsystem on this fabric.

Click **Next**.

12. In the "Review settings" page, review your selections and click **Finish**.

## Changing zone properties

You can change a zone name, a description, the assets assigned to a zone, and the zone set or sets to which a zone belongs.

To change zone properties, perform the following steps:

1. In the navigation pane, expand the **Fabric Manager** node and click **Fabrics**.
2. Click a fabric in the list and click **Zone Configuration**.
3. In the **Zone Configuration** area, click **Change**.
4. In the **Zones** area, click **Change**.
5. In the Zone Configuration window enter the name of the zone and, optionally, a description. The zone name must be unique in the fabric. Click **Next**.
6. In the next Zone Set Configuration window, you can change the assets to be included in the zone:
  - In the **Available Assets** column, select any zone assets to be added and click  to move them to the **Selected Assets** column.
  - In the **Selected Assets** column, select any zone assets to be removed from the zone and click  to move them to the **Available Assets** column.
  - Click **Next**.
7. In the next Zone Set Configuration window, you can change the zone sets to which the zone is assigned:
  - In the **Available Zone Sets** column, select any zone sets to which the zone is to be assigned and click  to move them to the **Selected Zone Sets** column.
  - In the **Selected Zone Sets** column, select any zone sets to which the zone is not to be assigned and click  to move them to the **Available Zone Sets** column.
8. Click **Finish**.

## Duplicating zones

You can use the Zones dialog to duplicate a zone.

To duplicate zones, perform the following steps:

1. In the navigation pane, expand the **Fabric Manager** node and click **Fabrics**.
2. Click a fabric in the list and click **Zone Configuration**.
3. In the **Zone Configuration** area, click **Change**.
4. In the **Zones** area, click **Duplicate**.
5. In the Zone Configuration window enter the name of the zone and, optionally, a description. The zone name must be unique in the fabric. Click **Next**.
6. In the next Zone Configuration window, you can change the assets to be included in the zone:
  - In the **Available Assets** column, select any zones to be added and click  to move them to the **Selected Assets** column. To remove selected zone assets, select the assets from the **Selected Assets** column and click  to move them to the **Available Assets** column.
  - Click **Finish**.
7. In the next Zone Configuration window, you can change the zone sets to which the zone is assigned:
  - In the **Available Zone Sets** column, select any zone sets to which the zone is to be assigned and click  to move them to the **Selected Zone Sets** column.
  - In the **Selected Zone Sets** column, select any zone sets to which the zone is not be assigned and click  to move them to the **Available Zone Sets** column.
8. Click **Finish**.

## Removing zones

You can use the Zones dialog to remove one or more zones from the list of available zones.

To delete zones, perform the following steps:

1. In the navigation pane, expand the **Fabric Manager** node and click **Fabrics**.
2. Click a fabric in the list and click **Zone Configuration**.
3. In the **Zone Configuration** area, click **Change**.
4. In the **Zones** area, select one or more zones and click **Remove**. Hold down the Control or Shift key to select multiple zones.
5. In the Zone Deletion window, click **Yes** to delete the selected zones or **No** to cancel the deletion.

## Working with zone sets

This topic describes how to create, change, duplicate, activate or deactivate, and delete zone sets.

A zone set is group of zones that function together on the fabric. Each zone set can accommodate up to 256 zones. All devices in a zone detect only devices assigned to that zone, but any device in that zone can be a member of other zones in the zone set.

### Creating zone sets

This topic provides information about creating new zone sets.

To create a zone set, follow this procedure:

1. In the navigation pane, expand the **Fabric Manager** node and click **Fabrics**.
2. Click a fabric in the list and click **Zone Configuration**.
3. In the **Zone Configuration** area, click **Change**.
4. In the **Zone Sets** area, click **Add**.
5. Type a name and description for the zone set, and click **Next**. The zone set name must be unique within the fabric.
6. In the Zone Set Configuration window, do one of the following:
  - Select one or more zones from the **Available Zones** column, move them to the **Selected Zones** column, and click **Finish**.
  - If there are no zones yet defined or if you are not adding any of the zones available at this time, click **Finish**. A Zone Set Configuration Error window opens stating: "This zone set does not contain any zones. This could result in an error when the zone configuration is applied later. Do you want to continue?" Click **Yes**.

### Changing zone set properties

You can change the zone set definition, which includes the name, description, and the zones that belong to the zone set. When you change and save a zone set definition, the properties are checked by the switches when that definition is stored in the fabric. This can help identify possible problems with that definition before the definition is activated, giving you a chance to correct any problems found before they affect the operation of the fabric.

**Note:** Changing and saving the *definition* for the active zone set does not change the active zone set itself. You must perform an additional step to apply the new definition to the active zone set.

**Note:** After you click **Change** to begin your zoning changes and before you click **Update and Activate** or **Update Only** to conclude your zoning changes, it is possible that other users might have made zoning changes to the same fabric. This may have happened through a switch element manager or switch CLI, as some switch vendors and models lack zone control session locking across the fabric. This could allow overwrite conditions of the changes to the active zoneset for the fabric and to the set of inactive zonesets.

To change the zone set properties, perform the following steps:

1. In the navigation pane, expand the **Fabric Manager** node and click **Fabrics**.
2. Click a fabric in the list and click **Zone Configuration**.
3. In the **Zone Configuration** area, click **Change**.
4. In the **Zone Sets** area, click the zone set to be changed and click **Change**.
5. In the Zone Set Configuration window, type a name and description for the zone set, and click **Next**. The zone set name must be unique within the fabric.
6. In the next Zone Set Configuration window, you can change the zones to be included in the zone set:
  - In the **Available Zones** column, select any zones to be added and click  to move them to the **Selected Zones** column.
  - In the **Selected Zones** column, select any zones to be removed from the zone set and click  to move them to the **Available Zones** column.
7. Click **Finish**.

## Activating and deactivating a zone set

Only one zone set can be active at a time. If you deactivate the active zone set, no zone sets are active until you activate another zone set.

To activate or deactivate a zone set, follow these steps:

1. In the navigation pane, expand the **Fabric Manager** node and click **Fabrics**.
2. Click a fabric in the list and click **Zone Configuration**.
3. In the **Zone Configuration** area, click **Change**.
4. In the **Zone Sets** area, click **Activate** or **Deactivate**.
5. In the **Zone Configuration** area, click one of the following actions:
  - **Update and Activate** to commit the changes you have made to the zone set configuration and immediately activate the zone set.
  - **Update Only** to commit the changes you have made to the zone set configuration without making them active.

## Duplicating zone sets

This section provides information about duplicating zone sets.

To create a duplicate zone set, perform the following tasks.

1. In the navigation pane, expand the **Fabric Manager** node and click **Fabrics**.
2. Click a fabric in the list and click **Zone Configuration**.
3. In the **Zone Configuration** area, click **Change**.
4. In the **Zone Sets** area, click the zone set to be duplicated and click **Duplicate**.
5. In the Zone Set Configuration window, type a name and description for the zone set, and click **Next**. The zone set name must be unique within the fabric.
6. In the Zone Set Configuration window, you can change the zones to be included in the new zone set:
  - In the **Available Zones** column, select any zones to be added and click  to move them to the **Selected Zones** column.
  - In the **Selected Zones** column, select any zones to be removed from the zone set and click  to move them to the **Available Zones** column.
7. Click **Finish**.

## Working with zone aliases

This topic describes how to add, change, duplicate, and remove zone aliases. Using zone aliases is a convenient way to work with a named collection of zone members that you want to manage together.

### Creating zone aliases

Creating a zone alias is a convenient way to assign a name to a collection of zone members that you want to manage together.

To create a zone alias:

1. In the navigation pane, expand the **Fabric Manager** node and click **Fabrics**.
2. Click a fabric in the list and click **Zone Configuration**.
3. In the **Zone Configuration** area, click **Change**.
4. In the **Zones Aliases** area, click **Add**.
5. Enter a unique name for the zone alias that will have zone members. Use the following guidelines for naming a zone alias:

- a. The maximum length for the zone alias name is 54 characters.
  - b. Allowed characters are: A-Z and a-z; \_ (underscores)
  - c. The name must not begin with a number.
  - d. Spaces are not allowed.
6. Enter an optional description of the zone alias. The description can be any combination of alphanumeric characters.
  7. Click **Next**.
  8. In the next Zone Alias Configuration window, select the assets (switches, devices, aliases) that you want to include in the zone alias, and move them from the **Available assets** column to the **Selected assets** column, and click **Next**.
  9. In the final Zone Alias Configuration window, select one or more zones, move them from the **Available Zones** column to the **Selected Zones** column, and click **Finish**.

**Note:** Not all devices support zone aliases. Please refer to the device manufacturer documentation for further information on zone aliases.

### Changing zone alias properties

You can change a zone alias name, description, the assets assigned to it, and the zone members that are specified in the zone alias.

To change zone alias properties, perform the following steps:

1. In the navigation pane, expand the **Fabric Manager** node and click **Fabrics**.
2. Click a fabric in the list and click **Zone Configuration**.
3. In the **Zone Configuration** area, click **Change**.
4. In the **Zone Aliases** area, select the zone alias you want to change and click **Change**.
5. In the Zone Alias Configuration window change the name of the zone alias and, optionally, enter or change the description. The zone alias name must be unique in the fabric. Use the following naming guidelines:
  - a. The maximum length for the zone alias name is 54 characters.
  - b. Allowed characters are: A-Z and a-z; \_ (underscores)
  - c. The name must not begin with a number.
  - d. Spaces are not allowed.
6. Click **Next**.
7. In the next Zone Alias Configuration window, you can change the assets to be included in the zone alias:
  - In the **Available Assets** column, select one or more assets to be added and click the  to move them to the **Selected Assets** column.
  - In the **Selected Assets** column, select one or more assets to be removed from the zone alias and click the  to move them to the **Available Assets** column.
  - Click **Next**.
8. In the final Zone Alias Configuration window, you can change the zone members as follows:
  - In the **Available Zones** column, select one or more zone members and click the  to move them to the **Selected Zones** column.

- In the **Selected Zones** column, select one or more zone members and click the  to move them to the **Available Zones** column.

9. Click **Finish**.

## Duplicating zone aliases

To create a new zone alias that's based on an existing one, you can duplicate a zone alias and then make changes to it.

To duplicate an existing zone alias and make changes to it, perform the following steps:

1. In the navigation pane, expand the **Fabric Manager** node and click **Fabrics**.
2. Click a fabric in the list and click **Zone Configuration**.
3. In the **Zone Configuration** area, click **Change**.
4. In the **Zone Aliases** area, select the zone alias you want to duplicate and click **Duplicate**.
5. In the Zone Alias Configuration window change the name of the zone alias and, optionally, enter or change the description. The zone alias name must be unique in the fabric. Use the following naming guidelines:
  - a. The maximum length for the zone alias name is 54 characters.
  - b. Allowed characters are: A-Z and a-z; \_ (underscores)
  - c. The name must not begin with a number.
  - d. Spaces are not allowed.
6. Click **Next**.
7. In the next Zone Alias Configuration window, you can change the assets to be included in the new zone alias:
  - In the **Available Assets** column, select any assets to be added and click the  to move them to the **Selected Assets** column.
  - In the **Selected Assets** column, select any assets to be removed from the zone alias and click the  to move them to the **Available Assets** column.
  - Click **Next**.
8. In the final Zone Alias Configuration window, you can change the zone alias as follows:
  - In the **Available Zones** column, select one or more zones and click the  to move them to the **Selected Zones** column.
  - In the **Selected Zones** column, select one or more zones and click the  to move them to the **Available Zones** column.
9. Click **Finish**.

## Removing zone aliases

The following procedure removes a selected zone alias from all zones in the currently selected fabric, and removes the zone alias from the fabric's zoning configuration definition. To remove a zone alias from an individual zone or a specific set of zones, use the Zone Configuration wizard.

To remove a zone alias, perform the following steps:

1. In the navigation pane, expand the **Fabric Manager** node and click **Fabrics**.
2. Click a fabric in the list and click **Zone Configuration**.

3. In the **Zone Configuration** area, click **Change**.
4. In the **Zone Aliases** area, select the zone alias you want to remove and click **Remove**. Hold down the Control or Shift key to select multiple zone aliases.
5. In the Zone Alias Deletion window, click **Yes** to delete the selected zone alias.

---

## Managing Tape Libraries

IBM Tivoli Storage Productivity Center provides the capability to manage your tape libraries. For this release, tape library management capabilities are limited to support for the IBM 3584 tape library (full support) and the IBM 3494 tape library (partial support).

You must have at least Tape Operator authority in order to access the functions in the Tape Manager node. To view your authority level, open the "Role-to-Group Mappings" window in the **Administrative Services > Configuration** node in the navigation tree.

1. Discover IBM tape libraries attached to your SAN fabrics.
2. View tape library information.
3. Monitor the performance of groups of tape libraries by probing for data and viewing alerts. .
4. Create and view asset and capacity reports using data collected from your tape libraries.

Asset reports can include such information as the library identifier and the status of the library. Capacity reports include such information as the number of drives in a library, the number of tape slots, and the number of occupied tape slots.

5. Use the topology viewer to view information about tape libraries, as described in "Working with tape libraries in the topology viewer" on page 539.

## Discovering tape libraries

Discovering tape libraries uses the same general process for discovering CIMOMs as discovering storage subsystems does.

- Tape Manager automatically discovers available devices by contacting the CIM agent that is running on those devices.
- You can add Tape CIMOMs by automatic SLP or manually.
- You can create discovery jobs to discover other Tape Library CIM agents, as described in "Discover storage subsystem, tape library, and fabric information with CIM agents" on page 333.
- You can set up your discoveries to run on a regular schedule, for example weekly.

However, you view your tape libraries from a different location in the navigation tree.

- To confirm the tape libraries that were discovered, complete the following steps:
  1. In the navigation tree, expand **Tape Manager**.
  2. Click **Tape Libraries**. The tape libraries that have been discovered will be listed in the right pane.

IBM Tivoli Storage Productivity Center can detect a tape library that is connected to a fabric through queries to the switches in the fabric and through CIMOM queries. However, only basic information is available at this point, and the

information from the two discoveries is not correlated. As a consequence, the tape library is displayed in the topology L0:Storage view as two separate icons:

- After the in-band discovery, as a tape library of unknown status (a blue diamond ) identified only by its world-wide name (WWN)
- After the CIMOM discovery, a tape library is identified as, for example, a 3494 or a TS3500

In order to correlate the information collected through the in-band and CIMOM discoveries, you must run a tape library probe. Then the tape library will be displayed by only one icon with its type identified.

## Viewing tape library information

View collected tape library data to stay aware of discovered tape libraries and usage information.

- Click **Tape Manager**. Left-click **Tape Libraries**. In the content pane, the Tape Libraries page is displayed, which lists the discovered tape libraries.  
Select a library from the table and then click one of the buttons to see further details about that library. For example, select a library and click **Drives** to open a page that lists all the drives for that library.  
You can also right-click a library in the **Tape Libraries** table and select **View Details**.
- Use the **View Details** feature in the topology viewer, as described in “Working with tape libraries in the topology viewer” on page 539.

## Monitoring tape libraries

Monitor the performance of tape libraries to be aware of events that occur, and to respond to alerts.

1. Create one or more tape library groups, as described in “Creating tape library groups” on page 373.
2. Create a probe job to collect data about your tape libraries and library groups, as described in “Creating tape library probes” on page 340.
3. View alerts that are generated by your tape libraries, as described in “Viewing alert logs” on page 403.

---

## Managing DS8000 storage systems using element managers

Use the Configuration Utility in IBM Tivoli Storage Productivity Center to add and manage element managers for IBM System Storage DS8000. *Element managers* are applications that are used to configure and manage a storage device. You can add and manage connections to the element manager that is provided with DS8000, DS8000 Storage Manager, or you can specify other element managers for a device.

The **Element Manager** tab in the Configuration Utility is used to add and manage DS8000 element managers. The **Element Manager** tab contains multiple sections. The **DS8000 Element Manager** section shows the DS8000 element managers that have been added to Tivoli Storage Productivity Center.

To expand or collapse the **DS8000 Element Manager** section, click the + or - icon by the section heading.

## The DS8000 Element Manager section

The **DS8000 Element Manager** section contains a table listing the element managers that are visible to Tivoli Storage Productivity Center and a **Select Action** list. This list enables you to add an element manager to the section and to manage existing element managers. The menu items that are shown in the **Select Action** list depend on whether you have selected an element manager in the table. This table contains the following fields:

### Element Manager

Shows the IP address of the element manager or the display name if a display name was defined.

### Connection Status

Shows the status of the element manager. The values that appear in this field are:

- **Online** (The element manager is accessible.)
- **Offline** (The element manager is not accessible)

### Device

The name for the device as defined in Tivoli Storage Productivity Center.

### UID/PWD

Shows whether a user ID and password have been defined for authentication to the element manager. The values that appear in this field are:

- **Yes** (A user ID and password have been defined.)
- **No** (A user ID and password have not been defined.)

### LIC Enabled

Shows whether a launch descriptor file has been registered for the element manager. An launch descriptor file is an XML file that describes the menus and the detailed uniform resource locators (URLs) for applications. A launch descriptor file is required to enable the launch in context feature for the device. Tivoli Storage Productivity Center provides a launch descriptor file for the element manager that is provided with DS8000.

The values that appear in this field are:

- **Yes** (Launch descriptor file has been registered.)
- **No** (Launch descriptor file has not been registered.)

### Managed

Shows whether the element manager is associated with a DS8000 that has subsystem interface connection for the device. The values that appear in this field are:

- **Yes** (The element manager is associated with a DS8000 that has subsystem interface connection for the device.)
- **No** (The element manager is not associated with a DS8000 that has subsystem interface connection for the device.)

## Configuring the DS8000 element manager

DS8000 Storage Manager is the element manager that is provided with IBM System Storage DS8000. This section describes how to add and manage DS8000 Storage Manager in IBM Tivoli Storage Productivity Center.

You can perform the following tasks for DS8000 element managers:

- Add DS8000 element managers that you want to manage.

- Start a DS8000 element manager (for example, DS8000 Storage Manager) to configure and administer the storage subsystems associated with the element manager. On Windows, the DS8000 Storage Manager is started in a browser window that is embedded in Tivoli Storage Productivity Center. On AIX, Linux, and UNIX, DS8000 Storage Manager is started in an external Web browser window.
- Modify or remove element managers.
- Test the connection between Tivoli Storage Productivity Center and element managers.

## DS8000 credentials

The configuration of DS8000 credentials depends on whether you are using the single sign-on feature in your environment. *Single sign-on* is an authentication process that enables you to start an application from another application using a single user ID and password. For more information about single sign-on, refer to “Single sign-on” on page 53.

To use single sign-on with DS8000, the DS8000 system must be release 4.2 or later and must be configured for Lightweight Directory Access Protocol (LDAP). Tivoli Storage Productivity Center passes the DS8000 user credentials as a Lightweight Third Party (LTPA) token.

If you are not using single sign-on, the DS8000 element manager user name and password are stored for each Tivoli Storage Productivity Center user. A set of user credentials must be stored for each Tivoli Storage Productivity Center user who wants to access an DS8000 element manager. The **Element Manager** tab lists all element managers known to Tivoli Storage Productivity Center, regardless of the presence of valid user credentials. Element manager credentials might be out of date or absent for that Tivoli Storage Productivity Center user.

If the element manager has been added to Tivoli Storage Productivity Center using different credentials from the ones you are using, or if you attempt to open the DS8000 element manager for the first time after the element manager was added to Tivoli Storage Productivity Center by DS CIM Agent discovery, the following message is shown:

The element manager GUI cannot be accessed because the user name and password are missing. Update the required fields in the next dialog. The GUI will be displayed after the fields have been correctly completed and the dialog closed.

If you created an element manager with one set of credentials and are currently logged on to Tivoli Storage Productivity Center as another user with different credentials, you can open the DS8000 element manager in one of two ways:

- **Add credentials.** Close the warning message. The **Modify Element Manager** window opens. Add the current credentials and click **Save**. You can then open the DS8000 element manager for that element manager.

**Important:** Use this method with caution because anyone who knows the Tivoli Storage Productivity Center credentials can manage the DS8000 device, including performing destructive operations.

- **Log on as the user who added the element manager.** Close the warning message and the **Modify Element Manager** window. Log off of Tivoli Storage

Productivity Center. Log on with the user ID that was used to create the element manager. From the Configuration Utility **Element Manager** tab, start the DS8000 element manager.

## Adding DS8000 element managers using the Configuration Utility

Use the Configuration Utility when you want to add one element manager at a time.

To add an element manager in Tivoli Storage Productivity Center, follow these steps:

1. Click **Element Management** in the toolbar, or expand the IBM Tivoli Storage Productivity Center node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab. Any existing element managers are automatically added to the **Element Manager** section when the tab opens.
2. In the **DS8000 Element Manager** section, select **Add Element Manager** from the **Select Action** list. The add Element Manager dialog box displays.
3. Define the information that is required to connect to the element manager using the following fields. Required fields are specified in bold in the dialog box. In the following field descriptions, required fields are marked by an asterisk.

- \*Host** Enter the Domain Name System (DNS) name or Internet Protocol (IP) address of the host computer where the element manager is located. You can enter an IPv4 or IPv6 name or address depending on what address types are configured on the element manager and on the system where Tivoli Storage Productivity Center is installed.
- Enter an IPv4 address in the following format: **###.###.###.###**. For example: 192.168.1.65.
  - Enter an IPv6 address. These addresses are typically written as eight groups of four hexadecimal digits, but might vary from site to site. For example: 2001:db8:0:0:1812:5b9e:3391:3156. You can use IPv6 addresses if the computer where Tivoli Storage Productivity Center is dual-stack enabled (IPv4 and IPv6).

**Restriction:** If the computer on which the element manager is located is IPv6-only, the Tivoli Storage Productivity Center servers must be installed on an IPv6-only or dual stack (IPv4 and IPv6 addresses are configured) computer.

- \*Port** Enter the port number on which the element manager listens for requests. The default port number that is shown depends on the value that is selected in the **Protocol** field. You can modify the port number if required for your environment.

### Username

Enter the user name that Tivoli Storage Productivity Center will use to log on to the element manager.

### Password

Enter the password associated with the user name that is defined in the **Username** field.

If the DS8000 element manager you want to add is a new installation and the enterprise storage server network interface (ESSNI) user password has not been changed from the initial value of **admin**, you are prompted to change the password. Be prepared to enter a password and record the new password in a safe place.

**\*Protocol**

Select the protocol (**http** or **https**) for the element manager.

**Display Name**

Enter a display name for the element manager. The display name is shown in the **Element Manager** field in the DS8000 element manager table. If this field is blank, the IP address of the computer on which the element manager is located is shown in the **Element Manager** field of the table. The display name is used in Tivoli Storage Productivity Center and does not affect the element manager itself.

**Save** Click this button to add the DS8000 element manager. Tivoli Storage Productivity Center tests the connection to the element manager. If the connection is successful, the element manager is displayed in the DS8000 element manager table. If the connection is unsuccessful, an error message displays indicating that the element manager at the specified IP address could not be added.

**Cancel**

Click this button to close the dialog box without adding the DS8000 element manager.

**Starting DS8000 element managers**

Use the Configuration Utility to start IBM System Storage DS8000 element managers from IBM Tivoli Storage Productivity Center. You can also start DS8000 element managers from other points in Tivoli Storage Productivity Center.

To start DS8000 element managers using the Configuration Utility follow these steps:

1. Expand the **IBM Tivoli Storage Productivity Center** node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab. **Note:** You can also access the Element Manager tab by selecting **Element Management** in the tool bar.
2. In the **DS8000 Element Manager** section, click the element manager that you want to start from the DS8000 element manager table.
3. Use one of the following methods to start the element manager:
  - To start the default element manager for DS8000, select **Launch Default Element Manager** from the **Select Action** list.
  - To start another element manager for DS8000, right-click the element manager that you want to start and click **Launch Element Manager**. Select the element manager that you want to start from the menu.

If the connection information for an element manager is valid, the element manager is started. If unsuccessful, an error message is displayed. The error messages that you receive describes one of the following problems:

- that the element manager at the specified IP address could not be started
- that the required connection information for the element manager has not been provided
- that the element manager is not installed and configured correctly (for local element manager installations such as XIV Storage Manager)

If you are prompted to enter additional information such as an ID and password for the element manager, complete the following steps:

1. Click **OK** in the message dialog box. The Modify Element Manager dialog box is displayed.

2. Enter the required information for the element manager and click **Save**.

## Modifying DS8000 element managers

Use the Configuration Utility to modify information for IBM System Storage DS8000 element managers in IBM Tivoli Storage Productivity Center.

To modify an element manager in Tivoli Storage Productivity Center, follow these steps:

1. Click **Element Management** in the toolbar, or expand the IBM Tivoli Storage Productivity Center node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab.
2. In the **DS8000 Element Manager** section, select the element manager that you want to modify from the DS8000 element manager table.
3. Select **Modify Element Manager** from the **Select Action** list. The Modify Element Manager dialog box is displayed.
4. Modify any of the following fields:

### Username

Enter the user name that Tivoli Storage Productivity Center will use to log on to the element manager.

### Password

Enter the password associated with the user name that is defined in the **Username** field.

If the DS8000 element manager you want to add is a new installation and the enterprise storage server network interface (ESSNI) user password has not been changed from the initial value of **admin**, you are prompted to change the password. Be prepared to enter a password and record the new password in a safe place.

### Password Confirm

Enter the same password that you entered in the **Password** field.

### Display Name

Enter a display name for the element manager. The display name is shown in the **Element Manager** field in the DS8000 element manager table. If this field is blank, the IP address of the computer on which the element manager is located is shown in the **Element Manager** field of the table. The display name is used in Tivoli Storage Productivity Center and does not affect the element manager itself.

**Save** Click this button to modify the element manager information. Tivoli Storage Productivity Center tests the connection to the element manager. If the connection is successful, the element manager information is saved. If the connection is unsuccessful, an error message appears indicating that the element manager at the specified IP address could not be added.

### Cancel

Click this button to close the dialog box without modifying the element manager information

## Removing DS8000 element managers

Use the Configuration Utility to remove IBM System Storage DS8000 element managers from IBM Tivoli Storage Productivity Center. This action does not affect DS8000 Storage Manager on the Hardware Management Console (HMC).

To remove an element manager from Tivoli Storage Productivity Center, complete the following steps:

1. Click **Element Management** in the toolbar, or expand the IBM Tivoli Storage Productivity Center node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab.
2. In the **DS8000 Element Manager** section, select the element manager that you want to remove from the DS8000 element manager table.
3. Select **Remove Element Manager** from the **Select Action** list. A confirmation dialog box is displayed.
4. Click **OK**. The element manager is deleted from the DS8000 element manager table. When you remove an element manager, it is removed only from the list of element managers that are visible to Tivoli Storage Productivity Center.

To exit the window without removing the element manager, click **Cancel**.

You can remove only one element manager from the DS8000 element manager table at a time.

### Testing the connection to DS8000 element managers

Use the Configuration Utility to test the connection to DS8000 element managers from IBM Tivoli Storage Productivity Center.

To test the connection to an element manager from Tivoli Storage Productivity Center, follow these steps:

1. Click **Element Management** in the toolbar, or expand the IBM Tivoli Storage Productivity Center node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab.
2. In the **DS8000 Element Manager** section, select the element manager for which you want to test the connection from the DS8000 element manager table.
3. Select **Test Element Manager Connection** from the **Select Action** list. IBM Tivoli Storage Productivity Center tests the status of the element manager connection. A message dialog box that states whether the test passed or failed is displayed.

## Configuring other element managers for DS8000

DS8000 Storage Manager is the element manager that is provided with IBM System Storage DS8000. However, you can add other element managers for DS8000 as described in this section.

### Adding user-defined element managers for DS8000

A *user-defined element manager* for IBM System Storage DS8000 is an element manager other than DS8000 Storage Manager. Use the Configuration Utility to add user-defined element managers for IBM System Storage DS8000 in IBM Tivoli Storage Productivity Center.

User-defined element managers are not displayed in the **DS8000 Element Manager** table. These element managers are displayed in the various launch menus that are provided in IBM Tivoli Storage Productivity Center.

To add user-defined element managers in Tivoli Storage Productivity Center, follow these steps:

1. In the navigation tree, expand **IBM Tivoli Storage Productivity Center**. Left-click **Configuration Utility**. In the content pane, click the **Element Manager** tab.

2. In the **DS8000 Element Manager** section, select the row in the DS8000 element manager table that contains the device to which you want to add a user-defined element manager.
3. Select **Add User Defined Element Manager** from the **Select Action** list. The Add User Defined Element Manager dialog box is displayed.
4. Enter a Uniform Resource Locator (URL) or command to start the element manager, and click **Save**.  
To exit without adding a element manager, click **Cancel**.

### Removing user-defined element managers for DS8000

Use the Configuration Utility to remove user-defined element managers for IBM System Storage DS8000 in IBM Tivoli Storage Productivity Center.

To remove a user-defined element manager from Tivoli Storage Productivity Center, follow these steps:

1. Click **Element Management** in the toolbar, or expand the IBM Tivoli Storage Productivity Center node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab.
2. In the **DS8000 Element Manager** section, select the row in the DS8000 element manager table that contains the device from which you want to remove a user-defined element manager.
3. Select **Remove Element Manager** from the **Select Action** list. The Remove Element Manager dialog box opens.
4. Select the element manager that you want to remove from the list and click **OK**. The element manager is removed. When you remove an element manager, it is removed only from the list of element managers that are visible to Tivoli Storage Productivity Center.  
To exit the window without removing the element manager, click **Cancel**.

---

## Managing other storage systems using element managers

Use the Configuration Utility in IBM Tivoli Storage Productivity Center to add and manage element managers for storage devices other than IBM System Storage DS8000. *Element managers* are applications that are used to configure and manage a storage device. You manage connections to the element managers that are provided with the storage device or you can specify other element managers for a device.

The **Element Manager** tab in the Configuration Utility is used to add and manage element managers. The **Element Manager** tab contains multiple sections. The **Other Device Element Manager** section shows element managers that have been added using a discovery job or existing element managers that were added to Tivoli Storage Productivity Center prior to release 4.1.

If you are gathering data from IBM XIV Storage System, the XIV system element manager is displayed in the **Other Device Element Manager** section. However, the tasks available for the other element managers in this section are not available for the XIV system element manager. Use the Storage Subsystem page to work with the XIV system element manager (see “Managing storage subsystems” on page 551).

To expand or collapse the **Other Device Element Manager** section, click the + or - icon by the section heading.

## Other Device Element Manager section

The **Other Device Element Manager** section contains a table listing the element managers or external tools that are visible to Tivoli Storage Productivity Center and a **Select Action** list. This list enables you to manage existing element managers. The menu items that are shown in the **Select Action** list depend on whether you have selected an element manager in the table. This table contains the following fields:

### Element Manager

Shows the IP address of the element manager or the display name if a display name was defined.

### Connection Status

Shows the status of the element manager. The values that appear in this field are:

- **Online** (The element manager is accessible.)
- **Offline** (The element manager is not accessible)

### Device

The name for the device as defined in Tivoli Storage Productivity Center.

### UID/PWD

Shows whether a user ID and password have been defined for authentication to the element manager. The values that appear in this field are:

- **Yes** (A user ID and password have been defined.)
- **No** (A user ID and password have not been defined.)

### LIC Enabled

Shows whether a launch descriptor file has been registered for the element manager. A launch descriptor file is an XML file that describes the menus and the detailed uniform resource locators (URLs) for applications. A launch descriptor file is required to enable the launch in context feature for the device.

The values that appear in this field are:

- **Yes** (Launch descriptor file has been registered.)
- **No** (Launch descriptor file has not been registered.)

## Adding element managers using CIMOM discovery

Use the CIM object manager (CIMOM) discovery process in IBM Tivoli Storage Productivity Center to add element managers that are managing the same storage subsystems as CIMOMs in your environment. The element managers discovered through the CIMOM discovery process are automatically added to the **Element Manager** tab in the Configuration Utility.

Use this method when you want to add multiple element managers to Tivoli Storage Productivity Center simultaneously. For example, use these steps when:

- You want to run a discovery against multiple CIMOMs and each of those CIMOMs has a registered storage system.
- You have more than one registered storage system per CIMOM.

This method does not apply to storage systems that use native interfaces:

- System Storage DS8000
- SAN Volume Controller

- The XIV system
- Storwize V7000
- Storwize V7000 Unified
- IBM SONAS

This procedure does not physically add the CIMOM to your environment, but provides Tivoli Storage Productivity Center with the information it requires to communicate with that CIMOM.

To add an element manager using CIMOM discovery in Tivoli Storage Productivity Center, complete the following steps:

1. Expand **Administrative Services > Data Sources > CIMOM Agents** in the navigation tree.
2. In the right-side pane, click **Add CIMOM**. The Add CIMOM dialog box is displayed.
3. Define the information that is required to add the CIMOM using the following fields. Required fields are specified in bold in the dialog box. In the following field descriptions, required fields are marked by an asterisk.

**\*Host** Enter the IP address of the computer on which the CIMOM is installed. You can enter an IPv4 or IPv6 address depending on what is supported on the computer where the CIMOM is located:

- Enter an IPv4 address in the following format: **###.###.###.###**. For example: 192.168.1.65
- Enter an IPv6 address. These addresses are typically written as eight groups of four hexadecimal digits, but might vary from site to site. For example: 2001:DB8::/32:1812:5b9e:3391:3156. You can use IPv6 addresses if the computer where Tivoli Storage Productivity Center is installed is IPv6 or dual stack (IPv4 and IPv6) enabled.

**Note:** If the computer on which the CIMOM is located is IPv6-only, the Tivoli Storage Productivity Center servers must be installed on an IPv6-only or dual stack (IPv4 and IPv6 enabled) computer.

**Port** Enter the port through which Tivoli Storage Productivity Center contacts the CIMOM. You can modify the default port number if required for your environment.

**Username**

If required by the CIMOM, enter the user name that Tivoli Storage Productivity Center uses to log on to the CIMOM.

**Password**

Enter the password for the user name that is defined in the **Username** field.

**\*Interoperability Namespace**

Enter the interoperability namespace of the CIMOM. This namespace within the CIMOM allows for accessing the CIM Interop Schema (including the class instances of the Server Profile) and determines how Tivoli Storage Productivity Center interacts with the CIMOM when retrieving information.

**Protocol**

Select the protocol (**http** or **https**) for the CIMOM.

**Truststore Location**

Enter the location (path on this computer) of the truststore for the CIMOM. The truststore is the certificate file for certificate-based authentication in the https protocol.

**Truststore Passphrase**

Enter the passphrase of the truststore for the CIMOM.

**Display Name**

Enter the name for the CIMOM as you want it to be shown in Tivoli Storage Productivity Center.

**Description**

Enter a short description for the CIMOM as you want it to be shown in Tivoli Storage Productivity Center.

**Test CIMOM connectivity before adding**

Select this check box to ensure that communication to the CIMOM is working properly before the CIMOM is added. If this box is not checked, the CIMOM is added without verifying connectivity with the specified parameters.

**Important:** Failure to check the CIMOM connection can cause a failure later if the CIMOM cannot be scanned or probed.

**Save** Click this button add the CIMOM.

- If you selected **Test CIMOM connectivity before adding**, Tivoli Storage Productivity Center attempts to connect to the CIMOM using the information provided in this dialog box. If the logon information for a CIMOM is incorrect, an error occurs and an associated error message dialog box is displayed.
- If you did not select **Test CIMOM connectivity before adding**, the CIMOM is associated with the element manager but connectivity with Tivoli Storage Productivity Center is not verified.

**Cancel**

Click this button to close the dialog box without adding the CIMOM.

4. Expand **Administrative Services > Discovery** in the navigation tree.
5. Right-click **CIMOM** and select **Run Now**. The CIMOM discovery process adds the element managers that are managing the same storage system as the CIMOM. The element managers are displayed on the appropriate element manager section on the Element Manager tab of the Configuration Utility. Element managers that are added through CIMOM discovery might exist on a Hardware Management Console (HMC) other than the HMC where the CIMOM is located.

## Modifying other element managers

Use the Configuration Utility to modify information for element managers in IBM Tivoli Storage Productivity Center.

To modify an element manager other than an IBM System Storage DS8000 element manager in Tivoli Storage Productivity Center, follow these steps:

1. Click **Element Management** in the toolbar, or expand the IBM Tivoli Storage Productivity Center node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab.
2. In the **Other Device Element Manager** section, select the element manager that you want to modify from the element manager table.

3. Select **Modify Element Manager** from the **Select Action** list. The Modify Element Manager dialog box is displayed.
4. Modify any of the following fields:

**Username**

Enter the user name that Tivoli Storage Productivity Center will use to log on to the element manager.

**Password**

Enter the password associated with the user name that is defined in the **Username** field.

**Password Confirm**

Enter the same password that you entered in the **Password** field.

**Display Name**

Enter a display name for the element manager. The display name is shown in the **Element Manager** field in the element manager table. If this field is blank, the IP address of the computer on which the element manager is located is shown in the **Element Manager** field of the table. The display name is used in Tivoli Storage Productivity Center and does not affect the element manager itself.

**Save** Click this button to modify the element manager information. Tivoli Storage Productivity Center tests the connection to the element manager. If the connection is successful, the element manager information is saved. If the connection is unsuccessful, an error message appears indicating that the element manager at the specified IP address could not be added.

**Cancel**

Click this button to close the dialog box without modifying the element manager information

## Starting other element managers

Use the Configuration Utility to start element managers from IBM Tivoli Storage Productivity Center. You can also start element managers from other points in Tivoli Storage Productivity Center.

To start element managers other than IBM System Storage DS8000 element managers from the Configuration Utility follow these steps:

1. Click **Element Management** in the toolbar, or expand the IBM Tivoli Storage Productivity Center node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab.
2. In the **Other Device Element Manager** section, click the element manager that you want to start from the element manager table.
3. Use one of the following methods to start the element manager:
  - To start the default element manager for a storage system, select **Launch Default Element Manager** from the **Select Action** list.
  - To start another element manager for a storage system, right-click the element manager that you want to start and click **Launch Element Manager**. Select the element manager that you want to start from the menu.

If the connection information for an element manager is valid, the element manager is started. If unsuccessful, an error message is displayed. The error message that you receive describes one of the following problems:

- that the element manager at the specified IP address could not be started

- that the required connection information for the element manager has not been provided
- that the element manager is not installed and configured correctly (for local element manager installations such as XIV Storage Manager)

If you are prompted to enter additional information such as an ID and password for the element manager, complete the following steps:

1. Click **OK** in the message dialog box. The Modify Element Manager dialog box is displayed.
2. Enter the required information for the element manager and click **Save**.

## Testing the connection to other element managers

Use the Configuration Utility to test the connection to element managers from IBM Tivoli Storage Productivity Center.

To test the connection to an element manager other than an IBM System Storage DS8000 element manager from Tivoli Storage Productivity Center, follow these steps:

1. Click **Element Management** in the toolbar, or expand the IBM Tivoli Storage Productivity Center node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab.
2. In the **Other Device Element Manager** section, select the element manager for which you want to test the connection from the element manager table.
3. Select **Test Element Manager Connection** from the **Select Action** list. IBM Tivoli Storage Productivity Center tests the status of the element manager connection. A message dialog box that states whether the test passed or failed is displayed.

## Adding user-defined element managers for other storage systems

A *user-defined element manager* is an element manager other than the manager that is provided with the storage system. Use the Configuration Utility to add user-defined element managers in IBM Tivoli Storage Productivity Center.

User-defined element managers are not displayed in the **Other Device Element Manager** table. These element managers are displayed in the various launch menus that are provided in IBM Tivoli Storage Productivity Center.

To add user-defined element managers for a storage device other than DS8000 in Tivoli Storage Productivity Center, follow these steps:

1. Click **Element Management** in the toolbar, or expand the IBM Tivoli Storage Productivity Center node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab.
2. In the **Other Device Element Manager** section, select the row in the element manager table that contains the storage system to which you want to add a user-defined element manager.
3. Select **Add User Defined Element Manager** from the **Select Action** list. The Add User Defined Element Manager dialog box is displayed.
4. Enter a Uniform Resource Locator (URL) or command to start the element manager, and click **Save**.

To exit without adding a element manager, click **Cancel**.

## Removing user-defined element managers for other storage systems

Use the Configuration Utility to remove user-defined element managers for storage systems in IBM Tivoli Storage Productivity Center.

To remove a user-defined element managers for a storage device other than DS8000 in Tivoli Storage Productivity Center, follow these steps:

1. Click **Element Management** in the toolbar, or expand the IBM Tivoli Storage Productivity Center node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab.
2. In the **Other Device Element Manager** section, select the row in the element manager table that contains the storage system from which you want to remove a user-defined element manager.
3. Select **Remove Element Manager** from the **Select Action** list. The Remove Element Manager dialog box opens.
4. Select the element manager that you want to remove from the list and click **OK**. The element manager is removed. When you remove an element manager, it is removed only from the list of element managers that are visible to Tivoli Storage Productivity Center.

To exit the window without removing the element manager, click **Cancel**.

---

## Launch and launch in context

The launch and launch in context features are used to start IBM Tivoli Storage Productivity Center and to start other applications from Tivoli Storage Productivity Center. The terms inbound and outbound are used to differentiate starting Tivoli Storage Productivity Center (inbound) and starting another application from Tivoli Storage Productivity Center (outbound).

Inbound launch in context refers to starting Tivoli Storage Productivity Center at a specific point in the graphical user interface (GUI). You can use inbound launch in context in either of the following ways:

- Configure an application such as Tivoli Enterprise Portal to start Tivoli Storage Productivity Center at functionally related locations in the Tivoli Storage Productivity Center GUI.
- Start Tivoli Storage Productivity Center from Java Web Start, the command line, or the Windows Start menu using parameters to specify the starting location in the Tivoli Storage Productivity Center GUI.

Outbound launch in context refers to starting other applications, such as administrative applications for storage systems and switches, from functionally related points in the Tivoli Storage Productivity Center GUI.

Launch refers to starting an application at the starting point for that application. Launch primarily refers to starting applications from the Tivoli Storage Productivity Center GUI. Starting applications from Tivoli Storage Productivity Center is referred to as an outbound launch.

**Related concepts:**

“Inbound launch in context feature” on page 57

With the inbound launch in context feature you can start IBM Tivoli Storage Productivity Center at a specified point in the graphical user interface (GUI).

“**Outbound launch and launch in context features**” on page 64

With the outbound launch and launch in context features, you can start the administrative applications for devices such as storage systems and switches from various points in the graphical user interface (GUI).

## Inbound launch in context feature

With the inbound launch in context feature you can start IBM Tivoli Storage Productivity Center at a specified point in the graphical user interface (GUI).

**Prerequisite:** You must have View and Modify permissions to use the launch in context feature.

You can use the launch in context feature to perform the following tasks in Tivoli Storage Productivity Center:

- Create a volume or VDisk
- Open the storage area network SAN Planner
- Create a capacity report
- Create a wasted space report

You can run the launch in context feature in the following ways:

- **Use Java Web Start** from a Web browser. See “Launch with Java Web Start” on page 57.
- **Use the command line on Windows, AIX, Linux, or UNIX** to enter the command and arguments on the command line. See “Launch from the command line” on page 59.
- **Use the Windows Start menu.** See “Launch from Start menu” on page 60.
- **Use the Tivoli Enterprise Portal GUI** to define, edit, and launch commands. See “Launch from Tivoli Enterprise Portal” on page 61.

The launch in context feature has a number of parameters. See “Launch in context parameters” on page 1432, “Launch in context task parameters” on page 1434, and “Available windows” on page 1435.

### Launch with Java Web Start

Using Java Web Start, you can use the launch in context feature from a Uniform Resource Locator (URL).

The launch in context feature requires Java Web Start 6 on the computer that is running the Web browser. If the correct release of Java Web Start is not present, you receive an error message when you enter the URL. The message states that you must download the Java Runtime Environment, which includes Java Web Start. Follow the link provided in the message to install the required software.

If you are using Internet Protocol Version 6 (IPv6) and are using Java Web Start to start IBM Tivoli Storage Productivity Center on a Windows system, use a system host name such as **tpc332.storage.newyork.xyz.com:9549** in the Web browser address field rather than an IPv6 address such as **[2001:DB8:0000:1234:0000:0000:5678:ABCD]:9549**.

To use the launch in context feature to perform a task or display a window on a remote server from your browser, complete the following steps:

1. Open your browser and type the launch in context command.

URLs cannot include spaces. In the command, a parameter and its value are separated by an equal sign (=). Parameter=value pairs are separated by an ampersand (&).

The format of a command to create a volume is:

```
https://device_server:device_port/ITSRM/jsp/jnlp/tpcgui.jsp?consoleClass=com.ibm.usmi.console.lic.tpc.LICConsole&-server=server:port&-function=disk.create_volume&-subsystem_id=ESS-2105-17844-IBM&-name=myvol&-number=2&-size=10&-unit=MB
```

The format of a command to view a window on a remote server is:

```
http://device_server:device_port/ITSRM/jsp/jnlp/tpcgui.jsp?consoleClass=com.ibm.usmi.console.lic.tpc.LICConsole&-server=server:port&-function=window_name
```

**Tip:** The Data server port value is 9549. The port value for the Device server is 9551 for https and 9550 for http. If the wrong the Device server port value is used, the return page cannot be interpreted by the browser. If the wrong Data server port value is used, the following error message is returned.

Unable to connect to the server

2. The first time a window or task is started, you receive a security warning informing you that the downloaded jar files have been digitally signed using a certificate from a trusted company. To prevent this message from being displayed in the future, select **Always trust content from this publisher** and click **Run**. If the Tivoli Storage Productivity Center graphical user interface (GUI) has not been downloaded on the local computer using Java Web Start, or the local computer does not have the latest version of the Tivoli Storage Productivity Center GUI, the GUI is downloaded.
3. If you included the user ID and password in the command, the sign-in dialog is bypassed, otherwise log on to the Tivoli Storage Productivity Center GUI. The Tivoli Storage Productivity Center GUI navigates to the tree node corresponding to the window name that you specified. You are connected using the user name and password that you entered. Depending on the value you specified for the -function parameter, the following actions might occur:
  - The specified window opens
  - For disk.create\_volume, depending on the parameters, the Create Volume wizard or Create VDisk wizard opens.
  - For disk.san\_planner, the SAN Planner panel opens with the given SAN plan ID.
  - For data.filesystem\_capacity\_by\_computer, the Capacity Report opens.
  - For TPC.reports\_data\_wasted\_space, the Wasted Space Report opens.

#### Restrictions:

- When you open a plan in the SAN Planner using launch in context, you must enter the exact name of the plan. The value for the **-plan\_id** parameter is case-sensitive and must match the name of the plan when it was created. For example, if you created a plan named **UserPlan1**, you must specify **-plan\_id UserPlan1** in the launch in context command.
- There is a known limitation when you launch the Filesystem Capacity > By Computer report using launch in context, you must specify the ID for the computer upon which you want to report. For example:

```
http://tpcserver14:9550/ITSRM/jsp/jnlp/
tpcgui.jsp?consoleClass=com.ibm.usmi.console.lic.tpc.LICConsole&-
server=tpcserver14.storage.xyz.com:9549&-
function=data.filesystem_capacity_by_computer&-computer_id=tpcserver14
```

The value you enter for the **computer\_id** parameter might not match the ID for that computer that is stored in the Tivoli Storage Productivity Center database repository. You receive a warning message if the ID for the computer that you enter in the URL does not match the ID that is stored in the data repository. To ensure that this report is displayed properly when you run from the launch in context facility, enter an ID for the computer that matches the ID that is displayed for it through the Topology Viewer or appropriate report in the product user interface.

Use the information in the following links to enter parameters. If any of the parameters are spelled incorrectly, an error message indicates the incorrect parameter.

“Launch in context parameters” on page 1432

You can use the launch in context parameters, definitions, and examples.

“Launch in context task parameters” on page 1434

Use the launch in context feature task parameters to perform tasks.

“Available windows” on page 1435

You can use windows with the inbound launch in context feature to start IBM Tivoli Storage Productivity Center. These windows are called with the `-function window name` argument.

## Launch from the command line

This topic describes how to start windows and tasks from the Windows AIX, Linux, or UNIX command line.

The bat file `tpc.bat` is used for Windows operating systems. The `.sh` file `TPCD.sh` is used for AIX, Linux, or UNIX systems. The parameters follow the file name. Parameters are separated by spaces. Parameters are optional and can appear in any order. See “Launch in context parameters” on page 1432, “Launch in context task parameters” on page 1434, and “Available windows” on page 1435 for the parameters.

Frequently used commands can be saved as unique command files and rerun as needed.

1. In the Command Prompt window, type the command for the action that you want to take, and press Enter.

The action occurs on the remote Data server. The graphical user interface (GUI) window for that action opens on the local computer.

2. Enter parameters if you previously did not enter any parameters. If you do not provide a user name, password, or server name, the IBM Tivoli Storage Productivity Center GUI opens the connection dialog box. If you do not provide these values, the GUI presents an error message box and requests the values. If you specify incorrect parameters, you receive an error message.

The following example launches a task from the Windows command line:

```
tpc.bat -user admin -passwd password1 -server
tivoli122.storage.usca.ibm.com:9549 -function
data.filesystem_capacity_by_computer -computer_id <computerID>
```

The following example uses the launch in context feature to view a window on the remote machine:

```
tpc.bat -user admin -passwd password1 -server  
tivoli122.storage.usca.ibm.com:9549 -function disk.storage_subsystem
```

#### Restrictions:

- When you open a plan in the SAN Planner using the command line or a Web browser for launch in context, you must enter the exact name of the plan. The value for **-plan\_id** in the command line is case-sensitive and must match the name of the plan when it was created. For example, if you created a plan named **UserPlan1**, you might enter the following command on the command line:

```
./TPCD.sh -user administrator -passwd passw0rd -server  
tpcserver14.storage.xyz.com:9549 -function disk.san_Planner -plan_id  
UserPlan1
```

- There is a known limitation when you start the Filesystem Capacity > By Computer report using launch in context. To start this report, you must specify the ID for the computer upon which you want to report. For example:

```
./TPCD.sh -user root -passwd "passwd" -server  
tpcserver14.storage.xyz.com:9549 -function  
data.filesystem_capacity_by_computer -computer_id tpcserver14
```

The value you enter for "computer\_id" might not match the ID for that computer that is stored in the Tivoli Storage Productivity Center database repository. You will receive a warning message if the ID for the computer you enter in the command line does not match the ID stored in the data repository. To ensure that this report is displayed properly when run from the launch in context command line or through Java Web Start, make sure to enter an ID for the computer that matches the ID that is displayed for it through the Topology Viewer or appropriate report in the product's user interface.

### Launch from Start menu

This topic describes how to start windows and actions from the Windows Start menu.

The bat file, `tpc.bat`, is used for Windows operating systems. The parameters follow the bat file name. Parameters are optional and can appear in any order. To use the launch in context feature from the Windows Start menu, complete the following steps:

1. Click **Start > Programs > IBM Tivoli Storage Productivity Center**, right-click **Productivity Center** and select **Properties**. The Productivity Center Properties window opens.
2. Enter the command-line arguments in the **Target** text field and click **Enter**.  
If the Data server is remote, the action occurs on the Data server and the graphical user interface (GUI) window the action opens is on the local computer.
3. Enter the parameters if you did not previously enter the necessary parameters. If you do not provide the user name, password, or server name, the Tivoli Storage Productivity Center GUI opens the connection dialog box. If you do not provide these values, the GUI presents an error message box and requests the values.

The following example starts a task from the Windows Start menu:

```
"C:\Program Files\IBM\TPC\gui\tpc.bat" -user admin -passwd password1
-server tivoli122.storage.usca.ibm.com:9549 -function
data.filesystem_capacity_by_computer -computer_id computerID
```

The following example uses the Windows Start menu to view a window on the remote server:

```
"C:\Program Files\IBM\TPC\gui\tpc.bat" -user admin -passwd password1
-server tivoli122.storage.usca.ibm.com:9549 -function
disk.storage_subsystem
```

**For more information see:**

“Launch in context parameters” on page 1432

You can use the launch in context parameters, definitions, and examples.

“Launch in context task parameters” on page 1434

Use the launch in context feature task parameters to perform tasks.

“Available windows” on page 1435

You can use windows with the inbound launch in context feature to start IBM Tivoli Storage Productivity Center. These windows are called with the

-function *window name* argument.

## Launch from Tivoli Enterprise Portal

This topic shows you how to start an existing launch definition from the Tivoli Enterprise Portal graphical user interface (GUI).

You must configure Tivoli Enterprise Portal before you can use the launch in context feature. For information on prerequisites and details on how to configure the launch in context feature with Tivoli Enterprise Portal, see “Configuring Tivoli Enterprise Portal” on page 62. After Tivoli Enterprise Portal has been configured, you can start the application from the configuration window or use **Launch** from the Tivoli Enterprise Portal navigation tree.

If you use the Tivoli Enterprise Portal navigation tree, **Launch** will open the Tivoli Enterprise Portal graphical user interface with your predefined launch in context commands. To use one of these commands, complete the following steps:

1. In the Tivoli Enterprise Portal window, expand **Enterprise > Windows Systems *your\_server\_name* > Windows OS**. Right-click **Disk** and select **Launch**. Disk is one of several values you can select. Values include Disk, Network, Enterprise Services, Memory, Printer, Process, Processor, and System.
2. The Create or Edit Launch Definitions window opens showing a list of defined launch definitions in the **Existing Launch Definitions** area.
3. Select the launch definition you want to use from the list and click **Launch**. The window or task that is defined by that launch definition opens.

For information on editing the launch in context command with the Tivoli Enterprise Portal GUI, see:

### Related tasks:

“Editing launch definitions” on page 63

You can edit an existing launch definition with the Tivoli Enterprise Portal graphical user interface (GUI).

### Configuring Tivoli Enterprise Portal:

You can configure Tivoli Enterprise Portal so that you can use the launch in context feature.

To configure Tivoli Enterprise Portal complete the following steps:

1. The initial steps depend on whether you are going to open a window or perform a task.
  - a. If you are opening a window, in the Tivoli Enterprise Portal navigation window on the local computer, select where you want the launch definition to originate from. This opens the corresponding view on the target computer. Right-click one of the following locations.
    - The navigator item
    - A row in a table or situation event console view
    - A slice of a pie chart
    - A bar of a bar chartIf the launch definition originates from a table, chart, or situation event console view, open the workspace containing the view. If you think you might edit the argument later, create the launch definition from a table or chart view.
  - b. If you are going to perform a task, create a launch definition for one of the following tasks:
    - Create a volume or VDisk
    - Open the SAN Planner
    - Create a capacity report
    - Create a wasted space report
2. In the Tivoli Enterprise Portal window, expand **Enterprise > Windows Systems > your\_server\_name > Windows OS**. Right-click **Disk** and select **Launch**. Disk is one of several values you can select. Values include Disk, Network, Enterprise Services, Memory, Printer, Process, Processor, and System.
3. The Create or Edit Launch Definitions window opens. Click **Create New**.
4. In the **Name** text field, type a descriptive name for this launch definition. This name is used in the definition list.
5. In the **Target** text box click **Browse** to locate the tpc.bat file. The Select files for directories for Launch Definitions window opens. A typical location for Windows systems is C:\Program Files\IBM\TPC\gui\tpc.bat. Select the correct directory and click **OK**.

When you start a launch definition from the command line, if any part of the path contains spaces, enclose the entire entry in quotation marks.

6. In the **Arguments** text field, enter any parameters that will be added when the application is started. Arguments are entered as *-parameter value*. In the Create or Edit Launch Definitions window, click **Browse** next to **Arguments** to locate the parameters that you want to use. The Select Browser Options window opens. Click **Substitutable Items** and then click **OK**. Select parameters from the **Selected Context** and **Extended Context** lists.

The **help** argument lists the available **function** values. You must type the help parameter by itself into the **Arguments** text field or into the form `tpc.bat -help functions` on the command line for Windows or `TPCD.sh -help functions` for UNIX. The **-help functions** parameter provides a window that lists the nodes in the navigation tree that are available to start. If you type **-help** without the **functions** parameter, it results in an error message.

When all parameters have been selected, click **OK** to return to the Create or Edit Launch Definitions window.

7. If the parameters can be changed at launch time (for example, you want to change the system ID), check the **Edit arguments before execution** box.
8. Specify a value for the **Start in** location. Click **Browse** to locate the IBM Tivoli Storage Productivity Center installation and select the folder **gui** where `tpc.bat` is located.
9. Click **Evaluate** to see how the command resolves when the application starts. Correct any of the parameters that are incorrect and reevaluate the command.
10. When you are satisfied with the launch definition, click **Apply** to save your changes. This keeps the window open so that you can start the current launch definition or create a new one. Click **OK** to save the launch definition and close the window.
11. To start the current definition, select **Launch**. The Tivoli Storage Productivity Center graphical user interface (GUI) with the function parameter that you have provided is opened.

**Related reference:**

“Launch in context parameters” on page 1432

You can use the launch in context parameters, definitions, and examples.

“Launch in context task parameters” on page 1434

Use the launch in context feature task parameters to perform tasks.

“Available windows” on page 1435

You can use windows with the inbound launch in context feature to start IBM Tivoli Storage Productivity Center. These windows are called with the `-function window name` argument.

**Editing launch definitions:**

You can edit an existing launch definition with the Tivoli Enterprise Portal graphical user interface (GUI).

If the **Edit arguments before execution** box was checked when a launch definition was configured, you can edit the launch definition by changing the attribute values. To edit a launch definition, complete the following steps:

1. In the Tivoli Enterprise Portal window, expand **Enterprise > Windows Systems > your\_server\_name > Windows OS**. Right-click **Disk** and select **Launch**. Disk is one of several nodes you can select. Nodes include Disk, Network, Enterprise Services, Memory, Printer, Process, Processor, and System.
2. The Create or Edit Launch Definitions window opens showing a list of launch definitions in the **Existing Launch Definitions** area.
3. Select the launch definition that you want to edit. The values are displayed.
4. Make the necessary changes in the text fields.
5. Click **Evaluate** to see how the arguments will resolve when the application starts. Correct any incorrect arguments and re-evaluate the command.
6. Click **Apply** to save the changes and keep the window open. Click **OK** to save the launch definition and close the window.

If you do not want to overwrite the existing launch definition, save the new launch definition with a unique name.

## Outbound launch and launch in context features

With the outbound launch and launch in context features, you can start the administrative applications for devices such as storage systems and switches from various points in the graphical user interface (GUI).

There are two options for starting an application from Tivoli Storage Productivity Center. The option that is available depends on the device that you want to start.

The launch feature starts an application at the starting point for that application.

The launch in context feature starts an application at a functionally related location in that application. Launch in context is available for the following applications:

- Tivoli Storage Productivity Center for Replication
- SAN Volume Controller 6.1 or later
- Storwize V7000
- Storwize V7000 Unified
- IBM SONAS

## Launch menu

When you right-click one of the following entities in Tivoli Storage Productivity Center GUI, you see a launch menu for that entity. The content of the launch menu varies as described in “Launch menu items” on page 65.

- Alert Log Viewer. Each row of the alert log is enabled for a launch in context menu. The context is determined by the type of the alert. Alert types include:
  - Replication
  - Storage Subsystem
  - Computer
  - Fabric
  - Switch
  - Port
  - Tape Library
- Disk Manager Storage Subsystems table
- Fabric Manager Fabrics table
- Tape Manager Tape Libraries table
- Element Manager page (of the Configuration Utility)
- Topology Viewer objects. To see the icons that are associated with each Topology Viewer object, refer to the following list.

## Topology Viewer objects

Topology Object	Icon
Fabric	

Topology Object	Icon
Switch	
Switch port	
Tape library	
Storage subsystem	
Storage subsystem port	
File system volume	
Storage disk	
Storage pool	

## Launch menu items

The following are the possible menu items that can be displayed in the launch menu:

### Launch in context defined application

This menu item is displayed for each application that is defined by a launch descriptor file. Tivoli Storage Productivity Center provides launch descriptor files for the following applications:

- DS8000 Storage Manager
- The management console for the storage systems that are listed under **Management GUI**.
- Tivoli Storage Productivity Center for Replication

If the corresponding launch descriptor files are found for the applications, the following menu items are displayed:

### DS8000 Storage Manager

Click this menu item to start DS8000 Storage Manager.

### Management GUI

Click this menu item to start the management console for the following storage systems:

- SAN Volume Controller 6.1 or later
- Storwize V7000
- Storwize V7000 Unified
- IBM SONAS

### Replication Storage Systems Overview

Click this menu item to start Tivoli Storage Productivity Center for Replication. The window that is opened in the Tivoli Storage Productivity Center for Replication GUI depends on the context for the entity that you selected. For example, if you right-click a storage device on the **Element Manager** tab of the Configuration Utility and click **Replication Storage Systems Overview**, the Tivoli Storage Productivity Center for Replication Storage Systems window opens.

If the launch descriptor file cannot be found, the **Launch file items error** menu item is displayed. Click this item to view a description of the problem. The **Launch file items error** menu item is also displayed in situations such as the IBM Tivoli Integrated Portal server is not installed or is not accessible, the Tivoli Storage Productivity Center Data server is not accessible, or another system error occurred.

### External Tools

This menu item shows any external tools that are defined in the Configuration Utility. Examples of external tools include web-based user interfaces and local executable files. For example, you might add the address of a website that you frequently access or an application that you often use such as a text editor or a spreadsheet.

### Element Manager

This menu item shows any element managers that were discovered for the device by a Storage Management Initiative Specification (SMI-S) query. To avoid menu item duplication, this item is not displayed when the associated element manager is defined by a launch descriptor file. In this situation, the element manager is displayed as a separate menu item.

### User Defined Tools

This menu item shows any user-defined element managers that are defined in the Configuration Utility. These element managers differ from the element managers in the **Element Manager** menu because they are user-defined and are not discovered by an SMI-S query.

### Example launch menu

The following figure shows an example launch menu for a storage system in the **L0:Storage** topology view. In this example, the menu items **Replication Storage Systems Overview**, **DS8000 Storage Manager**, and **External Tools** are displayed. The **Element Manager** menu item is not displayed because no element managers other than **DS8000 Storage Manager** were discovered. The **User Defined Tools** menu item is not displayed because there are no user-defined element managers that are defined in the Configuration Utility.

## Using the single sign-on feature with launch or launch in context

*Single sign-on* is an authentication process in which you can access more than one system or application by entering a single user ID and password. Single sign-on enables you to start applications from Tivoli Storage Productivity Center without providing logon credentials for the application. Single sign-on is available only for Tivoli Storage Productivity Center for Replication, DS8000, SAN Volume Controller 6.1 and later, and Storwize V7000.

For Tivoli Storage Productivity Center for Replication Storage Manager, single sign-on is enabled by default. For DS8000 Storage Manager, SAN Volume Controller, and Storwize V7000, single sign-on must be enabled.

To enable single sign-on, see the following topics in the Tivoli Storage Productivity Center information center:

- Configuring Tivoli Storage Productivity Center for DS8000 LDAP authentication
- Configuring Tivoli Storage Productivity Center for SAN Volume Controller and Storwize V7000 single sign-on

### Related concepts:

“Single sign-on” on page 53

*Single sign-on* is an authentication process that enables you to enter one user ID and password to access multiple applications. For example, you can access IBM Tivoli Integrated Portal and then access IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication from Tivoli Integrated Portal using a single user ID and password. Single sign-on integrates with the launch and launch in context features to enable you to move smoothly from one application to another application.

---

## External tools

External tools include Web-based user interfaces and local executable files, scripts, and batch files that you want to access from IBM Tivoli Storage Productivity Center. For example, you might define the address of a Web site that you frequently access or an application that you often use (a text editor, a spreadsheet application, and so on) as an external tool. External tools such as executable files, scripts, and batch files must exist on the same system as the Tivoli Storage Productivity Center graphical user interface (GUI).

Both element managers and external tools are configured on the **Element Manager** tab of the Configuration Utility (**IBM Tivoli Storage Productivity Center > Configuration**). The following tasks can be performed for external tools in the **External Tools** section of the **Element Manager** tab. The tasks that you can perform depend on your Tivoli Storage Productivity Center authorization

- Add external tools (Administrator)
- Start external tools (all authorization levels)
- View external tools (all authorization levels)
- Edit external tools (Administrator)
- Remove external tools (Administrator)

## Adding external tools

Use the Configuration Utility to add external tools to IBM Tivoli Storage Productivity Center.

Possibilities for external tools include:

- Executable files, shell scripts, or batch files. These files must exist on the same system as the Tivoli Storage Productivity Center graphical user interface (GUI).
- Uniform Resource Locators (URLs) for search engines or web encyclopedias

To add an external tool in Tivoli Storage Productivity Center, follow these steps:

1. Expand the **IBM Tivoli Storage Productivity Center** node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** page.
2. In the **External Tools** section, select **Add Tool** from the **Select Action** list. The Add External Tool dialog box is displayed.
3. Define the information that is required to connect to the element manager in the following fields. Required fields are specified in bold in the dialog box. In the following field descriptions, required fields are marked by an asterisk.
4. The **Add External Tool** window opens. Enter definitions in the following fields:

#### **\*URL/Command**

Enter the URL or shell command representing the external tool. You can enter an IPv4 or IPv6 address depending on what is supported on the machine where the external tool is located:

- Enter an IPv4 address in the following format: ###.###.###.###. For example: 127.0.0.1
- Enter an IPv6 address. The preferred IPv6 address representation is written as eight groups of four hexadecimal digits: xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx, where each x is a hexadecimal digit representing 4 bits. For example: 2001:DB8:0000:1234:0000:0000:5678:ABCD. You can also specify IPv6 addresses using shortened formats that omit leading zeros (2001:DB8:0:1234:0:0:5678:ABCD) or use double colons (2001:DB8:0000:1234::5678:ABCD) in place of a series of zeros. You must include brackets [] around IPv6 addresses to separate those addresses from their port numbers. For example: [2001:DB8::1234:0000:0000:5678:ABCD]:9550.

**Note:** If the computer on which the element manager is located is IPv6-only, the Tivoli Storage Productivity Center servers must be installed on an IPv6-only or dual stack (IPv4 and IPv6 addresses are configured) computer.

**Label** Enter the name of the tool. The label name is shown in the **Name** field in the external tools table. If this field is blank, the **Name** field is blank.

**Description**

Enter a short description for the external tool.

**Save** Click this button to save the external tool. Information about the external tool is stored in the tools.xml file. This file is stored in the following locations:

- Windows: \Documents and Settings\Administrator\Application Data\IBM\TPC\config\
- UNIX and Linux: .TPC/config/

**Cancel**

Click this button to close the dialog box without saving the external tool.

## Modifying external tools

Use the Configuration Utility to modify information for external tools in IBM Tivoli Storage Productivity Center.

To modify an external tool in Tivoli Storage Productivity Center, follow these steps:

1. Expand the **IBM Tivoli Storage Productivity Center** node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab.
2. In the **External Tools** section, select the tool that you want to modify from the external tools table.
3. Select **Modify Tool** from the **Select Action** list. The Modify External Tool dialog box is displayed.
4. Modify any of the following fields:

**URL/Command**

Enter the URL or shell command representing the external tool. You can enter an IPv4 or IPv6 address depending on what is supported on the machine where the external tool is located:

- Enter an IPv4 address in the following format: ###.###.###.###. For example: 127.0.0.1

- Enter an IPv6 address. The preferred IPv6 address representation is written as eight groups of four hexadecimal digits: `xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx`, where each x is a hexadecimal digit representing 4 bits. For example: `2001:DB8:0000:1234:0000:0000:5678:ABCD`. You can also specify IPv6 addresses using shortened formats that omit leading zeros (`2001:DB8:0:1234:0:0:5678:ABCD`) or use double colons (`2001:DB8:0000:1234::5678:ABCD`) in place of a series of zeros. You must include brackets `[]` around IPv6 addresses to separate those addresses from their port numbers. For example: `[2001:DB8::1234:0000:0000:5678:ABCD]:9550`.

**Note:** If the computer on which the element manager is located is IPv6-only, the Tivoli Storage Productivity Center servers must be installed on an IPv6-only or dual stack (IPv4 and IPv6 addresses are configured) computer.

**Label** Enter the name of the tool. The label name is shown in the **Name** field in the external tools table. If this field is blank, the **Name** field is blank.

**Description**

Enter a short description for the external tool.

**Save** Click this button to save the external tool.

**Cancel**

Click this button to close the dialog box without saving the external tool.

## Starting external tools

Use the Configuration Utility to start external tools from IBM Tivoli Storage Productivity Center.

To start an external tool from Tivoli Storage Productivity Center, follow these steps:

1. Expand the **IBM Tivoli Storage Productivity Center** node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab.
2. In the **External Tools** section, select the tool that you want to start from the external tools table.
3. Select **Launch Tool** from the **Select Action** list. The URL or command defined for the tool is run immediately.

## Removing external tools

Use the Configuration Utility to remove external tools from IBM Tivoli Storage Productivity Center.

To remove an external tool from Tivoli Storage Productivity Center, follow these steps:

1. Expand the **IBM Tivoli Storage Productivity Center** node in the navigation tree, click **Configuration Utility**, and open the **Element Manager** tab.
2. In the **External Tools** section, select the tool that you want to remove from the external tools table.
3. Select **Remove Tool** from the **Select Action** list. The Remove External Tool dialog box is displayed.
4. Click **OK**. The element manager is deleted from the external tools table.

To exit the window without removing the external tool, click **Cancel**.

**Note:** If the computer on which the element manager is located is IPv6-only, the Tivoli Storage Productivity Center servers must be installed on an IPv6-only or dual stack (IPv4 and IPv6 addresses are configured) computer.

---

## Working with invoices

With IBM Tivoli Storage Productivity Center you can develop invoice definitions and create invoices associated with data or resource usage.

Using Tivoli Storage Productivity Center you can:

- Charge users for the amount of *storage they are consuming* across a network and within relational database management system (RDBS) instances
- Charge users for the amount of *space they own* within the database and tablespace of RDBMS instances.

With Tivoli Storage Productivity Center you can collect usage information on a departmental, group, or user level. You can allocate costs by storage usage by user, disk capacity by computer, tablespace, or file system or physical device. You can create cost centers by creating user, computer, or tablespace groups, allowing organizations to chargeback individuals or business units for their storage usage. By understanding the costs associated with existing and future storage usage, you can improve the use of that storage and reduce the costs associated with its maintenances and upgrades.

Tivoli Storage Productivity Center uses the storage usage information gathered by probes and scans to generate invoices that chargeback for storage usage. Chargeback is the process of breaking down costs associated with data or resource usage and then distributing those costs back to the organizational consumers.

To collect the information needed for chargeback, you need to run probes and scans:

### Probes

Define probes when you want to charge by Disk Capacity. Probes collect statistics on the storage assets in your enterprise, such as computers, disk controllers, hard disks, file systems, storage subsystems, instances, logs, RDBMS objects, and so on. The results of probes are stored in the database repository and are used to supply the data necessary for Tivoli Storage Productivity Center's reporting function.

**Scans** Define scans when you want to charge by OS User groups. Scans collect statistics on the usage and trending of your actual storage consumption. The results of scans are stored in the database repository and are used to supply the data necessary for Tivoli Storage Productivity Center's Capacity, Usage, Usage Violations, and Backup Reporting facilities.

In addition to providing basic storage usage invoicing, Tivoli Storage Productivity Center integrates with the chargeback systems already implemented in your environment. It provides you with a higher level, application-specific CIMS output format. CIMS is IBM Tivoli Usage and Accounting Manager (ITUAM) which provides IT financial knowledge by measuring, analyzing, reporting, and billing based on usage and costs of shared computing resources. With Tivoli Storage Productivity Center, you can export chargeback data directly into ITUAM, giving you the ability to integrate your storage usage data with other enterprise chargeback information and processes.

## Planning for chargeback

Before generating data that will be used for chargeback, it is a good idea to plan ahead and gather basic information about your system and organization.

### Understand your environment

Understanding the users, data, and resources within your organization will help you determine the most reasonable and enforceable chargeback policies. In the planning stages of developing a chargeback policy, it will help you to understand such things as:

- The types of data stored within your environment
- Patterns of data usage
- Different types of users and user groups
- The IT resources that exist within your organization

### Determine the chargeback policy you want to implement

It is important to learn and understand the advantages and disadvantages of the charge back policy you want to implement. For example, with IBM Tivoli Storage Productivity Center, you can:

- Divide the cost of storage usage by all users
- Divide the cost of storage usage by individual users or groups of users
- Charge by resource
- Charge by individual usage of resources

### Define monitoring groups

Organize the IT resources within your environment into functional groups. Defining groups enables you to classify your data and resources into billable entities, which in turn provides the information on who is using what storage. This enables you to bill specific groups according to their usage of storage space. See "Creating a group" on page 373.

#### Computer groups

Computer groups collect operating system and RDBMS storage statistics on computers that are related to each other or belong to a common group such as a department, a location, a territory, and so forth. Examples of computer groups are Sales, Accounting, Development, IT.

A computer can belong to one computer group only.

#### User groups

User groups are users that are related to each other or belong to a common group such as a department, a location, a territory, and so forth. Examples of user groups are Administrators, Developers, Marketing staff, HR staff.

A user can belong to one user group only.

#### OS User groups

OS user groups are users that are grouped together within the operating system.

#### Database-tablespace groups

Database-tablespace groups monitor entire databases or tablespaces across multiple instances or databases. Examples of tablespace groups are System Tablespaces, System Databases, databases-tablespaces related to a specific application or applications, and so forth.

A database-tablespace can belong to one database-tablespace group only.

### **Determine what information you want to gather**

Determining what information you want to gather about the storage resources within your enterprise is critical to helping you implement a chargeback strategy. Probes and scans are the monitoring jobs you can define to collect information about operating system and RDBMS storage resources. The information gathered by these jobs is reflected in the data included within a Tivoli Storage Productivity Center invoice.

As you become more familiar with how a specific charge back model works for your organization, you can continue to review and implement to more advanced charge back models.

## **Setting up invoices**

This topic takes you through the task of setting up an invoice.

To set up an invoice, complete the following steps:

1. In the Navigation Tree pane, expand **Data Manager for Chargeback > Parameter Definition**. Data Manager for Chargeback - Configuration window opens.
2. In the **Output Format** area, specify the format for the output. You can click either of the following options:

#### **Invoice**

Creates a formatted text file suitable for opening in or importing into word processing applications.

**CIMS** Creates a text file with comma-separated fields suitable for importing into a ITUAM application.

3. In the **Type of Charges** area, specify the information that you want the invoice to contain. You can select one or more of the following check boxes:

#### **OS Storage Usage By User**

The resulting invoice includes the following information:

- Total space consumed by user groups and the cost of that usage
- Total space consumed by each user in the environment and the cost charged to each user

#### **OS Disk Capacity By Computer**

The resulting invoice includes the following information:

- Total space consumed by computer groups and the cost of that usage
- Total space consumed on each computer in the environment and the cost of that usage

#### **Storage Usage By Database User**

The resulting invoice includes the following information:

- Total space consumed by DB user groups and the cost of that usage
- Total space consumed by each DB user in the environment and the cost charged to each user

#### **Total Size By Database-Tablespace**

The resulting invoice includes the following information:

- Total space consumed by database-tablespace groups and the cost of that usage

- Total space consumed on each database or tablespace in the environment and the cost of that usage
4. (Invoice output format only) For each type of charge that you selected in step 3 on page 615, select the unit of measurement (kilobyte, megabyte, or gigabyte) and type a numerical value. For example, if you want to charge \$1.25 per megabyte of storage usage, select **Megabyte** and type 1.25 in the **Cost per** field. (CIMS output format only) If you select CIMS as the output type, the **Cost Per** field will be deselected. This is because you will set the rates and costing within the ITUAM application.
  5. If you selected **OS Storage Usage by User** or **Storage Usage by Database User**, select the profile that is used in the scan job. By default, this is either TPCUser.Summary By Owner for **OS Storage by User** or TPCUser.Db User Space for **Storage Usage by Database User**.
  6. Click  to save the invoice definition.

Invoice definitions are not saved in actual files, but the last invoice definition saved is the one that will be used to create the invoice.

## Generating an invoice

Generate an invoice and save it as a file.

To generate an invoice, complete the following steps:

1. In the Navigation Tree pane, expand the **Data Manager for Chargeback** node.
2. Click **Online Execution**. The Online Execution page opens.
3. Click the **Browse** button. The Open window opens, listing previously generated invoice files in the default directory. The default directory, or the directory where you have chosen to save the invoice files, is not part of the IBM Tivoli Storage Productivity Center application but on the computer where Tivoli Storage Productivity Center is installed.
  - a. Click on an existing file or type a new file name, including extension, in the **File name** text field. A text file (.txt) is the default file type for both output types.
 

**Note:** Unless you save the invoice as a separate file name, the default file (StorageChargeback.txt) will be overwritten each time you run an invoice. It is recommended that you save your invoices as a separate file name each time you run them.
  - b. Click the **Open** button. You will be returned to the Online Execution page. Alternatively, in the Online Execution page, without clicking the **Browse** button, type the full path name of the invoice file to be generated in the **Output File** text field.
4. Click the **Generate Output File** button to generate the invoice.

The invoice is saved to the file name and path you specified.

## Viewing and printing invoices

This topic discusses viewing or printing a generated invoice in both Invoice and CIMS output formats.

If you have generated the invoice in the Invoice output format, you can view and print that invoice with any text editor or word processing program. If you chose CIMS as the output format, use your ITUAM application to work with the invoice data.

To view and print an invoice generated in the Invoice output format, complete the following steps:

1. Start the text editor or word processing program.
2. Follow the steps in the word processing program to open the invoice. Open the invoice from the location you specified in the **Output File** field in the Online Execution page.
3. View the file and make any changes. If you make any changes to the file, be sure and save it under a different name.
4. Print the file from the word processing program.

To view and print an invoice generated in the CIMS output format, integrate IBM Tivoli Storage Productivity Center accounting data into the Tivoli Usage and Accounting Manager, by following the instructions in the Tivoli Usage and Accounting Manager Information Center. Alternatively, you can view the original invoice data in a text editor or word processing program. Remember that the data will be in the form of comma-separated fields.

## Sample Invoices

This section gives examples of sample invoices.

## Chapter 6. Managing resources in the web-based GUI

You can use the web-based GUI to monitor the condition, capacity, and relationships of the monitored resources within your storage environment.

Tivoli Storage Productivity Center also provides a stand-alone GUI for managing the storage infrastructure in an enterprise environment. Each GUI provides different functions for working with monitored resources. To view a comparison of the functions that are available in each GUI, see “Available functions and report information in the interfaces” on page 19.

Use the web-based GUI to complete the following storage-management tasks:

- View and acknowledge the status of resources that are monitored by Tivoli Storage Productivity Center. Resources include storage systems, servers, hypervisors, fabrics, and switches. Use this information to quickly determine the state of your storage environment.
- View summary and detailed information about resources, including properties, storage usage, storage capacity, and several key performance metrics. Use this information to monitor the storage on your hardware. For example, when migrating large amounts of data, you can identify the target resources that have enough storage capacity to accommodate the data and require the least amount of reconfiguration.
- View the relationships and storage mapping among resources. For example, you can view the resources such as servers and hypervisors to which volumes from a storage system are assigned.
- Identify potential problems and troubleshoot existing problems in a storage environment. For example, you can locate the internal resources of a storage system that might be causing a bottleneck in storage utilization.
- In the reporting, web-based interface, use a drag-and-drop approach to design custom reports that contain detailed information about the properties and performance of monitored resources. All the performance metrics from the stand-alone GUI are available in the reporting interface. For example, you can drag key metrics into a report to create and generate a performance chart for a specific volume of a storage system. The reporting interface also includes a set of predefined reports that provides quick access to preformatted data about resources.

**Related concepts:**

“Starting Tivoli Storage Productivity Center” on page 175

IBM Tivoli Storage Productivity Center provides two graphical user interface (GUI) applications for managing and monitoring the resources in a storage environment: a stand-alone GUI and a stand-alone GUI. You can start these GUIs on the Tivoli Storage Productivity Center server or on a remote system.

**Related reference:**

Chapter 5, “Managing resources in the stand-alone GUI,” on page 307

You can use the stand-alone GUI to manage and monitor the resources and storage infrastructure in an enterprise environment. This interface provides all the tools to manage data, disk, fabric, tape, and replication.

“Available functions and report information in the interfaces” on page 19

IBM Tivoli Storage Productivity Center 5.1 provides two graphical user interfaces (GUI) for managing the resources in a storage environment: a stand-alone GUI and a web-based GUI. Each interface provides different functions for working with monitored resources.

---

## Configuring resources for monitoring

You can use the stand-alone GUI to configure the resources that you want to monitor in web-based GUI. You must configure before you can collect data, generate reports, and manage storage that is related to those resources.

The Configure Devices wizard in the stand-alone GUI guides you through the steps for adding resources as a data source, running a discovery, specifying alerts, and setting up data collection schedules. After data is collected, you can use the web-based GUI to monitor the following resources:

- Storage systems
- Servers
- Fabrics
- Switches
- Hypervisors

To configure storage resources for monitoring, complete the following steps:

1. Start the stand-alone GUI for Tivoli Storage Productivity Center.
2. Access the Configure Devices wizard. There are two methods for accessing the wizard:
  - To start the wizard and then select the type of resource that you want to configure, click the **Configure Devices** icon on the toolbar or select the **Configure Devices** node in the navigation tree.
  - To start the wizard for a specific type of resource that you want to configure, access the panel for that resource and click **Add *resource\_type***, where *resource\_type* represents the type of resource. For example, click the **Add Storage Subsystem** button on the **Disk Manager > Storage Subsystem** panel.
3. Follow the steps in the wizard to add storage resources, set up alerts, and define data collection schedules.
4. After data is collected, use the web-based GUI to quickly monitor, manage, and troubleshoot resources and generated alerts.

### Related concepts:

“Starting Tivoli Storage Productivity Center” on page 175

IBM Tivoli Storage Productivity Center provides two graphical user interface (GUI) applications for managing and monitoring the resources in a storage environment: a stand-alone GUI and a stand-alone GUI. You can start these GUIs on the Tivoli Storage Productivity Center server or on a remote system.

## Resources that you can monitor in the web-based GUI

You can use the web-based GUI to monitor storage systems, servers, hypervisors, fabrics, and switches. Information about these top-level resources includes information about their internal resources and related resources. Internal resources are components that exist in a top-level resource. Related resources are external to a top-level resource, but are related to it through assigned storage, a network connection, or virtual hosting.

### Fabrics

A *fabric* is a network of hubs, switches, adapter endpoints, and connecting cables that support a communication protocol between devices. The following table shows the internal resources and related resources that you can monitor for fabrics.

Table 45. Fabric resources that you can monitor in the web-based GUI

Top-level resource icon	Internal resources	Related resources
	<ul style="list-style-type: none"><li> Blades</li><li> Ports</li><li> Switches</li><li> Zone sets</li></ul>	<ul style="list-style-type: none"><li> Hypervisors</li><li> Servers</li><li> Storage systems</li><li> Unknown resources</li></ul>

### Hypervisors

A *hypervisor* is a layer of software or a physical device that manages multiple, virtual instances of operating systems on the same hardware. Hypervisors that you can monitor in the web-based GUI include VMWare vSphere data sources such as ESX, ESXi, and vCenter servers.

The following table shows the internal resources and related resources that you can monitor for hypervisors.

Table 46. Hypervisor resources that you can monitor in the web-based GUI

Top-level resource icon	Internal resources	Related resources
	<ul style="list-style-type: none"><li> Virtual machines</li><li> Disks</li><li> Controllers</li><li> File systems and logical volumes</li></ul>	<ul style="list-style-type: none"><li> Storage systems</li><li> Fabrics</li><li> Switches</li></ul>

## Servers

A *server* is a computer or host that is connected to a network and provides an access point to that network. If a server is part of a cluster, information about that cluster is also available. The following table shows the internal resources and related resources that you can monitor for servers.

Table 47. Server resources that you can monitor in the web-based GUI

Top-level resource icon	Internal resources	Related resources
	<ul style="list-style-type: none"> <li> Disks</li> <li> Controllers</li> <li> Volume groups</li> <li> File systems and logical volumes</li> <li> Hypervisors</li> <li> Shares and exports</li> <li> Monitored directories</li> </ul>	<ul style="list-style-type: none"> <li> Storage systems</li> <li> Fabrics</li> <li> Switches</li> </ul>

## Storage systems

A *storage system* is a device, such as a Redundant Array of Independent Disks (RAID) controller, that creates and manages other storage devices. A storage virtualizer is a storage system that virtualizes storage space from internal storage or from another storage system.

Storage systems can be configured for block storage, file storage, or a combination of block and file storage. The method that a storage system uses for managing data determines the internal resources that are monitored.

The following table shows the internal resources and related resources that you can monitor for storage systems.

Table 48. Storage system resources that you can monitor in the web-based GUI

Top-level resource icon	Internal resources	Related resources
	<p><b>Block storage resources</b></p> <ul style="list-style-type: none"> <li> Controllers</li> <li> Disks</li> <li> External disks</li> <li> Host connections</li> <li> I/O groups</li> <li> Managed disks</li> <li> Modules</li> <li> Nodes</li> <li> Pools</li> <li> Ports</li> <li> RAID arrays</li> <li> Volumes</li> </ul> <p><b>File storage resources</b></p> <ul style="list-style-type: none"> <li> Controllers</li> <li> Clusters</li> <li> Disks</li> <li> Exports</li> <li> File systems</li> <li> Network shared disks</li> <li> Nodes</li> <li> Pools</li> </ul>	<ul style="list-style-type: none"> <li> Back-end storage systems</li> <li> Fabrics</li> <li> Hypervisors</li> <li> Servers</li> <li> Switches</li> </ul>

## Switches

A *switch* is a network infrastructure component to which multiple nodes attach. In Tivoli Storage Productivity Center, you can monitor Fibre Channel (FC) switches. The following table shows the internal resources and related resources that you can monitor for switches.

Table 49. Switch resources that you can monitor in the web-based GUI

Top-level resource icon	Internal resources	Related resources
	<ul style="list-style-type: none"> <li> Blades</li> <li> Fabrics</li> <li> Logical switches</li> <li> Parent switches</li> <li> Ports</li> </ul>	<ul style="list-style-type: none"> <li> Fabrics</li> <li> Hypervisors</li> <li> Servers</li> <li> Storage systems</li> <li> Switches</li> <li> Unknown resources</li> </ul>

## Display differences in the interfaces

Tivoli Storage Productivity Center stores information about monitored resources in a database repository. You can view this information in the stand-alone GUI or in the web-based GUI. Depending on the interface that you use, there might be some differences in how the information is presented.

### The web-based GUI does not show a fabric for a physical, Cisco SAN

The stand-alone GUI shows a "fabric" for a physical, Cisco SAN, whereas the web-based GUI does not show a "fabric" for a physical, Cisco SAN.

- In the stand-alone GUI, Tivoli Storage Productivity Center automatically generates a worldwide name (WWN) to represent a physical, CISCO SAN as a fabric. This WWN typically starts with the numbers "3000". The WWN for the fabric is shown on the **Topology > Fabrics** panel and in reports for fabrics.
- In the web-based GUI, a fabric is not shown for physical, Cisco SANs on the Fabrics page. Only the virtual fabrics, physical switches, and logical switches for Cisco Fibre Channel switches are shown in the web-based GUI.

### The number of unidentified endpoints on fabrics is different from the stand-alone GUI

The web-based GUI and stand-alone GUI might display a different number of unidentified endpoints on a fabric:

- In the web-based GUI, unidentified endpoints are labeled as **Unknown Resources** and each endpoint *port* is considered one **Unknown Resource**.
- In the stand-alone GUI, unidentified endpoints are labeled as **Other** and each endpoint *node* is considered one **Other**.

For example, an endpoint with two ports is shown as one **Other** resource in the stand-alone GUI, but in the web-based GUI it is shown as two **Unknown Resources**.

### Pool space for NetApp filers

For NetApp filers that are configured with block data, the values for pool space that are shown in the web-based GUI are different from the values shown in a storage management tool for NetApp filers, such as FilerView. The values that are different include total pool capacity and available pool space.

This discrepancy occurs because the pool space information that is collected by SMI-S agents for Tivoli Storage Productivity Center includes Write Anywhere File Layout (WAFL) and Snapshot reserve space, whereas tools like FilerView do not include this additional space.

---

## Viewing information about resources

You can view detailed information about the resources that are monitored by Tivoli Storage Productivity Center. Resources include storage systems, volumes, pools, servers, hypervisors, fabrics, and switches. You can also view information about internal and related resources.

**Remember:** Data collection jobs retrieve information about monitored resources. To ensure that the latest information about resources is available in the web-based GUI, run data collection jobs regularly. To learn about how to collect data, see “Collecting data” on page 337.

## How information is organized

Information about monitored resources is organized into different pages in the web-based GUI. You can use these pages to view summary information about all resources, detailed information about top-level resources, and detailed information about internal and related resources.

### The dashboard

The dashboard is displayed when you start a new session of Tivoli Storage Productivity Center or when you click **Home > Dashboard** in the navigation pane. Use the dashboard to view the following summary information about a storage environment:

- A topology or resource diagram of the top-level resources that are monitored by Tivoli Storage Productivity Center. This diagram shows the number of top-level resources that are monitored and their overall status. You can also click the icons in the resource diagram to view more detailed information about a top-level resource on a resource list page.
- Capacity information that was aggregated for storage systems, servers, and hypervisors. Use this information to view the overall storage capacity for each type of resource. This information is presented as horizontal bar charts.
- The status of Tivoli Storage Productivity Center jobs that were run during a specific time. You can also click links to access a complete list of jobs.
- The number of unacknowledged alerts that were detected on resources during a specific time. You can also click a link to access a complete list of alerts that were detected on all monitored resources.

To learn about how to view summary information on the dashboard, see “Viewing summary information about all resources” on page 631.

### Jobs page

Use the Jobs page to view the following information about Tivoli Storage Productivity Center jobs:

- The overall status of all jobs. Use this information to identify the number of jobs that are encountering problems when running.
- Information about specific jobs, including status, related resource, type, and schedule.

- Information about performance monitors, including status, last successful collection attempt, start time, end time, and remaining duration.
- Information in the log files for jobs.

To access the Jobs page, click **Home** > **Jobs** in the navigation pane.

## Alerts page

Use the Alerts page to view and manage the alert conditions that were detected on monitored resources. You can complete the following tasks on this page:

- View the overall number of alerts that were detected on monitored resources. This information is presented in a bar chart for the following types of alerts:
  - Database
  - Fabric
  - Hypervisor
  - Other
  - Performance
  - Replication
  - Server
  - Storage system
  - Tape library
  - Tivoli Storage Productivity Center
- View information about specific alerts, including severity, last occurrence, and the resources where they were detected.
- Acknowledge alerts that were reviewed but are not yet resolved.
- Unacknowledge alerts.
- Remove alerts from the page.

To access the Alerts page, click **Home** > **Alerts** in the navigation pane.

## Resource list pages

Use a resource list page as central location for viewing information about the top-level resources of a specific type. For example, use the Storage Systems page to view a list of the storage systems that are monitored by Tivoli Storage Productivity Center. Each resource list page corresponds to a specific type of resource, which includes storage systems, volumes, pools, servers, hypervisors, switches, and fabrics. You can view the following information on resource list pages:

- The overall status of the resources
- Key information about the resources
- Alerts that were generated for the resources
- Jobs that were run for the resources

To learn about how to access the list pages for resources, see “Viewing information about top-level resources” on page 633.

**Note:** Volumes and pools are internal resources of storage systems, but have their own resource list pages so that you can view them all in a central location.

## Resource detail pages

Use resource details pages to view information about resources that are internal or related to a top-level resource. For example, use the Storage System details page to view detailed information about a specific storage system. You can view the following information on resource detail list pages:

- The overall capacity and storage usage for a resource
- Key information about a resource
- Alerts that were generated for a resource
- Jobs that were run for a resource
- Information about components that exist in top-level resources
- Information about the resources that are related to another resource

To learn about how to access detail pages for resources, see “Viewing information about internal and related resources” on page 634.

## Reporting

Use the IBM Tivoli Common Reporting tool in the web-based GUI to view detailed reports about resources. The following reports are available:

### Predefined reports

These reports are included with Tivoli Storage Productivity Center. The following types of predefined reports are available:

- Resources
- Performance
- Historical space
- Storage tiering

### Custom reports

Unlike predefined reports, you can select the information that you want to include in custom reports. Custom reports can contain detailed information about the relationships between monitored resources, the properties of monitored resources, and detailed information about the performance of monitored resources.

To learn about how to use the IBM Tivoli Common Reporting tool, see Chapter 9, “Reporting in the web-based GUI,” on page 1143.

## Viewing summary information about all resources

Use the dashboard to monitor the overall status of monitored resources and identify potential problem areas in a storage environment. You can learn about the status and capacity of top-level resources, the jobs that are running monitoring actions, and the unacknowledged alert conditions that were detected.

1. In the navigation pane, click **Home** > **Dashboard**. The information on the dashboard is organized into the following sections:
  - The resource diagram
  - Capacity
  - Recent Jobs
  - Unacknowledged Alerts
2. Use the following sections on the dashboard to monitor resources, jobs, and alerts:

## The resource diagram

You can use the resource diagram to complete the following tasks:

- View the number of resources that are monitored for a resource type. A number in parentheses is shown next to each resource icon. This number represents the number of resources for a type that is monitored. For example, if 20 storage systems are monitored, the value **Storage Systems (20)** is shown.
- View a list of the resources that are monitored for a resource type. Each type of resource in the diagram is represented by an icon. To learn more about the individual resources for a resource type, click the related icon in the diagram. For example, if you click the icon for storage systems, a resource list page shows the storage systems that are being monitored.
- View the overall status for each resource type. A status icon is shown with each resource icon. The status icon represents the most critical status that was detected on a top-level resource. For example, if Tivoli Storage Productivity Center monitors 20 storage systems, and an error condition was detected for one of those storage systems, an error status icon is shown with the storage systems icon in the diagram. If no errors, warnings, or unreachable statuses were detected for the monitored storage systems, then a normal status icon is shown. To learn more about the status of resources, see “Monitoring the status of resources” on page 635.
- View the number of statuses that were detected and acknowledged for each resource type. To view the total number of statuses for a type of resource, move the mouse pointer over the status icon for that resource type. Hover help shows the total number of occurrences for each status, and the number of statuses that were acknowledged by a Tivoli Storage Productivity Center user.

## Capacity

You can use the **Capacity** section of the dashboard to view horizontal bar charts that show aggregated storage information for each type of top-level resource. You can use these charts to quickly determine overall storage capacity and available space.

To cycle through the storage information for different types of resources, click the forward and backward arrows  . Hover the mouse pointer over areas in the charts that are not labeled for additional information.

## Recent Jobs

You can use the **Recent Jobs** section of the dashboard to view a status summary of the Tivoli Storage Productivity Center jobs that completed during the selected time. This summary includes the number of jobs that have the following statuses: Running, Error, Warning, and Normal. Use the following actions to manage the display of job statuses:

- To select the time period for showing job statuses, click the forward and backward arrows  . You can view the status of all jobs that were run in the last hour, last day, or last week.
- To view detailed information about all jobs, click **View all jobs** to access the Jobs page.
- To view detailed information about performance jobs only, click **View performance jobs** to access the **Performance Monitors** tab on the Jobs page.

## Unacknowledged Alerts

You can use the **Unacknowledged Alerts** section of the dashboard to view the status summary of alerts that were detected on monitored resources during a specified time period. Alerts are generated when Tivoli Storage Productivity Center detects certain conditions or events on monitored resources. An unacknowledged alert is an alert that was not reviewed or resolved by a Tivoli Storage Productivity Center user.

Use the following actions to manage the display of statuses for unacknowledged alerts:

- To select the time period in which you want to view alert statuses, click the forward and backward arrows   to cycle through the choices. You can view the status of all unacknowledged alerts that were detected in the last hour, last day, or last week.
  - To view detailed information about alerts, click **View all alerts** to access the Alerts home page.
3. Optional: To view descriptions of the information that is available on the dashboard, click the help icon  in the upper-right corner of the page.

## Viewing information about top-level resources

Use a resource list page as a central location for viewing information about all the monitored resources of a specific type. Resources that have a list page include storage systems, volumes, pools, servers, hypervisors, switches, and fabrics.

1. In the navigation pane, hover the mouse pointer over the resource icon for the type of resource that you want to view. You can use the icons to access the following types of resources:
  - **Storage Resources:** storage systems, volumes, pools
  - **Server Resources:** servers, hypervisors
  - **Network Resources:** switches, fabrics
2. Select the type of resource that you want to view. For example, if you want to view information about servers, select **Server Resources > Servers**. A list of monitored servers is displayed on Servers page.
3. Locate the resource that you want to view in the list. Each column in the list shows information about the resource.
4. Optional: To view key attributes of a specific top-level resource without leaving the page, right-click the resource and select **View Properties**. A properties notebook is displayed. Information in a properties notebook can include storage statistics, hardware attributes, volume assignments, disk assignment, and performance metrics.
5. Optional: To view more detailed information about a specific top-level resource, including its internal and related resources, right-click the resource and select **View Details**. A resource details page is displayed. This page includes information about storage statistics, alerts, jobs, internal resources, and related resources.

A resource list page shows information about the monitored resources for the selected type. You can view the following information on this page:

- The overall status of the resources for a specific type
- Key information about the resources
- Alerts that were generated for the resources
- Jobs that were run for the resources

**Tip:** To view descriptions of the information that is available on a resource list page, click the **Help** icon  in the upper-right corner of the page.

**Related reference:**

“Resources that you can monitor in the web-based GUI” on page 625

You can use the web-based GUI to monitor storage systems, servers, hypervisors, fabrics, and switches. Information about these top-level resources includes information about their internal resources and related resources. Internal resources are components that exist in a top-level resource. Related resources are external to a top-level resource, but are related to it through assigned storage, a network connection, or virtual hosting.

## Viewing information about internal and related resources

Use resource details pages to view information about a specific top-level resource and its internal and related resources.

1. In the navigation pane, hover the mouse pointer over the resource icon for the type of resource that you want to view. The icons provide access to the following types of resources:
  - **Storage Resources:** storage systems, volumes, pools
  - **Server Resources:** servers, hypervisors
  - **Network Resources:** switches, fabrics
2. Select the type of the resource that you want to view. A resource list page shows the monitored resources for the selected type. For example, if you want to view a storage system, select **Storage Resources > Storage Systems**. A list of monitored storage systems is displayed on the Storage Systems page.
3. In the list of resources, right-click the resource that you want to view and select **View Details**. A resource details page is displayed. This page includes information about storage statistics, alerts, jobs, internal resources, and related resources.
4. To view information about the internal resources of the top-level resource, click the name of the internal resource in the **Internal Resources** section. A list of the internal resources is displayed. Each column in the list shows information about the resources. For example, on the details page for a server, click **Controllers** to view a list of the controllers that are associated with the server.
5. Optional: To view key attributes of a specific internal resource without leaving the page, right-click the resource and select **View Properties**.
6. To view information about resources that are related to the top-level resource, click the name of the related resource in the **Related Resources** section. A list of the related resources is displayed. For example, on the server details page, click **Storage Systems** to view a list of the storage systems that have at least one disk (volume) assigned to the server.
7. Optional: To view key attributes of a specific related resource without leaving the page, right-click the resource and select **View Properties**.
8. Optional: To view the resource details page for a related resource, right-click the resource and select **View Details**.

A resource details page shows information about a top-level resource. The information is available in the following links and sections on the page:

- **Overview:** The overall capacity and storage usage for a resource.
- **Properties:** Key information about a resource.
- **Alerts:** Alerts that were generated for a resource.
- **Jobs:** Jobs that were run for a resource.

- **Internal Resources:** Information about the components that exist in a higher-level resource.
- **Related Resources:** Information about the resources that are related to another resource. A related resource is external to a higher-level resource, but is related to it through assigned storage, a network connection, or virtual hosting.

**Tip:** To view descriptions of the information that is available on a resource details page, click the **Help** icon  in the upper-right corner of the page.

**Related reference:**

“Resources that you can monitor in the web-based GUI” on page 625

You can use the web-based GUI to monitor storage systems, servers, hypervisors, fabrics, and switches. Information about these top-level resources includes information about their internal resources and related resources. Internal resources are components that exist in a top-level resource. Related resources are external to a top-level resource, but are related to it through assigned storage, a network connection, or virtual hosting.

---

## Monitoring the status of resources

You can use the web-based GUI to monitor the status of resources and identify potential problem areas in a storage environment. Monitored resources include top-level resources and their internal and related resources.

Use status information to quickly determine the condition of your storage and if any actions must be taken. Tivoli Storage Productivity Center provides a number of different statuses to help you determine the condition of resources. Each status is represented by an icon in the web-based GUI.

*Table 50. Possible statuses of monitored resources*

Icon	Status	Description
	Error	A serious problem was detected on a resource or on its internal resources. Resolve these problems as soon as possible.
	Error - Acknowledged	An Error status was detected and acknowledged. An Error - Acknowledged status indicates that a status was reviewed and is either resolved or can be ignored.  An acknowledged status is not used when determining the status of related, higher-level resources. For example, if the status of a volume is Error, the status of the related storage system is also Error. If the Error status of the volume is acknowledged, its status is not used to determine the overall status of the storage system.
	Unreachable	A resource is not responding to requests from the Tivoli Storage Productivity Center server. This status might be caused by a problem in the network or by a Storage Resource agent that is no longer running and did not communicate that it was shutting down.

Table 50. Possible statuses of monitored resources (continued)

Icon	Status	Description
	Unreachable - Acknowledged	An Unreachable status was detected and acknowledged. An Unreachable - Acknowledged status indicates that a status was reviewed and is either resolved or can be ignored.  An acknowledged status is not used when determining the status of related, higher-level resources. For example, if the status of a controller is Unreachable, the status of the related server is also unreachable. If the Unreachable status of the controller is acknowledged, its status is not used to determine the overall status of the server.
	Warning	A Warning status represents potential problems on a resource or on its internal resources. This status is not critical.
	Warning - Acknowledged	A Warning status was detected and acknowledged. A Warning - Acknowledged status indicates that a status was reviewed and is either resolved or can be ignored.  An Warning - Acknowledged status is not used when determining the status of related, higher-level resources. For example, if the status of a controller is Warning, the status of the related server is also Warning. If the Warning status of the controller is acknowledged, its status is not used to determine the overall status of the server.
	Normal	No warnings or errors were detected on a monitored resource.
	Unknown	A resource is known to Tivoli Storage Productivity Center but is not monitored. To change an Unknown status, use a data collection job to collect status information about the resource.

For top-level resources, use the resource details page to view the status of their internal resources.

## How status is determined

Top-level resources that are monitored in the web-based GUI include storage systems, servers, hypervisors, fabrics, and switches. The status of a top-level resource is determined by its consolidated status and the propagated status of its internal resources.

A consolidated status is the status that is reported by the top-level resource for its own hardware. For example, if the cooling fans in a storage system are stopped and the internal temperature is too high, that status is reported to Tivoli Storage Productivity Center.

A propagated status is the combined statuses of the monitored, internal resources for a top-level resource. For example, if a Warning status is detected on a volume in a storage system, that Warning status is used to determine the overall status of the storage system.

Tivoli Storage Productivity Center uses the values for consolidated status and propagated status to calculate the overall status of a top-level resource. The statuses of the following internal resources are used to calculate the status of top-level resources.

Table 51. Internal resources that are used to determine the status of top-level resources

Top-level resource	Internal resources that are used to determine the status of a top-level resource
<p>Fabric</p> 	 ,  Blades, and ports on blades  Ports that are not blades  Switches
<p>Hypervisor</p> 	 Controllers  Ports on controllers  Virtual machines
<p>Server</p> 	 ,  Controllers, and ports on controllers  Volume groups  Monitored directories
<p>Storage system</p> 	 Clusters  Controllers  Disks  External disks  Modules  Network shared disks  Nodes  Pools, and the internal resources that are associated with pools: <ul style="list-style-type: none"> <li>•  Volumes</li> <li>•  RAID arrays</li> <li>•  Managed disks</li> </ul>  Ports
<p>Switch</p> 	 Blades  Logical switches  Ports

Tivoli Storage Productivity Center uses the following statuses of internal resources to help calculate the status top-level resources:

- Unknown
- Normal
- Error
- Warning
- Unreachable

**Tip:** Statuses that are acknowledged are not used to calculate the overall status of a top-level resource.

Internal resources for a top-level resource might have different statuses. Tivoli Storage Productivity Center uses the most severe status of an internal resource when determining the overall status for a top-level resource. For example, in a storage system, a port might have an Error status, a pool might have a Warning status, and a number of controllers might have an Unknown status. In this case, the overall status for the storage system is Error because it is the most severe status that was detected on the internal resources.

Statuses for internal resources are propagated in the following way to determine the status of a top-level resource:

- If an internal resource has an Error status, then the related top-level resource has an Error status.
- If an internal resource has an Unreachable status, and no other internal resources have an Error status, the related top-level resource has an Unreachable status.
- If an internal resource has a Warning status, and no other internal resources have an Error or Unreachable status, the related top-level resource has a Warning status.
- If an internal resource has a Normal status, and no other internal resources have an Error, Unreachable, or Warning status, the related top-level resources has a Normal status.
- If an internal resource has an Unknown status, and no other internal resources have an Error, Unreachable, Warning, or Normal status, the related top-level resource has an Unknown status.

The following table shows some of the possible combinations of statuses and their resulting, propagated status.

*Table 52. Propagation of the statuses for internal resources in the web-based GUI*

Error 	Unreachable 	Warning 	Normal 	Unknown 	Resulting status for top-level resource
				X	 Unknown
			X		 Normal
			X	X	 Normal
		X			 Warning
		X		X	 Warning

Table 52. Propagation of the statuses for internal resources in the web-based GUI (continued)

Error 	Unreachable 	Warning 	Normal 	Unknown 	Resulting status for top-level resource
		X	X	X	 Warning
	X				 Unreachable
	X			X	 Unreachable
	X		X	X	 Unreachable
	X	X	X	X	 Unreachable
X					 Error
X				X	 Error
X			X	X	 Error
X		X	X	X	 Error
X	X	X	X	X	 Error

## Viewing the overall status of resources

Use the dashboard to monitor the overall status of monitored resources and identify potential problem areas in a storage environment. The dashboard shows the overall status of storage systems, servers, hypervisors, fabrics, and switches, and the total number of different statuses that were detected on the individual resources for each type.

1. In the navigation pane, click **Home > Dashboard**. Information about the overall status of top-level resources is shown on the resource diagram.
2. View the status icon that is shown with each resource icon to determine the overall status of a resource type. The status icon represents the most critical status that was detected on the resources for a specific type.

For example, if Tivoli Storage Productivity Center monitors 20 storage systems, and an error condition was detected for one of those storage systems, the following status icon is shown with the storage systems icon:

 **Storage Systems (20)**

If no Error, Warning, or Unreachable statuses were detected on the monitored storage systems, the following status icon is shown with the storage systems icon:

 **Storage Systems (20)**

3. Move the mouse pointer over the status icon for a resource type to view the number of statuses that were detected and acknowledged for that resource type. Hover help shows the total number of occurrences for each status, and the number of statuses that were acknowledged by a Tivoli Storage Productivity Center user.

For example, move the mouse pointer over the status symbol for fabrics to view the number of monitored fabrics that have an Error, Unreachable, Warning, Normal, or Unknown status. If five fabrics have an Unreachable status, three fabrics have a Normal status, and no fabrics have an Error or Warning status, the following information is shown when you hover over the status icon for fabrics:

**Related reference:**

“How status is determined” on page 636

Top-level resources that are monitored in the web-based GUI include storage systems, servers, hypervisors, fabrics, and switches. The status of a top-level resource is determined by its consolidated status and the propagated status of its internal resources.

## Viewing the status of top-level resources

Use a resource list page as a central location for viewing the propagated statuses of top-level resources. Resources that have a list page with status information include storage systems, volumes, pools, servers, hypervisors, switches, and fabrics.

1. In the navigation pane, select the type of top-level resource that you want to view. For example, if you want to view the status of monitored switches, select **Network Resources > Switches**.
2. To view the total number of different statuses that were detected for the type of resource, check the status icons at the top of the resource list page. The number next to the icon represents how many of each status was detected.

For example, if 20 switches are monitored, and 10 have a Normal status while the other 10 have a Warning status, the following status information is displayed at the top of the page:

3. To view the status for specific resources, check the Status column in the list of resources. The value in the Status column represents the propagated status for a top-level resource.
4. Optional: Click the **Search** icon  to filter the list so that only resources with a specified status are shown. You can use filtering to identify the resources with the most serious Error conditions in your environment.
5. Optional: Select **Status**.
6. Optional: In the **Choose Value** list, select the status on which you want to filter. The list of resources is automatically refreshed and only resources with the filtered status are shown. For example, select **Warning**  to view only the resources on which a Warning status was detected.

## Viewing the status of internal resources

Use a resource details page to view the propagated status of a top-level resource and the status of its internal resources.

1. In the navigation pane, select a type of top-level resource. For example, if you want to view the status of monitored storage systems and their internal resources, select **Storage Resources > Storage Systems**.
2. Locate the resource in the list and check the Status column. The value in the Status column represents the propagated status for the top-level resource.
3. To view the status of internal resources, right-click the top-level resource and select **View Details**. A resource details page shows the internal resources for the selected resource.
4. Check for any status icons that are associated with an internal resource. If Tivoli Storage Productivity Center detects a status other than normal, an icon is displayed for the most critical status.

For example, if a server has three controllers with an Error status and two controllers with a Warning status, the Error status icon is shown for controllers in the **Internal Resources** section:

 **Controllers (5)** .

5. To view the status of specific internal resources, click the name of the internal resource in the **Internal Resources** section. A list of the monitored internal resources is displayed. For example, on the details page for a server, click **Controllers (5)** to view a list of the five controllers that are associated with the server.
6. Check the Status column to view the status for each internal resource.

**Tip:** When viewing information about some internal resources, the Status column might show values that are more specific than Error, Unreachable, Warning, Unreachable, Unknown, and Normal. Use this additional status to determine the cause of the problem for an internal resource.

For example, in the **Internal Resources** section on the details page for a storage system, an Error status is shown for managed disks:

 **Managed Disks (5)** .

This status means that one or more managed disks have an Error condition. When you view the list of managed disks, the Status column might show an Offline status for a specific managed disk. When an Offline status is detected, the web-based GUI shows it as an Error status on the details page for the storage system.

## Acknowledging the status of resources

The web-based GUI shows Error, Unreachable, and Warning statuses for top-level resources and internal resources. Sometimes these statuses might represent problems that commonly occur but can be ignored. In such cases, you can acknowledge the resources so that they are not used when propagating statuses for top-level resources or when calculating the total number of Error, Warning, and Unreachable conditions that were detected.

## Acknowledging the status of top-level resources

The web-based GUI shows a summary of the statuses for top-level resources on the dashboard and resource list pages. You can acknowledge the status of a top-level resource so that its status is not shown as Error, Unreachable, or Warning on those pages.

1. In the navigation pane, select the type of resource that has a status you want to acknowledge. For example, if you want to acknowledge the status of a switch, select **Network Resources > Switches**.
2. In the list of resources, locate the resource with the Error, Unreachable, or Warning status that you want to acknowledge.
3. Right-click the resource and select **Acknowledge status**. A window shows that the status for the specified resource was acknowledged.
4. Optional: To acknowledge multiple resources at the same time, press Ctrl and click each resource. To select a series of resources, select the first resource, and then press Shift and click the last resource. When the resources are selected, right-click a row in the list and select **Acknowledge status**.
5. Click **Close**.

When you acknowledge the status of a top-level resource, the following actions are taken on pages in the web-based GUI:

- The dashboard:
  - The status of the acknowledged resource is not used to determine the status icon that is displayed for that resource on the resource diagram. For example, if you acknowledge the Unreachable status for a switch, that Unreachable status is not used to determine the status icon that is displayed for the switch icon on the dashboard.
  - The acknowledged status is shown as **Acknowledged** when you point to the status icon for a resource. For example, if 10 switches have an Unreachable status and you acknowledge the status for one of them, the following information is shown when you hover the mouse over the switch icon:

 **9 Unreachable (1 Acknowledged)**

**Restriction:** The dashboard shows status icons and hover information for servers, hypervisors, switches, fabrics, and storage systems. The statuses of pools and volumes are used to calculate the status of these top-level resources, so their individual statuses are not shown on the dashboard.

- The resource details page:
  - The status icons at the top of the page are updated. For example, if 10 switches have an Unreachable status, and you acknowledge one of them, the total number Unreachable statuses decreases by one and the number of Unreachable - Acknowledged statuses increases by one. The following information is updated at the top of the Switches page:

 **9 Unreachable**  **1 Unreachable - Acknowledged**

- The value in the **Status** column for the resource is updated to show an acknowledged status. For example, if you acknowledge the Unreachable status for a switch, the following value is shown in the **Status** column:

 **Unreachable**

**Related reference:**

“Resources that you can monitor in the web-based GUI” on page 625

You can use the web-based GUI to monitor storage systems, servers, hypervisors, fabrics, and switches. Information about these top-level resources includes information about their internal resources and related resources. Internal resources are components that exist in a top-level resource. Related resources are external to a top-level resource, but are related to it through assigned storage, a network connection, or virtual hosting.

**Acknowledging the status of internal resources**

The web-based GUI uses the status of internal resources to determine the status of top-level resources. Sometimes these statuses might represent problems that commonly occur or are known, but can be ignored. In such cases, you can acknowledge the status of an internal resource so that it is not used when determining the status of a top-level resource.

For example, if the status of a volume is Error, the status of the related storage system is also Error. If the Error status of the volume is acknowledged, its status is not used to determine the overall status of the storage system. In this case, if the other internal resources of the storage system are Normal, then the status of the storage system is also Normal.

1. In the navigation pane, select the type of resource in which the internal resource is located. For example, if you want to acknowledge the status of internal resources for a switch, select **Network Resources > Switches**.
2. Right-click a resource and select **View Details**. For example, if you want to acknowledge the status of a port on a switch, right-click that switch and select **View Details**.
3. In the **Internal Resources** section of the resource details page, click the name of the internal resource. For example, if you want to acknowledge the status of a port on a switch, click **Ports**.
4. Right-click the resource and select **Acknowledge status**. A window shows that the status for the specified resource was acknowledged. For example, if you want to acknowledge the status of a port, right-click the port and select **Acknowledge status**.
5. Optional: To acknowledge multiple resources at the same time, press Ctrl and click each resource. To select a series of resources, select the first resource, and then press Shift and click the last resource. When the resources are selected, right-click a row in the list and select **Acknowledge status**.
6. Click **Close**. The status of the related, top-level resource might take several minutes to update.

When you acknowledge the status of an internal resource, the following actions occur:

- The status of the internal resource is no longer used to determine the status of the related, top-level resource.

For example, if you acknowledge the Error status for a controller on a server, the status of that controller is not used when determining the overall status of the server.

- The status icons at the top of the page for the internal resource are updated.

For example, if you acknowledge the Error status for a controller on a server, the total number of Error statuses decreases by one and the number of Error - Acknowledged statuses increases by one on the Controllers page. If originally

there were five controllers with Error statuses, the following updated status information is shown at the top of the page:

 4 Error  1 Error - Acknowledged

**Related reference:**

“Resources that you can monitor in the web-based GUI” on page 625

You can use the web-based GUI to monitor storage systems, servers, hypervisors, fabrics, and switches. Information about these top-level resources includes information about their internal resources and related resources. Internal resources are components that exist in a top-level resource. Related resources are external to a top-level resource, but are related to it through assigned storage, a network connection, or virtual hosting.

---

## Viewing jobs

Jobs are used to collect data about storage resources and complete other tasks that are related to monitoring a storage environment. Use the Jobs page in the web-based GUI to view all the jobs that are used by Tivoli Storage Productivity Center to monitor resources. Use resource list and resource details pages to view the jobs for specific resources and types.

Specifically, you can use the web-based GUI to complete the following tasks:

- View the status of all jobs in a central location
- View the status of performance monitor jobs on a dedicated tab
- Identify all the jobs that are related a specific type of resource
- Identify all the jobs that are related a specific resource
- Identify all the jobs that are encountering problems when running

The following terms are used in the web-based GUI:

- **Job:** A unit of work that monitors, manages, or collects data about a storage resource. In the stand-alone GUI, the term *schedule* is also used. These monitoring tasks include the following job actions:
  - Collecting data about resources with scans, probes, quotas, discovery, or performance monitors. For example, define a probe job to collect asset and status data about storage systems; define a scan job to collect file-level information about servers.
  - Running scripts.
  - Checking for quota violations.
  - Backing up and archiving files.
  - Analyzing storage configurations to determine whether existing SAN configurations violate defined best practices or policies.
  - Creating and implementing end-to-end storage plans.
  - Creating volumes.
  - Upgrading or deploying agents.
- **Run:** A run is a single invocation of a job.

**Tip:** If multiple resources are included in the same data collection job, a separate row for each resource is shown in the list of jobs. For example, if five storage systems are monitored by the same probe, a row for each storage system is shown in the list.

There is an exception for fabric jobs. Probes that collect data about multiple fabrics are not shown in the list. Only probes that collect data about one fabric are shown. For example, if five fabrics are monitored by the same probe, there is no entry for the probe or fabrics in the list. If one fabric is monitored by a probe, a row for the fabric is shown.

## Configuring the display of jobs

You can use the stand-alone GUI to configure how jobs are displayed in the web-based GUI.

### Setting the retention of jobs and logs

The jobs and logs that are shown in the web-based GUI are determined by configuration settings in the stand-alone GUI. The default setting is to show the last five runs of a job. Use the stand-alone GUI to change how many runs of a job are displayed in the web-based GUI.

1. Start the stand-alone GUI.
2. In the navigation pane, go to **Administrative Services > Configuration**.
3. Click **Log File and Cached Batch Report Retention**.
4. In the **Maximum number of runs to keep of each schedule** field, enter the maximum number of runs for a job (schedule) that you want to display in the web-based GUI.
5. Save the changes.

After you update the value for **Maximum number of runs to keep of each schedule** in the stand-alone GUI, the list of jobs on the Jobs page in the web-based GUI is automatically updated within a few minutes.

### Setting the retention of removed resources

Removed resources are resources that are no longer monitored by Tivoli Storage Productivity Center. When a resource is no longer monitored, use the stand-alone GUI to determine how long its related jobs are show in the web-based GUI.

For example, if a storage system is removed from Tivoli Storage Productivity Center, and the retention setting is set to two weeks, the jobs for that storage system are shown for an additional two weeks before they are removed from the Jobs page. The default setting for retaining job information about removed storage systems is two weeks.

1. Start the stand-alone GUI.
2. In the navigation pane, go to **Administrative Services > Configuration**.
3. Click **Removed Resource Retention**.
4. Select a resource and enter the number of days to retain information after it is no longer monitored by Tivoli Storage Productivity Center.
5. Save the changes.

After you change the retention settings in the stand-alone GUI, the list of jobs on the Jobs page in the web-based GUI is automatically updated within a few minutes.

## Viewing all jobs

Use the Jobs page as a central location to view and manage all the jobs that Tivoli Storage Productivity Center is using to monitor resources. You can view all data collection jobs for resources, including performance monitors.

1. In the navigation pane, go to **Home > Jobs**.
2. Use the **Jobs** tab to view a list of all Tivoli Storage Productivity Center jobs. The information about jobs is organized into columns. These columns include information about the status of jobs, the names of resources that are associated with jobs, the schedule for jobs, and links to job logs.
3. Optional: Click the **Performance Monitors** tab to only view information about performance monitor jobs. Performance monitor jobs collect performance statistics about storage systems and switches.  
The information about performance monitors is organized into columns. These columns include information about the status of jobs, the name of the storage systems or switches that are monitored, the most recent success percentage and collection attempt, the number of failed collections, and links to job logs.
4. Optional: View the icons at the top of the page to view a summary of the statuses for jobs. This summary includes the number of jobs that have a Failed, Warning, Successful, or Running status.

**Tip:** To view descriptions of the icons and columns on the Jobs page, click the **Help** icon  in the upper-right corner of the page.

## Viewing jobs for a type of resource

Use resource list pages to view only the jobs for a specific type of top-level resource. Each resource list page has a **Jobs** tab that lists only the jobs for monitored storage systems, servers, hypervisors, switches, or fabrics. For example, you can use the list page for storage systems to view only the jobs that are associated with storage systems.

1. In the navigation pane, select a type of top-level resource. For example, if you want to view the jobs that are related to storage systems, select **Storage Resources > Storage Systems**.
2. Click the **Jobs** tab to view a list of all the jobs for the monitored resources of that type. For storage systems and switches, performance jobs are also listed in the **Jobs** tab.

The information about jobs is organized into columns. These columns include information about the status of jobs, the names of resources that are associated with jobs, the schedule for jobs, and links to job logs.

**Tip:** The icon on the **Jobs** tab represents the most critical status of the jobs that are associated with monitored resources. For example, if one of the jobs for storage systems failed, the following icon is shown on the tab:

3. Optional: View the icons at the top of the **Jobs** tab for a summary of job statuses. This summary includes the number of jobs that have a Failed, Warning, Successful, or Running status.

**Tip:** To view descriptions of the icons and columns on the **Jobs** tab, click the **Help** icon  in the upper-right corner of the page.

## Viewing jobs for a specific resource

Use resource detail pages to view only the jobs for a specific resource. Each resource details page has a **Jobs** link that lists only the jobs for a monitored storage system, server, hypervisor, switch, or fabric.

1. In the navigation pane, select a type of top-level resource. For example, if you want to view the jobs that are related to storage systems, select **Storage Resources > Storage Systems**.
2. Right-click a resource in the list and select **View Details**. In the **General** section, the number next to **Jobs** represents the number of jobs that are associated with the resource. For example, **Jobs (3)** indicates that there are three jobs that you can view.

The icon next to the **Jobs** link represents the most critical status of the jobs that are associated with the resource. For example, if a job failed, the following icon is shown:

**Jobs (3)** 

3. Click the **Jobs** link in the **General** section to view the jobs for the resource. The information about jobs is organized into columns. These columns include information about the status of jobs, the names of resources that are associated with jobs, the schedule for jobs, and links to job logs.
4. Optional: View the icons at the top of the page to view a summary of the statuses for jobs. This summary includes the number of jobs that have a Failed, Warning, Successful, or Running status.

**Tip:** To view descriptions of the icons and columns that are shown for jobs, click the **Help** icon  in the upper-right corner of the page.

## Viewing job logs

Job logs include detailed information about the status, actions, and progress of a job. Status information includes informational, warning, and error messages that are related to each action in a job that is taken during processing. You can use this information to troubleshoot any errors that might occur when a job is run.

1. In the navigation pane, go to the Jobs page, a list of jobs for a specific type of resource, or a list of jobs for a specific resource. For example, to view a list of jobs for storage systems, go to **Storage Resources > Storage Systems** and click the **Jobs** tab.
2. Locate the job that has a log file you want to view.
3. In the **Logs** column, click **View Logs**. A separate window opens to show information about the most recent run of the job.
4. Optional: In the Logs window, to view the log for previous runs of a job, select a run from the **Select a log** list.
5. Optional: To view only the actions in a job run that have a Warning or Error status, select an option from the **Show all** list. You can choose to view only actions that have the following statuses:
  -  Only error entries
  -  Only warning entries
  -   Error and warning entries
6. Optional: To view an explanation of the message that is associated with an action, click the link in the **ID** column.

The information on the Logs page is automatically updated every 30 seconds. New entries are added to end of the log. You can view the following information on a Logs page:

- The overall status of a job. The icon that is shown in the **Select a log** list represents the most critical status that was generated by an action in the job.
- The status for each action in a job. An icon and type of status is shown in the **Status** column for each action.
- The date and time when an action was completed. The date, time, and time zone when the action was taken is shown in the **Date and Time** column.
- The ID of the message that is associated with an action. You can click the value in **ID** column to view more information about a message.
- A description of an action. This value is shown in the **Description** column.

**Tip:** You can use the navigation and search functions of the web browser to locate information on the page.

---

## Managing alerts

Alerts are generated when Tivoli Storage Productivity Center detects certain conditions or events on monitored resources. Many conditions can trigger alerts. You can set up Tivoli Storage Productivity Center so that it generates alert notifications for conditions that you specify.

Before you use the web-based GUI to view and manage alerts, you must complete these tasks:

- Add resources for monitoring by Tivoli Storage Productivity Center. Use the Configure Devices wizard in the stand-alone GUI to add resources for monitoring.
- Specify the conditions on resources that trigger alert notifications. Use the stand-alone GUI to create alerts.
- Collect data about storage resources. Alerts are triggered by conditions that are detected during data collection. Use the stand-alone GUI to create data collection schedules.

The conditions that trigger alert notifications depend on the type of resource that you are monitoring. Some triggering conditions, like thresholds, require you to enter values for triggering alerts. In general, the following types of conditions can trigger alerts:

- A data collection schedule did not complete
- A change occurred in the storage infrastructure
- A performance threshold was violated

**Tip:** Tivoli Storage Productivity Center does not use the alert conditions that are detected on a resource to determine the overall status of the resource.

**Related concepts:**

“Monitoring the status of resources” on page 635

You can use the web-based GUI to monitor the status of resources and identify potential problem areas in a storage environment. Monitored resources include top-level resources and their internal and related resources.

**Related tasks:**

“Configuring resources for monitoring” on page 624

You can use the stand-alone GUI to configure the resources that you want to monitor in web-based GUI. You must configure before you can collect data, generate reports, and manage storage that is related to those resources.

“Working with alerts” on page 385

Create an alert, configure how the alert is publicized, or edit, delete, disable, rename, or view an alert.

“Collecting data” on page 337

Create data collection jobs to gather information about the storage resources in your environment. There are different data collection jobs within IBM Tivoli Storage Productivity Center depending on the type of information is collected and from which types of resources the information is retrieved: discovery, probes, Tivoli Storage Productivity Center Server probes, scans, and pings.

## Alert severities

Tivoli Storage Productivity Center determines the severity of alert conditions that it detects on monitored resources. Use the severity level to help determine the priority in which you resolve alerts.

Each severity is represented by an icon in the web-based GUI.

*Table 53. Possible severities of alerts*

Icon	Status	Description
	Critical	An alert with a Critical severity represents a serious problem on a resource or on its internal resources. Resolve these problems as soon as possible.
	Critical - Acknowledged	An alert with a Critical severity was acknowledged. A Critical - Acknowledged severity indicates that an alert was reviewed and is either resolved or can be ignored.
	Warning	An alert with a Warning severity represents potential problems on a resource or on its internal resources. The condition that generated the alert is not critical.
	Warning - Acknowledged	An alert with a Warning severity was acknowledged. A Warning - Acknowledged severity indicates that an alert was reviewed and is either resolved or can be ignored.
	Informational	An alert with an Informational severity does not represent a problem, but is intended to provide information about actions related to a resource.
	Informational - Acknowledged	An alert with an Informational severity was acknowledged. An Informational - Acknowledged severity indicates that an alert was reviewed and can be ignored.

### Related reference:

“Triggering conditions for alerts” on page 1439

You can define alerts so that IBM Tivoli Storage Productivity Center notifies you when a specified event occurs. Such events are the *triggering conditions* for the alert. The specific triggering conditions that you can use to define an alert depend on the sort of storage resource that you are monitoring.

## Viewing all alerts

Use the Alerts page as a central location to view and manage all the alerts that were detected by Tivoli Storage Productivity Center.

The Alerts page is organized into two sections:

### Alerts summary chart

The summary chart at the top of the page is a visual representation of the alerts that were detected on monitored resources. The chart consists of stacked bars with the number and severity of current alerts on the y-axis and the resource type on the x-axis. The y-axis labeling scales dynamically according to the highest number of alerts in any of the categories.

### Alerts list

The alerts list shows information about all the alerts that were detected on monitored resources. Information in the list is organized into columns. These columns include information about the condition that was detected, the severity of the alert, when the alert was detected, and the names of the resources where the alert condition was detected.

The version of Tivoli Storage Productivity Center that detected an alert determines where information about the alert is displayed. Alerts that were generated in version 5.1 or later are displayed on the Alerts page and in the **Alerts** tab on the pages for the related resources. Alerts that were generated in versions of the product before 5.1, also called migrated alerts, are only displayed on the Alerts page.

**Tip:** Depending on how data is configured for a NetApp filer, alerts are shown on different pages in the interface:

- Alerts for the block data in a NetApp filer are shown in the **Alerts** tab on the Storage Systems page and in the list of alerts on the Alerts page.
  - Alerts for the file data in a NetApp filer are only shown in the list of alerts on the Alerts page.
1. In the navigation pane, go to **Home > Alerts**. Information about alerts is shown in the list of alerts.
  2. Optional: To view the number of alerts for a specific type of resource, hover the mouse pointer over the related icon in the summary chart. For example, if you want to view the number of Critical, Warning, and Informational alerts that were triggered by hypervisors, hover the mouse pointer over the **Hypervisors** icon .
  3. Optional: To filter the list of alerts for a specific type of resource, click the icon for that resource in the summary chart. For example, if you only want to view a list of alerts for hypervisors, click the **Hypervisors** icon .

**Tip:** To view descriptions of the icons and columns on the Jobs page, click the **Help** icon  in the upper-right corner of the page.

## Viewing alerts for a type of resource

Use resource list pages to view only the alerts for a specific type of top-level resource. Each resource list page has an **Alerts** tab that lists only the alerts for monitored storage systems, servers, hypervisors, switches, or fabrics. For example, you can use the list page for storage systems to view only the alerts that were detected on monitored storage systems.

1. In the navigation pane, select a type of top-level resource. For example, if you want to view the alerts that are related to storage systems, select **Storage Resources > Storage Systems**.
2. Click the **Alerts** tab to view a list of all the alerts for the monitored resources of that type. The information about alerts is organized into columns. These columns include information about the condition that was detected, the severity of the alert, when the alert was detected, and the names of the resources where the alert condition was detected.

**Tip:** The icon on the **Alerts** tab represents the most severe alert condition that was detected on the monitored resources. For example, if one of the jobs for storage systems failed, the following icon is shown on the tab:

**Alerts.**

3. Optional: View the icons at the top of the **Alerts** tab for a summary of alert severities. This summary includes the number of alerts that have a Critical, Warning, Informational, or Acknowledged status.

**Tip:** To view descriptions of the icons and columns on the **Alerts** tab, click the **Help** icon  in the upper-right corner of the page.

## Viewing alerts for a specific resource

Use resource detail pages to view only the alerts for a specific top-level resource. Each resource details page has an **Alerts** link that lists only the alerts for a monitored storage system, server, hypervisor, switch, or fabric. For example, you can use the details page for a storage system to view only the alerts that were detected for that storage system.

1. In the navigation pane, select a type of top-level resource. For example, if you want to view the alerts that are related to storage systems, select **Storage Resources > Storage Systems**.
2. Right-click a resource in the list and select **View Details**. In the **General** section, the number next to **Alerts** represents the number of alert conditions that were detected on the resource. For example, **Alerts (25)** indicates that 25 alerts were detected on the resource.

The icon next to the Alerts link represents the most severe alert condition that was detected on the resource. For example, if alerts with an Error severity were detected the following icon is shown:

**Alerts (25)** 

3. Click the **Alerts** link in the **General** section to view the alerts that were detected on the resource. The information about alerts is organized into columns. These columns include information about the condition that was

detected, the severity of the alert, when the alert was detected, and the names of the resources where the alert condition was detected.

4. Optional: View the icons at the top of the page for a summary of alert severities that were detected. This summary includes the number of alerts that have a Critical, Warning, Informational, or Acknowledged status.

**Tip:** To view descriptions of the icons and columns that are shown for alerts, click the **Help** icon  in the upper-right corner of the page.

## Removing alerts

Remove alerts when you no longer require to view them in the web-based GUI. By default, alerts are automatically removed based on retention settings that are defined in the stand-alone GUI. However, you can use the remove actions to manually remove alerts from the web-based GUI.

1. Go to a list of alerts that includes the alerts that you want to remove. For example, if you want to remove alerts for different types of top-level resources, go to **Home > Alerts**.
2. Right-click the alert that you want to remove and select **Remove alerts**.
3. Click **Remove** to remove the alert. When you remove an alert, it is no longer shown on the Alerts page or in the **Alerts** tabs on the related resource list and resource detail pages.

For example, if you remove an alert for a fabric, that alert is removed from the Alerts page, Fabrics page, and Fabric details page.

4. Optional: To remove all the alerts that are shown in a list, select **Remove all alerts** from the **Actions** menu.
5. Optional: To remove all the acknowledged alerts that are shown in a list, select **Remove acknowledged alerts** from the **Actions** menu.

## Acknowledging alerts

Some alerts in Tivoli Storage Productivity Center are triggered by conditions that commonly occur and can be ignored. In such cases, you acknowledge these alerts to indicate that they were reviewed and do not require immediate resolution. By acknowledging alerts, you can more quickly identify the other alerts in lists that must still be reviewed and resolved.

1. Go to a list of alerts that includes the alerts that you want to acknowledge. For example, if you want to acknowledge the alerts for a specific server, complete the following steps.
  - a. In the navigation pane, go to **Server Resources > Servers**.
  - b. Right-click the server that has alerts you want to acknowledge and select **View Details**.
  - c. Click the **Alerts** link.
2. Right-click the alert that you want to acknowledge and select **Acknowledge alerts**. The severity of the alert is changed to Acknowledged on the Alerts page, resource list page, and resource details page.

For example, if you acknowledge a server alert that has a Warning severity, it is shown on the Alerts page, Servers page, and Server details page with the following severity:

**Warning - Acknowledged**

3. Optional: To acknowledge multiple alerts at the same time, press Ctrl and click each alert. To select a series of alerts, select the first alert, and then press Shift and click the last alert. When the alerts are selected, right-click a row in the list and select **Acknowledge alerts**.
4. Optional: To acknowledge all the alerts that are shown in a list, select **Acknowledge all alerts** from the **Actions** menu.
5. Optional: To acknowledge all the alerts with an Informational severity in a list, select **Acknowledged informational alerts** from the **Actions** menu. You might want to acknowledge all Informational alerts when you want to view only alerts that represent potential or serious problems that require action to resolve.

---

## Exporting information about resources, jobs, and alerts

You can save information about resources, jobs, or alerts to a PDF, CSV, or HTML file. Information that you can export from the web-based GUI includes all the values that are being shown in the columns for a list of resources, jobs, or alerts.

The information that you export to a file is organized according to the sorting, filtering, and column order that is defined for a list. Before you export information, complete the following tasks to configure a list:

- Change the order of columns in the list as you want them to appear in the generated file.
- Hide columns in the list that you do not want to include in the generated file. Information in hidden columns is not exported.
- Sort the rows in the list as you want them to appear in the generated file. Each list in the web-based GUI has a column or set of columns that determines the order of its rows.
- Filter the list to show only the resources, jobs, or alerts that you want to export. Use filtering to limit the rows that are shown in a list based on value in a specific column or set of default columns.

You can export information that is shown on the following pages:

### Resource list and resource details pages

You can export information about the top-level resources, internal resources, or related resources that are shown on resource list pages and resource details pages. For top-level resources, you can also export information about related jobs or alerts.

For example, you can export information about monitored switches on the **Switches** page. When you select the export action, the generated file includes the column values for each monitored switch in the list. In the **Jobs** or **Alerts** tabs on the **Switches** page, you can export information about all the jobs or alerts that are related to switches.

### The Alerts page

On the **Home > Alerts** page, you can export information about all the alerts that were detected for monitored resources. Information that you can export includes all the values that are being shown in the columns for the list of alerts.

### The Jobs page

On the **Home > Jobs** page, you can export information about all the jobs that are associated with monitored resources. Information that you can export includes all the values that are being shown in the columns for the list of jobs.

1. In the web-based GUI, go to a list of resources, jobs, or alerts for which you want to export information.
2. Click **Actions** and select **Export** > *file\_format*, where *file\_format* represents the format that you want to use for a file. The following formats are available:

#### CSV (comma-separated values)

A CSV file is a file that contains comma-delimited values and can be viewed with a text editor or imported into a spreadsheet application. The information in a CSV file has the following format:

```
"Column_name","Column_name","Column_name","Column_name","Column_name","Column_name"
"data","data","data","data","data","data"
```

where `Column_name` represents the name of a column in a table and `data` represents the data that is associated with a column.

**PDF** You can view a PDF file with Acrobat reader. The information that you export to a PDF file is formatted into a table.

**Tip:** When you export a table of data that contains many columns, the rows in that table might span multiple pages in the resulting PDF. For example, if a table contains 20 columns, then the row for a specific resource might be shown on more than one page (10 columns on the first page and 10 columns on the second page).

To reduce the amount of pages that a table spans, before you select the export action, hide the columns that you do not want to include in the PDF. Continue hiding columns until the table no longer spans multiple pages.

#### HTML

You can view an HTML file with a web browser. The information that you export to an HTML file is formatted into a table.

3. Optional: Depending on how your web browser is configured, you can specify the name and location of the generated file.
4. Click the save option to export the information to a file.

#### Related concepts:

“Viewing information about resources” on page 629

You can view detailed information about the resources that are monitored by Tivoli Storage Productivity Center. Resources include storage systems, volumes, pools, servers, hypervisors, fabrics, and switches. You can also view information about internal and related resources.

“Customizing lists of resources, jobs, and alerts”

The web-based GUI uses lists to show information about resources, jobs, and alerts. The information in each list is organized into columns and rows. You can customize these lists by filtering information, sorting rows, and showing, hiding, and reordering columns.

---

## Customizing lists of resources, jobs, and alerts

The web-based GUI uses lists to show information about resources, jobs, and alerts. The information in each list is organized into columns and rows. You can customize these lists by filtering information, sorting rows, and showing, hiding, and reordering columns.

## Filtering lists

You can filter the items that are shown in a list. Use filtering when you want to limit the rows that are shown in a list based on values in a specific column or set of columns. For example, when viewing alerts, you can filter the list so that only alerts with a value of Warning in the Severity column are shown.

1. In the web-based GUI, go to a list of resources, jobs, or alerts that you want to filter.
2. Click the **Filter** icon  to determine how to filter the list. The following options are available:

### Filter by Default Columns

Select this option to apply the filter to the set of the default columns in a list. Each list contains a set of default columns on which you can filter.

For example, in the lists of alerts on the **Home > Alerts** page, select this option to apply filter text to the following columns at the same time: Condition, Severity, Alert Category, Resource, Internal Resource, Total Occurrences, Alert Name.

### Filter by a Specific Column

Select this option to apply filter text to a specific column in a list. For example, on the **Home > Alerts** page, select the **Condition** column if you want to apply filter text to values in that column only.

**Restriction:** Some columns in lists cannot be used for filtering and are not shown under the **Filter by a Specific Column** option.

3. In **Filter** text box , type the text for filtering a list. You can type letters, whole words, partial words, and numbers. When filtering on certain columns, you can select from a list of values rather than typing in filter text.

For example, when filtering on the **Status** column, you can select one of the following values as the filter text: Error, Unreachable, Warning, Normal, Unknown.

4. Press Enter to apply the filter to the list. Only rows with values that match or partially match the filter text are shown.

For example, on the **Home > Alerts** page, if you select to filter on the Severity column and type critical as the filter text, only alerts that have a severity of critical and critical - acknowledged are shown in the list.

**Tip:** The name of a column to which a filter applies is shown next to the **Filter** icon .

5. Optional: To remove the filtering for a list, click **Reset**.

## Sorting lists

Each list of resources in the web-based GUI has a column or set of columns that determines the order of its rows. You can sort the columns in a list to organize the rows according to your requirements.

For example, the list of ports on a fabric is ordered by switch name, blade slot, and port number, in that order. You can change the sort order of these columns to organize a list of resources according to your requirements.

**Tip:** A visual indicator  is shown next to the primary column that determines the sort order of a list.

1. In the web-based GUI, go to a list of resources, jobs, or alerts that you want to sort.
2. Complete the following tasks to sort the rows in the list:
  - To change whether the rows in a list are sorted by ascending or descending order, click the name of the primary column in the heading row. Click the name of the column again to reverse the sort order.
  - To change the column that determines the sort order of resources, click the name of that column. For example, click the Name column to sort the list of resources alphabetically, or click the **Status** column to sort the list according to the status of resources.

**Tip:** When you click a column other than the primary sort column, that column becomes the new primary sort column. However, the previous primary column maintains its sort order (ascending or descending).

For example, if a list of resources is ordered by the Name column in ascending order and you click the Status column, the rows are sorted according to the statuses of resources. At the same time, the resources for each type of status are still sorted in ascending order by the Name column. There is a maximum of three columns that can be sorted upon at the same time.

3. Optional: To reset the order of the rows for a column to the default setting, right-click the heading row in the list and select **Reset Table Preferences**.

## Showing, hiding, and reordering columns in lists

Each list in the web-based GUI has a set of columns that contain information about resources, jobs, or alerts. You can change the order of columns, show columns that are hidden, and hide columns that are shown in these lists.

1. In the web-based GUI, go to a list of resources, jobs, or alerts that you want to customize.
2. Complete the following tasks to customize the columns in the list:
  - To show or hide the columns in a list, right-click any of the column headings and select or clear the check box next to a column name.
  - To change the order of columns, click a column heading and drag it to a new position in the list.

**Tip:** The changes that you make to column settings are saved from session to session.

3. Optional: To reset the order and display of columns to the default setting, right-click any of the column headings and select **Reset Table Preferences**.

---

## Chapter 7. Managing replication

Manage replication components, including setting up the management servers, adding storage connections and paths, creating sessions and copy sets, setting up data replication, performing planned maintenance, and recovering from a disaster.

---

### Administering

Administer IBM Tivoli Storage Productivity Center for Replication to authorize users, start and use the graphical user interface (GUI), start and stop services, and many other administrative tasks.

### Starting and stopping Tivoli Storage Productivity Center for Replication

Use these procedures to start and stop Tivoli Storage Productivity Center for Replication, including the embedded WebSphere Application Server and DB2.

#### Starting Tivoli Storage Productivity Center for Replication

To start IBM Tivoli Storage Productivity Center for Replication, the embedded IBM WebSphere Application Server instance must be started. WebSphere Application Server is started by default after Tivoli Storage Productivity Center for Replication is installed.

This topic contains references to *WAS\_HOME*, which refers to the path for the Tivoli Storage Productivity Center for Replication *ewas* directory. The path depends on the operating system and the location of the Tivoli Storage Productivity Center for Replication installation. The default path for Windows operating systems is `C:\Program Files\IBM\TPC\ewas`. The default path for AIX and UNIX operating systems is `opt/IBM/TPC/ewas`.

#### Starting Tivoli Storage Productivity Center for Replication on Windows:

You can start Tivoli Storage Productivity Center for Replication from the desktop or from the command line.

From the desktop, start the WebSphere Application Server service by using the Windows **Services** interface.

From the command line, issue the following command:

```
WAS_HOME/profiles/ReplicationServerProfile/bin/  
startServer.bat ReplicationServer
```

#### Starting Tivoli Storage Productivity Center for Replication on AIX or Linux:

To start Tivoli Storage Productivity Center for Replication, issue the following command from the command line:

```
WAS_HOME/profiles/ReplicationServerProfile/bin/  
startServer.sh -username user_name -password password ReplicationServer
```

Where *user\_name* and *password* are your WebSphere Application Server user name and password.

#### Starting Tivoli Storage Productivity Center for Replication on z/OS:

If you use IBM WebSphere Application Server OEM Edition for z/OS with IBM Tivoli Storage Productivity Center for Replication for System z, see the *IBM WebSphere Application Server OEM Edition for z/OS Configuration Guide* to start Tivoli Storage Productivity Center for Replication for System z.

If you use WebSphere Application Server for z/OS, complete the following steps to start Tivoli Storage Productivity Center for Replication for System z:

1. Ensure that the WebSphere Application Server hierarchical file system (HFS), IBM DB2 HFS, and Tivoli Storage Productivity Center for Replication for System z HFS are all mounted on the UNIX System Services. The root installation directory for Tivoli Storage Productivity Center for Replication for System z is *path\_prefix/usr/lpp/Tivoli/RM*. The root production directory is *path\_prefix/opt/lpp/Tivoli/RM*.
2. Obtain the symbolic link for the *was.env* file. The symbolic link is in the format *cell\_short\_name.node\_short\_name.server\_short\_name*. For example, *SYS7.SYS7.BBOS001*. To get the symbolic link, complete the following steps:
  - a. Issue the **TSO ISH** command to start the Interactive System Productivity Facility (ISPF) shell.
  - b. Enter the path for the *was.env* file. For example, *path\_prefix/zWebSphere/version/config1*.
  - c. Find the symbolic link to the *was.env* file. This is the value that is required for the **ENV** parameter in the following step.
3. Issue the command from the IBM z/OS System Display and Search Facility (SDSF) panel to start the WebSphere Application Server, as shown in the following example. The address spaces that are shown might be different in your environment.

```
/START BB06ACR,JOBNAME=BBOS001,ENV=was.env_symbolic_link
```

The initiator is BB06ACR, and the job name is BBOS001. When you start the BB06ACR address space, the BBODMNB address space also starts.

## Stopping Tivoli Storage Productivity Center for Replication

To stop IBM Tivoli Storage Productivity Center for Replication, you must stop the embedded IBM WebSphere Application Server instance.

This topic contains references to *WAS\_HOME*, which refers to the path for the Tivoli Storage Productivity Center for Replication *ewas* directory. The path depends on the operating system and the location of the Tivoli Storage Productivity Center for Replication installation. The default path for Windows operating systems is *C:\Program Files\IBM\TPC\ewas*. The default path for AIX and UNIX operating systems is *opt/IBM/TPC/ewas*.

### Stopping Tivoli Storage Productivity Center for Replication on Windows:

You can stop Tivoli Storage Productivity Center for Replication from the desktop or from the command line.

From the desktop, stop the WebSphere Application Server service from the Windows **Services** interface.

From the command line, issue the following command:

```
WAS_HOME/profiles/ReplicationServerProfile/bin/  
stopServer.bat ReplicationServer
```

### Stopping Tivoli Storage Productivity Center for Replication on AIX or Linux:

To stop Tivoli Storage Productivity Center for Replication, issue the following command from the command line:

```
WAS_HOME/profiles/ReplicationServerProfile/bin/  
stopServer.sh -username user_name -password password ReplicationServer
```

Where *user\_name* and *password* are your WebSphere Application Server user name and password.

### **Stopping Tivoli Storage Productivity Center for Replication on z/OS:**

If you use IBM WebSphere Application Server OEM Edition for z/OS with IBM Tivoli Storage Productivity Center for Replication for System z, see the *IBM WebSphere Application Server OEM Edition for z/OS Configuration Guide* to stop Tivoli Storage Productivity Center for Replication for System z.

If you use WebSphere Application Server for z/OS, complete the following steps to stop Tivoli Storage Productivity Center for Replication for System z:

1. Issue commands from the IBM z/OS System Display and Search Facility (SDSF) panel to stop the WebSphere Application Server for z/OS daemon, as shown in the following example commands. The address spaces that are shown might be different in your environment.

```
/STOP BBOS001
```

```
/STOP BBODMNB
```

Where **/STOP BBOS001** stops the server address space and **/STOP BBODMNB** stops the WebSphere Application Server for z/OS daemon address space.

2. Issue the **/D A,L** command to display the processes that are running and verify that the stop command completed. If the BBOS001 or BBODMNB address spaces are displayed, issue the **/CANCEL** command for each address space.

## **Verifying that components are running**

This information describes how to verify that the IBM Tivoli Storage Productivity Center for Replication components are running.

### **Verifying that WebSphere Application Server is running**

The method that you use to verify that IBM WebSphere Application Server is running in your environment depends on the operating system. By default, the WebSphere Application Server is started automatically after IBM Tivoli Storage Productivity Center for Replication is installed.

#### **Verifying that WebSphere Application Server is running on Windows:**

To verify that IBM WebSphere Application Server is running, open the Windows **Services** interface and check the status of the WebSphere Application Server service.

#### **Verifying that WebSphere Application Server is running on AIX or Linux:**

To verify that WebSphere Application Server is running, issue the **ps** command.

#### **Verifying that WebSphere Application Server is running on z/OS:**

To verify that WebSphere Application Server is running, use the IBM z/OS System Display and Search Facility (SDSF) panel to issue the **/D A,L** command.

If the server and daemon address spaces for IBM WebSphere Application Server for z/OS are started, for example BBOS001 and BBODMNB, then WebSphere Application Server for z/OS is running.

If the server and daemon address spaces for IBM WebSphere Application Server OEM Edition for z/OS are started, for example WASOM1S, WASOM1, and WASOM1D, then WebSphere Application Server OEM Edition for z/OS is running.

## Verifying that the IBM Tivoli Storage Productivity Center for Replication server is running

This information describes how to verify whether the IBM Tivoli Storage Productivity Center for Replication server is running.

Perform one or more of these tasks to determine whether the IBM Tivoli Storage Productivity Center for Replication server is running:

- Start the IBM Tivoli Storage Productivity Center for Replication GUI or start up the IBM Tivoli Storage Productivity Center for Replication command line interface shell. If either of these methods is successful, then the IBM Tivoli Storage Productivity Center for Replication server is running.
- Determine whether IBM WebSphere Application Server is running. If IBM WebSphere Application Server is not running, then the IBM Tivoli Storage Productivity Center for Replication server is also not running.
- If IBM WebSphere Application Server is running, perform these steps to determine if IBM Tivoli Storage Productivity Center for Replication is configured correctly in IBM WebSphere Application Server:
  1. From a command prompt, change to the `WAS_HOME/profiles/ReplicationServerProfile/bin` directory.
  2. Enter the `wsadmin` command.
  3. Enter the `$AdminApp list` command.

If you see CSM and CSMGUI in the resulting list, then IBM Tivoli Storage Productivity Center for Replication is configured correctly.
- View the `csmTrace.log` file in the `WAS_HOME/profiles/ReplicationServerProfile/logs/CSM` directory. If the `csmTrace.log` is being updated regularly and increasing in size, then IBM Tivoli Storage Productivity Center for Replication is running.

## Identifying the version of IBM Tivoli Storage Productivity Center for Replication

The version of code on the IBM Tivoli Storage Productivity Center for Replication server determines the available features and enhancements added to the product.

By clicking **About**, located in the Main menu, you can view the version and release of the IBM Tivoli Storage Productivity Center for Replication. The `-ver` command that is described in the *IBM Tivoli Storage Productivity Center Command-Line Interface Reference* also displays the current version of the product.

## Backing up and restoring IBM Tivoli Storage Productivity Center for Replication configuration data

You can back up the entire IBM Tivoli Storage Productivity Center for Replication database. You can also back up copy sets in a specific session. You can then use the backup files to restore a previous configuration or recover from a disaster.

### Back up and recovery

You can backup and recover copy set data for a specific session and the complete Tivoli Storage Productivity Center for Replication database.

## Copy sets

You can export data about all copy sets in a specific session to maintain a backup copy that you can use to recover if you lose the session or to upgrade to a different management server.

When exporting copy sets, Tivoli Storage Productivity Center for Replication creates a backup of the session and saves the data in a comma separated value (CSV) file, which you can view or edit in a spreadsheet program such as Microsoft Excel. The exported CSV file includes the session name, session type, date that the data was exported, and the copy sets for each role pair. There is one line per copy set, and the volumes in the copy set are separated by a comma (for example: ESS:2105.FCA57:VOL:17C7,ESS:2105.12043:VOL:17C7).

The following example illustrates the content of the CSV file for a FlashCopy session. Note that the first valid row must contain the appropriate role names for the session. The order of the copy sets does not matter, and you can include extra roles. A copy set is created from each row that follows the role names. All rows must have data in each column to be a valid row. Note that the number sign (#) indicates that the line is a comment. Lines that are comments are ignored.

```
#Session1,  
#FlashCopy,  
#Oct 2, 2009 10:03:18 AM  
  
H1,T1  
DS8000:2107.FRLL1:VOL:1004,DS8000:2107.FRLL1:VOL:1104  
DS8000:2107.FRLL1:VOL:1011,DS8000:2107.FRLL1:VOL:1101  
DS8000:2107.FRLL1:VOL:1005,DS8000:2107.FRLL1:VOL:1105
```

**Important:** You must manually save this file on the local system when you export copy sets from the Tivoli Storage Productivity Center for Replication Web interface.

## IBM Tivoli Storage Productivity Center for Replication database

Tivoli Storage Productivity Center for Replication database contains all product data, including data about storage systems, sessions, copy sets, paths, user administration and management servers. You can back up this data and use the backup file to recover from a disaster or restore a previous configuration.

**Important:** You must have Administrator privileges to back up and recover the database.

The current data is stored in a new file each time you create a backup. The backup file is named *yyyyMMdd\_HHmmsSSS.zip*, where *yyyy* is the year, *MM* is the month, *dd* is the day, *HH* is the hour, *mm* is the minute, *ss* is the seconds, *SSS* is the milliseconds when the backup command was run. It is your responsibility to delete backup versions that are no longer needed.

By default, the backup file is stored in the *WAS\_HOME/profiles/ReplicationServerProfile/database/backup* directory. You can change the default location by editing the **db.backup.location** property in the *rmserver.properties* file, which is located in the *WAS\_HOME/profiles/ReplicationServerProfile/properties* directory.

The backup file contains the Tivoli Storage Productivity Center for Replication database data at the time the backup was performed. Any changes that were made

after the backup are not reflected when the backup files are used to restore an IBM Tivoli Storage Productivity Center for Replication database. It is recommended that you create a new backup file:

- After changing the IBM Tivoli Storage Productivity Center for Replication database data, such as adding or deleting a storage system, changing properties, and changing user privileges
- After an IBM Tivoli Storage Productivity Center for Replication session changes direction. For example, if a Metro Mirror session was copying data from H1 to H2 when the backup was taken, and later, the session was started in the H2 to H1 direction. The session must be in the Prepared state before you create the backup.
- After a site switch has been declared and the Enable Copy To Site command has been issued. After you create a backup, consider deleting the previous backup to prevent IBM Tivoli Storage Productivity Center for Replication from starting the copy in the wrong direction.

When you create a backup, ensure that all IBM Tivoli Storage Productivity Center for Replication sessions are either in the Defined, Prepared or Target Available state.

Restoring the IBM Tivoli Storage Productivity Center for Replication database from a backup copy puts IBM Tivoli Storage Productivity Center for Replication back to the point in time when the backup was made. Relationships that exist on the storage systems that were created by IBM Tivoli Storage Productivity Center for Replication after the backup was made will no longer be managed by IBM Tivoli Storage Productivity Center for Replication until you add the copy set to the session and IBM Tivoli Storage Productivity Center for Replication assimilates the relationship into the session. Copy sets that were deleted after the backup will be restored and a subsequent Start command to the session will create new relationships; therefore, you must remove the deprecated copy sets before issuing the Start command.

After restoring a Global Mirror session, you must stop the Global Mirror master and subordinates before restarting the Global Mirror session. Refer to your DS6000 and DS8000 storage system documentation for more information.

## Backing up the IBM Tivoli Storage Productivity Center for Replication database

This topic describes how to create a backup of the IBM Tivoli Storage Productivity Center for Replication database, including data about storage systems, sessions, copy sets, user administration and management server configuration.

To back up the IBM Tivoli Storage Productivity Center for Replication database, run the **mkbackup** command from the command line, for example:

```
csmlcli> mkbackup
```

### Prerequisites:

- You must have Administrator privileges to run this command.
- This procedure applies to only the zero-administration embedded repository. This procedure *is not* applicable when DB2 is being used as the persistent data store for the IBM Tivoli Storage Productivity Center for Replication database. For information about restoring your DB2 environment, refer to your DB2 documentation.

By default, the backup file is stored in the `WAS_HOME/profiles/ReplicationServerProfile/database/backup` directory. You can change the default

location by editing the **db.backup.location** property in the `rmsserver.properties` file, which is located in the `WAS_HOME/profiles/ReplicationServerProfile/properties` directory.

## Restoring the IBM Tivoli Storage Productivity Center for Replication database

You can restore IBM Tivoli Storage Productivity Center for Replication database that was previously backed up to the local system.

### Important:

- Restoring the database does not require Administrator privileges. However, you must be able to access the files on the IBM Tivoli Storage Productivity Center for Replication server that are listed in the procedure.
- This procedure applies to only the zero-administration embedded repository. This procedure *is not* applicable when DB2 is being used as the persistent data store for the IBM Tivoli Storage Productivity Center for Replication database. For information about restoring your DB2 environment, refer to your DB2 documentation.

Perform these steps to restore the IBM Tivoli Storage Productivity Center for Replication database from a backed up version:

1. Stop IBM Tivoli Storage Productivity Center for Replication on the active management server by running the **stopServer** command from a command line.
2. Delete the `WAS_HOME/profiles/ReplicationServerProfile/database/csmdb` directory and all contents in it.
3. Uncompress the backup file into the `WAS_HOME/profiles/ReplicationServerProfile/database` directory.
4. If IBM Tivoli Storage Productivity Center for Replication is running on z/OS, change the permissions of the `csmdb` directory by running the following commands:
  - `chgrp -R $WAS_GROUP csmdb`
  - `chmod -R u+rwx csmdb`
  - `chmod -R g+rwx csmdb`
  - `chmod -R o+r csmdb`
5. Restart IBM Tivoli Storage Productivity Center for Replication on the active management server by running the **startServer** command from a command line.
6. Resolve any changes that might have occurred since the backup was created.
7. Start the IBM Tivoli Storage Productivity Center for Replication sessions using the appropriate start commands. The start commands reestablish the relationship between the volume pairs and synchronize data on those volumes.
8. If you have a standby management server, reestablish that standby relationship to update the database on the standby server.

## Exporting copy set data

You can export data about all copy sets in a specific session, to maintain a backup copy that can be used to recover if you lose your session or upgrade to a different server.

Perform these steps to export the copy sets in a specific session:

1. In the navigation tree, select **Sessions**. The Sessions panel is displayed
2. Select the session for which you want to export copy sets.

3. Select **Export Copy Sets** from the **Actions** list, and click **Go**. The Export Copy Set wizard displays the status of the export and a link to the exported file.
4. Click that link and save the file to the local system.

**Important:** You must save the file to your local system. After you close the panel, the data will be lost.

5. Click **Finish**.

### Importing copy set data

You can import copy set data that was previously exported to a comma separated value (CSV) file.

Perform the following steps to import copy sets into an existing session:

1. In the navigation tree, select **Sessions**. The Session panel is displayed.
2. Select the session for which you want to import copy sets.
3. Select **Add Copy Sets** from the **Actions** list, and click **Go**. The Add Copy Sets wizard is displayed.
4. Select **Use a CSV file to import copy sets**.
5. Type the location and name of the CSV file to import, or use **Browse** to select the file. Then, click **Next**.
6. Verify that the matching results were successful, and then click **Next**.
7. Select the copy sets you want to add, and then click **Next**.
8. Confirm the number of copy sets that you want to create, and click **Next**. A progress bar displays.
9. Click **Next**.
10. Verify the matches, and click **Finish**.

---

## Managing management servers

This section provides information about how to set up active and standby management servers, restore a lost connection between the management servers, or perform a takeover on the standby management server.

### Management servers

The *management server* is a system that has IBM Tivoli Storage Productivity Center for Replication installed. The management server provides a central point of control for managing data replication.

You can create a high-availability environment by setting up a *standby management server*. A standby management server is a second instance of Tivoli Storage Productivity Center for Replication that runs on a different physical system, but is continuously synchronized with the primary (or active) Tivoli Storage Productivity Center for Replication server. The active management server issues commands and processes events, while the standby management server records the changes to the active server. As a result, the standby management server contains identical data to the active management server and can take over and run the environment without any loss of data. If the active management server fails, you can issue the Takeover command to make the standby management server take over.

## Connecting the active management server to the standby management server

Ensure that the active management server is connected to the standby management server. This connection creates the *management server relationship* that begins the synchronization process. Each management server can be in only one management server relationship.

A management server relationship might become disconnected for a number of reasons, including a connectivity problem or a problem with the alternate server. Issue the Reconnect command to restore synchronization.

## Performing a takeover on the standby management server

If you must perform a takeover and use the standby server, ensure that you shut down the active management server first. You must ensure that you do not have two active management servers. If there are two active management servers and a condition occurs on the storage systems, both management servers respond to the same conditions, which might lead to unexpected behavior.

If you perform an action on the active management server when the servers are disconnected, the servers will be out of synch.

## Viewing the status of the management servers

You can view the status of the active and standby management servers from the Management Servers panel in the Tivoli Storage Productivity Center for Replication graphical user interface (GUI). If you are logged on to the active management server, the icons on this panel show the status of the standby management server. If you are logged on to the standby management server, the icons on this panel show the status of the active management server.

When the status is Synchronized, the standby management server contains the same data that the active management server contains. Any update to the active management server database is replicated to the standby server database.

## Managing volumes on storage systems

When you add direct connections, Hardware Management Console (HMC) connections, or z/OS connections on the active management server, Tivoli Storage Productivity Center for Replication automatically enables the management of attached extended count key data (ECKD<sup>™</sup>) volumes, non-attached count key data (CKD) volumes, and all fixed-block volumes on the storage system. To disable management of volumes on the storage system, use the volume protection function.

## Information specific to management servers in z/OS environments

If the standby management server is not in the active server z/OS sysplex, the standby server is not able to communicate with the storage systems using a z/OS connection; therefore, another connection must be made using a TCP/IP connection.

If DB2 is configured for data sharing mode across the z/OS sysplex, one of the Tivoli Storage Productivity Center for Replication servers must be configured to

use the zero-administration embedded repository. If the embedded repository is not used, the two servers will overwrite the same data in the Tivoli Storage Productivity Center for Replication database.

## SNMP alerts

This topic describes the SNMP alerts that are sent by IBM Tivoli Storage Productivity Center for Replication and the associated object IDs (OIDs).

SNMP alerts are sent during the following general events:

- Session state change
- Configuration change
- Suspending-event notification
- Communication failure
- Management Server state change

### Session state change SNMP trap descriptions

This topic lists the SNMP traps that are sent during a session state change. A different trap is sent for each state change. These alerts are sent by only the active management server.

A session state change SNMP trap is sent each time the session changes to one of the following states:

- Defined
- Preparing
- Prepared
- Suspended
- Recovering
- Flashing
- Target Available
- Suspending
- (Metro Global Mirror only) SuspendedH2H3
- (Metro Global Mirror only) SuspendedH1H3

An SNMP trap is also sent when a recovery point objective (RPO) threshold is exceeded for a role pair that is in the session.

*Table 54. Session state change traps*

Object ID (OID)	Description
1.3.6.1.4.1.2.6.208.0.1	The state of session X has transitioned to Defined.
1.3.6.1.4.1.2.6.208.0.2	The state of session X has transitioned to Preparing.
1.3.6.1.4.1.2.6.208.0.3	The state of session X has transitioned to Prepared.
1.3.6.1.4.1.2.6.208.0.4	The state of session X has transitioned to Suspended.
1.3.6.1.4.1.2.6.208.0.5	The state of session X has transitioned to Recovering.
1.3.6.1.4.1.2.6.208.0.6	The state of session X has transitioned to Target Available.
1.3.6.1.4.1.2.6.208.0.19	The state of session X has transitioned to Suspending.
1.3.6.1.4.1.2.6.208.0.20	The state of session X has transitioned to SuspendedH2H3.
1.3.6.1.4.1.2.6.208.0.21	The state of session X has transitioned to SuspendedH1H3.
1.3.6.1.4.1.2.6.208.0.22	The state of session X has transitioned to Flashing.
1.3.6.1.4.1.2.6.208.0.23	The state of session X has transitioned to Terminating.
1.3.6.1.4.1.2.6.208.0.26	The recovery point objective for the role pair of X in session Y has passed the warning threshold of Z seconds.

Table 54. Session state change traps (continued)

Object ID (OID)	Description
1.3.6.1.4.1.2.6.208.0.27	The recovery point objective for the role pair of X in session Y has passed the severe threshold of Z seconds.

**Related reference:**

“Session states” on page 769

You can view the health and status of a session in the Tivoli Storage Productivity Center for Replication GUI.

“Session properties” on page 771

You can view and modify the description and options for a session. The options that are presented depend on the storage system type and the session type that you select.

**Configuration change SNMP trap descriptions**

This topic lists the SNMP traps that are sent when the configuration changes. These alerts are sent by only the active management server.

Configuration change SNMP traps are sent after the following configurations changes are made:

- One or more copy sets have been added or deleted from a session  
 An alert is sent for each set of copy sets added to or removed from a session. Note that an alert for copy set changes is sent only once within 15 minutes of a configuration change, so you might not see alerts from successive changes that occur within that 15-minute period. For example, if you make a copy set configuration change that causes an alert to be sent at 10:41:01, and if you were to make additional copy set changes at 10:42:04 and 10:50:09, no alerts would be sent for these two changes because they occurred within the 15-minute minimum interval from the first alert.
- PPRC path definitions have been changed  
 An alert is sent for each path configuration change made.

Table 55. Configuration change traps

Object ID (OID)	Description
1.3.6.1.4.1.2.6.208.0.7	One or more copy sets have been added or deleted from this session. <b>Note:</b> An event is sent for each session at least every 15 minutes.
1.3.6.1.4.1.2.6.208.0.8	Peer-to-Peer Remote Copy (PPRC) path definitions have been changed. An event is sent for each path configuration change.

**Suspending-event notification SNMP trap descriptions**

These SNMP traps that are sent during a suspending-event notification. The traps are sent by the active and standby management server.

Suspending-event notification SNMP traps indicate that a session has transitioned to a Severe status due to an unexpected error.

Table 56. Suspending-event notification traps

Object ID (OID)	Description
1.3.6.1.4.1.2.6.208.0.9	The session is in a Severe state due to an unexpected error.

## Communication-failure SNMP trap descriptions

This topic lists the SNMP traps that are sent during a communication-failure. These alerts are sent by both the active and standby management servers.

Communication-failure SNMP traps are sent after the following events occur:

- A server times out attempting to communicate with a storage system.
- A server encounters errors attempting to communicate with a storage system.
- An active server terminates communication with a standby server as a result of communication errors.
- A standby encounters communication errors with an active server.

After an SNMP trap for a given failure is sent, it is not resent unless communication has been reestablished and failed again.

Table 57. Communication-failure traps

Object ID (OID)	Description
1.3.6.1.4.1.2.6.208.0.10	Server X has timed out attempting to communicate with storage system Y.
1.3.6.1.4.1.2.6.208.0.11	Server X has encountered errors attempting to communicate with storage system Y.
1.3.6.1.4.1.2.6.208.0.12	Active server X has terminated communication with standby server Y as a result of communication errors.
1.3.6.1.4.1.2.6.208.0.13	Standby server X has encountered communication errors with active server Y.

## Management Servers state-change SNMP trap descriptions

This topic lists the SNMP traps that are sent when the state of the management server changes. These alerts are sent by both the active and standby management servers.

A management server state change SNMP trap is sent each time the management server changes to one of the following states:

- Unknown
- Synchronization Pending
- Synchronized
- Disconnected Consistent
- Disconnected

Table 58. Management Servers state-change traps

Object ID (OID)	Description
1.3.6.1.4.1.2.6.208.0.14	The IBM Tivoli Storage Productivity Center for Replication Server Management Server connection X->Y has changed state to Unknown (previously Offline).
1.3.6.1.4.1.2.6.208.0.15	The IBM Tivoli Storage Productivity Center for ReplicationServer Management Server connection X->Y has changed state to Synchronized.
1.3.6.1.4.1.2.6.208.0.16	The IBM Tivoli Storage Productivity Center for Replication Server Management Server connection X->Y has changed state to Disconnected Consistent (previously Consistent Offline).

Table 58. Management Servers state-change traps (continued)

Object ID (OID)	Description
1.3.6.1.4.1.2.6.208.0.17	The IBM Tivoli Storage Productivity Center for Replication Server Management Server connection X->Y has changed state to Synchronization Pending.
1.3.6.1.4.1.2.6.208.0.18	The IBM Tivoli Storage Productivity Center for Replication Server Management Server connection X->Y has changed state to Disconnected.

## Setting up a standby management server

You can set up a standby management server in two ways: setting up the management server you are logged in to as the standby management server, or designating another server as the standby management server.

**Note:** When you define a standby management server, the IBM Tivoli Storage Productivity Center for Replication code must be at the same level on both the standby and active management servers.

### Setting the local management server as the standby server

This topic describes how to set the management server on which you are currently logged in as the standby management server.

**Attention:** When you set the local management server, the server you are logged in at will be wiped of all session information, and replaced with the session information belonging to the server you specified.

**Important:** The standby management server port number must be the same on both the management server and the standby management server in a high-availability relationship. If you change the standby management server port number on either the management server or the standby management server, you must also change the port number on the other server.

Perform these steps to set the local management server as the standby server:

1. In the navigation tree, select **Management Servers**.
2. From the **Action** menu, select **Set This Server as Standby**, and click **Go**. This opens the Set This Server As Standby panel.
3. Enter the domain name or IP address of the desired active management server.
4. Click **OK** to connect to the active server. You have now designated the server you are logged in at as the standby server.

### Setting a remote management server as the standby server

This topic describes how to set up a management server on which you are not logged in as the standby server.

**Attention:** When you set a remote management server as the standby server, the remote management server is wiped of all session information and replaced with the session information belonging to the management server you specified.

**Important:** The standby management server port number must be the same on both the management server and the standby management server in a high-availability relationship. If you change the standby management server port number on either the management server or the standby management server, you must also change the port number on the other server.

Perform these steps to set a remote management server as the standby server:

1. In the navigation tree, select **Management Servers**.
2. Select **Define Standby** from the drop-down menu, and click **Go**. The Define Standby panel appears.
3. Type the domain name or IP address of the server that you are defining as the new standby management server. Log in to the standby management server by entering the username and password.
4. Click **OK** to connect to the standby management server.

## Applying maintenance to an active management server

If an active management server develops a problem during an active session, you can reinstall Tivoli Storage Productivity Center for Replication on the server without affecting the session.

Follow these steps to reinstall Tivoli Storage Productivity Center for Replication on the active management server.

1. If the heartbeat is enabled, disable it:
  - a. In the navigation tree, select **Advanced Tools**.
  - b. Click **Disable Heartbeat**.
2. On the standby server, Server 2, issue a take-over. This makes Server 2 the active server. It is possible that the original active server, Server 1, is still listed on the Server 2 Management Servers page. If so, select **Remove Standby**.
3. Disable the heartbeat on Server 2, in case there are any problems.
4. Uninstall Tivoli Storage Productivity Center for Replication on Server 1.
5. Reinstall Tivoli Storage Productivity Center for Replication on Server 1.

**Note:** If no changes have been made to the configuration while Server 1 was being reinstalled, steps 6 and 7 are not necessary.

6. When Tivoli Storage Productivity Center for Replication is running on Server 1, log into Server 2 and set Server 1 as the standby server for Server 2.  
This step copies the configuration from Server 2 to Server 1. This process takes a few minutes.
7. When the management servers status is synchronized, issue a take-over on Server 1.  
This makes Server 1 an active server, able to control sessions.

**Note:** It is possible that Server 2 is still listed on the Server 1 Management Servers page. If this is the case, select **Remove Standby**.

8. Disable the heartbeat on Server 1 to make sure this active server does not have any problems.

**Note:** If you do not need to reinstall Tivoli Storage Productivity Center for Replication on Server 2, skip steps 9 and 10.

9. Uninstall Tivoli Storage Productivity Center for Replication from Server 2.
10. Reinstall Tivoli Storage Productivity Center for Replication on Server 2.
11. On Server 2, go to the Management Servers page and select the **Set This Server As Standby** option, entering the information for Server 1. When this step is complete, Server 1 is the active server, and Server 2 is the standby server.

12. When you are confident that the active server is running without any problems, enable the heartbeat again, if desired.

## Reconnecting the active and standby management servers

If the active and standby management servers become disconnected, reestablish that connection.

Perform these steps to cause the standby management server to become the active management server:

1. In the navigation tree, select **Management Servers**. The Management Servers panel is displayed.
2. Select **Reconnect** from the **Actions** list, and click **Go**.

## Performing a takeover on the standby management server

If the active management server fails, you can force the standby management server to take over monitoring and managing replication responsibilities.

**Important:** If the current active management server is still active, you must not attempt to control the replication environment simultaneously from both management servers. Instead, either reconfigure the current active management server to be a standby management server, or shut it down.

Perform these steps to cause the standby management server to become the active management server:

1. If the active management server is functioning, take it offline so you do not have two active management servers managing the same sessions.
2. Log in to the IBM Tivoli Storage Productivity Center for Replication Web interface running on the standby management server.
3. In the navigation tree, select **Management Servers**. The Management Servers panel is displayed.
4. Select **Takeover** from the **Actions** list, and click **Go**.
5. To reestablish high-availability, perform one of these steps:
  - Choose another server to be the standby management server. See instructions for setting up a standby management server.
  - Bring the failed management server back online, and then make that server the standby management server. See “Setting up a standby management server” on page 669.
  - Bring the failed management server back online, and then make that server the active management server to return to the original configuration. Repeat the steps in this section and then add the original standby server as the standby server.

**Important:** Do *not* use the **Reconnect** command if you perform a takeover. You would use the **Reconnect** command when the active server loses its connection with the standby server; it reconnects the two servers. Do *not* use the **Reconnect** command after a takeover to reconnect to the original active server.

## Configuring SNMP

The SNMP community name has a default value of `public`.

To change the community name, modify or add the **csn.server.snmp\_community\_string** property in the `rmserver.properties` file, which is located in the `WAS_HOME/profiles/ReplicationServerProfile/properties` directory.

## Adding SNMP managers

Use the **mksnmp** command to add an SNMP manager to the list of servers to which IBM Tivoli Storage Productivity Center for Replication sends SNMP alerts.

IBM Tivoli Storage Productivity Center for Replication uses management information base (MIB) files to provide a textual description of each SNMP alert sent by IBM Tivoli Storage Productivity Center for Replication. You must configure the SNMP manager to use both the `SYSAPPL-MIB.mib` and `ibm-TPC-Replication.mib` files. These MIB files are located in the `WAS_HOME/profiles/ReplicationServerProfile/etc` directory. Follow the directions provided by your SNMP manager application to configure it to use the MIB files.

**Tip:** You can also find the MIB files on the installation DVD in the `TPCRM/CSM-Client/etc` directory.

**Note:** IBM Tivoli Storage Productivity Center for Replication sends all SNMP alerts to each registered SNMP manager. SNMP alerts are not specific to any particular session, and all alerts for any session are sent. You cannot choose to send a subset of SNMP alerts.

## Changing the standby management server port number

The standby management server port is used for communication between the active and standby management server. This port is initially defined during the installation. You can manually change this port after installation.

**Important:** The standby management server port number must be the same on both the management server and the standby management server in a high-availability relationship. If you change the standby management server port number on either the management server or the standby management server, you must also change the port number on the other server.

1. Open the `rmserver.properties` file in the `WAS_HOME/profiles/ReplicationServerProfile/properties` directory.
2. Modify the port number for the following property:  
`communications.haPort=port_number`
3. Restart IBM Tivoli Storage Productivity Center for Replication. You must restart IBM Tivoli Storage Productivity Center for Replication to activate property changes. Properties are not synchronized between the IBM Tivoli Storage Productivity Center for Replication management servers and must be done on each IBM Tivoli Storage Productivity Center for Replication management server.

## Changing the client port number

The client port is used to log in to the graphical user interface and command line interface from a remote system. This port is initially defined during the installation. You can manually change this port after installation.

**Important:** The client port number must be the same on both the management server and the standby management server in a high-availability relationship. If

you change the client port number on either the management server or the standby management server, you must also change the port number on the other server.

1. Open the `rmserver.properties` file in the `WAS_HOME/profiles/ReplicationServerProfile/properties` directory.
2. Modify the port number for the following property:  
`communications.port=port_number`
3. Open the `repcli.properties` file in the `install_root/cli` directory.
4. Modify the port number for the following property:  
`port=port_number`
5. Restart IBM Tivoli Storage Productivity Center for Replication. You must restart IBM Tivoli Storage Productivity Center for Replication to activate property changes. Properties are not synchronized between the IBM Tivoli Storage Productivity Center for Replication management servers and must be maintained on each IBM Tivoli Storage Productivity Center for Replication management server.

---

## Managing storage systems

To replicate data among storage systems using IBM Tivoli Storage Productivity Center for Replication, you must add connections to the storage systems. After a storage system is added, you can associate a location, modify connection properties, set volume protection, and refresh the storage configuration for that storage system.

### Storage systems

A *storage system* is a hardware device that contains data storage. Tivoli Storage Productivity Center for Replication can control data replication within and between various storage systems.

To replicate data among storage systems using Tivoli Storage Productivity Center for Replication, you must manually add a connection to each storage system in the Tivoli Storage Productivity Center for Replication configuration. This allows you to omit storage systems for which Tivoli Storage Productivity Center for Replication is not to manage replication and omit storage systems that are being managed by another Tivoli Storage Productivity Center for Replication management server.

For redundancy, you can connect a single storage system using a combination of direct, Hardware Management Console (HMC), and z/OS connections.

You can use the following storage systems:

- IBM TotalStorage Enterprise Storage Server (ESS) Model 800
- IBM System Storage DS6000
- IBM System Storage DS8000
- IBM System Storage SAN Volume Controller
- IBM Storwize V7000
- IBM Storwize V7000 Unified
- IBM XIV Storage System

A System Storage SAN Volume Controller or Storwize V7000 can virtualize a variety of storage systems. Although Tivoli Storage Productivity Center for Replication does not support all storage systems, you can manage these storage systems through a single System Storage SAN Volume Controller or Storwize

V7000 cluster interface. Tivoli Storage Productivity Center for Replication connects directly to the System Storage SAN Volume Controller or Storwize V7000 clusters.

You can define a location for each storage system and for each site in a session. When adding copy sets to the session, only the storage systems whose location matches the location of the site are allowed for selection. This ensures that a session relationship is not established in the wrong direction.

**Notes:**

- Tivoli Storage Productivity Center for Replication does not automatically discover the physical locations of storage systems. You can manually assign a location to a storage system from the GUI and CLI.
- Throughout this document, *ESS/DS* refers to the following models:
  - IBM TotalStorage Enterprise Storage Server Model 800
  - IBM System Storage DS8000
  - IBM System Storage DS6000

## Storage connections

You must create a connection from the IBM Tivoli Storage Productivity Center for Replication management server to each storage system. You can connect either directly or through a Hardware Management Console (HMC) or IBM z/OS connection.

A single storage system can be connected using multiple connections for redundancy. For example, you can connect a IBM System Storage DS8000 storage system using an HMC connection and a z/OS connection. Tivoli Storage Productivity Center for Replication monitors how a storage system has been added to the configuration.

When you add a storage connection to the Tivoli Storage Productivity Center for Replication configuration, the storage system and the connection are added to the active management server configuration. For direct and HMC connections, the storage system and connection are also added to the standby management server configuration. For z/OS connections, only the storage system is added to the standby management server configuration. The connection is not added because the standby management server might not be running on z/OS and might not have access to the volumes on the storage system through a z/OS connection.

The storage systems are not required to be connected to the standby management server. However, if a storage system does not have a connection on the standby management server, you cannot manage copy services on the storage system from the standby server.

**Important:** If the Metro Mirror heartbeat is enabled, do not connect to a IBM TotalStorage Enterprise Storage Server Model 800, System Storage DS8000, or System Storage DS6000 storage system using both an HMC connection and a direct connection. If you have both types of connections and the direct connection is lost, the session changes to the suspended state even though the HMC connection is still valid. If both connections are lost and the session is in the suspended state, restart the session when connectivity is regained to synchronize the session with the hardware.

When Tivoli Storage Productivity Center for Replication is running on z/OS and a storage system is added to the Tivoli Storage Productivity Center for Replication

configuration through a TCP/IP (direct or HMC) connection, all ECKD volumes that are attached to the management server are managed through the TCP/IP connection. To use the Fibre Channel connection, you must explicitly add the storage system to the Tivoli Storage Productivity Center for Replication configuration through a z/OS connection.

If a storage system was previously added to the Tivoli Storage Productivity Center for Replication configuration through a z/OS connection and later the storage system is added through a TCP/IP connection, all non-attached ECKD volumes and fixed block volumes are added to the Tivoli Storage Productivity Center for Replication configuration.

When you remove a storage system, Tivoli Storage Productivity Center for Replication automatically removes all connections that the storage system is using with exception of the z/OS connection. You can also individually remove each connection through which the storage system is connected.

If Tivoli Storage Productivity Center for Replication has multiple connections to a specific storage system, the order in which you remove the connections produces different results:

- If you remove all direct and HMC connections first, the fixed block and non-attached ECKD volumes are removed from the Tivoli Storage Productivity Center for Replication configuration. The remaining ECKD volumes that are attached through the z/OS connection remain in the Tivoli Storage Productivity Center for Replication configuration until the z/OS connection is removed. Removing the TCP/IP connection also disables the Metro Mirror heartbeat.
- If you remove the z/OS connection first and if there is an HMC or direct connection to volumes, those volumes are not removed from the Tivoli Storage Productivity Center for Replication configuration.
- HyperSwap can run provided that volumes are attached and available to z/OS storage, even if you are using a TCP/IP connection to storage.

### **Direct connection**

By using a TCP/IP connection, the Tivoli Storage Productivity Center for Replication management server can connect directly to certain storage systems. The TCP/IP connection is required to discover a system's configuration (such as LSSs, volumes, volume size, and format), issue queries, and receive asynchronous events.

The Tivoli Storage Productivity Center for Replication management server can connect directly with the following systems:

- TotalStorage Enterprise Storage Server
- DS6000
- DS8000
- System Storage SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified
- The XIV system

DS8000 storage systems on an IPv4 network can be connected directly to the management server. A direct connection requires an Ethernet card in the cluster. DS8000 systems on an IPv6 network cannot use a direct connection. They can be connected only through an HMC or z/OS connection.

When you add a direct connection to a DS or ESS cluster, specify the following information for cluster 0 and 1:

- IP addresses or domain names
- Ports
- User names
- Passwords

System Storage SAN Volume Controller or Storwize V7000 can virtualize various storage systems. Although Tivoli Storage Productivity Center for Replication does not support all storage systems, you can manage these storage systems through a single System Storage SAN Volume Controller or Storwize V7000 cluster interface. Tivoli Storage Productivity Center for Replication connects directly to the System Storage SAN Volume Controller or Storwize V7000 clusters. When you add a direct connection to a System Storage SAN Volume Controller or Storwize V7000 cluster to the Tivoli Storage Productivity Center for Replication configuration, specify the cluster IP address of the System Storage SAN Volume Controller or Storwize V7000 cluster, which in turn points to multiple System Storage SAN Volume Controller or Storwize V7000 storage systems. Ensure that the user name and password are correct for the cluster. If incorrect values are used, significant communication problems can occur, such as never advancing to the Prepared state.

**Important:** The System Storage SAN Volume Controller or Storwize V7000 user name must have privileges to maintain SSH keys. For information about troubleshooting Secure Shell connections to the System Storage SAN Volume Controller or Storwize V7000, see the Ethernet Connection Restrictions on System Storage SAN Volume Controller website at [www-01.ibm.com/support/docview.wss?uid=ssg1S1002896](http://www-01.ibm.com/support/docview.wss?uid=ssg1S1002896).

### Hardware Management Console connection

The IBM Tivoli Storage Productivity Center for Replication management server can connect to DS8000 storage systems through a Hardware Management Console (HMC). An HMC can have multiple DS8000 storage systems connected to it. When you add an HMC to the IBM Tivoli Storage Productivity Center for Replication configuration, all DS8000 storage systems that are behind the HMC are also added. You cannot add or remove individual storage systems that are behind an HMC.

You can also add a dual-HMC configuration, in which you have two HMCs for redundancy. You must configure both HMCs identically, including the user ID and password.

If planned maintenance is necessary on the HMC, it is recommended that you disable the Metro Mirror heartbeat on the management server while the maintenance is performed.

If the HMC needs to go down frequently or reboots frequently, it is recommended that you disable the Metro Mirror heartbeat. If the Metro Mirror heartbeat is required, the direct connection is recommended instead of an HMC connection.

**Important:** If a DS8000 storage system uses an HMC connection, the Metro Mirror heartbeat could trigger a freeze on the storage system and impact applications for the duration of the long busy timeout timer if the HMC is shut down for any reason, including upgrading microcode. The long busy timeout timer is the time after which the storage system will allow I/O to begin again after a freeze occurs if no run command has been issued by Tivoli Storage Productivity Center for Replication. The default value is two minutes for ECKD volumes or one minute for fixed block volumes.

**Notes:**

- The user ID that you use to connect to the HMC must have admin, op\_storage, or op\_copy\_services privileges on the DS8000 storage system. In addition, the user ID must have Copy Services access to any volumes that are in resource groups on the DS8000 storage system.
- For minimum microcode requirements to connect to a DS8000 through a management console, see the Supported Storage Products List website at [www-01.ibm.com/support/docview.wss?uid=swg21386446](http://www-01.ibm.com/support/docview.wss?uid=swg21386446).

**z/OS connections**

An IBM Tivoli Storage Productivity Center for Replication management server that runs on z/OS can connect to IBM TotalStorage Enterprise Storage Server (ESS) Model 800, DS8000, and DS6000 storage systems through a z/OS connection. The z/OS connection is used to issue replication commands and queries for attached ECKD volumes over an existing Fibre Channel network and to receive asynchronous events. When a storage system is added to IBM Tivoli Storage Productivity Center for Replication through the z/OS connection, all ECKD volumes that are attached to the IBM Tivoli Storage Productivity Center for Replication management system are added to the IBM Tivoli Storage Productivity Center for Replication configuration. ECKD volumes that are not attached to the IBM Tivoli Storage Productivity Center for Replication z/OS management server are not added to the IBM Tivoli Storage Productivity Center for Replication configuration through the z/OS connection.

**Notes:**

- Ensure that all volumes in the logical storage subsystem (LSS) that you want to manage through a z/OS connection are attached to z/OS. Either the entire LSS must be attached to z/OS or none of the volumes in the LSS should be attached to z/OS for IBM Tivoli Storage Productivity Center for Replication to properly manage queries to the hardware.
- The z/OS connection is limited to storage systems that are connected to an IBM Tivoli Storage Productivity Center for Replication management server running z/OS.
- The Metro Mirror heartbeat is not supported through the z/OS connection. To use the Metro Mirror heartbeat, the storage systems must be added using a direct connection or Hardware Management Console (HMC) connection. If the Metro Mirror heartbeat is enabled, a storage system is added through a direct connection and z/OS connection, and the direct connection becomes disconnected, then a suspend results as there is no heartbeat through the z/OS connection.

If at least one volume in a Logical Storage Subsystem (LSS) is attached through a z/OS connection, then all volumes in that LSS must be similarly attached. For example, if there are two ECKD volumes in an LSS, and one volume is attached to the IBM Tivoli Storage Productivity Center for Replication system using a z/OS connection and the other is attached through a direct connection, IBM Tivoli Storage Productivity Center for Replication would have knowledge of direct-connected volume. IBM Tivoli Storage Productivity Center for Replication issues commands to both volumes over the Fibre Channel network; however, commands issued to the direct-connection volume will fail, and IBM Tivoli Storage Productivity Center for Replication will show that the copy set that contains that volume has an error.

Use the following guidelines to add storage systems through a z/OS connection:

- Use the z/OS connection to manage ECKD volumes that are attached to an IBM Tivoli Storage Productivity Center for Replication management server running z/OS.
- To manage z/OS attached volumes through a z/OS connection (for example, for HyperSwap), you must explicitly add the z/OS connection for that storage system in addition to a TCP/IP connection (either the direct connection or the HMC connection).
- Create a z/OS connection before all TCP/IP connections if you want to continue to have IBM Tivoli Storage Productivity Center for Replication manage only the attached ECKD volumes.

**Tip:** It is recommended that you create both TCP/IP and z/OS connections for ECKD volumes to allow for greater storage accessibility.

## Protected volumes

You can mark volumes as protected if you do not want those volumes used for replication.

When a volume is marked as protected, you cannot include that volume in a copy set. This protection applies only to IBM Tivoli Storage Productivity Center for Replication.

You might want to protect a volume in the following instances:

- The volume contains data that you never want to be copied to another volume. For example, the volume is secure, but if the data is copied to an unsecured volume, the data could be read. For this reason, the volume should not be the source for a relationship.
- The volume contains data that you do not want to be overwritten. For this reason, the volume should not be the target of a relationship.

Only administrators can change the volume protection settings.

## Site awareness

You can associate a location with each storage system and each site in a session. This *site awareness* ensures that only the volumes whose location matches the location of the site are allowed for selection when you add copy sets to the session. This prevents a session relationship from being established in the wrong direction.

**Note:** To filter the locations for site awareness, you must first assign a site location to each storage system.

IBM Tivoli Storage Productivity Center for Replication does not perform automatic discovery of locations. Locations are user-defined and specified manually.

You can change the location associated with a storage system that has been added to the IBM Tivoli Storage Productivity Center for Replication configuration. You can choose an existing location or add a new one. Locations are deleted when there is no longer a storage system with an association to that location.

When adding a copy set to a session, a list of candidate storage systems is presented, organized by location. Storage systems that do not have a location are displayed and available for use when you create a copy set.

You can also change the location for any site in a session. Changing the location of a session does not affect the location of the storage systems that are in the session.

Changing the location of a storage system might have consequences. When a session has a volume role with a location that is linked to the location of the storage system, changing the location of the storage system could change the session's volume role location. For example, if there is one storage system with the location of A\_Location and a session with the location of A\_Location for its H1 role, changing the location of the storage system to a different location, such as B\_Location, also changes the session's H1 location to Site 1. However, if there is a second storage system that has the location of A\_Location, the session's role location is not changed.

**Important:** Location matching is enabled only when adding copy sets. If you change the location of a storage system or volume role, IBM Tivoli Storage Productivity Center for Replication does not audit existing copy sets to confirm or deny location mismatches.

## Adding a storage connection

You can add one or more connections to a storage system. To replicate data among storage systems by using Tivoli Storage Productivity Center for Replication, you must add connections to the storage systems.

**Prerequisites:** You must have Administrator privileges to add a storage connection.

A single storage system can be connected by a combination of direct, management-console, and z/OS connections. Perform these steps to add a storage system connection:

1. In the navigation tree, select **Storage Systems**. The Storage Systems panel is displayed in the Storage Systems view.
2. Click **Add Storage Connection**. The Add Storage System wizard Type page is displayed.
3. Select the connection type that you want to use to add the storage systems and click **Next**. The Connection page is displayed.
4. Perform one of these steps depending on the type of storage connection that you selected:
  - **DS8000 / ESS 800 / DS6000 (Direct Connection):** Enter the IP address or domain name, port number, user name, and password for both cluster 0 and cluster 1 in the appropriate fields.  
  
In a System Storage DS8000 environment, if resource groups are defined on the System Storage DS8000 that you are connecting to, the user name you define here must have the appropriate access level on the System Storage DS8000 to manage copy services for the volumes that are used by Tivoli Storage Productivity Center for Replication.
  - **DS8000 (HMC Connection):** Enter the primary HMC IP address or domain, user name, password, and optionally the secondary HMC IP address or domain name in the appropriate fields.
  - **SAN Volume Controller / Storwize V7000 / Storwize V7000 Unified (Direct Connection):** Enter the cluster IP address or domain name, user name, and password in the appropriate fields.

The following are considerations for connection:

- a. Authentication with the storage system cluster is performed by public key exchange. When adding a storage system cluster to the Tivoli Storage Productivity Center for Replication configuration, specify the user ID and password of an administrator on the cluster that has sufficient privileges to maintain the Secure Shell (SSH) keys.
  - b. When a valid user name and password are specified, Tivoli Storage Productivity Center for Replication audits the public keys installed on the storage system cluster to ensure that the Tivoli Storage Productivity Center for Replication key has the correct access levels. If the key is not installed on the cluster, Tivoli Storage Productivity Center for Replication attempts to install the key. If you install the key yourself, install the public key found in the `WAS_HOME/profiles/ReplicationServerProfile/etc` directory on the storage system cluster by using the SSH Key Maintenance panel on the storage system graphical user interface. The public key ID is installed under `tpcr`.
  - c. You must use a storage system cluster superuser user name and password to correctly receive indications from the storage system cluster.
  - d. For Storwize V7000, Storwize V7000 Unified, or SAN Volume Controller version 5.0 or later, you must create a user ID through the storage system administration console on the cluster to which you want to attach Tivoli Storage Productivity Center for Replication. This user ID must have local authentication type and have the Administrator role authority.
- **XIV (Direct Connection):** Enter the IP address or domain name of the XIV system node. Enter a user name and password of a user with appropriate access rights to the XIV system.
  - **z/OS (FICON Connection):** Select one or more storage systems from the list of candidate systems that match the selected storage type, or click **All** to select all storage systems.

5. Click **Next**.

6. Click **Finish**.

**Related information:**

## Removing a storage connection

You can remove a single connection to a storage system from the IBM Tivoli Storage Productivity Center for Replication configuration.

**Prerequisites:** You must have Administrator privileges to remove a storage connection.

When removing a connection, the storage system might have other connections and therefore still be connected to IBM Tivoli Storage Productivity Center for Replication.

When removing a connection, all storage systems that rely on only that connection are removed. If a storage system is removed, the volumes for that storage system are removed from management server control. All copy sets with a volume on the removed storage systems are also removed from their respective sessions, making the target volume unrecoverable.

If Tivoli Storage Productivity Center for Replication has multiple connections to a specific storage system, the order in which you remove the connections produces different results:

- If you remove all direct and HMC connections first, the fixed block and non-attached ECKD volumes are removed from the Tivoli Storage Productivity Center for Replication configuration. The remaining ECKD volumes that are attached through the z/OS connection remain in the Tivoli Storage Productivity Center for Replication configuration until the z/OS connection is removed. Removing the TCP/IP connection also disables the Metro Mirror heartbeat.
- If you remove the z/OS connection first and if there is an HMC or direct connection to volumes, those volumes are not removed from the Tivoli Storage Productivity Center for Replication configuration.
- HyperSwap can run provided that volumes are attached and available to z/OS storage, even if you are using a TCP/IP connection to storage.

Perform one of these procedures to remove a storage connection:

1. In the navigation tree, select **Storage Systems**. The Storage Systems panel is displayed in the Storage Systems view.
2. Click the **Connections** tab.
3. Select the storage connection that you want to remove.

**Important:** If you choose to delete an HMC connection, all storage systems that share the HMC connection will also be removed.

4. Select **Remove Connection** from the **Actions** list, and click **Go**.
5. Click **Yes** to remove the storage system.

## Removing a storage system

You can remove a storage system from the IBM Tivoli Storage Productivity Center for Replication configuration.

**Prerequisites:** You must have Administrator privileges to remove a storage system.

Removing a storage system removes all volumes on that storage system from management server control. All copy sets with a volume on the removed storage system are removed from their respective sessions, making the target volume unrecoverable. All connections to the removed storage system are removed, and any storage systems sharing these connections are also removed.

Perform these steps to remove a storage system:

1. In the navigation tree, select **Storage Systems**. The Storage Systems panel is displayed in the Storage Systems view.
2. Select the storage system that you want to remove.

**Important:** All connections to this storage system will be removed, all volumes on the storage system will be removed from management server control, and all copy sets that have a volume on this storage system will be removed from their respective sessions, leaving the target volume unrecoverable. Any storage systems sharing these connections will be removed as well.

3. Select **Remove Storage System** from the **Actions** list, and click **Go**.
4. Click **Yes** to remove the storage system.

## Modifying the location of storage systems

You can associate a location with a storage system after a connection has been made to that storage system.

**Prerequisites:** You must have Administrator privileges to modify the location of a storage system.

Changing the location of a storage system might have consequences. When a session has a volume role with a location that is linked to the location of the storage system, changing the location of the storage system could change the session's volume role location. For example, if there is one storage system with the location of A\_Location and a session with the location of A\_Location for its H1 role, changing the location of the storage system to a different location, such as B\_Location, also changes the session's H1 location to Site 1. However, if there is a second storage system that has the location of A\_Location, the session's role location is not changed.

Perform these steps to modify the location of a storage system:

1. In the navigation tree, select **Storage Systems**. The Storage Systems panel is displayed in the Storage Systems view.
2. Change the location of the storage system by selecting a previously defined location from the drop-down list or type a new name in the table cell.  
To disable site awareness, set the location to None.

**Note:** Locations are deleted from the drop-down list when there is no longer a storage system with an association to that location.

## Modifying storage connection properties

You can modify the connection properties for a storage system, including IP addresses, user name and password.

### Prerequisites:

- You must have Administrator privileges to modify storage connection properties.
- The storage system must be in the Disconnected state to change most storage connection parameters. You can add a secondary HMC to an existing HMC connection without the HMC being disconnected.

A storage system can lose connection to the management server, for example, if a port is blocked by a firewall or the user name or password is changed on the storage system. If the storage system loses connection, you might need to modify parameters (for example, user name or password) manually on the storage system, and then update the parameters in IBM Tivoli Storage Productivity Center for Replication.

Perform these steps to modify storage connection properties:

1. In the navigation tree, select **Storage Systems**. The Storage Systems panel is displayed in the Storage Systems view.
2. Click the **Connections** tab.
3. Perform one of these steps to view details for a specific storage connection:
  - Click the storage connection ID.
  - Select the storage connection, click **View/modify Connection Details** from the actions list, and then click **Go**.
4. Modify the appropriate settings match the settings for the storage system.
5. Click **Apply** to continue making changes, and click **OK** when finished.

## Refreshing the storage system configuration

You can refresh the storage system configuration to query the storage system for changes, such as which volumes are contained in an LSS. You might do this when you reconfigure a storage system and you want IBM Tivoli Storage Productivity Center for Replication to be aware of the changes.

**Prerequisites:** You must have Administrator privileges to modify storage connection settings.

Perform these steps to refresh the storage configuration:

1. In the navigation tree, select **Storage Systems**. The Storage Systems panel is displayed in the Storage Systems view.
2. Select the storage system for which you want to refresh the configuration.
3. Select **Refresh Configuration** from the **Actions** list, and click **Go**.

## Setting volume protection

To ensure that data on a volume is not overwritten, you set its status to protected. Protected volumes are excluded from replication.

You must have Administrator privileges to change the protection setting of a volume.

1. In the navigation tree, select **Storage Systems**. The Storage Systems page is opened.
2. Click **Volume Protection**. The Volume Protection wizard is opened.
3. Select a storage system.
4. Optional: Depending on the type of storage system:
  - a. Select **All IO Groups** or a specific I/O group.
  - b. Select **All Logical Storage Subsystems** or a specific logical storage subsystem.
  - c. Select **All Pools** or a specific pool.
5. Optional: In the **Volume** field, select a single volume.
6. Optional: In the **Volume Mask** field, enter a sequence of characters and wildcards that match user-defined or system-defined volume IDs. To protect a specific volume, enter the volume ID such as `ESS:2105.FCA57:VOL:1000`. To use a pattern to retrieve one or more volume IDs, you can enter a partial volume ID and use the wildcard character (\*) to represent zero or more characters. For example, to retrieve all volume IDs that contain the characters `FCA57`, you enter `*FCA57*`.
7. Click **Next**.
8. Verify the search results, and click **Next**.
9. Click **Select All** to protect all the volumes. Alternatively, select a check box next to the volumes that you want to protect.
10. Click **Next**.
11. Click **Finish**.

## Restoring data from a journal volume

This topic provides information on restoring data from a journal (J) volume. It describes how to restore data from journal volume used as part of a ESS/DS6000/DS8000 Global Mirror session, or as part of a Metro Global Mirror

session, if data was corrupted on a host volume after you issued a **Recover** command. Following these steps will enable you to return to a consistent copy of the data on the host volume.

Perform the following steps to move the data from the journal volume back to the host volume:

**Note:** Follow these instructions only if you have already issued a **Recover** command to the site containing the journal volume. After the **Recover** command is issued, the journal volume will hold a copy of the consistent data at the time the command was issued.

1. Outside of IBM Tivoli Storage Productivity Center for Replication, using the DS8000 GUI /CLI, issue withdraw initiate background copy (issue a **rmflash -cp** command) on pairs containing the journal volume (for example, H2J2). This copies the remaining uncopied tracks from the host to the journal. Then, ensure all the Out of Sync (OOS) tracks reach zero.
2. Create a separate FlashCopy session either with IBM Tivoli Storage Productivity Center for Replication, or with the DS8000 GUI /CLI (issue a **mkflash** command with background copy), with the following conditions:
  - The journal volume (Jx) is the source volume.
  - The host volume (Hx or Ix if using a session with Practice capabilities) is the target volume.
  - x is the site the **Recover** command was issued to.

---

## Managing host systems

*Host system* refers to an IBM AIX 5.3 or 6.1 server that is connected to IBM System Storage DS8000 devices. A connection from Tivoli Storage Productivity Center for Replication to the host system is used to enable the automatic swap of input/output (I/O) from the primary storage unit to the secondary storage unit in the case of a primary error.

A connection to the host system is required to use the Tivoli Storage Productivity Center for Replication Open HyperSwap feature. For the software and hardware required to support Open HyperSwap, see “Setting up the environment for Open HyperSwap” on page 100.

Connecting to a host system requires the IP address or host name of the system and the port number for communication. All connections are secured via a Secure Socket Layer (SSL) connection.

**Restriction:** Open HyperSwap is not supported for AIX host servers that are in a clustered environment such as PowerHA (previously known as HACMP).

**Related tasks:**

“Managing a session with HyperSwap and Open HyperSwap replication” on page 99

HyperSwap and Open HyperSwap provide high availability of data if a primary disk storage system failure occurs. When a failure occurs in writing I/O to the primary storage system, the failure is detected by IOS, and IOS automatically swaps the I/O to the secondary site with no user interaction and minimal application effect.

## Adding a host system connection

You can add a connection to one or more host systems to the IBM Tivoli Storage Productivity Center for Replication configuration.

**Prerequisites:** You must have Administrator privileges to add a host system connection.

For the software and hardware required to support Open HyperSwap, see “Setting up the environment for Open HyperSwap” on page 100.

Perform these steps to add a host system connection:

1. In the navigation tree, select **Host Systems**. The Host Systems panel is displayed.
2. Click **Add Host Connection**. The Add Host Connection dialog box is displayed.
3. Enter the host name or IP address and the port for the host system and click **Add Host**. The host system is displayed on the Host Systems panel. The default port is 9930. Unless the port has been modified in Subsystem Device Driver Path Control Module (SDDPCM), use the default port.

The host system is displayed in the Host System table. If the connection is successful, the status **Connected** is displayed for the connection. If the connection was not successful, the status **Disconnected** is displayed.

## Modifying a host system connection

You can modify host system connections in the IBM Tivoli Storage Productivity Center for Replication configuration.

**Prerequisites:** You must have Administrator privileges to modify a host system connection and the connection must be in a disconnected state.

Perform these steps to modify a host system connection:

1. In the navigation tree, select **Host Systems**. The Host Systems panel is displayed.
2. Select the host system connection that you want to modify.
3. Select **Modify Host Connection** from the **Select Action** list, and click **Go**.
4. Modify the information that is presented for the host system and click **Update Host**. The updated host system information is displayed on the Host Systems panel.

The updated host system information is displayed in the Host System table. If the connection is successful, the status **Connected** is displayed for the connection. If the connection was not successful, the status **Disconnected** is displayed.

## Removing a host system connection

You can remove host system connections from the IBM Tivoli Storage Productivity Center for Replication configuration.

**Prerequisites:** You must have Administrator privileges to remove a host system.

Removing a host system connection disables the ability to use Open HyperSwap. Any session using the host system to provide Open HyperSwap capabilities can no longer communicate with the host and Open HyperSwap is disabled for the entire session.

Perform these steps to remove a host system connection:

1. In the navigation tree, select **Host Systems**. The Host Systems panel is displayed.
2. Select the host system connection that you want to remove.
3. Select **Remove Host Connection** from the **Select Action** list, and click **Go**.
4. Click **OK** to remove the host system connection.

## Removing a session from a host system connection

You can remove a session that is associated with a host system from the IBM Tivoli Storage Productivity Center for Replication configuration. Once removed, the host no longer recognizes the session that is managing the volumes attached to that host. This function is to be used primarily for cleanup purposes.

When a session has Open HyperSwap enabled, the session communicates with the host system and the host system stores an association to that session on the IBM Tivoli Storage Productivity Center for Replication server. If the Tivoli Storage Productivity Center for Replication server that made the association becomes inaccessible, it might be necessary to clean up and remove the session association from a different Tivoli Storage Productivity Center for Replication server.

If a host system has an associated session, the session name is displayed in the **Sessions** column of the Host Systems table. If the session is a session that is currently defined on the Tivoli Storage Productivity Center for Replication server, the session name is displayed as a link. The link opens the Session Details panel.

If the session name is not a session on the server, an icon is displayed. This session must be removed because the host system can support only a single session association. The session association must be removed before a Tivoli Storage Productivity Center for Replication server can re-establish capabilities with the host system.

**Prerequisites:** You must have Administrator privileges to remove a host system.

Perform these steps to remove session association from a host system connection:

1. In the navigation tree, select **Host Systems**. The Host Systems panel is displayed.
2. Select the host system connection that contains the session that you want to remove.
3. Select **Remove Session Association** from the **Select Action** list, and click **Go**.
4. Click **OK** to remove the host system connection.

The session name is removed from the **Session** column on the Host Systems table.

---

## Managing logical paths

Logical paths define the relationship between a source logical subsystem (LSS) and a target LSS that is created over a physical path. To configure logical paths for TotalStorage Enterprise Storage Server, System Storage DS8000, and DS6000, use the ESS/DS Paths panel in Tivoli Storage Productivity Center.

To configure partnerships for the following storage systems, use the graphical user interface (GUI) or command-line interface (CLI):

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified
- The XIV system

## Viewing logical paths

You can view all logical paths that are defined on an IBM TotalStorage Enterprise Storage Server, IBM System Storage DS8000, or IBM System Storage DS6000 storage system.

Perform one of these procedures to view logical paths:

- From the ESS/DS Paths panel of IBM Tivoli Storage Productivity Center for Replication:
  1. In the navigation tree, select **ESS/DS Paths**. The ESS/DS Paths panel is displayed.
  2. Click the storage system ID to display logical paths for that storage system.
- From the Storage Systems panel:
  1. In the navigation tree, select **Storage Systems**. The Storage Systems panel is displayed in the Storage Systems view.
  2. Select an ESS, DS6000, or DS8000 storage system for which you want to view logical paths.
  3. Select **View Paths** from the **Select Action** list, and click **Go**. The ESS/DS Paths panel is displayed with a list of defined logical paths.

## Adding logical paths

This topic describes how to add IBM TotalStorage Enterprise Storage Server, IBM System Storage DS8000, and IBM System Storage DS6000 logical paths.

Ensure that you have defined the appropriate storage systems on the Storage Systems panel.

Perform these steps to add logical paths:

1. In the IBM Tivoli Storage Productivity Center for Replication navigation tree, select **ESS/DS Paths**.
2. Click **Manage Paths**. The Path Management wizard is displayed.
3. From the drop-down boxes in the Path Management wizard, select the source storage system, source logical storage system, target storage system, and target logical storage system. Then, click **Next**.
4. From the drop-down boxes in the Path Management wizard, select the source port and target port and click **Add**. You can add multiple paths between the logical storage subsystems, or just one at a time. When you have made your selections, click **Next**.

5. Confirm your selections and click **Next**.
6. Verify the remaining wizard panels and click **Next**.
7. Click **Finish**.

## Adding logical paths using a CSV file

You can create a comma separated (CSV) file to define logical paths. The CSV file specifies storage systems pairings and associated port pairings that are used for replication. IBM Tivoli Storage Productivity Center for Replication uses the port pairings defined in the CSV file to establish logical paths

Perform these steps to add IBM TotalStorage Enterprise Storage Server, IBM System Storage DS8000, and IBM System Storage DS6000 logical paths using a CSV file:

1. Create a CSV file named `portpairings.csv` in the `WAS_HOME/profiles/ReplicationServerProfile/properties` directory. You can create the CSV file in a spreadsheet such as Microsoft Excel or in a text editor. An example CSV file is as follows:

```
#
# Example CSV file
#
2107.04131:2107.01532,0x0331:0x0024,0x0330:0x0100,0x0331:0x000C
2107.05131:2107.01532,0x0330:0x0029,0x0331:0x0001
```

Each line represents a storage system to storage system pairing. The first value represents the storage systems, which are delimited by a colon. The remaining values are the port pairs, which are delimited by a colon. All values are separated by a comma. Commented lines must start with #,

2. To enable the changes in the file, perform a task that requires new paths to be established. For example, suspend a session to remove the logical paths and then issue the **Start H1->H2** command to enable the paths to use the port pairings in the CSV file.

### Considerations when creating and using the CSV file:

- The CSV file does not affect Global Mirror control paths.
- Port mapping is bi-directional. A logical path is established from system A to system B and from system B to system A depending on the direction of the pairs on the hardware.
- If the CSV file contains multiple lines that specify the same storage system to storage system pairing, Tivoli Storage Productivity Center for Replication uses the last line. This rule applies regardless of the order of the storage system pairing. For example, if you have storage systems 2107.04131:2107.01532 defined on the first line of the CSV file and then have 2107.01532:2107.04131 defined on the second line, Tivoli Storage Productivity Center for Replication uses second line.
- If a line in the CSV contains information that is not formatted correctly, the line is ignored. This rule includes lines that specify storage systems but do not include ports or include ports that are not formatted correctly.
- If the CSV file contains valid and invalid port pairs, the valid port pairs might or might not be established. Invalid port pairs can cause the following errors to be displayed in the Tivoli Storage Productivity Center for Replication console and in the ESS/DS Paths panel:
  - Return Code F52: This error is displayed if a port is invalid.

- Return Code 0400: This error is displayed if a port is invalid and out of the range for the device.

Other storage system error codes might be displayed also, depending on the path topology, types of paths, and the incorrect port pairings specified in the CSV file.

- If the CSV file contains no valid port pairs, no logical paths are established and subsequent commands to the storage systems that require logical paths might fail. If there are existing logical paths for a storage system, those paths are used until they are removed.

## Removing logical paths

This topic describes how to remove IBM TotalStorage Enterprise Storage Server, IBM System Storage DS8000, and IBM System Storage DS6000 logical paths.

1. In the IBM Tivoli Storage Productivity Center for Replication navigation tree, select **ESS/DS Paths**.
2. Click the link for the storage system that contains the paths that you want to remove.
3. Select the paths that you want to remove.
4. From the drop-down box, select **Remove**.
5. Click **Go**.

---

## Setting up data replication

This topic describes the how to set up data replication in your environment, including creating sessions and adding copy sets to those sessions.

A *session* is a container of multiple copy sets managed by a replication manager. A *copy set* is a set of volumes that contain copies of the same data. All the volumes in a copy set are the same format (count key data [CKD] or fixed block) and size. In a replication session, the number of volumes in a copy set and the role that each volume in the copy set plays are determined by the session type.

## Sessions

A *session* is used to perform a specific type of data replication against a specific set of volumes. The source volume and target volumes that contain copies of the same data are collectively referred to as a copy set. A session can contain one or more copy sets.

The type of data replication that is associated with the session determines the actions that you can perform against all copy sets in the session, the number of volumes that a copy set can contain, and the role that each volume plays.

**Attention:** Use only the Tivoli Storage Productivity Center for Replication graphical user interface (GUI) or command-line interface CLI to manage session relationships, such as volume pairs and copy sets. Do not modify session relationships through other interfaces such as the System Storage DS CLI. If you modify relationships through other interfaces, a loss of consistency can across the relationships that are managed by the session. The exceptions to this requirement are failover operations that are managed by external applications for certain session and storage system types as described in “Failover and fallback operations” on page 695.

## Copy sets

During data replication, data is copied from a source volume to one or more target volumes, depending on the session type. The source volume and target volumes that contain copies of the same data are collectively referred to as a *copy set*.

Each volume in a copy set must be of the same size and volume type (for example, 3380 volumes must be used with other 3380 volumes and SAN Volume Controller volumes must be used with other SAN Volume Controller volumes). The number of volumes in the copy set and the role that each volume plays is determined by the session type (or copy type) that is associated with the session to which the copy set belongs.

Use the Add Copy Sets wizard to add copy sets to an existing session. You can select a storage system; a logical subsystem (LSS), I/O group, or pool; or single volume for each role and then create one or more copy sets for the session.

You can use one of the following volume pairing options to automatically create multiple copy sets in the same session.

### **Storage system matching (System Storage DS8000, System Storage DS6000, or TotalStorage Enterprise Storage Server Model 800 Metro Mirror sessions only)**

Creates copy sets by matching volumes (based on the volume IDs) across all logical subsystems (LSSs) for the selected storage systems. For example, volume 01 on the source LSS is matched with volume 01 on the target LSS.

You cannot select the storage system and select **All Logical Subsystems** in the list of LSSs. You can also do auto-matching at the LSS level for Metro Mirror sessions.

### **LSS, I/O group, or pool matching**

Creates copy sets by matching all volumes based on the selected LSS, I/O group, or pool for each role in copy set.

Select the storage system and LSS, I/O group, or pool, and then select **All Volumes** in the **Volume** list.

If you do not want to use the auto-generated volume pairing for a copy set, clear that copy set so that it is not added during the wizard. Then, add the remaining copy sets and reopen the Add Copy Set wizard and manually enter the volume pairings that you want.

Invalid copy sets are not added to the session. Copy sets can be invalid if their volumes are not the same type or size.

You can remove copy sets that you do not want to add to the session, even if they are valid. This process enables you to filter and eliminate unwanted copy sets before they are added to the session.

You can export the copy sets to take a snapshot of your session at a particular point in time for backup purposes.

**Note:** You can copy an entire storage system only for Metro Mirror sessions.

## **Considerations for adding copy sets**

When you create a copy set for a session, a warning is displayed if one or more of the selected volumes exist in another session. If the volume you selected is in another session, confirm whether you want to add the volume to this session.

Ensure that you intend to have the volume in multiple sessions because having the volume in multiple sessions can create conflicts. A scenario in which you would want the same volumes in multiple sessions is one in which you create a session for normal replication and then create another session for a disaster recovery practice. You must use the same target volumes in both sessions.

You can use extent space-efficient volumes as copy set volumes for the following System Storage DS8000 session types. Extent space-efficient volumes must be fixed block (FB). You cannot use count key data (CKD) volumes.

**FlashCopy (System Storage DS8000 6.2 or later)**

You can use a combination of extent space-efficient and other volume types as source and target volumes in the copy set.

**Metro Mirror (System Storage DS8000 6.3 or later)**

If you use an extent space-efficient volume as a source or target volume in the copy set, you must use extent space-efficient volumes for all source and target volumes in the copy set.

**Global Mirror or Metro Global Mirror (System Storage DS8000 6.3 or later)**

You can use extent space-efficient volumes as source, target, and journal volumes. If you use an extent space-efficient volume as a source or target volume in the copy set, you must use extent space-efficient volumes for all source and target volumes in the copy set. In this situation, the journal volumes can be extent space-efficient volumes, track space-efficient volumes, or a combination of both volume types. If extent space-efficient volumes are not used as source or target volumes, journal volumes can be extent space-efficient, track space-efficient, and other types of volumes.

## **Considerations for removing copy sets**

You remove a copy set or range of copy sets by selecting the following items:

- Source volume
- LSS, I/O group, or pool
- Storage system

When the list of copy sets that meet your criteria is displayed, you can select the copy sets that you want to remove.

The consequence of removing copy sets varies depending on the state of the session:

**Defined**

There is no relationship on the hardware. The copy set is removed from Tivoli Storage Productivity Center for Replication data store.

**Preparing or Prepared**

The copy set is currently copying data, so Tivoli Storage Productivity Center for Replication terminates the hardware relationship for the copy set. The rest of the copy sets continue to run uninterrupted.

**Suspended or Target Available**

Any existing relationships on the hardware are removed for the copy set.

Before removing all copy sets from that session, terminate the session. Removing the copy sets when the session is active can considerably increase the amount of time it takes for the copy set removal to complete. Copy sets are removed one at a time, and when the session is active, commands are issued to the hardware.

However, if you terminate the session first, then commands are not issued to the hardware and the removal process completes faster.

**Tip:** When you remove a copy set from Tivoli Storage Productivity Center for Replication, you might want to keep hardware relationships on the storage systems. These relationships are useful when you want to migrate from one session type to another or when resolving problems. For more information about keeping the hardware relationships when removing copy sets, see *Removing Copy Sets*.

The behavior that occurs when a copy set is removed varies depending on the storage system:

**ESS 800, DS6000, and DS8000:**

- The complete copy set is removed from Tivoli Storage Productivity Center for Replication.
- Any peer-to-peer remote copy (PPRC) pair that is part of a Global Mirror consistency group is removed from the consistency group on the storage system.
- If the PPRC pair is part of a Global Mirror consistency group and is the last remaining source volume in a subordinate session, the subordinate session is removed from the storage system.
- If the PPRC pair is the last remaining participant in a Global Mirror session, the Global Mirror session is removed from the storage system.
- Any PPRC relationship remains on the storage system.
- A Metro Mirror (synchronous PPRC) pair that is in a HyperSwap configuration is removed from that configuration but the pair remains on the hardware.
- FlashCopy relationship remains on the storage system if the hardware has not completed any background copy.

**SAN Volume Controller, Storwize V7000, Storwize V7000 Unified, or the XIV system**

- The complete copy set is removed from Tivoli Storage Productivity Center for Replication.
- FlashCopy, Metro Mirror, and Global Mirror relationships are pulled out of their consistency group. If they are the last remaining relationship in a consistency group, that consistency group is removed from the hardware.

When you specify the force removal option, all knowledge of the specified copy set is removed from Tivoli Storage Productivity Center for Replication, even if the relationship itself still exists. In this situation, you are not able to remove the relationship using Tivoli Storage Productivity Center for Replication, because no information about the relationship exists. If you force a removal of a copy set and the removal fails, you must manually remove the relationship from the hardware. If you do not, you cannot create new relationships.

One benefit of forcing a removal of the copy sets is that Tivoli Storage Productivity Center for Replication does not manage the consistency of copy sets that it has no knowledge of. This means that additional commands to the session do not affect the removed copy sets, even though they are still in a relationship on the hardware.

If you do not specify the force removal option and an error occurs that prevents the hardware relationships from being removed, the copy set is not removed from

Tivoli Storage Productivity Center for Replication. The copy set remains as part of the session, and you can still perform actions on it.

### **Volume roles**

Volume roles are given to every volume in the copy set. The role defines how the volume is used in the copy set and, for multi-site sessions, the site location of the volume. For example, the H1 role is made up of host-attached volumes that are located at the primary site.

The site determines the location of the volumes. The number of sites in a copy set is determined by the type of data replication (also known as the session type) that is associated with the session. Tivoli Storage Productivity Center for Replication supports up to three sites:

- Site 1** The location of the primary storage that contain the source data. Upon initial configuration, this site contains the host volumes with updates that are copied to the target volumes.
- Site 2** The location of the secondary storage that receives the copy updates from the primary storage.
- Site 3** (Metro Global Mirror only) The location of the tertiary storage that receives data updates from the secondary storage.

The volume roles that are needed in a copy set are determined by the type of replication that is associated with the session. Tivoli Storage Productivity Center for Replication supports these volume roles:

#### **Host volume**

A volume that is connected to a server that reads and writes I/O. A host volume can be the source of updated tracks when the server connected to the host volume is actively issuing read and write input/output (I/O). A host volume can also be the target of the replication. When the host volume is the target, writes are inhibited.

Host volumes are abbreviated as H $x$ , where  $x$  identifies the site.

#### **Journal volume**

A volume that stores data that has changed since the last consistent copy was created. This volume functions like a journal and holds the required data to reconstruct consistent data at the Global Mirror remote site. When a session must be recovered at the remote site, the journal volume is used to restore data to the last consistency point. A FlashCopy replication session can be created between the host or intermediate volume and the corresponding journal volume after a recover request is initiated to create another consistent version of the data.

Journal volumes are abbreviated as J $x$ , where  $x$  identifies the site.

#### **Intermediate volume**

A volume that receives data from the primary host volume during a replication with practice session. During a practice, data on the intermediate volumes is flash copied to the practice host volumes.

Depending on the replication method being used, data on intermediate volumes might not be consistent.

Intermediate volumes are abbreviated as I $x$ , where  $x$  identifies the site.

#### **Target volume**

(FlashCopy only) A volume that receives data from a source, either a host or intermediate volume. Depending on the replication type, that data

might or might not be consistent. A target volume can also function as a source volume. For example, a common use of the target volume is as a source volume to allow practicing for a disaster (such as data mining at the recovery site while still maintaining disaster recovery capability at the production site).

## Role pairs

A *role pair* is the association of two volume roles in a session that take part in a copy relationship. For example, in a Metro Mirror session, the role pair can be the association between host volumes at the primary site and host volumes at the secondary site (H1-H2).

The flow of data in the role pair is shown using an arrow. For example, H1>H2 denotes that H1 is the source and H2 is the target.

*Participating role pairs* are role pairs that are currently participating in the session's copy.

*Non-participating role pairs* are role pairs that are not actively participating in the session's copy.

Snapshot sessions do not use role pairs.

## Practice volumes

You can use a *practice volume* to practice what you would do in the event of a disaster, without interrupting current data replication. Practice volumes are available in Metro Mirror, Global Mirror, and Metro Global Mirror sessions.

To use the practice volumes, the session must be in the prepared state. Issuing the Flash command against the session while in the Prepared state creates a usable practice copy of the data on the target site.

**Note:** You can test disaster-recovery actions without using practice volumes; however, without practice volumes, you cannot continue to copy data changes between volumes while testing disaster-recovery actions.

## Consistency groups

For Global Mirror and Metro Global Mirror sessions, IBM Tivoli Storage Productivity Center for Replication manages the consistency of dependant writes by creating a consistent point-in-time copy across multiple volumes or storage systems. A *consistency group* is a set of target volumes in a session that have been updated to preserve write order and are therefore recoverable.

*Data exposure* is the period when data is written to the storage at the primary site until data is replicated to storage at the secondary site. Data exposure is influenced by factors such as:

- Requested consistency-group interval time
- Type of storage systems
- Physical distance between the storage systems
- Available bandwidth of the data link
- Input/output (I/O) load on the storage systems

To manage data exposure, you can change the consistency group interval time. The *consistency group time interval* specifies how often a Global Mirror and Metro Global Mirror session attempts to form a consistency group. When you reduce this value, it might be possible to reduce the data exposure of the session. A smaller interval

value causes the session to attempt to create consistency groups more frequently, which might also increase the processing load and message-traffic load on the storage systems.

## Failover and failback operations

If a session has *failover* and *failback* capabilities, you can perform a site switch in which you move the operation of Tivoli Storage Productivity Center for Replication from one site to another, and change the direction of the copy without completing a full copy.

Failover is the process of temporarily switching production to a backup facility following a scheduled maintenance period or a disaster at a production site. A failover operation can be followed by a failback operation, which is the process of returning production to its original location and resuming the copy between the two sites.

The failover and failback operations use remote mirror and copy functions for these tasks:

- To reduce the time that is required to synchronize volumes after switching sites during planned or unplanned outages.
- To eliminate the need to perform a full volume copy from the recovery site to the production site, which can reduce the time that is required to resume operations at the production site.

## Failover operations that are managed by other applications

Applications such as the IBM Series i Toolkit, VMware Site Recovery Manager, and Veritas Cluster Server can also manage failover operations for the session types that are listed in the following table.

Session type	Storage systems
Metro Mirror Single Direction	<ul style="list-style-type: none"> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• System Storage SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> </ul>
Metro Mirror Failover/Failback	<ul style="list-style-type: none"> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• System Storage SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> <li>• The XIV system</li> </ul>
Metro Mirror Failover/Failback with Practice	<ul style="list-style-type: none"> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• System Storage SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> </ul>

Session type	Storage systems
Global Mirror Single Direction	<ul style="list-style-type: none"> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• System Storage SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> </ul>
Global Mirror Either Direction with Two-Site Practice	<ul style="list-style-type: none"> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> </ul>
Global Mirror Failover/Failback	<ul style="list-style-type: none"> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• System Storage SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> <li>• The XIV system</li> </ul>
Global Mirror Failover/Failback with Practice	<ul style="list-style-type: none"> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• System Storage SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> </ul>

If an application completes a failover operation for a session, the Severe status is displayed for the session on the Session Details page in Tivoli Storage Productivity Center for Replication and an error message is generated for the role pairs for which the failover occurred. To view the error message:

1. On the Session Details page, click the link for each role pair for which the failover occurred.
2. On the Role Pair Details page, click the **Show** link for each role pair. This link is in the **Details** column.

To change the session status to Normal, use the application to confirm that the role pairs that are in the session are consistent and then restart the session.

## Data replication

With Tivoli Storage Productivity Center for Replication, you can use several methods to replicate data. The type of data replication that is associated with a session is known as the *session type*.

The following sections describe the session types that are supported by Tivoli Storage Productivity Center for Replication. Depending on the edition of Tivoli Storage Productivity Center for Replication that you are using, some of these session types might not be available.

### Basic HyperSwap

Basic HyperSwap sessions are available for the following license types and storage systems.

Table 59. Basic HyperSwap

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication Basic Edition for System z</li> <li>• Tivoli Storage Productivity Center for Replication for System z</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> </ul>	<p>Basic HyperSwap replication is a Metro Mirror replication method that provides high availability if a disk storage system failure occurs. Using Basic HyperSwap with Metro Mirror, you can configure and manage your synchronous Peer-to-Peer Remote Copy (PPRC) pairs.</p>

## FlashCopy

FlashCopy sessions are available for the following license types and storage systems.

Table 60. FlashCopy

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication Basic Edition for System z</li> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> </ul>	<p>FlashCopy replication creates a point-in-time copy in which the target volume contains a copy of the data that was on the source volume when the FlashCopy was established. Using FlashCopy, the data exists on the second set of volumes in the same storage system, and you can restore the data to the first set of volumes.</p> <p>SAN Volume Controller or Storwize V7000 FlashCopy sessions are managed by using FlashCopy consistency groups. Sessions for IBM TotalStorage Enterprise Storage Server (ESS) and IBM DS6000 and DS8000 are not managed by using FlashCopy consistency groups.</p>

## Snapshot

Snapshot sessions are available for the following license types and storage systems.

Table 61. Snapshot

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"><li>• Tivoli Storage Productivity Center for Replication Basic Edition for System z</li><li>• Tivoli Storage Productivity Center for Replication for System z</li><li>• All editions of Tivoli Storage Productivity Center</li></ul>	The XIV system	Snapshot is a session type that creates a point-in-time copy of a volume or set of volumes without having to define a specific target volume. The target volumes of a Snapshot session are automatically created when the snapshot is created.

## Metro Mirror Single Direction

Metro Mirror Single Direction sessions are available for the following license types and storage systems.

Table 62. Metro Mirror Single Direction

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"><li>• Tivoli Storage Productivity Center for Replication for System z</li><li>• All editions of Tivoli Storage Productivity Center</li></ul>	<ul style="list-style-type: none"><li>• TotalStorage Enterprise Storage Server Model 800</li><li>• System Storage DS8000</li><li>• System Storage DS6000</li><li>• SAN Volume Controller</li><li>• Storwize V7000</li><li>• Storwize V7000 Unified</li></ul>	Metro Mirror is a method of synchronous, remote data replication that operates between two sites that are up to 300 KM apart. The source is located in one storage system and the target is located in another storage system. Using Metro Mirror, the data exists on the second site that is less than 300 KM away, and you can restore the data to the first site.

## Metro Mirror Failover/Failback

Metro Mirror Failover/Failback sessions are available for the following license types and storage systems.

Table 63. Metro Mirror Failover/Failback

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> <li>• The XIV system</li> </ul>	<p>Metro Mirror is a method of synchronous, remote data replication that operates between two sites that are up to 300 KM apart. Using Metro Mirror Failover/Failback, the data exists on the second site that is less than 300 KM away. You can use failover and failback to switch the direction of the data flow. Using this method, you can run your business from the secondary site.</p> <p>Using Metro Mirror with HyperSwap, the data exists on the second site that is less than 300 KM away. You can restore the data to the first site. You can also use failover for a backup copy of the data if your primary volumes encounter a permanent I/O error.</p>

## Metro Mirror Failover/Failback with Practice

Metro Mirror Failover/Failback with Practice sessions are available for the following license types and storage systems.

Table 64. Metro Mirror Failover/Failback with Practice

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> </ul>	<p>Metro Mirror is a method of synchronous, remote data replication that operates between two sites that are up to 300 KM apart. The source is located in one storage system and the target is located in another storage system. Metro Mirror Failover/Failback with Practice combines Metro Mirror and FlashCopy to provide a point-in-time copy of the data on the remote site.</p>

## Global Mirror Single Direction

Global Mirror Single Direction sessions are available for the following license types and storage systems.

Table 65. Global Mirror Single Direction

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> </ul>	<p>Global Mirror is a method of asynchronous, remote data replication between two sites that are over 300 KM apart. It maintains identical data in both the source and target, where the source is located in one storage system and the target is located in another storage system. Using Global Mirror, the data exists on the second site that is more than 300 KM away, and you can restore the data to the first site.</p>

## Global Mirror Either Direction with Two-Site Practice

Global Mirror Either Direction with Two-Site Practice sessions are available for the following license types and storage systems.

Table 66. Global Mirror Either Direction with Two-Site Practice

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> </ul>	<p>Global Mirror is a method of asynchronous, remote data replication between two sites that are over 300 KM apart. It maintains identical data in both the source and target, where the source is located in one storage system and the target is located in another storage system. Global Mirror Either Direction with Two-Site Practice combines Global Mirror and FlashCopy to provide a point-in-time copy of the data on either the primary or secondary sites that are over 300 KM apart.</p>

## Global Mirror Failover/Failback

Global Mirror Failover/Failback sessions are available for the following license types and storage systems.

Table 67. Global Mirror Failover/Failback

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> <li>• The XIV system</li> </ul>	<p>Global Mirror is a method of asynchronous, remote data replication between two sites that are over 300 KM apart. It maintains identical data in both the source and target, where the source is located in one storage system and the target is located in another storage system. Using Global Mirror Failover/Failback, the data exists on the second site that is more than 300 KM away, and you can use failover and failback to switch the direction of the data flow. This ability enables you to run your business from the secondary site.</p>

## Global Mirror Failover/Failback with Practice

Global Mirror Failover/Failback with Practice sessions are available for the following license types and storage systems.

Table 68. Global Mirror Failover/Failback with Practice

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS8000</li> <li>• System Storage DS6000</li> <li>• SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> </ul>	<p>Global Mirror is a method of asynchronous, remote data replication between two sites that are over 300 KM apart. It maintains identical data in both the source and target, where the source is located in one storage system and the target is located in another storage system. Global Mirror Failover/Failback with Practice combines Global Mirror and FlashCopy to provide a point-in-time copy of the data on a remote site at a distance over 300 KM away from your first site.</p>

## Metro Global Mirror

Metro Global Mirror sessions are available for the following license types and storage systems.

Table 69. Metro Global Mirror

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800 (only H1 site)</li> <li>• System Storage DS8000</li> </ul>	<p>Metro Global Mirror is a method of continuous, remote data replication that operates between three sites that varying distances apart. Metro Global Mirror combines Metro Mirror synchronous copy and Global Mirror asynchronous copy into a single session, where the Metro Mirror target is the Global Mirror source. Using Metro Global Mirror and Metro Global Mirror with HyperSwap, the data exists on a second site that is less than 300 KM away, and a third site that is more than 300 KM away. Metro Global Mirror uses both Metro Mirror and Global Mirror Failover/Failback to switch the direction of the data flow. This ability enables you to run your business from the secondary or tertiary sites.</p> <p>Using Basic HyperSwap with Metro Global Mirror, you can configure and manage three-site continuous replication that is needed in a disaster recovery event.</p>

## Metro Global Mirror with Practice

Metro Global Mirror with Practice sessions are available for the following license types and storage systems.

Table 70. Metro Global Mirror with Practice

Supported software	Supported storage systems	Description
<ul style="list-style-type: none"> <li>• Tivoli Storage Productivity Center for Replication for System z</li> <li>• All editions of Tivoli Storage Productivity Center</li> </ul>	<ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800 (only H1 site)</li> <li>• System Storage DS8000</li> </ul>	<p>Using Metro Global Mirror with Practice, you can practice your disaster recovery actions while maintaining disaster recovery capabilities. The data exists on a second site that is less than 300 KM away, and a third site that is more than 300 KM away. Metro Global Mirror uses both Metro Mirror and Global Mirror Failover/Failback to switch the direction of the data flow. You can run your business from the secondary or tertiary sites, and simulate a disaster.</p>

## Basic HyperSwap (ESS, DS6000, and DS8000)

Basic HyperSwap is a copy services solution for z/OS version 1.9 and later. It provides high availability of data if a disk storage system failure occurs. Basic HyperSwap does not replace a disaster recovery solution. If a session is suspended but the suspend operation was not caused by a HyperSwap trigger, the session is not frozen to ensure that it is consistent.

When HyperSwap is combined with Metro Mirror and Metro Global Mirror replication, you can prepare your system for disaster recovery and ensure high availability of data. If a session is suspended but the suspend operation was not caused by a HyperSwap trigger, the session is frozen to ensure that it is consistent.

**Restriction:** This replication method is only available on ESS, DS6000, and DS8000 storage systems, and on management servers that run IBM Tivoli Storage Productivity Center for Replication Basic Edition for System z or IBM Tivoli Storage Productivity Center for Replication for System z.

Basic HyperSwap replication performs the following actions:

- Manages CKD volumes in Metro Mirror to manage synchronous peer-to-peer remote copy (PPRC) relationships.
- Permits only CKD volumes to be added to the HyperSwap session. The graphical user interface (GUI) shows only CKD volumes when you add a copy set. The command-line interface (CLI) does not add a copy set if a fixed block volume is specified.
- Monitors events that indicate a storage device failed.
- Determines whether the failing storage device is part of a Metro Mirror synchronous PPRC pair.
- Determines the action to be taken from policy.
- Ensures that data remains consistent.
- Swaps the I/O between the primary logical devices in the consistency group with the secondary logical devices in the consistency group. A swap can occur from the preferred logical devices to the alternate logical devices or from the alternate logical devices to the preferred logical devices.

## Metro Mirror Failover/Failback with HyperSwap

Metro Mirror Failover/Failback uses HyperSwap to configure and manage synchronous PPRC pairs.

## Metro Global Mirror with HyperSwap

Metro Global Mirror with HyperSwap is a z/OS replication feature that provides the three-site continuous replication that you can use if a disaster occurs.

**Restriction:** If a HyperSwap event occurs when you run a Metro Global Mirror operation with a HyperSwap session, a full copy operation of the data occurs to return the system to a full three-site configuration. If you issue a HyperSwap command when you run a Metro Global Mirror operation with a HyperSwap session, a full copy operation does not occur. A full copy is required only for an unplanned HyperSwap session or a HyperSwap-initiated session by using the z/OS **SETHS SWAP** command.

## Example

Jane is using multiple DS8000 storage systems. The host applications run on a z/OS operating system and the z/OS environment is connected to the DS8000 storage systems. She has a site in Manhattan and a secondary DS8000 in Hoboken. While it is not required that she has a disaster recovery solution in effect, she does need to have a high-availability solution to keep her applications running all the time. Jane is worried that if a volume fails on the DS8000 in Manhattan, her database application might fail. Even a small downtime can be costly to Jane.

Jane uses a Basic HyperSwap session to mirror the data on the DS8000 in Manhattan to the secondary DS8000 in Hoboken. If a volume at the Manhattan site fails, Basic HyperSwap automatically directs application I/O to the mirrored volumes in Hoboken.

## FlashCopy

FlashCopy replication creates a point-in-time copy in which the target volume contains a copy of the data that was on the source volume when the FlashCopy was established.

The ESS, DS6000, and DS8000 provide multiple logical subsystems (LSSs) within a single physical subsystem, while the following platforms provide multiple I/O groups:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

All platforms can use local replication in which the source volume is located in one LSS or I/O group and the target volume is located in the same or another LSS or I/O group. Using the FlashCopy feature, you can reference and update the source volume and target volume independently.

The following figure illustrates how a FlashCopy session works.

## Example

Jane works for a bank. Jane uses a FlashCopy session to make a point-in-time copy of the customer data in existing international accounts. Every night, the bank's servers start batch processing. Jane uses the FlashCopy session to create checkpoint restarts for the batch processing if the batch processing fails. In the batch processing, the first step is to balance all international accounts and to make a

FlashCopy point-in-time copy of the resulting data. The second step in the batch processing is to complete the international disbursements.

If the second step in the batch process fails, Jane can use the data from the FlashCopy session that was taken of the first step to repeat the second step. In this way, Jane does not have to begin the entire process again. Jane also uses a CLI script that performs a FlashCopy operation every night at 11:59 PM, and another script that quiesces the database. She backs up the data to tape on the target storage system, and then sends the tape to the bank's data facility for storage.

## Snapshot

Snapshot is a session type that creates a point-in-time copy of a volume or set of volumes. You do not have to define a specific target volume. The target volumes of a Snapshot session are automatically created when the snapshot is created.

The XIV system uses a snapshot session to create a large number of volume copies without affecting system performance. By using the snapshot function to create a point-in-time copy, and to manage the copy, you can save storage. With the XIV system snapshots, no storage capacity is used by the snapshot until the source volume or the snapshot is changed.

The following figure illustrates how a Snapshot session works.

## Example

Jane's host applications are using an XIV system for their back-end storage. With the XIV system, Jane can create a large number of point-in-time copies of the data. The snapshot function ensures that if data becomes corrupted, she can restore the data to any point in time.

Jane sets up a Snapshot session by using Tivoli Storage Productivity Center for Replication and specifies the volumes on the XIV system that are used by the host applications. Jane does not have to provision target volumes for all the snapshots she intends to make. She can quickly configure a single Snapshot session.

When the session is configured, Jane uses a CLI script that runs a **Create Snapshot** command to the session every two hours. If a problem occurs, such as data becoming corrupted, Jane can find a snapshot of the data from a time before the problem occurred. She can restore the data to that point.

By creating a set of snapshots of the data, Jane can also schedule batch processing against that data every day. She can use the batch processing to analyze certain trends in the market without affecting the host applications.

## Metro Mirror

Metro Mirror is a method of synchronous, remote data replication that operates between two sites that are up to 300 KM apart. The source is located in one storage system and the target is located in another storage system.

**Attention:** If you have Tivoli Storage Productivity Center for Replication for System z sessions that contain Metro Mirror relationships, ensure that the session does not contain system volumes (such as paging volumes) unless you select the **Manage H1-H2 with HyperSwap** or the **Enable Hardened Freeze** option for the session. By using these options, z/OS Input/Output Supervisor (IOS) manages freeze operations for the volumes in the session, which prevents Tivoli Storage Productivity Center for Replication from freezing the volumes and possibly freezing itself.

Metro Mirror replication maintains identical data in both the source and target. When a write operation is issued to the source copy, the changes made to the source data are propagated to the target before the write operation finishes processing. If the storage system ends, no data is lost when you use Metro Mirror if data must be used from the recovery site.

A Metro Mirror session in Global Copy mode creates an asynchronous relationship to accommodate the high volume of data that is migrated. As a result, the data on the target system might no longer be consistent with the source system. The Metro Mirror session switches back to a synchronous relationship when Metro Mirror reissues a **Start** command. In addition, you can start a Metro Mirror session in Global Copy mode and toggle between Metro Mirror and Global Copy modes to accommodate periods in which you require host I/O response time over data consistency.

**Tip:** To determine whether there is any out-of-sync data that must be copied before the session is consistent, check the percent that is complete in the session details page.

### Metro Mirror Single Direction

The following figure illustrates how a Metro Mirror Single Direction session works.

### Metro Mirror Failover/Failback

Using Metro Mirror Failover/Failback, the data exists on the second site, which is less than 300 KM away, and you can switch the direction of the data flow. You can use this session type to run your business from the secondary site, and to copy changes made at the second site back to the primary site when you want to resume production at the primary site.

The following figure illustrates how a Metro Mirror with Failover/Failback session works.

## Metro Mirror Failover/Failback with Practice

A Metro Mirror Failover/Failback with Practice session combines Metro Mirror and FlashCopy features to provide a point-in-time copy of the data on the remote site. You can use this session type to practice what you might do if a disaster occurs, without losing your disaster recovery capability.

This solution consists of two host volumes and an intermediate volume.

The following figure illustrates how a Metro Mirror Failover/Failback with Practice session works.

## Metro Mirror Failover/Failback with HyperSwap

You can enable a Metro Mirror Failover/Failback session to have HyperSwap capabilities. To enable the HyperSwap feature, the following conditions must apply:

- The session is running on an Tivoli Storage Productivity Center for Replication server that runs on IBM z/OS.
- The volumes are only for TotalStorage Enterprise Storage Server, DS6000, and System Storage DS8000 systems.
- The volumes are count key data (CKD) volumes that are attached to the z/OS system.

Metro Mirror Failover/Failback with HyperSwap combines the high availability of Basic HyperSwap with the redundancy of a two-site Metro Mirror Failover/Failback solution when managing count key data (CKD) volumes on z/OS. If the primary volumes encounter a permanent I/O error, the I/O is automatically swapped to the secondary site with minimal effect on the application.

A swap can be planned or unplanned. A planned swap occurs when you issue a HyperSwap command from the **Select Action** list in the graphical user interface (GUI) or when you issue a **cmdsess -action hyperswap** command.

The following figure illustrates how a Metro Mirror Failover/Failback session that is enabled for HyperSwap works.

## Metro Mirror Failover/Failback

For more information about enabling HyperSwap, see “Managing a session with HyperSwap and Open HyperSwap replication” on page 99.

## Metro Mirror Failover/Failback with Open HyperSwap

You can enable a Metro Mirror Failover/Failback session to have Open HyperSwap capabilities. To enable Open HyperSwap processing, the following conditions must apply:

- The volumes in the session are System Storage DS8000 5.1 or later volumes.
- The volumes in the session are fixed block and are mounted to IBM AIX 5.3 or AIX 6.1 hosts with the following modules installed:
  - Subsystem Device Driver Path Control Module (SDDPCM) version 3.0.0.0 or later
  - Multi-Path Input/Output (MPIO) module (the version that is provided with AIX version 5.3 or 6.1)
- The connections between the AIX host systems and the Tivoli Storage Productivity Center for Replication server are established.

Metro Mirror Failover/Failback with Open HyperSwap combines the high availability of Basic HyperSwap on z/OS for fixed-block AIX volumes with the redundancy of a two-site Metro Mirror Failover/Failback solution. If the primary volumes encounter a permanent I/O error, the I/O is automatically swapped to the secondary site with minimal effect on the application.

A swap can be planned or unplanned. A planned swap occurs when you issue a HyperSwap command from the **Select Action** list in the GUI or when you issue a **cmdsess -action hyperswap** command.

The following figure illustrates how a Metro Mirror Failover/Failback session that is enabled for Open HyperSwap works.

## Metro Mirror Failover/Failback

For more information about enabling Open HyperSwap, see “Managing a session with HyperSwap and Open HyperSwap replication” on page 99.

## Examples

Read the following scenarios for information on using Metro Mirror for synchronous, remote data replication between two sites.

### Metro Mirror Single Direction

At the beginning of a work week, Jane is notified that between 10:00 AM and 11:00 AM on the next Friday, power in her building is going to be shut off. Jane does not want to lose any transactions during the power outage, so she decides to transfer operations to the backup site during the outage. She wants a synchronous copy method with no data loss for the critical business functions, so she chooses Metro Mirror, which can be used between locations that are less than 300 KM apart.

In a synchronous copy method, when a write is issued to change the source, the change is propagated to the target before the write is posted. This method of replication maintains identical data in both the source and target. The advantage of this method is when a disaster occurs, there is no data loss at the recovery site because both writes must complete before signaling completion of a write to the source application. Because the data must be copied to both System Storage DS8000 devices before the write is completed, Jane can be sure that the data is safe.

The night before the planned outage, Jane quiesces the database and servers in San Francisco and starts the database and servers in Oakland. To accomplish this task, Jane issues the **Suspend** and **Recover** commands, and then issues the **Start** command on the secondary site. She shuts down the equipment in San Francisco to avoid any power spikes when she restarts the system after the power is turned on.

### Metro Mirror in Global Copy mode

At the beginning of a work week, Jane is notified that between 10:00 AM and 11:00 AM on the next Friday, power in her building is going to be shut off. Jane does not want to lose any transactions during the power outage, so she decides to transfer operations to the backup site during the outage. She wants a synchronous copy method with no data loss for the critical business functions, so she chooses Metro Mirror, which can be used between locations that are less than 300 KM apart.

Jane wants to limit the effect on any applications while completing the initial Metro Mirror synchronization, so she begins the session in Global Copy mode. After she sees that approximately 70% of the data is copied, Jane decides to switch the session to Metro Mirror mode, assuring data consistency.

### Metro Mirror with Practice

Jane wants to run a Metro Mirror with Practice from San Francisco to Oakland. She wants to verify the recovery procedure for the Oakland site, but she cannot stop running the Metro Mirror session while she takes time to practice a recovery. By using a Metro Mirror with Practice session, Jane can practice the disaster recovery scenario in Oakland while the Metro Mirror session runs uninterrupted. By practicing running the applications at the Oakland site, Jane is better prepared to recover data if a disaster occurs at the San Francisco site.

While her session is running in Prepared state, Jane practices a recovery at the Oakland site by issuing the **Flash** command. This command momentarily pauses the session and starts a FlashCopy to the H2 volumes.

As soon as the FlashCopy is started, the session is restarted. These FlashCopy files create a consistent version of the data on the H2 volume that she can use for recovery testing, while the session continues to replicate data from San Francisco to Oakland. As a result, she can carry out the recovery testing without stopping the replication for any extended duration of time.

If, at some point, the Metro Mirror session is suspended because of a failure, Jane can use the practice session to restart the data replication process. She maintains a consistent copy of the data at the Oakland site, in case of a failure during the resynchronization process. When the session is suspended, she can issue a **Recover** command to create a consistent version of the data on the H2 volumes. After the **Recover** command completes, she can issue the **Start H1->H2** command to resynchronize the data from the San Francisco site to the Oakland site.

If a failure occurs before the restarted session is in Prepared state, she has a consistent version of the data on the H2 volumes. She only has to issue the **Recover** command to put the session into Target Available state and make the H2 volumes accessible from the servers. If the session was not in Prepared state when it was suspended, the subsequent **Recover** command does not issue the FlashCopy files to put the data on the H2 volumes. This means that the consistent data on the H2 volumes is not overwritten if the data to be copied to them is not consistent.

#### **Metro Mirror Failover/Failback enabled for Open HyperSwap**

Jane wants to run a Metro Mirror with Practice from San Francisco to Oakland. She wants to verify the recovery procedure for the Oakland site, but she cannot stop running the Metro Mirror session while she takes time to practice a recovery. By using a Metro Mirror with Practice session, Jane can practice the disaster recovery scenario in Oakland while the Metro Mirror session runs uninterrupted. By practicing running the applications at the Oakland site, Jane is better prepared to recover data if a disaster occurs at the San Francisco site.

While the session is running in a Prepared state, Jane practices a recovery at the Oakland site by issuing the **Flash** command. This command momentarily pauses the session and starts a FlashCopy to the H2 volumes. As soon as the FlashCopy is started, the session is restarted. These FlashCopy files create a consistent version of the data on the H2 volume that she can use for recovery testing, while the session continues to replicate data from San Francisco to Oakland. As a result, she can carry out the recovery testing without stopping the replication for any extended duration of time.

If the Metro Mirror session is suspended because of a failure, Jane can use the practice session to restart the data replication process while she maintains a consistent copy of the data at the Oakland site, in case of a failure during the resynchronization process. When the session is suspended, she can issue a **Recover** command to create a consistent version of the data on the H2 volumes. After the **Recover** command completes, she can issue the **Start H1->H2** command to resynchronize the data from the San Francisco site to the Oakland site.

If a failure occurs before the restarted session is in Prepared state, she has a consistent version of the data on the H2 volumes. She only has to issue the **Recover** command to put the session into Target Available state and make the H2 volumes accessible from the servers. If the session was not in

Prepared state when it was suspended, the subsequent **Recover** command does not issue the FlashCopy files to put the data on the H2 volumes. This means that the consistent data on the H2 volumes is not overwritten if the data to be copied to the volumes is not consistent.

### Selecting a HyperSwap session

A global insurance company decided to use Tivoli Storage Productivity Center for Replication to manage its disaster recovery environment. Jane wants minimal data exposure, both for planned outages such as routine maintenance, and for unplanned disasters. They have CKD volumes on System Storage DS8000 devices, and use z/OS operating systems. They have two data centers in New York.

Jane chooses a Metro Mirror recovery solution, because her priority is to protect the system from regional disasters. Jane decides to use Metro Mirror solution, because her company has two data centers located near each other. Jane realizes that because she uses a z/OS operating system, CKD, and System Storage DS8000 hardware, she can also use a HyperSwap solution. Using Metro Mirror Failover/Failback with HyperSwap, Jane can minimize the effects on any applications, while she maintains the failover process to the secondary site. Jane decides Metro Mirror Failover/Failback with HyperSwap is the best solution.

After installing and configuring Tivoli Storage Productivity Center for Replication on z/OS, Jane starts the Tivoli Storage Productivity Center for Replication GUI. She adds the Tivoli Storage Productivity Center for Replication storage devices that she intends to use on all sites. From the Session Overview page, Jane uses the Create Session wizard, and selects the **Metro Mirror Failover/Failback** session type. She selects the **Manage H1H2 with HyperSwap** option. After finishing the wizard, Jane clicks **Launch Add Copy Sets Wizard**. She completes this wizard, and issues a **Start H1->H2** command. After the initial copy is completed, Jane can safely replicate the data between both sites. She can also issue the **HyperSwap** command between sites 1 and 2 to switch sites with minimal effect on the application during either a disaster or maintenance period.

### Performing a planned HyperSwap

Jane's company used Metro Mirror Failover/Failback with HyperSwap sessions for the past three months. However, Jane needs to perform maintenance on an H1 volume. During this time, Jane does not want the applications or replication to be interrupted. To prevent this interruption, before the maintenance is scheduled to begin, Jane uses the Tivoli Storage Productivity Center for Replication GUI to perform a HyperSwap operation to the H2 volumes. This process transitions the applications so that the data is written to H2. To perform a planned HyperSwap operation, Jane issues a **HyperSwap** command.

### Understanding what happens when an unplanned HyperSwap occurs

Several weeks after the planned maintenance at Jane's company is completed, an incident occurs at the H1 site. A disk controller fails, causing one of the H1 volumes to encounter a permanent I/O error. Jane's data is safe because she used Metro Mirror Failover/Failback with HyperSwap, and the H2 volume is an exact duplicate of the H1 volume. When the permanent I/O error is detected, a HyperSwap is triggered. The application transitions to write data to the H2 volumes. The applications are not interrupted.

Jane configured a Simple Network Management Protocol (SNMP) listener to alert her to any events, so she receives the SNMP event that indicates

that a HyperSwap occurred. Jane investigates the cause of the HyperSwap process and uses the z/OS console to identify the volume that triggered the HyperSwap process. Jane replaces the faulty disk controller. Then, to recover from the unplanned HyperSwap process, Jane issues the **Start H2->H1** command.

## Global Mirror

Global Mirror is a method of asynchronous, remote data replication between two sites that are over 300 kilometers (km) apart. It maintains identical data in both the source and target, where the source is located in one storage system and the target is located in another storage system.

The data on the target is typically written a few seconds after the data is written to the source volumes. When a write is issued to the source copy, the change is propagated to the target copy, but subsequent changes are allowed to the source before the target verifies that it received the change. Because consistent copies of data are formed on the secondary site at set intervals, data loss is determined by the amount of time since the last consistency group was formed. If the system fails, Global Mirror might lose some data that was being transmitted when the failure occurs. Using Global Mirror, you can ensure that data is recoverable and consistent if a disaster occurs.

## Global Mirror Single Direction

You can use a Global Mirror Single Direction session to run a Global Mirror replication process from only the primary site.

For ESS, DS6000, and DS8000 storage systems, each copy set in the single direction session consists of two host volumes and a journal volume. The following figure illustrates how a Global Mirror Single Direction session works on an ESS, DS6000, or DS8000 storage system.

For the following storage systems, each copy set in the Global Mirror Single Direction session consists of two host volumes:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

The following figure illustrates how a Global Mirror Single Direction session works on these storage systems.

### Global Mirror Either Direction with Two-Site Practice (ESS, DS6000, and DS8000)

By using a Global Mirror Either Direction with Two-Site Practice session, you can run Global Mirror replication from either the primary or secondary site. It combines Global Mirror and FlashCopy to provide a point-in-time copy of the data on a remote site at a distance over 300 km away from your first site. By using this practice session, you can create volumes on both the primary and secondary site to practice what you might do if a disaster occurred, without affecting the disaster recovery capability.

**Restriction:** This replication method is available on only ESS, DS6000, and DS8000 storage systems.

The session consists of two host volumes, two intermediate volumes, and two journal volumes. The following figure illustrates how a Global Mirror Either Direction with Two-Site Practice session works.

### Global Mirror Failover/Failback

Using Global Mirror Failover/Failback, your data exists on the second site that is more than 300 km away, and you can use failover or failback processing to switch the direction of the data flow. You can run your business from the secondary site.

For ESS, DS6000, and DS8000 storage systems, each copy set in the Global Mirror Failover/Failback session consists of two host volumes and a journal volume. The following figure illustrates how a Global Mirror Failover/Failback session works on an ESS, DS6000, or DS8000 storage system.

For the following storage systems, each copy set in the Global Mirror Failover/Failback session consists of two host volumes:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified
- The XIV system

The following figure illustrates how a Global Mirror Failover/Failback session works on these storage systems.

### Global Mirror Failover/Failback with Practice

A Global Mirror Failover/Failback with Practice session combines Global Mirror and FlashCopy features to provide a point-in-time copy of the data on a remote site at a distance over 300 KM away from your primary site. You can use this to practice what you might do if a disaster occurred, without affecting the disaster recovery capability.

For ESS, DS6000, and DS8000 storage systems, each copy set in the Global Mirror Failover/Failback with Practice session consists of two host volumes, an intermediate volume, and a journal volume. The following figure illustrates how a Global Mirror Failover/Failback with Practice session works on an ESS, DS6000, or DS8000 storage system.

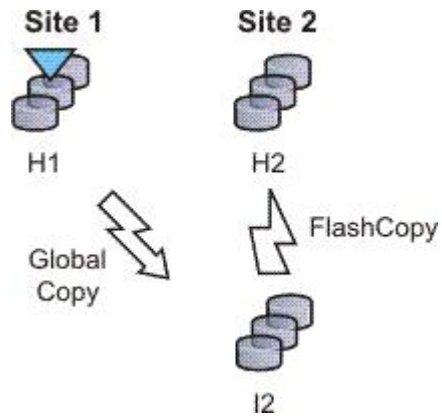

For the following storage systems, each copy set in the Global Mirror failover/failback with Practice session consists of two host volumes and an intermediate volume:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

The following figure illustrates how a Global Mirror Failover/Failback with Practice session works on these storage systems.

### Examples

Read the following scenarios for information on using Global Mirror for asynchronous, remote data replication between two sites.

#### Global Mirror Single Direction

Although Jane's FlashCopy and Metro Mirror copies were both planned, Jane realizes that sometimes a failure can occur, and she wants to ensure that the data is safe. Because Jane works in San Francisco, she wants her other site to be far away if a disaster occurs locally. Her other site is based in Houston. A minor earthquake occurs in San Francisco and power and

communications both fails. Jane arranged for the data on customer accounts that recently opened or closed to be asynchronously copied in Houston, using Global Mirror. Jane risks losing the bytes of data that were being processed when the tremor disrupted the processing in San Francisco. However, she understands that it is minor inconvenience when weighed next to the value of backing up her data to an area that is not prone to earthquakes.

#### **Global Mirror with Practice**

Jane wants to run a Global Mirror with practice from San Francisco to Houston. She plans to verify her recovery procedure for the Houston site, but she cannot stop running the Global Mirror session while she takes time to practice a recovery. By using a Global Mirror with Practice session, Jane can practice her disaster recovery scenario in Houston while the Global Mirror session runs uninterrupted. When she practices running the applications at the Houston site, Jane is better prepared to recover the data if a disaster ever strikes the San Francisco site.

#### **Global Mirror Either Direction with Two-Site Practice**

Jane wants to run a Global Mirror with Practice from San Francisco to Houston. She plans to verify her recovery procedure for the Houston site, but she cannot stop running the Global Mirror session while she takes time to practice a recovery. By using a Global Mirror Either Direction with Two-Site Practice session, Jane can practice her disaster recovery scenario in Houston while the Global Mirror session runs uninterrupted. When she practices running the applications at the Houston site, Jane is better prepared to recover the data if a disaster ever strikes the San Francisco site.

Jane can use the Global Mirror Either Direction with Two-Site Practice session to run asynchronous consistent data replication from either the San Francisco site or the Houston site. She can practice the disaster-recovery tasks at the target site, regardless of the location of the current production site. Jane's business can run a consistent Global Mirror session from its Houston site back to San Francisco while it runs a production site at Houston.

### **Setting up Global Mirror for Resource Groups on System Storage DS8000**

If resource groups are defined on a System Storage DS8000, Global Mirror session IDs might be defined for some users. To determine which session IDs are valid, you must modify the `rmserver.properties` file and add the following property:

```
gm.master.sessionid.gm_role,session_name = xx
```

where `gm_role` is the role that has the master volume (for example, H1 in a Global Mirror failover/failback session), `session_name` is the name of the session that uses the session ID, and `xx` is the decimal number for the session ID.

**Tip:** System Storage DS8000 represents session IDs as a two-digit hexadecimal number. Use the decimal version of that number. For example, if you want a Global Mirror Failover/Failback session to use a session ID of 0F, the decimal number is 15, as shown in the following example:

```
gm.master.sessionid.H2.11194_wprac=15
```

### **Metro Global Mirror (ESS and DS8000)**

Metro Global Mirror is a method of continuous, remote data replication that operates between three sites that are varying distances apart. Metro Global Mirror

combines Metro Mirror synchronous copy and Global Mirror asynchronous copy into a single session, where the Metro Mirror target is the Global Mirror source.

This replication method is available on only TotalStorage Enterprise Storage Server Model 800 and System Storage DS8000 storage systems. You can select ESS storage systems in only the H1 volume role. All other volume roles must use DS8000 volumes.

You can use both ESS and DS8000 volumes in the H1 volume role. If ESS and DS8000 storage systems are both used in the H1 role, the DS8000 storage system performs Incremental Resync processing, and the ESS storage system performs a full copy operation. Because you cannot use the Incremental Resync function with ESS, a full copy is required when you change from H1->H2->H3 to H1>H3 and from H2->H1->H3 to H2->H3.

**Attention:** If you have Tivoli Storage Productivity Center for Replication for System z sessions that contain Metro Global Mirror relationships, ensure that the session does not contain system volumes (such as paging volumes) unless you select the **Manage H1-H2 with HyperSwap** or the **Enable Hardened Freeze** option for the session. By using these options, z/OS Input/Output Supervisor (IOS) manages freeze operations for the volumes in the session, which prevents Tivoli Storage Productivity Center for Replication from freezing the volumes and possibly freezing itself.

Metro Global Mirror maintains a consistent copy of data at the remote site, with minimal effect on applications at the local site. This remote mirroring function works in combination with FlashCopy to provide a disaster-recovery solution that includes the following features:

- Fast failover and failback
- Rapid reestablishment of three-site mirroring, without production outages
- Data currency at the remote site with minimal time lag at the local site, an average of only 3 - 5 seconds for many environments
- Quick resynchronization of mirrored sites using only incremental changes

If Tivoli Storage Productivity Center for Replication runs on a z/OS operating system, you can configure a Metro Global Mirror session to control the Metro Mirror relationship between the primary and secondary site by using the HyperSwap feature. With HyperSwap enabled, a failure on the primary storage system causes an automatic HyperSwap operation, which transparently redirects application I/O to the auxiliary storage system. The Global Mirror relationship continues to run uninterrupted throughout this process. With this configuration, you can achieve almost a zero data loss at larger distances.

Using synchronous mirroring, you can switch from local site H1 to remote site H2 during a planned or unplanned outage. It also provides continuous disaster recovery protection of the H2 and H3 sites. You do not have to configure H2, if a switch from site H1 occurs. With this configuration, you can reestablish H2->H1->H3 recoverability while production continues to run at site H2. Additionally, this setup can reduce the workload on site H1.

**Important:**

- If HyperSwap occurs by event when running a Metro Global Mirror with a HyperSwap session, a full copy of the data occurs to return to a full three-site configuration. If you issue a HyperSwap command when running a Metro

Global Mirror with a HyperSwap session, a full copy does not occur. A full copy is required only for an unplanned HyperSwap or a HyperSwap initiated using the z/OS SETHS SWAP command.

- In Metro Global Mirror and Metro Global Mirror with Practice sessions, when the H1 is on an ESS storage system, you might risk filling up the space efficient journal volumes. Because incremental resynchronization is not available on the ESS storage system, full copies are performed in many of the transitions.

## Metro Global Mirror

A Metro Global Mirror session with Practice combines Metro Mirror, Global Mirror, and FlashCopy across three sites to provide a point-in-time copy of the data on the third site.

The following figure illustrates how a Metro Global Mirror session works.

## Metro Global Mirror with Practice

A Metro Global Mirror session with Practice combines Metro Mirror, Global Mirror, and FlashCopy across three sites to provide a point-in-time copy of the data on the third site. You can use this session to practice what you might do if a disaster occurred without losing your disaster recovery capability.

The session consists of three host volumes, an intermediate volume, and a journal volume. The following figure illustrates how a Metro Global Mirror with Practice session works.

**Note:** In Metro Global Mirror and Metro Global Mirror with Practice sessions, when the H1 is on an ESS storage system, you might risk filling up the space efficient journal volumes. Because incremental resynchronization is not available on the ESS storage system, full copies are performed in many of the transitions.

## Examples

Read the following scenarios for information on using Metro Global Mirror for continuous, remote data replication between three sites.

### Metro Global Mirror

Although Jane works in San Francisco, she wants to run the business from either Oakland, the secondary site, or Houston, the tertiary site. Jane can use Metro Global Mirror with Failover/Failback to switch the direction of the data flow, so that she can run the business from either Oakland or Houston. Using Metro Global Mirror, Jane has zero data loss at the secondary site and minimal data loss at the tertiary site.

### Metro Global Mirror with Practice

Jane wants to run a Metro Global Mirror with Practice from San Francisco to Houston. She plans to verify her recovery procedure for the Houston site. However, she cannot stop running the Metro Global Mirror session while she takes time to practice a recovery. By using a Metro Global Mirror with Practice session, Jane can practice her disaster recovery scenario in Houston while the Metro Global Mirror session runs uninterrupted. When she practices running the applications at the Houston site and is prepared to run the applications at the Oakland site, if necessary, Jane is prepared to recover data if a disaster occurs at the San Francisco site.

Jane can use Metro Global Mirror with Practice to switch the direction of the data flow, so that she can run the business from either Oakland or Houston. Using Metro Global Mirror, Jane has zero data loss at the secondary site and minimal data loss at the tertiary site.

## Managing a session with HyperSwap and Open HyperSwap replication

HyperSwap and Open HyperSwap provide high availability of data if a primary disk storage system failure occurs. When a failure occurs in writing I/O to the primary storage system, the failure is detected by IOS, and IOS automatically swaps the I/O to the secondary site with no user interaction and minimal application effect.

### Sessions that can be enabled for HyperSwap or Open HyperSwap:

You can create sessions that enable swapping, which provides a session with a highly available business continuity solution.

### Sessions that can enable HyperSwap

The following session types can enable HyperSwap processing:

- Basic HyperSwap
- Metro Mirror with Failover/Failback
- Metro Global Mirror

To enable HyperSwap processing, the following conditions must apply:

- The session is running on a Tivoli Storage Productivity Center for Replication server that is running on IBM z/OS.
- The volumes are only for TotalStorage Enterprise Storage Server, System Storage DS8000, and DS6000 systems.
- The volumes are count key data (CKD) volumes that are attached to the z/OS system.

### Sessions that can enable Open HyperSwap

Only Metro Mirror with Failover/Failback session type can enable Open HyperSwap processing.

To enable Open HyperSwap processing, the following conditions must apply:

- The volumes in the session are System Storage DS8000 5.1 or later volumes.
- The volumes in the session are fixed block and mounted to IBM AIX 5.3 or AIX 6.1 hosts with the following modules installed:
  - Subsystem Device Driver Path Control Module (SDDPCM) version 3.0.0.0 or later
  - Multi-Path Input/Output (MPIO) module (the version that is provided with AIX version 5.3 or 6.1)
- The connections between the AIX host systems and the Tivoli Storage Productivity Center for Replication server are established.

### Setting up the environment for HyperSwap:

You must set up an environment in which you can run HyperSwap processing before you can enable HyperSwap for a IBM Tivoli Storage Productivity Center for Replication session.

Complete the following steps before you enable HyperSwap. For more information about these steps, see the IBM Tivoli Storage Productivity Center for Replication for System z Installation and Configuration Guide.

1. Install IBM Tivoli Storage Productivity Center for Replication for System z.

2. Set up the data store and configure other necessary system settings.
3. Ensure that all RESERVEs are converted to global enqueues (ENQs).
4. Ensure that all volumes in the session that you are enabling for HyperSwap are attached to the IBM z/OS system that runs Tivoli Storage Productivity Center for Replication.
5. Set up and start the IOSHSAPI and HSIB tasks.

### Setting up the environment for Open HyperSwap:

You must set up an environment in which you can run Open HyperSwap processing before you can enable Open HyperSwap for a IBM Tivoli Storage Productivity Center for Replication session.

Complete the following steps before you enable Open HyperSwap.

1. Ensure that the IBM AIX hosts and IBM System Storage DS8000 meet the following hardware and software requirements:

#### AIX requirements

You can find the supported AIX version for each Tivoli Storage Productivity Center for Replication release in the support matrix at <http://www.ibm.com/support/docview.wss?uid=swg21386446>. Click the link for the applicable release under Agents, Servers, and GUI.

You must have the following AIX modules installed:

- Subsystem Device Driver Path Control Module (SDDPCM) version 3.0.0.0 or later
- Multi-Path Input/Output (MPIO) module (the version that is provided with AIX)

#### System Storage DS8000 hardware requirements

The Open HyperSwap function requires System Storage DS8000 5.1 or later.

You cannot use Open HyperSwap with High Availability Cluster Multi-Processing (HACMP).

2. Create connections from Tivoli Storage Productivity Center for Replication to the AIX hosts by following the instructions at “Adding a host system connection” on page 685.
3. Assign copy set volumes from the storage device to the host by using the System Storage DS8000 command-line interface (CLI) or the graphical user interface (GUI).
4. Run the AIX **cfgmgr** command to discover the volumes that are assigned to the host.

### Considerations for Open HyperSwap and the AIX host:

- A single session that has the Open HyperSwap function enabled can manage multiple hosts; however, each host can be associated with only one session. Multiple hosts can share the session.
- For AIX 5.3, a single host can manage a maximum of 1024 devices that are enabled for Open HyperSwap processing on the host, with eight logical paths configured for each copy set in the session. For AIX 6.1, a single host can manage a maximum of 1024 devices that are enabled for Open HyperSwap processing on the host, with 16 logical paths that are configured for each copy set in the session.

- If an application on the host opened a device, a Tivoli Storage Productivity Center for Replication session for that device cannot be ended. The **Terminate** command fails. To end the session, you must either close the application or remove the copy sets from the session. If you remove copy sets from the session, you must ensure that the application writes the data to the correct volume when the copy set relationship is restored.
- Open HyperSwap processing can fail on a subset of hosts for the session and continue to run on the remaining hosts for the same session. In this situation, you must determine the best action to take if the application is writing data to volumes on the source system and to volumes on the target system.
- To enable Open HyperSwap processing on the host, see the *IBM System Storage Multipath Subsystem Device Driver User's Guide*.

*Configuring timers to support Open HyperSwap:*

You can configure timeout values for the storage system, Tivoli Storage Productivity Center for Replication, and AIX hosts systems. These values can affect the operation of Open HyperSwap.

The following various timeout values can affect Open HyperSwap:

**Storage system quiesce timeout value**

This value is the time when the storage system starts a quiesce operation. When the timer value expires, I/O is resumed on the primary device. The default timeout value is 2 minutes, but the value can be set from 30 to 600 seconds. To set the quiesce timeout value, use the **chdev** command in the *IBM System Storage Multipath Subsystem Device Driver User's Guide*.

**Storage system long busy timeout value**

This value is the time in seconds that the logical subsystem (LSS) consistency group volume stays in the long busy state after a remote mirror and copy error is reported.

**Timeout values for the applications that are on the host**

The various applications that are running on the host have timeout values. The timeout values vary depending on the application.

**Considerations for setting timers**

Consider the following information for setting timers:

- If the host quiesce timer is set to a shorter value than the Tivoli Storage Productivity Center for Replication response timer, an I/O swap failure can occur. If a storage system triggers an unplanned failover and if the storage system quiesce timer expires before Tivoli Storage Productivity Center for Replication responds, the host attempts to write I/O to the primary volume where the loss of access occurred. If the hardware condition that caused the loss of access continues, the write I/O operation fails again and an unplanned Open HyperSwap is not performed.
- If the host quiesce timer is set to a longer value than the Tivoli Storage Productivity Center for Replication response timer, an application timeout might occur if Open HyperSwap takes too long to complete.

**Enabling a session for HyperSwap or Open HyperSwap:**

Enabling HyperSwap or Open HyperSwap for a session provides business recovery and business continuity.

Ensure that you can use the HyperSwap or Open HyperSwap functions in your environment. See “Setting up the environment for HyperSwap” on page 99 or “Setting up the environment for Open HyperSwap” on page 100.

Enable a HyperSwap or Open HyperSwap session by completing the following steps:

1. In the Tivoli Storage Productivity Center for Replication navigation tree, select **Sessions**. Click the button next to the session that you want to enable.
2. From the **Select Action** menu, select **View/Modify Properties** and click **Go**. If you did not create the session, click **Create Session**. You can enable the HyperSwap or Open HyperSwap function on the Properties page
3. In **ESS / DS Metro Mirror Options**, select the appropriate HyperSwap or Open HyperSwap options:
  - **Manage H1-H2 with HyperSwap**. This option enables a session to manage the H1-H2 sequence using HyperSwap. If you select this option, select from the following additional options.
    - **Disable HyperSwap**. Select this option to prevent a HyperSwap from occurring by command or event.
    - **On Configuration Error**. Choose one of the following options:
      - **Partition the system(s) out of the sysplex**. Select this option to partition out of the sysplex when a new system is added to the sysplex and encounters an error in loading the configuration. A restart of your system is required if you select this option.
      - **Disable HyperSwap**. Select this option to prevent a HyperSwap from occurring by command or event.
    - **On Planned HyperSwap Error**. Choose one of the following options:
      - **Partition out the failing system(s) and continue swap processing on the remaining system(s)**. Select this option to partition out the failing system and continues the swap processing on any remaining systems.
      - **Disable HyperSwap after attempting backout**. Select this option to stop the HyperSwap action, and disable the HyperSwap commands or events.
    - **On Unplanned HyperSwap**. Choose one of the following options:
      - **Partition out the failing system(s) and continue swap processing on the remaining system(s)**. Select this option to partition out the failing systems and continues the HyperSwap processing on the remaining systems when a new system is added to the sysplex and HyperSwap does not complete. A restart of your system is required if you select this option.
      - **Disable HyperSwap after attempting backout**. Select this option to stop the HyperSwap action, and disable the HyperSwap commands or events.
  - **Manage H1-H2 with Open HyperSwap**. If volumes are attached to an IBM AIX host, Tivoli Storage Productivity Center for Replication can manage the H1-H2 sequence of a Metro Mirror session using Open HyperSwap. If this option is selected, a failure on the host accessible volumes triggers a swap, which redirects application I/O to the secondary volumes. Only volumes that are currently attached to the host systems that are defined on the Tivoli Storage Productivity Center for Replication Host Systems panel are eligible for Open HyperSwap.

- **Disable Open HyperSwap.** Select this option to prevent a swap from occurring by a command or event while keeping the configuration on the host system and all primary and secondary volumes coupled.
4. Click **OK** to apply the selected options.

#### **Restarting an AIX Host System that is enabled for Open HyperSwap:**

When an AIX host system is restarted, the host automatically opens any volumes for I/O that were open before the system was restarted. If Open HyperSwap was enabled for a set of volumes on the host system, the host must determine which storage system is the primary system before the host can allow the volumes to be opened.

If the Metro Mirror relationship for the set of volumes is in Prepared or Suspended state and the host has connectivity to both the primary and secondary storage systems, the host can determine through the hardware which storage system is the primary system. In this situation, the host automatically opens the volumes.

If the Metro Mirror relationship for the set of volumes is in Prepared state and the host has connectivity to only the secondary storage system, all I/O to the volumes might be blocked on the host system. The I/O might be blocked until the host can verify the primary volume in the relationship. The AIX varyonvg command fails to open the volumes for I/O to prevent the application from writing to an incorrect volume. If the host can determine which volume is the primary volume in the relationship and connectivity to the primary storage system is still lost, a Hyperswap event is triggered. This event causes all I/O to be automatically opened and directed to the secondary storage system.

If the Metro Mirror relationship for the set of volumes is in Target Available state or the host system does not have connectivity and is unable to determine which site is the primary site, all I/O to the volumes are blocked on the host system. The Target Available state occurs after a Hyperswap or a Recover command is issued for the session. The varyonvg command fails to open the volumes for I/O to prevent the application from writing to an incorrect volume.

#### **Unblocking I/O on the host system after a host system restart**

When any of the previous scenarios cause I/O to be blocked, manual actions might be necessary to remove the block.

If the relationships are in Target Available state on the hardware, issue the **Start** command to the session in the required direction of the relationship. This action defines the primary storage system for the host. The host system can allow the volumes to be opened for I/O processing.

If the relationships cannot be restarted, or the host cannot determine the primary storage system, it might be necessary to manually decouple the volumes on the host system.

To decouple the volumes, complete one of the following tasks:

- Stop the session or remove the copy set. This action requires a full copy when the relationships are restarted.
- Remove Object Data Manager (ODM) entries by using the following command:  
`odmdelete -o Volume_Equivalency`

**Restriction:** This command deletes copy set information; use it only for this scenario.

### Planned and unplanned swaps:

After a session is enabled for HyperSwap or Open HyperSwap processing and reaches Prepared state, Tivoli Storage Productivity Center for Replication loads the configuration of volumes that can be swapped to a z/OS or AIX operating system.

When the load is complete, the session can start a planned or unplanned swap. The H1-H2 role pair of the session shows a type of HS. An "H" is displayed over the connection in the dynamic image for that role pair, as shown in the following figure.

Metro Mirror Failover/Failback

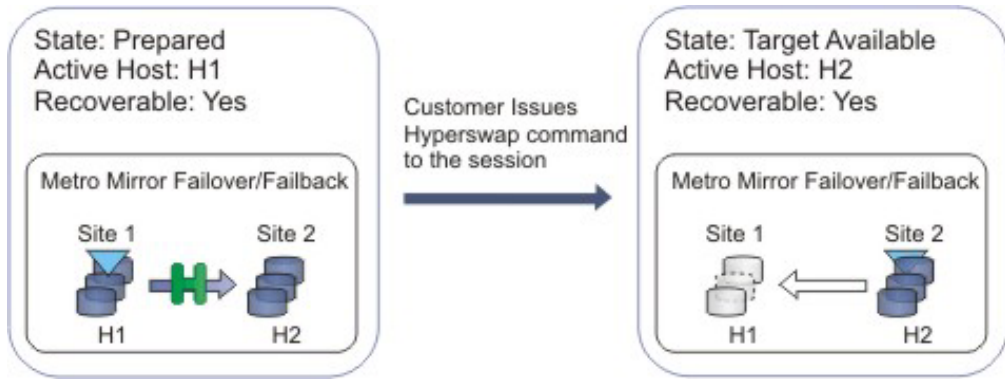

### Completing a Planned Swap

When the session configuration is loaded on z/OS for HyperSwap or AIX for Open HyperSwap, the session is considered swap capable. There may be cases such as a planned maintenance or a migration from the primary storage, in which a planned swap might be required. When the session is in swap capable state, a planned swap can be completed by issuing the **HyperSwap** command for the session.

After you run a planned swap for z/OS HyperSwap and Open HyperSwap, the session transitions to Target Available state and all the H1-H2 pairs are in Target Available state. If the H1-H2 role pair was consistent at the time of the swap, the session has a status of Normal, which indicates that H1-H2 is consistent. If the H1-H2 role pair was not consistent at the time of the swap, the session has a status of SEVERE. The active host on the session is shown as H2.

All I/O is redirected to the H2 volumes. After a successful swap to site 2, you cannot enable the copy function to site 2. The only way to restart the copy processing is by issuing the **Start H2->H1** command. To have the volumes protected with high availability and disaster recovery again, correct the error that caused the swap to occur, and manually restart the session to begin copying data to the other site.

The following figure illustrates a planned swap operation.

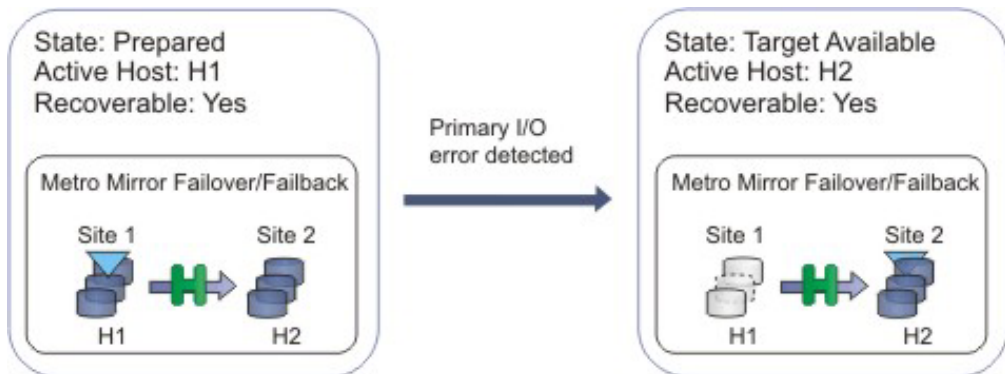

### Unplanned swaps

When the session configuration is loaded on z/OS for HyperSwap processing or on AIX for Open HyperSwap processing, the session is considered swap capable. If a primary I/O error occurs, a swap occurs automatically. For HyperSwap, z/OS completes the swap and then alerts Tivoli Storage Productivity Center for Replication that a swap occurred. For Open HyperSwap, Tivoli Storage Productivity Center for Replication and the AIX host work together to complete the swap.

When an unplanned swap occurs for HyperSwap and Open HyperSwap, the session transitions to Target Available state and all the H1-H2 pairs are in Target Available state. If the H1-H2 role pair was consistent at the time of the swap, the session has a status of Normal and indicates that H1-H2 is consistent. If the H1-H2 role pair was not consistent at the time of the swap, the session might show a status of SEVERE. The active host on the session is shown as H2.

All I/O is redirected to the H2 volumes. After a successful swap to site 2, you cannot enable the copy function to site 2. Therefore, it is not possible to issue a **Start H1->H2** command. The only way to restart the copy processing is by issuing a **Start H2->H1** command. To have the volumes protected with high availability and disaster recovery again, correct the error that caused the swap to occur, and manually restart the session to begin copying data to the other site.

The following figure illustrates an unplanned swap.

## Scenarios that require a full copy in Metro Global Mirror with HyperSwap sessions

You must run a full copy to return to the three-site configuration after a swap when the following conditions occur:

- If you run a Metro Global Mirror session with the HyperSwap function and you issue the **HyperSwap** command by using the z/OS HyperSwap API.
- If you run a Metro Global Mirror session with the HyperSwap function and an unplanned swap occurs.

*Verifying a session for a planned or unplanned swap:*

You can verify whether a session is capable of a planned or unplanned swap from the z/OS console on HyperSwap or the AIX host on Open HyperSwap.

Verify the status of HyperSwap from the z/OS console:

1. View the overall status of the HyperSwap session. Issue the `ds hs,status` command. For example:

```
15.03.06 SYSTEM1 d hs,status
15.03.06 SYSTEM1 STC00063 IOSHM0303I HyperSwap Status 531
Replication Session: SR_HS
HyperSwap enabled
New member configuration load failed: Disable
Planned swap recovery: Disable
Unplanned swap recovery: Disable
FreezeAll: No
Stop: No
```

2. Verify all the volumes in the configuration. Issue the `ds hs,config(detail,all)` command. For example:

```
15.03.51 SYSTEM1 d hs,config(detail,all)
15.03.51 SYSTEM1 STC00063 IOSHM0304I HyperSwap Configuration 534
Replication Session: SR_HS
Prim. SSID UA DEV# VOLSER Sec. SSID UA DEV# Status
06 02 00F42 8K3602 06 04 00FA2
06 01 00F41 8K3601 06 03 00FA1
06 00 00F40 8K3600 06 02 00FA0
```

Verify the status of Open HyperSwap from the AIX host:

1. View the session association and the path that the I/O is being routed to. The path is indicated by an asterisk. Issue the `pcmpath query device` command. For example:

```
host1> pcmpath query device 14
```

```
DEV#: 14 DEVICE NAME: hdisk14 TYPE: 2107900 ALGORITHM: Load Balance
SESSION NAME: session1
OS Direction: H1<-H2
```

```
=====
PRIMARY SERIAL: 25252520000
```

Path#	Adapter/Path Name	State	Mode	Select	Errors
0	fscsi0/path0	CLOSE	NORMAL	6091	0
1	fscsi0/path2	CLOSE	NORMAL	6300	0
2	fscsi1/path4	CLOSE	NORMAL	6294	0
3	fscsi1/path5	CLOSE	NORMAL	6187	0

```
SECONDARY SERIAL: 34343430000 *
```

Path#	Adapter/Path Name	State	Mode	Select	Errors
4	fscsi0/path1	CLOSE	NORMAL	59463	0

5	fscsi0/path3	CLOSE	NORMAL	59250	0
6	fscsi1/path6	CLOSE	NORMAL	59258	0
7	fscsi1/path7	CLOSE	NORMAL	59364	0

### Temporarily disabling HyperSwap or Open HyperSwap:

In some situations, it might be necessary to temporarily disable the HyperSwap or Open HyperSwap function for a session.

You might want to disable HyperSwap or Open HyperSwap in the following circumstances:

- If you are performing maintenance on the system
- If one sysplex member cannot communicate with one or more volumes

Complete these steps to disable Open HyperSwap for a specific session:

1. In the Tivoli Storage Productivity Center for Replication navigation tree, select **Sessions**.
2. Select the sessions for which you want to disable the HyperSwap or Open HyperSwap function.
3. Select **View/Modify Properties** from the **Select Actions** list, and click **Go**.
4. Select **Disable HyperSwap** or **Disable Open HyperSwap**, and click **OK**.

**Tip:** On management servers that run on a z/OS operating system, you can disable the HyperSwap function from an MVS command prompt window by entering the **SETHS DISABLE** command.

### Using active and standby Tivoli Storage Productivity Center for Replication servers with HyperSwap or Open HyperSwap:

You can set up an active and standby management server configuration with HyperSwap or Open HyperSwap.

#### Active and standby servers with HyperSwap

When the storage system is set up to connect through the z/OS interface, the connection information is sent to the standby server and a connection is attempted. The connection might fail if the standby server does not run on a z/OS operating system or does not have access to the same volumes. If the connection fails and the standby server resumes the processing, the standby server cannot manage the HyperSwap processing.

On the z/OS system, if the session configuration was successfully loaded before the HyperSwap processing, the z/OS system can manage the HyperSwap processing. If the z/OS system swaps the volumes but cannot communicate with the Tivoli Storage Productivity Center for Replication server, the session is set to Suspended or Severe state. To set the session to Target Available state, clear the **Manage H1-H2 with Hyperswap** option, and issue the **Recover** command for the session.

#### Active and standby servers with Open HyperSwap

When there is an active and standby management server configuration and a host system connection is added to the active server, a connection is attempted between the host system and the standby server. After AIX loads the session configuration, Open HyperSwap processing is possible only if there is communication between

AIX and the Tivoli Storage Productivity Center for Replication server. If a standby server resumes the processing and is unable to connect to the host system that manages the swap, the session cannot run Open HyperSwap processing. You must activate communication to the host system before the session can run Open HyperSwap processing.

**Related tasks:**

“Managing management servers” on page 664

This section provides information about how to set up active and standby management servers, restore a lost connection between the management servers, or perform a takeover on the standby management server.

## Session commands

The commands that are available for a session depend on the session type.

Commands are issued synchronously to IBM Tivoli Storage Productivity Center for Replication sessions . Any subsequent command issued to an individual session is not processed until the first command has completed. Some commands can take an extended amount of time to complete, such as the **Start** command as it sets up the hardware. The GUI continues to allow you to issue commands to other sessions and not hold up functionality. When a command has completed, the console displays the results of the command.

### Basic HyperSwap commands

Use this information to learn about commands available for Basic HyperSwap sessions.

**Note:** Individual suspend and recover commands are not available in HyperSwap.

*Table 71. Basic HyperSwap commands*

Command	Action
<b>HyperSwap</b>	Triggers a HyperSwap where I/O is redirected from the source volume to the target volume, without affecting the application using those volumes. You can use this command if you want to perform maintenance on the original source volumes.
<b>Start H1-&gt;H2</b>	Starts copying data synchronously from H1 to H2 in a Metro Mirror session. <b>Note:</b> A session might go into a Severe state with error code 1000000 before the session returns to Normal/Prepared State and HyperSwap Capable. The duration of the Severe state depends on how large of a session is running.
<b>Start H2-&gt;H1</b>	Starts copying data synchronously from H2 to H1 in a Metro Mirror session. You can issue this command only after the session has been swapped and the production site is H2. To enable data protection when the H1 volumes are available again, start I/O to the H2 volumes, and issue this command to replicate data from the H2 volumes to H1 volumes.
<b>Stop</b>	Suspends updates to all the targets of pairs in a session. You can issue this command at any time during an active session. <b>Note:</b> After you issue the stop command, targets might not be consistent.
<b>Terminate</b>	Removes all physical copies and relationships from the hardware during an active session.

## FlashCopy commands

Use this information to learn about commands available for FlashCopy sessions.

Table 72. FlashCopy commands

Command	Action
<b>Start</b>	Performs any steps necessary to define the relationship before performing a FlashCopy operation. For ESS, DS6000, and DS8000, this command is not an option. Issue this command to put the session in the prepared state for the following storage systems: <ul style="list-style-type: none"><li>• SAN Volume Controller</li><li>• Storwize V7000</li><li>• Storwize V7000 Unified</li></ul>
<b>Flash</b>	Performs the FlashCopy operation using the specified options. Issue the Flash command to create a data consistent point-in-time copy for a FlashCopy Session with volumes on the following storage systems: <ul style="list-style-type: none"><li>• SAN Volume Controller</li><li>• Storwize V7000</li><li>• Storwize V7000 Unified</li></ul> For a FlashCopy session containing ESS, DS6000, and DS8000 volumes, the Flash command by itself is not sufficient to create a consistent copy. To create a consistent copy using the ESS, DS6000, and DS8000 Flash commands, you must quiesce application I/O before issuing the Flash command.
<b>InitiateBackgroundCopy</b>	Copies all tracks from the source to the target immediately, instead of waiting until the source track is written to. This command is valid <i>only</i> when the background copy is not already running.
<b>Terminate</b>	Removes all active physical copies and relationships from the hardware during an active session.  If you want the targets to be data consistent before removing their relationship, you must issue the <b>InitiateBackgroundCopy</b> command if NOCOPY was specified, and then wait for the background copy to complete by checking the copying status of the pairs.

## Snapshot commands

Use this information to learn about commands that are available for Snapshot sessions and groups. A snapshot group is a grouping of snapshots of individual volumes in a consistency group at a specific point in time.

Table 73. Snapshot session commands

Command	Action
<b>Create Snapshot</b>	Creates a snapshot of the volumes in the session
<b>Restore</b>	Restores the H1 volumes in the session from a set of snapshot volumes. You must have at least one snapshot group to restore from. When you issue this command in the Tivoli Storage Productivity Center for Replication graphical user interface (GUI), you are prompted to select the snapshot group.

Table 74. Snapshot group commands

Command	Action
<b>Delete</b>	Deletes the snapshot group and all the individual snapshots that are in the group from the session and from the XIV system. If the deleted snapshot group is the last snapshot group that is associated with the session, the session returns to the Defined state.
<b>Disband</b>	Disbands the snapshot group. When a snapshot group is disbanded, the snapshot group no longer exists. All snapshots in the snapshot group become individual snapshots that are no longer associated to the consistency group or the session. After a snapshot group is disbanded, it is no longer displayed in or managed by Tivoli Storage Productivity Center for Replication. If the disbanded snapshot group is the last snapshot group that is associated with the session, the session returns to the Defined state.
<b>Duplicate</b>	Duplicates the snapshot group. When a snapshot group is duplicated, a new snapshot group is created with new snapshots for all volumes that are in the duplicated group. The name of the duplicated snapshot group is generated automatically by the XIV system.
<b>Lock</b>	Locks a snapshot group. If the snapshot group is locked, write operations to the snapshots that are in the snapshot group are prevented. By default, a snapshot group is locked when it is created. This action is valid only if the snapshot group is unlocked.
<b>Overwrite</b>	Overwrites the snapshot group to reflect the data that is on the H1 volume.
<b>Rename</b>	Renames the snapshot group to a name that you provide. The name can be a maximum of 64 alphanumeric characters.
<b>Restore</b>	Restores the contents of a snapshot group by using another snapshot group in the session. Both of the snapshot groups must contain the same subset of volumes.
<b>Set Priority</b>	Sets the priority in which a snapshot group is deleted. The value can be the number 1 - 4. A value of 1 specifies that the snapshot group is deleted last. A value of 4 specifies that the snapshot group is deleted first.
<b>Unlock</b>	Unlocks a snapshot group. If the snapshot group is unlocked, write operations to the snapshots that are in the snapshot group are enabled and the snapshot group is displayed as modified. This action is valid only if the snapshot group is locked.

## Metro Mirror commands

Use this information to learn about commands available for Metro Mirror sessions.

Table 75. Metro Mirror commands

Command	Action
<b>Enable Copy to Site 1</b>	Run this command and confirm that you want to reverse the direction of replication before you reverse the direction of copying in a failover and failback session. After you issue this command, the <b>Start H2-&gt;H1</b> command becomes available.

Table 75. Metro Mirror commands (continued)

Command	Action
<b>Enable Copy to Site 2</b>	Run this command and confirm that you want to reverse the direction of replication before reversing the direction of copying in a failover and failback session. After you issue this command, the <b>Start H1-&gt;H2</b> command becomes available.
<b>HyperSwap</b>	Triggers a HyperSwap where I/O is redirected from the source volume to the target volume, without affecting the application using those volumes. You can use this command if you want to perform maintenance on the original source volumes. This command is available only for Tivoli Storage Productivity Center for Replication for System z.
<b>Start</b>	Establishes a single-direction session with the hardware and begins the synchronization process between the source and target volumes.
<b>Start H1-&gt;H2</b>	Establishes Metro Mirror relationships between the H1 volumes and the H2 volumes, and begins data replication from H1 to H2.
<b>Start H2-&gt;H1</b>	Establishes Metro Mirror relationships between the H2 volumes and the H1 volumes and starts data replication from H2 to H1. Indicates direction of a failover and failback between two hosts in a Metro Mirror session. If the session has been recovered such that the production site is now H2, you can issue the <b>Start H2-&gt;H1</b> command to start production on H2 and start data replication.
<b>Stop</b>	Inconsistently suspends updates to all the targets of pairs in a session. This command can be issued at any point during an active session. <b>Note:</b> Targets after the suspend are not considered to be consistent.
<b>StartGC</b>	Establishes Global Copy relationships between the H1 volumes and the H2 volumes, and begins asynchronous data replication from H1 to H2. While in the Preparing state, it will not change to the Prepared state unless you switch to Metro Mirror.
<b>Suspend</b>	Causes all target volumes to remain at a data-consistent point and stops all data that is moving to the target volumes. This command can be issued at any point during a session when the data is actively being copied. <b>Note:</b> It is recommended that you avoid using the same LSS pairs for multiple Metro Mirror sessions. Metro Mirror uses a freeze command on ESS, DS6000, and DS8000 storage systems to create the data-consistent point. If there are other Metro Mirror sessions overlapping the same LSS pairs as in this session, those sessions are also suspended.  When a <b>Suspend</b> command is issued to a source volume in an LSS that has source volumes in another active Metro Mirror session, the other source volumes are affected only if they have the same target LSS. The primary volumes are suspended, but volumes in the same source LSS that have target volumes in a different LSS are not affected because they use a different PPRC path connection.
<b>Recover</b>	Issues the <b>Recover</b> command to suspended sessions. This command performs the steps necessary to make the target available as the new primary site. Upon completion of this command, the session becomes Target Available.

Table 75. Metro Mirror commands (continued)

Command	Action
<b>Terminate</b>	Removes all copy relationships from the hardware during an active session. If you want the targets to be data consistent before removing their relationship, you must issue the <b>Suspend</b> command, then the <b>Recover</b> command, and then the <b>Terminate</b> command.

## Metro Mirror with Practice commands

Use this information to learn about commands available for Metro Mirror with Practice sessions.

Table 76. Metro Mirror with Practice commands

Command	Action
<b>Enable Copy to Site 1</b>	Run this command and confirm that you want to reverse the direction of replication before you reverse the direction of copying in a failover and failback session. After you issue this command, the <b>Start H2-&gt;H1</b> command becomes available.
<b>Enable Copy to Site 2</b>	Run this command and confirm that you want to reverse the direction of replication before reversing the direction of copying in a failover and failback session. After you issue this command, the <b>Start H1-&gt;H2</b> command becomes available.
<b>Flash</b>	Creates a FlashCopy image from I2 volumes to H2 volumes. The amount of time for this to occur will vary depending on the number of copy sets in the session. <b>Note:</b> For ESS, DS6000, and DS8000 storage systems, the <b>Flash</b> command uses the freeze and thaw processing to create a data consistent point for the FlashCopy. If there is another Metro Mirror session overlapping on one or more of the same LSS pairs, that session will be suspended. It is also possible that the suspension of the other session might cause the Metro Mirror session to remain suspended after the flash command is issued instead of returning to Prepared state. Avoid using the same LSS pairs for multiple Metro Mirror sessions if possible.
<b>Start H1-&gt;H2</b>	Establishes a Metro Mirror relationship from the H1 volumes to the I2 volumes, and begins data replication.
<b>Start H2-&gt;H1</b>	Establishes a Metro Mirror relationship from H2 to H1 and begins data replication.
<b>StartGC_H1H2</b>	Distinguishes when the session is in the Preparing state from H1 to I2 and begins the asynchronous process between the source and target volumes. While in the Preparing state the session will not change to the Prepared state unless you switch to Metro Mirror.
<b>StartGC_H2H1</b>	Distinguishes when the session is in the Preparing state from H2 to H1 and begins the asynchronous process between the source and target volumes. While in the Preparing state the session will not change to the Prepared state unless you switch to Metro Mirror.

Table 76. Metro Mirror with Practice commands (continued)

Command	Action
<b>Suspend</b>	<p>Causes all target volumes to remain at a data-consistent point and stops all data that is moving to the target volumes. This command can be issued at any point during a session when the data is actively being copied.</p> <p><b>Note:</b> The Metro Mirror command uses a freeze command on the ESS, DS6000, and DS8000 devices to create the data-consistent point. If there are other Metro Mirror sessions overlapping the same LSS pairs as in this session, those sessions will also become suspended. Avoid using the same LSS pairs for multiple Metro Mirror sessions.</p> <p>When a <b>Suspend</b> command is issued to a source volume in an LSS that has source volumes in another active Metro Mirror session, the other source volumes are affected only if they have the same target LSS. The primary volumes are suspended, but volumes in the same source LSS that have target volumes in a different LSS are not affected because they use a different PPRC path connection.</p>
<b>Stop</b>	<p>Inconsistently suspends updates to all the targets of pairs in a session. This command can be issued at any point during an active session.</p> <p><b>Note:</b> Targets after the suspend are not considered to be consistent.</p>
<b>Terminate</b>	Terminates all copy relationships on the hardware.
<b>Recover</b>	<p>Takes a point-in-time copy of the data on I2 to the H2 volumes, enabling the application to be attached and run from the H2 volumes on site 2.</p> <p><b>Note:</b> The point-in-time copy is performed when the session is in a recoverable state to avoid that previous consistent data on H2 are overwritten by inconsistent data upon Recover. You can issue the <b>Flash</b> command if you want to force a point-in-time copy from I2 to JH2 volumes afterwards.</p>

## Global Mirror commands

Use this information to learn about commands available for Global Mirror sessions.

Table 77. Global Mirror commands

Command	Action
<b>Enable Copy to Site 1</b>	Run this command and confirm that you want to reverse the direction of replication before you reverse the direction of copying in a failover and failback session. After you issue this command, the <b>Start H2-&gt;H1</b> command becomes available.
<b>Enable Copy to Site 2</b>	Run this command and confirm that you want to reverse the direction of replication before reversing the direction of copying in a failover and failback session. After you issue this command, the <b>Start H1-&gt;H2</b> command becomes available.
<b>Start</b>	Establishes all relationships in a single-direction session and begins the process necessary to start forming consistency groups on the hardware.

Table 77. Global Mirror commands (continued)

Command	Action
<b>Start H1-&gt;H2</b>	Starts copying data from H1 to H2 in a Global Mirror Failover/Failback session. Establishes the necessary relationships in the session and begins the process necessary to start copying data from the H1 site to the H2 site and to start forming consistency groups.
<b>Start H2-&gt;H1</b>	Starts copying data from H2 to H1 in a failover and failback session for TotalStorage Enterprise Storage Server Model 800, System Storage DS6000, and System Storage DS8000. If a recover was performed on a session such that the production site is now H2, you can issue a <b>Start H2-&gt;H1</b> to start moving data back to Site 1. However, this start does not provide consistent protection as it copies only asynchronously back because of the long distance. A Global Copy relationship is used. When you are ready to move production back to Site 1, issue a suspend to the session; this puts the relationships into a synchronized state and suspends them consistently. Sessions are consistent when copying H2->H1 for the following storage systems: <ul style="list-style-type: none"> <li>• SAN Volume Controller</li> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> </ul>
<b>StartGC H1-&gt;H2</b>  This command is available only for Global Mirror Failover/Failback and Global Mirror Failover/Failback with Practice sessions.	Establishes Global Copy relationships between site 1 and site 2 and begins asynchronous data replication from H1 to H2. To change the session state from Preparing to Prepared, you must issue the <b>Start H1-&gt;H2</b> command and the session must begin to form consistency groups.  There is no disaster recovery protection for Global Copy relationships. If a disaster such as the loss of a primary storage system or a link failure between the sites occurs, the session might be inconsistent when you issue the <b>Recover</b> command.  This command is available for the following storage systems: <ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS6000</li> <li>• System Storage DS8000</li> </ul>
<b>Suspend</b>	Stops all consistency group formation when the data is actively being copied and suspends the H1->H2 Global Copy pairs. To issue the pause command to the Global Mirror session on the hardware without suspending the Global Copy pairs, open the <code>rmsserver.properties</code> file and add the following property to disable the Global Copy suspension on the <b>Suspend</b> command: <b><code>csm.server.sus_gc_pairs_on_gm_pause = false</code></b> . The default property is <b>true</b> and the <b>Suspend</b> command automatically suspends the Global Copy pairs.
<b>Recover</b>	Issue this command to recover the session to the target site. This command performs the steps necessary to make the target host volumes consistent and available for access as the new primary site. Upon completion of this command, the session becomes Target Available. Do not access H2 volumes until the <b>Recover</b> command is completed and the session displays Target Available and Recoverable. A Recover to H2 also establishes a point-in-time copy to J2 to preserve the last consistent data.

Table 77. Global Mirror commands (continued)

Command	Action
<b>Terminate</b>	Removes all physical copies and relationships from the hardware during an active session.  If you want the targets to be data consistent before removing their relationship, you must issue the <b>Suspend</b> command, the <b>Recover</b> command, and then the <b>Terminate</b> command.

## Global Mirror with Practice commands

Use this information to learn about commands available for Global Mirror with Practice sessions.

Table 78. Global Mirror with Practice commands

Command	Action
<b>Enable Copy to Site 1</b>	Run this command and confirm that you want to reverse the direction of replication before you reverse the direction of copying in a failover and failback session. After you issue this command, the <b>Start H2-&gt;H1</b> command becomes available.
<b>Enable Copy to Site 2</b>	Run this command and confirm that you want to reverse the direction of replication before reversing the direction of copying in a failover and failback session. After you issue this command, the <b>Start H1-&gt;H2</b> command becomes available.
<b>Flash</b>	The Flash command on a Global Mirror Practice session for TotalStorage Enterprise Storage Server Model 800, System Storage DS6000, and System Storage DS8000 temporarily pauses the formation of consistency groups. The Flash command ensures that all I2s are consistent, and then flashes the data from I2 to the H2 volumes. After the flash is complete, the Global Mirror session is automatically restarted, and the session begins forming consistency groups on I2. You can then use the H2 volumes to practice your disaster recovery procedures.
<b>Start H1-&gt;H2</b>	Starts copying data from H1 to H2. After the first pass of the copy is complete for all pairs, the session establishes the I2->J2 FlashCopy pairs. The session starts the Global Mirror master so that the hardware begins to form consistency groups, to ensure that consistent data is at site 2.
<b>Start H2-&gt;H1</b>	Starts copying data from H2 to H1 in a failover and failback session. If a recover was performed on a session such that the production site is now H2, you can issue a <b>Start H2-&gt;H1</b> to start moving data back to Site 1. However, this start does not provide consistent protection as it copies only asynchronously back because of the long distance. <b>Note:</b> TotalStorage Enterprise Storage Server Model 800, System Storage DS6000, and System Storage DS8000 volumes are not consistent for the <b>Start H2-&gt;H1</b> command. A Global Copy relationship is used. When you are ready to move production back to Site 1, issue a suspend command to the session. The relationships are put into a synchronized state and are suspended consistently.

Table 78. Global Mirror with Practice commands (continued)

Command	Action
<p><b>StartGC H1-&gt;H2</b></p> <p>This command is available only for Global Mirror Failover/Failback and Global Mirror Failover/Failback with Practice sessions.</p>	<p>Establishes Global Copy relationships between site 1 and site 2 and begins asynchronous data replication from H1 to I2. To change the session state from Preparing to Prepared, you must issue the <b>Start H1-&gt;H2</b> command and the session must begin to form consistency groups.</p> <p>There is no disaster recovery protection for Global Copy relationships. If a disaster such as the loss of the primary Tivoli Storage Productivity Center for Replication server occurs, the session might be inconsistent when you issue the <b>Recover</b> command.</p> <p>This command is available for the following storage systems:</p> <ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server Model 800</li> <li>• System Storage DS6000</li> <li>• System Storage DS8000</li> </ul>
<b>Terminate</b>	Removes all physical copies and relationships on the hardware.
<b>Suspend</b>	Stops all consistency group formation when the data is actively being copied and suspends the H1-I2 Global Copy pairs. To issue the pause command to the Global Mirror session on the hardware without suspending the Global Copy pairs, open the <code>rmserver.properties</code> file and add the following property to disable the Global Copy suspension on the <b>Suspend</b> command: <b><code>csm.server.sus_gc_pairs_on_gm_pause = false</code></b> . The default property is <b>true</b> and the <b>Suspend</b> command automatically suspends the Global Copy pairs..
<b>Recover</b>	Restores consistent data on I2 volumes and takes a point-in-time copy of the data on I2 to the H2 volumes, enabling the application to be attached and run from the H2 volumes on site 2. The I2 volumes continue to hold the consistent data and can be flashed again to H2 by using the <b>Flash</b> command.

## Metro Global Mirror commands

Use this information to learn about commands available for Metro Global Mirror sessions.

Table 79. Metro Global Mirror commands

Command	Action
<b>Enable Copy to Site 1</b>	Run this command and confirm that you want to reverse the direction of replication before you reverse the direction of copying in a failover and failback session. After you issue this command, the <b>Start H2-&gt;H1-&gt;H3</b> command becomes available.
<b>Enable Copy to Site 2</b>	Run this command and confirm that you want to reverse the direction of replication before reversing the direction of copying in a failover and failback session. After you issue this command, the <b>Start H1-&gt;H2-&gt;H3</b> command becomes available.
<b>HyperSwap</b>	Causes a site switch, equivalent to a suspend and recover for a Metro Mirror with failover and failback individual suspend and recover commands are not available. This command is available only for Tivoli Storage Productivity Center for Replication for System z.

Table 79. Metro Global Mirror commands (continued)

Command	Action
<b>Start H1-&gt;H2-&gt;H3</b>	<p>(This is the Metro Global Mirror initial start command.) Establishes Metro Mirror relationships between H1 and H2, and Global Mirror relationships between H2 and H3. For Metro Global Mirror, this includes the J3 volume to complete the Global Mirror configuration. (The J3 volume role is the journal volume at site 3.). <b>Start H1-&gt;H2-&gt;H3</b> can be used from some Metro Global Mirror configurations to transition back to the starting H1-&gt;H2-&gt;H3 configuration.</p> <p>This command is valid only when the session is in a defined, preparing, prepared, or suspended state.</p>
<b>Start H1-&gt;H3</b>	<p>From the H1-&gt;H2-&gt;H3 configuration, this command changes the session configuration to a Global Mirror-only session between H1 and H3, with H1 as the source. Use this command in case of an H2 failure with transition bitmap support provided by incremental resynchronization. It can be used when a session is in preparing, prepared, and suspended states because there is not a source host change involved.</p> <p>This command allows you to bypass the H2 volume in case of an H2 failure and copy only the changed tracks and tracks in flight from H1 to H3. After the incremental resynchronization is performed, the session is running Global Mirror from H1 to H3 and thus loses the near-zero data loss protection achieved with Metro Mirror when running H1-&gt;H2-&gt;H3. However, data consistency is still maintained at the remote site with the Global Mirror solution.</p> <p>From H2-&gt;H1-&gt;H3 configuration, this command changes the session configuration to a Global Mirror-only session configuration between H1 and H3, with H1 as the source. Use this command when the source site has a failure and production is moved to the H1 site. This can be done for unplanned HyperSwap. The Global Mirror session is continued. This is a host-volume change so this command is valid only when restarting the H1-&gt;H3 configuration or from the TargetAvailable H2-&gt;H1-&gt;H3 state.</p>
<b>Start H2-&gt;H3</b>	<p>From the H1-&gt;H2-&gt;H3 configuration, this command moves the session configuration to a configuration between H2 and H3, with H2 as the source. Use this command when the source site has a failure and production is moved to the H2 site, for example, for unplanned HyperSwap. The Global Mirror session is continued. This session is a host-volume change so this command is valid only when restarting the H1-&gt;H3 configuration or from the TargetAvailable H2-&gt;H1-&gt;H3 state.</p> <p>From the H2-&gt;H1-&gt;H3 configuration, this command changes the session configuration to a configuration between H2 and H3 with H2 as the source. Use this command in case of an H1 failure with transition bitmap support provided by incremental resynchronization. Because there is not a source-host change involved, it can be used when the session is in preparing, prepared, and suspended states <b>Start H2-&gt;H1-&gt;H3</b> can be used to transition back to the starting H2-&gt;H1-&gt;H3 configuration.</p>

Table 79. Metro Global Mirror commands (continued)

Command	Action
<b>Start H2-&gt;H1-&gt;H3</b>	(This is the Metro Global Mirror start command.) This is the configuration that completes the HyperSwap processing. This command creates Metro Mirror relationships between H2 and H1 and Global Mirror relationships between H1 and H3. For Metro Global Mirror, this includes the J3 volume to complete the Global Mirror configuration.
<b>Start H3-&gt;H1-&gt;H2</b>	<p>After recovering to H3, this command sets up the hardware to allow the application to begin writing to H3, and the data is copied back to H1 and H2. However, issuing this command does not guarantee consistency in the case of a disaster because only Global Copy relationships are established to cover the long distance copy back to site 1.</p> <p>To move the application back to H1, you can issue a suspend while in this state to drive all the relationships to a consistent state and then issue a freeze to make the session consistent. You can then issue a <b>Recover</b> followed by a <b>Start H1-&gt;H2-&gt;H3</b> to go back to the original configuration.</p>
<b>SuspendH2H3</b>	<p>When running H1-&gt;H2-&gt;H3, this command issues a pause to the Global Mirror master and causes the Global Mirror master to stop forming consistency groups.</p> <p>This command is valid only when the session is in a prepared state. Stops all consistency group formation when the data is actively being copied and suspends the H2&gt;H3 Global Copy pairs. To issue the pause command to the Global Mirror session on the hardware without suspending the Global Copy pairs, open the <code>rmserver.properties</code> file and add the following property to disable the Global Copy suspension on the <b>Suspend</b> command: <b><code>csm.server.sus_gc_pairs_on_gm_pause = false</code></b>. The default property is <b>true</b> and the <b>Suspend</b> command automatically suspends the Global Copy pairs..</p>
<b>SuspendH1H3</b>	<p>When running H2-&gt;H1-&gt;H3, this command issues a pause to the Global Mirror master and causes the Global Mirror master to stop forming consistency groups.</p> <p>This command is valid only when the session is in a prepared state. Stops all consistency group formation when the data is actively being copied and suspends the H2-&gt;H3 Global Copy pairs. To issue the pause command to the Global Mirror session on the hardware without suspending the Global Copy pairs, open the <code>rmserver.properties</code> file and add the following property to disable the Global Copy suspension on the <b>Suspend</b> command: <b><code>csm.server.sus_gc_pairs_on_gm_pause = false</code></b>. The default property is <b>true</b> and the <b>Suspend</b> command automatically suspends the Global Copy pairs..</p>
<b>RecoverH1</b>	Specifying H1 makes the H1 volume TargetAvailable. Metro Global Mirror (when running H2->H1->H3) can move production to either the H1 or H3 set of volumes. IBM Tivoli Storage Productivity Center for Replication processing differs, depending on the recovery site. Therefore, the site designation is added to the <b>Recover</b> command so IBM Tivoli Storage Productivity Center for Replication can set up for the failback.

Table 79. Metro Global Mirror commands (continued)

Command	Action
<b>RecoverH2</b>	Specifying H2 makes the H2 volume TargetAvailable. Metro Global Mirror (when running H1->H2->H3) can move production to either the H2 or H3 set of volumes. IBM Tivoli Storage Productivity Center for Replication processing is different depending on the recovery site. Therefore the site designation is added to the <b>Recover</b> command so IBM Tivoli Storage Productivity Center for Replication can prepare for the failback.
<b>RecoverH3</b>	<p>Specifying H3 makes the H3 volume TargetAvailable. Metro Global Mirror (when running H1-&gt;H2-&gt;H3) can then move production to the H3 set of volumes. Because Tivoli Storage Productivity Center for Replication processing differs depending on the recovery site, the site designation is added to the <b>Recover</b> command so that Tivoli Storage Productivity Center for Replication can prepare for the failback.</p> <p>This command prepares H3 so that you can start the application on H3. H3 becomes the active host, and you then have the option start H3-&gt;H1-&gt;H2 to perform a Global Copy copy back. The recovery establishes point-in-time copy to J3 volumes to preserve the last consistent data.</p>

## Metro Global Mirror with Practice commands

Use this information to learn about commands available for Metro Global Mirror with Practice sessions.

Table 80. Metro Global Mirror with Practice commands

Command	Action
<b>Enable Copy to Site 1</b>	Run this command and confirm that you want to reverse the direction of replication before you reverse the direction of copying in a failover and failback session.
<b>Enable Copy to Site 2</b>	Run this command and confirm that you want to reverse the direction of replication before reversing the direction of copying in a failover and failback session.

Table 80. Metro Global Mirror with Practice commands (continued)

Command	Action
<b>Flash</b>	<p>This command is available in the following states:</p> <ul style="list-style-type: none"> <li>• Target Available state when the active host is H3  <b>Note:</b> Use this command if the FlashCopy portion of the Recover command from I3 to H3, fails for any reason. The problem can be addressed; and a <b>Flash</b> command issued to complete the flash of the consistent data from I3 to H3.</li> <li>• Prepared state when the active host is H1 and data is copying H1 to H2 to I3, or the active host is H2 and data is copying H2 to H1 to H3.</li> <li>• Prepared state when the active host is H2 and data is copying H2 to I3.</li> <li>• Prepared state when the active host is H1 and data is copying H1 to I3.</li> </ul> <p>Use this command if the FlashCopy portion of the Recover command from I3 to H3, fails for any reason. The problem can be addressed, and a <b>Flash</b> command issued to complete the flash of the consistent data from I3 to H3.</p> <p>Issuing a <b>Flash</b> command on a Global Mirror Practice session for ESS, DS6000 and DS8000 will temporarily pause the formation of consistency groups, ensure that all I3s are consistent, and then flash the data from I3 to the H3 volumes. After the flash is complete, the Global Mirror session will be automatically restarted, and the session will begin forming consistency groups on I3. You can then use the H3 volumes to practice your disaster recovery procedures.</p>
<b>RecoverH1</b>	<p>Specifying H1 makes the H1 volume TargetAvailable. Metro Global Mirror (when running H1-&gt;H2-&gt;H3) can move production to either the H2 or H3 set of volumes. IBM Tivoli Storage Productivity Center for Replication processing differs, depending on the recovery site. Therefore the site designation is added to the <b>Recover</b> command so IBM Tivoli Storage Productivity Center for Replication can prepare for the failback. The FlashCopy creates a consistent copy of the data on the H3 volumes so that an application can recover to those volumes and begin writing I/O. When the FlashCopy is complete, the session will reach a Target Available state, and you can attach your volumes on Site 3.</p>
<b>RecoverH2</b>	<p>Specifying H2 makes the H2 volume TargetAvailable. Metro Global Mirror (when running H1-&gt;H2-&gt;H3) can move production to either the H2 or H3 set of volumes. IBM Tivoli Storage Productivity Center for Replication processing differs, depending on the recovery site. Therefore the site designation is added to the <b>Recover</b> command so IBM Tivoli Storage Productivity Center for Replication can prepare for the failback.</p>
<b>RecoverH3</b>	<p>Specifying H3 makes the H3 volume the TargetAvailable. When running H1-&gt;H2-&gt;H3, Metro Global Mirror can move production to either the H2 or H3 set of volumes. IBM Tivoli Storage Productivity Center for Replication processing differs, depending on the recovery site; therefore, the site designation is added to the <b>Recover</b> command so IBM Tivoli Storage Productivity Center for Replication can prepare for the failback.</p>
<b>Re-enable Copy to Site 1</b>	<p>After issuing a <b>RecoverH1</b> command, you can run this command to restart the copy to the original the direction of replication in a failover and failback session.</p>

Table 80. Metro Global Mirror with Practice commands (continued)

Command	Action
<b>Re-enable Copy to Site 2</b>	After issuing a <b>RecoverH2</b> command, you can run this command to restart the copy to the original the direction of replication in a failover and failback session.
<b>Re-enable Copy to Site 3</b>	After issuing a <b>RecoverH3</b> command, you can run this command to restart the copy to the original the direction of replication in a failover and failback session.
<b>Start H1-&gt;H2-&gt;H3</b>	<p>Metro Global Mirror initial start command. This command creates Metro Mirror relationships between H1 and H2, and Global Mirror relationships between H2 and H3. For Metro Global Mirror, this includes the J3 volume to complete the Global Mirror configuration. (The J3 volume role is the journal volume at site 3.). <b>Start H1-&gt;H2-&gt;H3</b> can be used from some Metro Global Mirror configurations to return to the starting H1&gt;H2&gt;H3 configuration.</p> <p>This command is valid only when the session is in a defined, preparing, prepared, target-available, or suspended state.</p>
<b>Start H1-&gt;H3</b>	<p>From the H1-&gt;H2-&gt;H3 configuration, this command changes the session configuration to a Global-Mirror-only session between H1 and H3, with H1 as the source. Use this command in case of an H2 failure with transition bitmap support provided by incremental resynchronization. Because there is not a source host change involved, it can be used when a session is in preparing, prepared, and suspended states.</p> <p>You can use this command to bypass the H2 volume in case of an H2 failure and copy only the changed tracks and tracks in flight from H1 to H3. After the incremental resynchronization is performed, the session is running Global Mirror from H1 to H3 and thus loses the near-zero data loss protection achieved with Metro Mirror when running H1-&gt;H2-&gt;H3. However, data consistency is still maintained at the remote site with the Global Mirror solution.</p> <p>From H2-&gt;H1-&gt;H3 configuration, this command changes the session configuration to a Global-Mirror-only session configuration between H1 and H3, with H1 as the source. Use this command when the source site has a failure and production is moved to the H1 site. This can be done for unplanned HyperSwap. The Global Mirror session is continued. This is a host-volume change so this command is valid only when restarting the H1-&gt;H3 configuration or from the TargetAvailable H2-&gt;H1-&gt;H3 state.</p>

Table 80. Metro Global Mirror with Practice commands (continued)

Command	Action
<b>Start H2-&gt;H3</b>	<p>From the H1-&gt;H2-&gt;H3 configuration, this command moves the session configuration to a configuration between H2 and H3, with H2 as the source. Use this command when the source site has a failure and production is moved to the H2 site. This can be done for unplanned HyperSwap. The Global Mirror session is continued. This is a host-volume change so this command is valid only when restarting the H1&gt;H3 configuration or from the TargetAvailable H2-&gt;H1-&gt;H3 state.</p> <p>From the H2-&gt;H1-&gt;H3 configuration, this command changes the session configuration to a configuration between H2 and H3 with H2 as the source. Use this command in case of an H1 failure with transition bitmap support provided by incremental resynchronization. Because there is not a source-host change involved it can be used when the session is in preparing, prepared, and suspended states. <b>Start H2-&gt;H1-&gt;H3</b> can be used to return to the starting H2-&gt;H1-&gt;H3 configuration.</p>
<b>SuspendH2H3</b>	<p>When running H1-&gt;H2-&gt;H3, this command issues a pause to the Global Mirror master and causes the Global Mirror master to stop forming consistency groups.</p> <p>This command is valid only when the session is in a prepared state. It stops all consistency group formation when the data is actively being copied and suspends the H2-&gt;H3 Global Copy pairs. To issue the pause command to the Global Mirror session on the hardware without suspending the Global Copy pairs, open the <code>rmsserver.properties</code> file and add the following property to disable the Global Copy suspension on the <b>Suspend</b> command: <b><code>csm.server.sus_gc_pairs_on_gm_pause = false</code></b>. The default property is <b>true</b> and the <b>Suspend</b> command automatically suspends the Global Copy pairs..</p>
<b>SuspendH1H3</b>	<p>When running H2-&gt;H1-&gt;H3, this command issues a pause to the Global Mirror master and causes the Global Mirror master to stop forming consistency groups.</p> <p>This command is valid only when the session is in a prepared state. Stops all consistency group formation when the data is actively being copied and suspends the H2-&gt;H3 Global Copy pairs. To issue the pause command to the Global Mirror session on the hardware without suspending the Global Copy pairs, open the <code>rmsserver.properties</code> file and add the following property to disable the Global Copy suspension on the <b>Suspend</b> command: <b><code>csm.server.sus_gc_pairs_on_gm_pause = false</code></b>. The default property is <b>true</b> and the <b>Suspend</b> command automatically suspends the Global Copy pairs..</p>
<b>Terminate</b>	This command terminates all copy relationships on the hardware.

## Site awareness

You can associate a location with each storage system and each site in a session. This *site awareness* ensures that only the volumes whose location matches the location of the site are allowed for selection when you add copy sets to the session. This prevents a session relationship from being established in the wrong direction.

**Note:** To filter the locations for site awareness, you must first assign a site location to each storage system.

IBM Tivoli Storage Productivity Center for Replication does not perform automatic discovery of locations. Locations are user-defined and specified manually.

You can change the location associated with a storage system that has been added to the IBM Tivoli Storage Productivity Center for Replication configuration. You can choose an existing location or add a new one. Locations are deleted when there is no longer a storage system with an association to that location.

When adding a copy set to a session, a list of candidate storage systems is presented, organized by location. Storage systems that do not have a location are displayed and available for use when you create a copy set.

You can also change the location for any site in a session. Changing the location of a session does not affect the location of the storage systems that are in the session.

Changing the location of a storage system might have consequences. When a session has a volume role with a location that is linked to the location of the storage system, changing the location of the storage system could change the session's volume role location. For example, if there is one storage system with the location of A\_Location and a session with the location of A\_Location for its H1 role, changing the location of the storage system to a different location, such as B\_Location, also changes the session's H1 location to Site 1. However, if there is a second storage system that has the location of A\_Location, the session's role location is not changed.

**Important:** Location matching is enabled only when adding copy sets. If you change the location of a storage system or volume role, IBM Tivoli Storage Productivity Center for Replication does not audit existing copy sets to confirm or deny location mismatches.

## Preserve Mirror option

This topic presents recommendations for using the Preserve Mirror option in FlashCopy and Metro Mirror sessions.

When the source of the FlashCopy relationship is a source of a Metro Mirror relationship, and the target of the FlashCopy relationship is the source of a Metro Mirror relationship, the Preserve Mirror option attempts to preserve the consistency of the Metro Mirror relationship at the target of the FlashCopy relationship, preventing a full copy from being performed over the Metro Mirror link. Instead, parallel flashes will be performed (if possible) on both sites. If the consistency cannot be preserved, the Flash for the FlashCopy relationships will fail, and the data of the Metro Mirror relationship at the target of the FlashCopy relationship will not be changed.

**Note:** This option is available only on DS8000 storage devices with the required code levels installed.

However, in some instances, the Preserve Mirror option can cause a Metro Mirror session to go into a Preparing state, or even a Suspended state. This topic describes the recommended usage of the Preserve Mirror feature. Using this feature in other ways might lead to a Metro Mirror session going into a Preparing or Suspended state.

## FlashCopy session

You can use the Preserve Mirror option in FlashCopy sessions in two different methods:

### Perform an incremental resynchronization

To perform an incremental resynchronization, select the **Incremental** and **Persistent** options in the FlashCopy session: do *not* select the **No Copy** option.

### Perform a single full copy

To perform a single full copy, ensure that the **Incremental**, **Persistent** and **No Copy** options are *not* selected before you issue a **Flash** command. If you use the **No Copy** option, issue either an **Initiate Background Copy** command or **Terminate** command before you issue the Flash command.

Refer to your DS8000 documentation for more information about the Preserve Mirror function.

## Metro Mirror session

You can set up your Metro Mirror pairs in two different ways, depending on the level of consistency you need, and your preferences.

**Note:** For the examples in this section, the source pair is H1a->H2a and the target pair is H1b->H2b. The source pair will contain volumes that will be the source of the FlashCopy relationship and the target pair will always contain volumes that will be the target of the FlashCopy relationship.

### Create one Metro Mirror session, and add the Metro Mirror pairs as copy sets to that session

The benefit to this approach is that you do not need to worry about whether the host considers the H1a->H2a and H1b->H2b volumes to be consistent with one another. IBM Tivoli Storage Productivity Center for Replication will ensure that all of the volumes remain consistent.

A drawback to this approach is that when using the **Attempt to preserve Metro Mirror consistency, but fail FlashCopy if Metro Mirror target consistency cannot be preserved** option (Preserve Mirror Required), there is a chance that the target pair (H1b->H2b) might suspend unexpectedly: this causes all other pairs in the Metro Mirror session to suspend (including H1a->H2a). This can occur when a FlashCopy establish or withdraw fails unexpectedly on the remote (H1b->H2b) site. If the host requires the H1a->H2a and H1b->H2b volumes to be consistent, then you should suspend all other volumes.

### Create one Metro Mirror session for the H1a->H2a volumes, and another Metro Mirror session for the H1b->H2b volumes

Use this option when the hosts and applications do not require the H1a->H2a and H1b->H2b volumes to be consistent with one another. In this case, you should create one Metro Mirror session for all of the H1a->H2a volumes, and another Metro Mirror session for the H1b->H2b volumes. The H1a->H2a pair is added to the first session, while the H1b->H2b pair is added to the second Metro Mirror session. As long as the host does not require consistency between the H1a and H1b volumes, this option benefits you when you use the **Attempt to preserve Metro Mirror consistency, but fail FlashCopy if Metro Mirror target consistency cannot be preserved** option (Preserve Mirror Required). The benefit is that if one

pair is suspended (such as H1a->H2a), the pairs in the other session will not be affected, since it is in a different Metro Mirror session. Using this method, you can avoid the situation in which a critical application is writing to the source pair (H1a->H2a), while a batch job is writing to the target pair (H1b->H2b), and both pairs are in the same IBM Tivoli Storage Productivity Center for Replication session. These factors cause both applications to receive extended long busy signals, instead of just the batch job.

## Creating sessions and adding copy sets

This section describes how to create a session for a specific replication method and then add copy sets to that session.

### Creating a FlashCopy session and adding copy sets

FlashCopy replication creates a point-in-time copy in which the target volume contains a copy of the data that was on the source volume when the FlashCopy session was established.

When you create a FlashCopy session for Global Mirror or Metro Global Mirror space-efficient target volumes, you must select **No Copy** for the FlashCopy session. With space-efficient volumes, you can use your FlashCopy repository more efficiently. Instead of requiring an equal amount of space to write data to, you can set aside a smaller amount of space in which to write data, where only the tracks that are changed are recorded. When your pool of storage is full, you can no longer perform a FlashCopy operation, and your session goes into a Severe state.

1. Follow these steps to create a FlashCopy session:
  - a. In the navigation tree, select **Sessions**.
  - b. Click **Create Session**.
  - c. In the Create Session wizard, for the **Choose Hardware Type** list, select the item that shows the type of storage system for the session.
  - d. In the **Choose Session Type** list, select **FlashCopy** and click **Next**.
  - e. On the Properties page, enter a session name and a description. Select the options that you want, as described in "Session properties" on page 771. The options that are displayed depend on the storage system type. After you select the options that you want, click **Next**.
  - f. On the Site Locations page, select a location for Site 1 and click **Next**.
  - g. On the Results page, verify that the session was added successfully.
2. Follow these steps to add copy sets to the session:
  - a. On the Results page of the Create Session wizard, click **Launch Add Copy Sets Wizard**.
  - b. In the Add Copy Sets wizard, complete the following information. The field names that are displayed depend on the storage system type. When you complete the information, click **Next**.

#### Storage system

Select a storage system. If the role has a location assigned to it, acceptable values for the storage system list are storage systems assigned to the same location as the role, and storage systems assigned to no location. In this case, the storage systems are grouped under different headings. If the role does not have a location, any storage system is acceptable.

#### Logical storage system or I/O Group

Select a logical storage system (LSS) or I/O group.

### Volume

Select one volume or all volumes. The volumes are limited to the volumes within the LSS or I/O group that you selected.

You can use extent space-efficient volumes as source and target volumes for System Storage DS8000 6.2 or later. You can use a combination of extent space-efficient and other volume types as source and target volumes.

Extent space-efficient volumes must be fixed block (FB). You cannot use count key data (CKD) volumes.

### Session image

Shows an image that represents the session in which the role for which you are selecting volumes is highlighted. This image shows how many roles are in the session and how the roles are distributed between the sites.

### Volume Details

Shows information about the selected volume, including the volume name, full name, type, capacity, and whether the volume is protected and space-efficient.

### Use a CSV file to import copy sets

Select this option to import copy sets from a comma-separated value (CSV) file, click **Use a CSV file to import copy sets**. Type the full path name of the CSV file or click **Browse** to select the CSV file.

- c. On the Choose Target page, select the target storage system, LSS or I/O group, and volume. Click **Next**.
- d. On the Select Copy Sets page, select the copy sets that you want to add. You can click **Select All** to select all copy sets, **Deselect All** to select none of the copy sets, or **Add More** to add more copy sets to this session. Click **Next**.
- e. On the Confirm page, the number of copy sets to be added is displayed. Click **Next**.
- f. A progress bar is displayed. When the copy sets are added, review the results and click **Finish**.

### Related concepts:

“Sessions” on page 689

A *session* is used to perform a specific type of data replication against a specific set of volumes. The source volume and target volumes that contain copies of the same data are collectively referred to as a copy set. A session can contain one or more copy sets.

“Data replication” on page 75

With Tivoli Storage Productivity Center for Replication, you can use several methods to replicate data. The type of data replication that is associated with a session is known as the *session type*.

### Creating a Snapshot session and adding copy sets

A Snapshot session is a session type that creates a point-in-time copy of a volume or set of volumes without having to define a specific target volume. Snapshot sessions are available only for the XIV system.

1. Follow these steps to create a Snapshot session:
  - a. In the navigation tree, expand **Sessions**.
  - b. Click **Create Session**.

- c. In the Create Session wizard, for the **Choose Hardware Type** list, select **XIV**.
  - d. In the **Choose Session Type** list, select **Snapshot** and click **Next**.
  - e. On the Properties page, type a session name and description, and click **Next**.
  - f. On the Site Locations page, select a location for Site 1 and click **Next**.
  - g. On the Results page, verify that the session was added successfully.
2. Follow these steps to add copy sets to the session:
- a. On the Results page of the Create Session wizard, click **Launch Add Copy Sets Wizard**.
  - b. From the **Host1 storage system** list, select the storage system that contains the volumes that you want to add.  
 If the H1 role has an assigned location, only those storage systems that have the same location as the H1 role or storage systems that do not have a set location are displayed for selection.  
 If the H1 role does not have an assigned location, all storage systems are displayed for selection.  
 Storage systems that are assigned to a location are listed under the location name. Storage systems that are not assigned to a location are listed under the **None**. column.
  - c. From the **Host1 pool** list, select the pool that contains the volumes.
  - d. From the **Host1 volume** list, select the volumes. To select multiple volumes, press Ctrl or Shift and click the volumes in the list.
  - e. If you want to import copy sets from a comma-separated value (CSV) file, click **Use a CSV file to import copy sets**. Type the full path name of the CSV file or click **Browse** to select the CSV file. Click **Next**.
  - f. On the Matching Results page, click **Next** if the match was successful.
  - g. On the Select Copy Sets page, select from the following options and click **Next**.

**Select All**

Click this button to select all of the copy sets in the table.

**Deselect All**

Click this button to clear all of the copy sets in the table.

**Add More**

Click this button to add another copy set to the list of copy sets to be created.

When you click **Add More**, you are returned to the Choose Host1 page of the wizard. The **Host1 storage system** and **Host1 pool** lists are populated with the values from the previously selected copy set. When you select the volumes for the various roles, the volumes are matched together and added to the list of copy sets on this page.

**Selection check boxes**

Select one or more copy sets that you want to create.

**Host 1** Lists the volume IDs that are associated with the Host1 role. You can click the link to display information about the volume, including the full name, type, capacity, and whether the volume is protected and space efficient.

### Copy Set

Displays the copy set information for the specified copy sets and any warning or error messages that are associated with the copy set.

A warning or icon next to the **Show** button indicates that you cannot create a copy set for the H1 volume. Click **Show** to view the message.

- h. On the Confirm page, the number of copy sets to be added is displayed. Click **Next**.
- i. A progress bar is displayed. When the copy sets are added, review the results and click **Finish**.

### Related concepts:

With Tivoli Storage Productivity Center for Replication, you can use several methods to replicate data. The type of data replication that is associated with a session is known as the *session type*.

### Creating a Metro Mirror session and adding copy sets

A Metro Mirror session is a method of synchronous, remote data replication that operates between two sites that are up to 300 KM apart.

1. Follow these steps to create a Metro Mirror session:
  - a. In the navigation tree, select **Sessions**.
  - b. Click **Create Session**.
  - c. In the Create Session wizard, for the **Choose Hardware Type** list, select the item that shows the type of storage system for the session.
  - d. In the **Choose Session Type** list, select a Metro Mirror session type and click **Next**.
  - e. On the Properties page, enter a session name and description. Depending on the session type and storage system, additional options are displayed. Select the options that you want, as described in “Session properties” on page 771. After you select the options that you want on the Properties page, click **Next**.
  - f. On the Site Locations pages, select a location for Sites 1 and 2, and click **Next**.
  - g. On the Results page, verify that the session was added successfully.
2. Follow these steps to add copy sets to the session:
  - a. On the Results page of the Create Session wizard, click **Launch Add Copy Sets Wizard**.
  - b. In the Add Copy Sets wizard, enter the following information for the Host pages. The field names that are displayed depend on the storage system type. When you complete the information on each page, click **Next**.

### Storage system

Select a storage system. If the role has a location assigned to it, acceptable values for the storage system list are storage systems assigned to the same location as the role, and storage systems assigned to no location. In this case, the storage systems are

grouped under different headings. If the role does not have a location, any storage system is acceptable.

#### **Logical storage system, I/O Group, or Pool**

Select a logical storage system (LSS), I/O group, or pool.

#### **Volume**

Select one volume or all volumes. The volumes are limited to the volumes within the LSS, I/O group, or pool that you selected.

You can use extent space-efficient volumes as source and target volumes for System Storage DS8000 6.3 or later. If you use an extent space-efficient volume as a source or target volume in the copy set, all source and target volumes in the copy set must be extent space-efficient volumes.

Extent space-efficient volumes must be fixed block (FB). You cannot use count key data (CKD) volumes.

#### **Session image**

Shows an image that represents the session in which the role for which you are selecting volumes is highlighted. This image shows how many roles are in the session and how the roles are distributed between the sites.

#### **Volume Details**

Shows information about the selected volume, including the volume name, full name, type, capacity, and whether the volume is protected and space-efficient.

#### **Use a CSV file to import copy sets**

Select this option to import copy sets from a comma-separated value (CSV) file, click **Use a CSV file to import copy sets**. Type the full path name of the CSV file or click **Browse** to select the CSV file.

- c. On the Select Copy Sets page, select the copy sets that you want to add. You can click **Select All** to select all copy sets, **Deselect All** to select none of the copy sets, or **Add More** to add more copy sets to this session. Click **Next**.
- d. On the Confirm page, the number of copy sets to be added is displayed. Click **Next**.
- e. A progress bar is displayed. When the copy sets are added, review the results and click **Finish**.

#### **Related tasks:**

“Managing a session with HyperSwap and Open HyperSwap replication” on page 99

HyperSwap and Open HyperSwap provide high availability of data if a primary disk storage system failure occurs. When a failure occurs in writing I/O to the primary storage system, the failure is detected by IOS, and IOS automatically swaps the I/O to the secondary site with no user interaction and minimal application effect.

### **Creating a Global Mirror session and adding copy sets**

A Global Mirror session is a method of asynchronous, remote data replication between two sites that are over 300 KM apart.

1. Follow these steps to create a Global Mirror session:
  - a. In the navigation tree, select **Sessions**.
  - b. Click **Create Session**.

- c. In the Create Session wizard, for the **Choose Hardware Type** list, select the item that shows the type of storage system for the session.
  - d. In the **Choose Session Type** list, select a Global Mirror session type and click **Next**.
  - e. On the Properties page, enter a session name and description. Depending on the session type and storage system, additional options are displayed. Select the options that you want, as described in “Session properties” on page 771. After you select the options that you want on the Properties page, click **Next**.
  - f. On the Site Locations pages, select a location for Sites 1 and 2, and click **Next**.
  - g. On the Results page, verify that the session was added successfully.
2. Follow these steps to add copy sets to the session:
    - a. On the Results page of the Create Session wizard, click **Launch Add Copy Sets Wizard**.
    - b. In the Add Copy Sets wizard, complete the following information for the Host and Journal pages. The field names that are displayed depend on the storage system type. When you complete the information on each page, click **Next**.

#### **Storage system**

Select a storage system. If the role has a location assigned to it, acceptable values for the storage system list are storage systems assigned to the same location as the role, and storage systems assigned to no location. In this case, the storage systems are grouped under different headings. If the role does not have a location, any storage system is acceptable.

#### **Logical storage system, I/O Group, or Pool**

Select a logical storage system (LSS), I/O group, or pool from this list.

#### **Volume**

Select one volume or all volumes. The volumes are limited to the volumes within the LSS, I/O group, or pool that you selected.

You can use extent space-efficient volumes as source, target, and journal volumes for System Storage DS8000 6.3 or later. If you use an extent space-efficient volume as a source or target volume in the copy set, all source and target volumes in the copy set must be extent space-efficient volumes. In this situation, the journal volumes can be extent space-efficient volumes, track space-efficient volumes, or a combination of both volume types. If you do not use an extent space-efficient volume as the source or target volume, journal volumes can be extent space-efficient, track space-efficient, and other types of volumes.

Extent space-efficient volumes must be fixed block (FB). You cannot use count key data (CKD) volumes.

#### **Session image**

Shows an image that represents the session in which the role for which you are selecting volumes is highlighted. This image shows how many roles are in the session and how the roles are distributed between the sites.

### Volume Details

Shows information about the selected volume, including the volume name, full name, type, capacity, and whether the volume is protected and space-efficient.

### Use a CSV file to import copy sets

Select this option to import copy sets from a comma-separated value (CSV) file, click **Use a CSV file to import copy sets**. Type the full path name of the CSV file or click **Browse** to select the CSV file.

- c. On the Select Copy Sets page, select the copy sets that you want to add. You can click **Select All** to select all copy sets, **Deselect All** to select none of the copy sets, or **Add More** to add more copy sets to this session. Click **Next**.
- d. On the Confirm page, the number of copy sets to be added is displayed. Click **Next**.
- e. A progress bar is displayed. When the copy sets are added, review the results and click **Finish**.

### Related concepts:

“Sessions” on page 689

A *session* is used to perform a specific type of data replication against a specific set of volumes. The source volume and target volumes that contain copies of the same data are collectively referred to as a copy set. A session can contain one or more copy sets.

“Data replication” on page 75

With Tivoli Storage Productivity Center for Replication, you can use several methods to replicate data. The type of data replication that is associated with a session is known as the *session type*.

### Creating a Metro Global Mirror session and adding copy sets

A Metro Global Mirror session is a method of continuous, remote data replication that operates between three sites of varying distances apart. Metro Global Mirror combines Metro Mirror synchronous copy and Global Mirror asynchronous copy into a single session, where the Metro Mirror target is the Global Mirror source.

1. Follow these steps to create a Metro Global Mirror session:
  - a. In the navigation tree, select **Sessions**.
  - b. Click **Create Session**.
  - c. In the Create Session wizard, for the **Choose Hardware Type** list, select the item that shows the type of storage system for the session.
  - d. In the **Choose Session Type** list, select a Metro Global Mirror session type and click **Next**.
  - e. On the Properties page, enter a session name and a description. Select the options that you want, as described in “Session properties” on page 771. After you select the options that you want, click **Next**.
  - f. On the Site Locations pages, select a location for Sites 1, 2, and 3, and click **Next**.
  - g. On the Results page, verify that the session was added successfully.
2. Follow these steps to add copy sets to the session:
  - a. On the Results page of the Create Session wizard, click **Launch Add Copy Sets Wizard**.

- b. In the Add Copy Sets wizard, complete the following information for the Host and Journal pages. The field names that are displayed depend on the storage system type. When you complete the information on each page, click **Next**.

#### **Storage system**

Select a storage system. If the role has a location assigned to it, acceptable values for the storage system list are storage systems assigned to the same location as the role, and storage systems assigned to no location. In this case, the storage systems are grouped under different headings. If the role does not have a location, any storage system is acceptable.

#### **Logical storage system**

Select a logical storage system.

#### **Volume**

Select one volume or all volumes. The volumes are limited to the volumes within the LSS that you selected.

You can use extent space-efficient volumes as source, target, and journal volumes for System Storage DS8000 6.3 or later. If you use an extent space-efficient volume as a source or target volume in the copy set, all source and target volumes in the copy set must be extent space-efficient volumes. In this situation, the journal volumes can be extent space-efficient volumes, track space-efficient volumes, or a combination of both volume types. If you do not use an extent space-efficient volume as the source or target volume, journal volumes can be extent space-efficient, track space-efficient, and other types of volumes.

Extent space-efficient volumes must be fixed block (FB). You cannot use count key data (CKD) volumes.

#### **Session image**

- d. On the Confirm page, the number of copy sets to be added is displayed. Click **Next**.
- e. A progress bar is displayed. When the copy sets are added, review the results and click **Finish**.

## Using the Metro Mirror heartbeat

This topic provides information about Metro Mirror heartbeat, including how to enable and disable the heartbeat.

### Metro Mirror heartbeat

The *heartbeat* is a Metro Mirror function. When the Metro Mirror heartbeat is disabled, data consistency across multiple storage systems is not guaranteed if the IBM Tivoli Storage Productivity Center for Replication management server cannot communicate with one or more storage systems. The problem occurs as a result of the Hardware Freeze Timeout Timer function within the storage system. If the controlling software loses connection to a storage system, the Metro Mirror relationships that it is controlling stay established and there is no way to *freeze* those pairs to create consistency across the multiple storage systems. When the freeze times out, dependent I/O is written to the target storage systems, which might corrupt data consistency. Freeze refers to a Metro Mirror (peer-to-peer remote copy [PPRC]) freeze function.

When determining whether to use the Metro Mirror heartbeat, analyze your business needs. Disabling the Metro Mirror heartbeat might result in data inconsistency. If you enable the Metro Mirror heartbeat and a freeze occurs, your applications will be unable to write during the freeze.

Metro Mirror heartbeat is disabled by default.

Metro Mirror heartbeat is not available for Metro Mirror with HyperSwap or Metro Global Mirror with HyperSwap.

There are two cases where lost communication between the coordination software (controller) and one or more storage systems can result in data consistency loss:

#### Freeze event not detected by a disconnected storage system

Consider a situation with four storage system machines in a primary site and four in a secondary site. One of the four storage systems on the primary loses the connection to the target site. This causes the affected storage system to prevent any writes from occurring, for a period determined by the Freeze timeout timer. At the same time, the affected storage controller loses communication with the controlling software and cannot communicate the Freeze event to the software.

Unaware of the problem, the controlling software does not issue the Freeze command to the remaining source storage systems. The freeze will stop dependent writes from being written to connected storage systems. However, once the Freeze times out and the long-busy is terminated, dependent write I/Os continue to be copied from the storage systems that did not receive the Freeze command. The Metro Mirror session remains in a state where one storage system has suspended copying while the other three storage systems are still copying data. This state causes inconsistent data on the target storage systems.

#### Freeze event detected, but unable to propagate the Freeze command to all storage systems

Consider a situation with four storage system machines in a primary site and four in a secondary site. One of the four storage systems on the primary loses the connection to the target site. This causes the affected storage system to issue long-busy to the applications for a period

determined by the Freeze timeout timer. At the same time, one of the remaining three source systems loses communications with the controlling software.

The storage system that had an error writing to its target cannot communicate the Freeze event to the controlling software. The controlling software issues the Freeze command to all but the disconnected storage system (the one that lost communication with the software). The long-busy stops dependent writes from being written to the connected storage systems.

However, once the Freeze times out on the frozen storage system and the long-busy is terminated, dependent write I/Os continue to the target storage system from the source storage system that lost communication and did not receive the Freeze command. The Metro Mirror session remains in a state where three storage systems have suspended copying and one storage system is still copying data. This state causes inconsistent data on the target storage systems.

Before IBM Tivoli Storage Productivity Center for Replication V3.1, if the controlling software within a Metro Mirror environment detected that a managed storage system lost its connection to its target, the controlling software stopped all the other source systems to ensure consistency across all the targets. However, if the controlling software lost communication with any of the source subsystems during the failure, it could not notify those storage systems of the freeze event or ensure data consistency. The Metro Mirror heartbeat helps to overcome this problem. In a high-availability configuration, the Metro Mirror heartbeat is continued by the standby server after the Takeover command is issued on the standby, enabling you to perform actions on the standby server without causing a freeze.

IBM Tivoli Storage Productivity Center for Replication registers with the managed ESS 800, DS6000 or DS8000 storage systems within a Metro Mirror session when the start command is issued to the session. After this registration occurs, a constant heartbeat is sent to the storage system. If the storage system does not receive a heartbeat from the IBM Tivoli Storage Productivity Center for Replication management server within the allotted time (a subset of lowest LSS timeout value across all the source LSSs), the storage system initiates a freeze. If IBM Tivoli Storage Productivity Center for Replication did not successfully communicate with the storage system, it initiates a freeze on the remaining storage system after the allotted time is expired.

**Note:** It is recommended that you avoid using the same LSS pairs for multiple Metro Mirror sessions. Metro Mirror uses a freeze command on ESS, DS6000, and DS8000 storage systems to create the data-consistent point. If there are other Metro Mirror sessions overlapping the same LSS pairs as in this session, those sessions are also suspended.

When you are using the Metro Mirror heartbeat, be aware that:

- The Metro Mirror heartbeat can cause a single point of failure: if an error occurs on just the management server and not the storage system, a freeze might occur.
- When the Metro Mirror heartbeat timeout occurs, the storage system remains in a long busy state for the duration of the LSS freeze timeout.

**Note:** If Metro Mirror heartbeat is enabled for storage systems that are connected through a HMC connection, a connection loss might cause lost Metro Mirror heartbeats, resulting in Freeze actions with application I/O impact for configured Extended Long Busy timeout.

The Metro Mirror heartbeat is supported on storage systems connected through a TCP/IP (direct connect or HMC) connection. It is not supported on storage systems connected through a z/OS connection. Enabling the Metro Mirror heartbeat with a z/OS connection does not fail; however, a warning message is displayed specifying that the Metro Mirror heartbeat function does not work unless you have an IP connection.

If Metro Mirror heartbeat is enabled for storage systems that are connected through a TCP/IP (either direct connect or HMC) connection and z/OS connection, and the TCP/IP connection fails, IBM Tivoli Storage Productivity Center for Replication suspends the Metro Mirror session because there is no heartbeat through the z/OS connection.

If Metro Mirror heartbeat is enabled for storage systems that are connected through a TCP/IP connection and z/OS connection and you remove all TCP/IP connections, IBM Tivoli Storage Productivity Center for Replication suspends the Metro Mirror sessions and the applications using those volume will be in Extended Long Busy timeout until the storage system's internal timeout timer expires. Ensure that you disable the Metro Mirror heartbeat for all Metro Mirror sessions before removing the last TCP/IP connection to avoid the Extended Long Busy timeout.

### **Enabling and disabling the Metro Mirror heartbeat**

The Metro Mirror heartbeat guarantees data consistency across multiple storage systems when the IBM Tivoli Storage Productivity Center for Replication management server cannot communicate with one or more storage systems. The Metro Mirror heartbeat is disabled by default.

To enable the Metro Mirror heartbeat, perform the following steps:

1. In the navigation tree, select **Advanced Tools**.
2. To enable the Metro Mirror heartbeat, click **Enable Heartbeat**.
3. To disable the Metro Mirror heartbeat, click **Disable Heartbeat**.

## **Exporting copy set data**

You can export data about all copy sets in a specific session, to maintain a backup copy that can be used to recover if you lose your session or upgrade to a different server.

Perform these steps to export the copy sets in a specific session:

1. In the navigation tree, select **Sessions**. The Sessions panel is displayed.
2. Select the session for which you want to export copy sets.
3. Select **Export Copy Sets** from the **Actions** list, and click **Go**. The Export Copy Set wizard displays the status of the export and a link to the exported file.
4. Click that link and save the file to the local system.

**Important:** You must save the file to your local system. After you close the panel, the data will be lost.

5. Click **Finish**.

## Importing copy set data

You can import copy set data that was previously exported to a comma separated value (CSV) file.

Perform the following steps to import copy sets into an existing session:

1. In the navigation tree, select **Sessions**. The Session panel is displayed.
2. Select the session for which you want to import copy sets.
3. Select **Add Copy Sets** from the **Actions** list, and click **Go**. The Add Copy Sets wizard is displayed.
4. Select **Use a CSV file to import copy sets**.
5. Type the location and name of the CSV file to import, or use **Browse** to select the file. Then, click **Next**.
6. Verify that the matching results were successful, and then click **Next**.
7. Select the copy sets you want to add, and then click **Next**.
8. Confirm the number of copy sets that you want to create, and click **Next**. A progress bar displays.
9. Click **Next**.
10. Verify the matches, and click **Finish**.

## Exporting historical data for Global Mirror role pairs

You can export data for a Global Mirror role pair that is in a session to a comma-separated value (CSV) file. You can then use the data in the CSV file to analyze trends in your storage environment that affect your recovery point objective (RPO).

Complete these steps to export data to a CSV file:

1. In the IBM Tivoli Storage Productivity Center for Replication navigation tree, click **Sessions**.
2. Click the Global Mirror session for which you want to export data.
3. Click **Export Global Mirror Data** from the **Select Action** menu, and click **Go**. The Export Historical Data for Global Mirror wizard is displayed.
4. Complete the following information, and then click **Next**.

### Select the role pair

Select the role pair for the data that you want to show in the CSV file.

### Select the type of data

Select the type of data that you want to export to a CSV file.

Depending on the data type that you select, the CSV file contains data about the RPO or data about logical subsystem (LSS) out-of-sync tracks.

To better analyze trends, you can create a CSV file with one data type and then create a file with the other data type. For example, the file that contains data for the RPO might show that the RPO threshold is often exceeded on a particular day and time. You can then view the file that contains data for logical subsystem (LSS) out-of-sync tracks to see whether a particular LSS or set of LSSs have high out-of-sync track values for that day and time.

**RPO** Select this option to export data for the RPO. The data that is shown in the export file includes the average RPO for the dates that you select and information related to the formation of consistency groups.

### LSS Out-of-Sync Tracks

Select this option to export data for the out-of-sync tracks that are in the LSSs.

#### Start date

Select the start date for the data that you want to show in the export file.

By default, the date range maximum for RPO files is 31 days of data and the maximum for LSS out-of-sync track files is 7 days of data.

#### End date

Select the end date for the data that you want to show in the export file.

If the export was successful, a link to the CSV file is provided on the Results page. You can save the CSV file to your local system.

## Modifying the location of session sites

You can change the location associated with each site of in session.

**Prerequisites:** You must have Administrator privileges to modify the location of a site.

Changing the location of a site in a session does not affect the location of the storage systems associated with that site.

Perform these steps to modify the location of a site:

1. In the navigation tree, select **Sessions**. The Sessions panel is displayed.
2. Select the session whose site locations you want to change.
3. Click **Modify Site Location(s)** from the actions list, and then click **Go**. The Modify Site Locations wizard is displayed.
4. Select the location for the site from the drop-down list, and then click **Next**. Repeat for each available site.

To disable site awareness, set the location to None.

**Note:** You can select only locations that have already been associated with one or more storage systems.

5. Click **Next**.
6. Click **Finish**.

## Removing sessions

This topic describes how to remove sessions.

**Important:** You can remove only sessions that are in the Defined state.

Perform these steps to remove a session:

1. In the navigation tree, select **Sessions**.
2. Click the radio button next to the session you want to remove.
3. Select **Remove Session** from the **Actions** drop-down menu, and click **Go**.

## Removing copy sets

This topic describes how to remove copy sets.

Perform these steps to remove a copy set:

1. In the IBM Tivoli Storage Productivity Center for Replication navigation tree, select **Sessions**. Click the radio button next to the session that you want to remove copy sets from.
2. From the **Select Action** menu, select **Remove Copy Sets** and click **Go**. This starts the Remove Copy Sets wizard.
3. From the drop-down menus in the Remove Copy Sets wizard, select the Host 1 storage system, logical storage subsystem, and volume or select the all option. If you select all for a filter, the lower-level filter or filters are disabled. Click **Next**.
4. Select the copy sets that you want to remove and click **Next**.
5. The number of copy sets to be removed is displayed. Select the following options for removing the copy sets and click **Next**:
  - **Do you want to keep the base relationships on the hardware, but remove the copy sets from the session?**
    - **Yes**. This option specifies that the base relationships remain on the hardware, but the copy sets are removed from the Tivoli Storage Productivity Center for Replication session. This option supports scenarios in which it might be best to leave the relationship on the hardware to avoid performing a full copy. For example, when you are migrating from one session type to another.  
Only the base relationships (Metro Mirror, Global Copy, Snapshot, and FlashCopy) remain on the hardware. The relationships are removed from any consistency groups that are defined on the storage system.
    - **No**. This option specifies that all relationships for the copy sets are removed from the hardware as well as the Tivoli Storage Productivity Center for Replication session. This option is the default.
  - **If there are errors removing relationships on the hardware, do you want to force the copy sets to be removed from the session?**
    - **Yes**. This option forces the removal of copy sets despite any errors that occur when removing the relationships from the storage system. Once a forced removal is complete, any relationships that remain on the storage system for that copy set must be removed manually using the storage system interface.
    - **No**. This option does not force the removal of copy sets. This option enables you to correct the errors and try to remove the copy sets again. This option is the default.
6. After the copy sets are removed, click **Finish**.

**Important:** If an application on the host has opened a device, the copy sets in a Tivoli Storage Productivity Center for Replication session for that device are removed, but the copy sets remain coupled on the host. To decouple the copy sets, see the Troubleshooting and support section of the Tivoli Storage Productivity Center for Replication Information Center at <http://publib.boulder.ibm.com/infocenter/tivihelp/v4r1/index.jsp>.

**Related concepts:**

“Copy sets” on page 690

During data replication, data is copied from a source volume to one or more target volumes, depending on the session type. The source volume and target volumes that contain copies of the same data are collectively referred to as a *copy set*.

## Migrating an existing configuration to Tivoli Storage Productivity Center for Replication

This topic describes how to convert an existing DS6000 or DS8000 hardware relationship for a Metro Mirror, Global Mirror, or Metro Global Mirror session. This topic also describes how to assimilate pairs in a relationship for a Metro Mirror or Global Mirror session with SAN Volume Controller, Storwize V7000 Unified or Storwize V7000 volumes.

You can either complete this action manually or use the data migration utility for Tivoli Storage Productivity Center for Replication. You can download the data migration utility from the Data Migration Utility for IBM Tivoli Storage Productivity Center for Replication website at <http://www-01.ibm.com/support/docview.wss?uid=swg24000625>. The data migration utility can handle all session types, and produces the Tivoli Storage Productivity Center for Replication CLI command script files and DSCLI script files necessary to migrate the relationships to Tivoli Storage Productivity Center for Replication.

### Metro Mirror

To manually assimilate pairs in a relationship for a Metro Mirror session, complete the following steps:

1. Determine which existing Metro Mirror pairs you want Tivoli Storage Productivity Center for Replication to manage, and record the names of your source and target volumes.
2. Create a Metro Mirror session in Tivoli Storage Productivity Center for Replication.
3. Using the Add Copy Set Wizard, choose the same source and target volumes that you identified in step 1.
4. Complete the Add Copy Set Wizard, and ensure that all copy sets are created successfully.
5. Issue a **Start** command from Tivoli Storage Productivity Center for Replication. At this time, the session automatically assimilates the relationships on the hardware (for example, if they are already in a Prepared state, Tivoli Storage Productivity Center for Replication will show them as Prepared).

**Note:** The **Start** command does not fully resynchronize data; instead, it detects the existing relationships and adopts them.

### Global Mirror

To manually assimilate pairs in a relationship for a Global Mirror session, complete the following steps:

1. Terminate the Global Mirror session on the hardware using the IBM System Storage DS command-line interface (DSCLI) or another application.
2. Remove the volumes from the Global Mirror session using the DSCLI or another application.
3. Close the session on each LSS upon which it is open using the DSCLI or another application.

4. Determine which existing Global Mirror pairs you want Tivoli Storage Productivity Center for Replication to manage, and record the names of your source and target volumes.
5. Create a Global Mirror session in Tivoli Storage Productivity Center for Replication.
6. Using the Add Copy Set Wizard, choose the same source and target volumes that you identified in step 4.
7. Complete the Add Copy Set Wizard, and ensure that all copy sets are created successfully.
8. Issue a **Start** command from Tivoli Storage Productivity Center for Replication. At this time, the session automatically assimilates the relationships on the hardware.

**Note:** The **Start** command does not fully resynchronize data; instead, it detects the existing relationships and adopts them.

### **Assimilating Metro Mirror pairs into a Three Site Metro Global Mirror session**

To manually assimilate a set of Metro Mirror pairs into a Three Site Metro Global Mirror session, complete the following steps:

1. Determine which existing Metro Mirror pairs you want Tivoli Storage Productivity Center for Replication to manage, and record the names of your source and target volumes.
2. Create a Metro Global Mirror session in Tivoli Storage Productivity Center for Replication.
3. Using the Add Copy Set Wizard, choose the same source and target volumes for the H1 and H2 roles of the Metro Global Mirror copy set, that you identified in step 1.
4. Complete the Add Copy Set Wizard, and ensure that all copy sets are created successfully.
5. Issue a **Start** command from Tivoli Storage Productivity Center for Replication. At this time, the session automatically assimilates the Metro Mirror relationships on the hardware (for example, if they are already in a Prepared state, Tivoli Storage Productivity Center for Replication will show them as Prepared). In addition, the **Start** command will establish the Global Copy relationships.

**Note:** The **Start** command does not fully resynchronize data on the Metro Mirror pairs assimilated; instead, it detects the existing relationships and adopts them. However, a full synchronization will be required for the Global Copy pairs.

### **Assimilating Three Site pairs into a Three Site Metro Global Mirror session**

To assimilate a full Three Site set of pairs into a Three Site Metro Global Mirror session, complete the following steps:

1. Terminate the Global Mirror session on the hardware using the IBM System Storage DS command-line interface (DSCLI) or another application.
2. Remove the volumes from the Global Mirror session using the DSCLI or another application
3. Close the session on each LSS upon which it is open using the DSCLI or another application.

4. Determine which existing Metro Mirror and Global Copy pairs you want Tivoli Storage Productivity Center for Replication to manage, and record the names of your source and target volumes.
5. Create a Metro Global Mirror session in Tivoli Storage Productivity Center for Replication.
6. Using the Add Copy Set Wizard, choose the same source and target volumes for the H1, H2 and H3 roles of the Metro Global Mirror copy set, that you identified in step 4.
7. Complete the Add Copy Set Wizard, and ensure that all copy sets are created successfully.
8. Issue a Start command from IBM Tivoli Storage Productivity Center for Replication. At this time, the session automatically assimilates the Metro Mirror and Global Copy relationship on the hardware.

**Note:** The **Start** command does not fully resynchronize data on the Metro Mirror and Global Copy pairs assimilated; instead, it detects the existing relationships and adopts them.

### **Global Mirror and Metro Mirror assimilation for SAN Volume Controller, Storwize V7000, Storwize V7000 Unified, or the XIV system**

To manually assimilate pairs in a relationship for a Metro Mirror or Global Mirror session with SAN Volume Controller, Storwize V7000, Storwize V7000 Unified or the XIV system volumes, complete the following steps:

1. Remove all pairs from the consistency group and delete the consistency group on the storage system using CLI for the storage system.
2. Determine which existing Metro Mirror and Global Mirror pairs you want Tivoli Storage Productivity Center for Replication to manage, and record the names of your source and target volumes.
3. Create a Metro Mirror or Global Mirror session in Tivoli Storage Productivity Center for Replication.
4. Using the Add Copy Set Wizard, choose the same source and target volumes that you identified in step 2.
5. Complete the Add Copy Set Wizard, and ensure that all copy sets are created successfully.
6. Issue a **Start** command from Tivoli Storage Productivity Center for Replication. The session automatically assimilates the relationships on the hardware and adds them to a new consistency group on the storage system.

**Note:** The **Start** command does not fully resynchronize data; instead, it detects the existing relationships and adopts them placing them in a consistency group managed by the session.

---

## **Practicing disaster recovery**

You can use practice volumes to test your disaster recovery actions while maintaining disaster recovery capability. Practice volumes are available in Metro Mirror Failover and Failback sessions, Global Mirror Failover and Failback, Global Mirror Either Direction sessions, and Metro Global Mirror with Practice sessions.

**Important:** You can test your disaster recovery actions without using practice volumes. However, without practice volumes, you cannot maintain disaster recovery capability while continuing to copy the data.

## Practice volumes

You can use a *practice volume* to practice what you would do in the event of a disaster, without interrupting current data replication. Practice volumes are available in Metro Mirror, Global Mirror, and Metro Global Mirror sessions.

To use the practice volumes, the session must be in the prepared state. Issuing the Flash command against the session while in the Prepared state creates a usable practice copy of the data on the target site.

**Note:** You can test disaster-recovery actions without using practice volumes; however, without practice volumes, you cannot continue to copy data changes between volumes while testing disaster-recovery actions.

## Practicing disaster recovery for a Metro Mirror Failover/Failback with Practice session

A Metro Mirror Failover and Failback session with Practice combines Metro Mirror and FlashCopy to provide a point-in-time copy of the data on the remote site. You can use this to practice what you might do if a disaster occurred, without losing your disaster recovery capability.

This function is available on the following storage systems:

- System Storage SAN Volume Controller
- Storwize V7000
- TotalStorage Enterprise Storage Server Model 800
- System Storage DS8000
- System Storage DS6000

Perform these steps to practice disaster recover actions for a Metro Mirror Failover/Failback with Practice session:

1. Start a Metro Mirror with Practice session.
2. When the Metro Mirror session reaches the Prepared state, issue a Flash command to make a point-in-time copy of the data on H2. This creates a consistent point-in-time copy of your data on the H2 volume and then restarts the session so the copying from H1 to I2 continues. This temporarily stops copying of the data from site 1 to site 2, and creates a consistent point-in-time copy. The data replication from H1 to I2 is then restarted.

**Note:** For ESS, DS6000, and DS8000 storage systems, the **Flash** command uses the freeze and thaw processing to create a data consistent point for the FlashCopy. If there is another Metro Mirror session overlapping on one or more of the same LSS pairs, that session will be suspended. It is also possible that the suspension of the other session might cause the Metro Mirror session to remain suspended after the flash command is issued instead of returning to Prepared state. Avoid using the same LSS pairs for multiple Metro Mirror sessions if possible.

3. Practice the same actions you would take in an actual disaster, using H2 as your new host volume, while running the real application on H1.

## Practicing disaster recovery for a Global Mirror either Direction with two-site Practice session

A Global Mirror (either direction) with two-site Practice combines Global Mirror and FlashCopy to provide a point-in-time copy of the data on a remote site at a

distance over 300 km away from your first site. You can use this to practice what you might do if a disaster occurred, without losing your disaster recovery capability.

**Note:** This function is available only on ESS, DS6000, and DS8000 storage systems.

Perform these steps to practice disaster recover actions for a Global Mirror either Direction with two-site Practice session:

1. Start a Global Mirror with Practice session.
2. When the session reaches the Prepared state, issue a Flash command to restore consistent data on I2 and make a point-in-time copy of the data on H2. This creates a consistent point-in-time copy of your data on the H2 volume and then restarts the session so the copying from H1 to I2 continues. This temporarily stops copying of the data from site 1 to site 2, and creates a consistent point-in-time copy. The data replication from H1 to I2 is then restarted.

**Note:** FlashCopy must be always a full copy due to limitations of the hardware.

3. Practice the same actions you would take in an actual disaster, using H2 as your new host volume, while running the real application on H1.

**Note:** With two directions, you can reverse the direction of your data flow.

## Practicing disaster recovery for a Global Mirror Failover/Failback with Practice session

A Global Mirror Failover and Failback with Practice combines Global Mirror and FlashCopy to provide a point-in-time copy of the data on a remote site at a distance over 300 km away from your first site. You can use this to practice what you might do if a disaster occurred.

You can do this practice without losing your disaster recovery capability. The number of volumes used for the device varies, but the steps to conduct a Global Mirror Failover and Failback with Practice are the same for both devices.

This function is available on the following storage systems:

- System Storage SAN Volume Controller
- Storwize V7000
- TotalStorage Enterprise Storage Server Model 800
- System Storage DS8000
- System Storage DS6000

Perform these steps to practice disaster recover actions for a Global Mirror Failover/Failback with Practice session:

1. Start a Global Mirror with Practice session.
2. When the session reaches the Prepared state, issue a Flash command to restore consistent data on I2 and make a point-in-time copy of the data on H2. This creates a consistent point-in-time copy of your data on the H2 volume and then restarts the session so the copying from H1 to I2 continues. This temporarily stops copying of the data from site 1 to site 2, and creates a consistent point-in-time copy. The data replication from H1 to I2 is then restarted.

**Note:** FlashCopy must be always a full copy due to limitations of the hardware.

3. Practice the same actions you would take in an actual disaster, using H2 as your new host volume, while running the real application on H1.

## Practicing disaster recovery for a Metro Global Mirror Failover/Failback with Practice session

A Metro Global Mirror Failover/Failback with Practice session combines Metro Mirror, Global Mirror and FlashCopy across three sites to provide a point-in-time copy of the data on the third site. You can use this to practice what you might do if a disaster occurred without losing your disaster recovery capability.

**Note:** This function is available on ESS, DS6000, and DS8000 storage systems.

The intermediate volume is on the third site (I3). This maintains disaster recovery capability while a copy is kept on the H3 volume for practice purposes.

Perform these steps to practice disaster recover actions for a Metro Global Mirror Failover/Failback with Practice session:

1. Start a Metro Global Mirror with Practice session.
2. When the session reaches the Prepared state, issue a Flash command to take a point-in-time copy of the data that is on I3, on H3. This creates a consistent point-in-time copy of your data on the H3 volume, and then automatically restarts the session so that copying from H1 to H2 to I3 continues. The Flash command temporarily stops copying the data from site 2 to site 3, in order to create a consistent point-in-time copy on I3, while maintaining disaster recovery capabilities on site 2 using the Metro Mirror portion of the session. Then, data replication from H2 to I3 is restarted.

**Note:** FlashCopy must be always a full copy due to hardware limitations.

3. Practice the same actions you would take in an actual disaster, using H3 as your practice host volume, while you run the real application on H1. This enables you to use the same scripts and commands to run on H3 that you would use in an actual disaster.

---

## Monitoring health and status

### Viewing the health summary

Use the Health Overview panel to view overall health and status of sessions, storage systems, host systems, and management servers.

The Health Overview panel is the first panel that you see after you log on. You can display this panel by selecting **Health Overview** in the Tivoli Storage Productivity Center for Replication navigation tree. This panel provides the following information:

#### Overall session status

Indicates session status, which can be normal, warning, or severe. The status can also be inactive, if all sessions are defined or if no sessions exist.

#### Overall storage system status

Indicates the connection status of storage systems.

#### Overall host system status

Indicates the connection status of host systems.

### Management server status

Indicates the status of the standby server if you are logged on to the local server. If you are logged on to the standby server, this status indicates the status of the local server. Management server status is not available if you are using Tivoli Storage Productivity Center for Replication Basic Edition for System z.

Health information is always shown as a mini-panel under the navigation tree.

## Viewing SNMP alerts

IBM Tivoli Storage Productivity Center for Replication SNMP trap descriptions can be viewed from the IBM Tivoli Storage Productivity Center Alert panel.

From the IBM Tivoli Storage Productivity Center GUI, in the navigation tree, expand **Alerting > Alert Log > All** and select **Replication**.

## Viewing sessions

This section describes how to view sessions details and session properties.

### Session status icons

The IBM Tivoli Storage Productivity Center for Replication GUI uses icons to represent the status of each session.

The following table describes each session status icon.

Table 81. Session status icons

Icon	Meaning	Description
	Inactive	The session is in a defined state, with no activity on the hardware.
	Normal	A consistent copy of the data either exists or is being maintained.
	Warning	For Metro Mirror, Global Mirror, and Metro Global Mirror, the session might have volumes that are being synchronized or are about to be synchronized, with no suspended volumes. For FlashCopy, the warning status is valid only after the start command is issued and before the flash. This warning status means that the session is either preparing or is ready for a flash command but targets do not yet have a consistent copy.  If a HyperSwap session is degraded, which means it is enabled on one or more sysplex members and disabled on at least one sysplex member, then the session is in a warning state.
	Severe	One or more errors must be dealt with immediately. Possible causes include the following: <ul style="list-style-type: none"><li>• One or more volumes are suspended</li><li>• A session is suspended</li><li>• A volume is not copying correctly</li></ul>

### Session images

The IBM Tivoli Storage Productivity Center for Replication GUI provides a visual aid to help you create and manage your sessions. The visual aid shows the number

of volume roles in the session and how the roles are distributed between the sites. It also shows the copy method and direction.

### Volume role symbols

The volume role symbols represent the replication status on the volumes.

Table 82. Volume role symbols

Symbol	Description	Meaning
	Active host volumes	This symbol represents volumes that contain the source of updated tracks to which the application is actively issuing read and write input/output (I/O).
	Recoverable volumes	This symbol represents volumes that contain a consistent copy of the data.
	Inconsistent volumes	This symbol represents the volumes that do not contain a consistent copy of the data.
	Selected volumes	This symbol represents the volumes that are selected for an operation (for example, changing location or displaying role pair information).
		
		

### Data copying symbols

The data copying symbols are arrows indicate the type of copy that occurs between the volume roles. The direction of the arrow indicates the direction of the copy.

Table 83. Data copying symbols

Symbol	Description	Meaning
	FlashCopy copying (the lightning bolt indicates the direction of the FlashCopy)	This symbol represents a FlashCopy relationship in which data is being copied from the host to the target.
		
	FlashCopy copying with errors (the lightning bolt indicates the direction of the FlashCopy)	This symbol represents a FlashCopy relationship in which data is being copied from the host to the target, but there are errors on one or more pairs.
		
	FlashCopy inactive (the lightning bolt indicates the direction of the FlashCopy)	This symbol represents an inactive FlashCopy relationship.
		

Table 83. Data copying symbols (continued)

Symbol	Description	Meaning
	FlashCopy inactive with errors (the lightning bolt indicates the direction of the FlashCopy)	This symbol represents an inactive FlashCopy relationship in which there are errors on one or more pairs.
		
	Metro Mirror copying	This symbol represents a copying Metro Mirror relationship.
	Metro Mirror copying with errors	This symbol represents a Metro Mirror relationship that is copying, but with errors on one or more pairs.
	Metro Mirror inactive	This symbol represents an inactive Metro Mirror relationship.
	Metro Mirror inactive with errors	This symbol represents an inactive Metro Mirror relationship with errors on one or more pairs.
	Global Copy copying	This symbol represents a copying Global Copy relationship.
		
	Global Copy copying with errors	This symbol represents a copying Global Copy relationship with errors on one or more pairs.
		
	Global Copy inactive	This symbol represents an inactive Global Copy relationship.
		
	Global Copy inactive with errors	This symbol represents an inactive Global Copy relationship with errors on one or more pairs.
		
	HyperSwap or Open HyperSwap	This symbol HyperSwap or Open HyperSwap for a session. If a failure occurs when input/output (I/O) is being written to the primary storage system, HyperSwap or Open HyperSwap automatically swap the I/O to the secondary site with no user interaction and little or no application impact.

## Session states

You can view the health and status of a session in the Tivoli Storage Productivity Center for Replication GUI.

**Attention:** Use only the Tivoli Storage Productivity Center for Replication graphical user interface (GUI) or command-line interface CLI to manage session relationships, such as volume pairs and copy sets. Do not modify session relationships through other interfaces such as the System Storage DS CLI. If you modify relationships through other interfaces, a loss of consistency can occur across the relationships that are managed by the session. The exceptions to this requirement are failover operations that are managed by external applications for certain session and storage system types as described in “Failover and failback operations” on page 695.

You can use the Refresh States command to refresh the states of the session. Issue this command to query the states of the copy sets on the hardware. You do not need to run this command under typical circumstances; Tivoli Storage Productivity Center for Replication refreshes the states of its sessions through multiple means. However, if you discover an inconsistency between Tivoli Storage Productivity Center for Replication and the hardware, you can use this command to enable IBM Tivoli Storage Productivity Center for Replication to update itself. Because this command triggers multiple queries on the hardware (having an adverse impact on hardware performance if you run it too often), you can only execute this command every few minutes in each session.

The following table describes each session state.

*Table 84. Session states*

State	Session type	Description
Defined	All	The session exists but is inactive.
Flashing	All	In a Metro Mirror or Global Mirror session, data copying is temporarily suspended while a consistent practice copy of data is being prepared on site 2.  In a Metro Global Mirror session, data copying is temporarily suspended while a consistent practice copy of data is being prepared on site 3.

Table 84. Session states (continued)

State	Session type	Description
Prepared	All	<p>The source to target data transfer is active.</p> <p>In a Metro Mirror, Global Mirror, or Metro Global Mirror session, the data written to the source is transferred to the target, and all volumes are consistent and recoverable.</p> <p>In a FlashCopy session, the volumes are not yet consistent, but the flash is ready to begin.</p> <p><b>Important:</b> For sessions on the following storage systems, do not alter the relationships on the hardware that you established with Tivoli Storage Productivity Center for Replication:</p> <ul style="list-style-type: none"> <li>• System Storage SAN Volume Controller</li> <li>• Storwize V7000</li> </ul> <p>For example, if a Metro Mirror session with one copy set is in the Prepared state, and you stop the role pair, the session is still displayed in the Prepared state.</p>
Preparing	All	<p>The volumes are initializing, synchronizing, or resynchronizing.</p> <p>In a Metro Mirror, Global Mirror, or Metro Global Mirror session, synchronization occurs after the first <b>Start</b> command is issue on a session. Resynchronization occurs when a volume was prepared and then suspended. The hardware records the changed tracks so that on the next startup, only the changed tracks are copied.</p> <p>In a FlashCopy session, the volumes are initializing. The preparing state for FlashCopy sessions applies only to the System Storage SAN Volume Controller or Storwize V7000.</p>
Recovering	All	<p>The session is in the process of recovering.</p>
Suspended	All	<p>Data copying has temporarily stopped.</p> <p><b>Important:</b> The suspended state applies only to Global Mirror, Metro Mirror, and Metro Global Mirror sessions.</p>
SuspendedH1H2 MGM	Metro Global Mirror	<p>Data copying between site 1 and site 2 is suspended.</p>
SuspendedH1H3 MGM	Metro Global Mirror	<p>Data copying between site 1 and site 3 is suspended.</p>

Table 84. Session states (continued)

State	Session type	Description
Suspending	All	The session is transitioning into a Suspended state. <b>Important:</b> The Suspending state applies only to Global Mirror and Metro Global Mirror sessions and does not apply to the System Storage SAN Volume Controller or Storwize V7000.
Target available	All	Target volumes are available for application updates.
Terminating	FlashCopy	The session is being terminated because you issued a Terminate action under the following conditions: <ul style="list-style-type: none"> <li>• You permitted the target to be Metro Mirror or Global Copy.</li> <li>• You set the Require or Attempt to Preserve Mirror option.</li> </ul> <p>The session displays as Terminating until the FlashCopy background copy is complete and no longer exists on the hardware.</p>

## Session properties

You can view and modify the description and options for a session. The options that are presented depend on the storage system type and the session type that you select.

Session properties include the following attributes:

### Description

Type the description for this session.

### ESS/DS FlashCopy Options

Select the FlashCopy options that you want to associate with this session:

#### Incremental

Select this option to set up the relationship for recording changes to the H1 volume. Any subsequent FlashCopy operation for that session copies only the tracks that changed since the last flash. Incremental always assumes persistence.

**Note:** This option is used along with the Persistent and No-Copy options.

#### Persistent

Select this option to keep the relationship established on the hardware after all source tracks are copied to the target. If this option is not selected, the local replication relationship ends after the T1 volume contains a complete point-in-time image of the H1 volume.

**Note:** If you select the Incremental option, the Persistent option is automatically selected as well.

### **No Copy**

Select this option if you do not want the hardware to write the background copy until the source track is written to. Data is not copied to the H1 volume until the blocks or tracks of the T1 volume are modified. If you want a complete point-in-time copy of the T1 volume to be created on the H1 volume, do not use the **No Copy** option.

### **Allow FlashCopy target to be Metro Mirror source**

Select this option if the target of the FlashCopy relationship is to overwrite all data on the source of a Metro Mirror relationship. If this option is cleared, a flash to a Metro Mirror source volume fails.

If you select this option, you must also select one of the following policies:

#### **Do not attempt to preserve Metro Mirror consistency**

Select this option if the Metro Mirror or Global Copy pair at the target of the FlashCopy relationship is to perform a full copy of the data to the secondary of the Metro Mirror or Global Copy pair.

#### **Attempt to preserve Metro Mirror consistency, but allow FlashCopy even if Metro Mirror target consistency cannot be preserved**

Select this option to attempt to preserve the consistency of the Metro Mirror relationship at the target of the FlashCopy relationship when both the source and target of the FlashCopy relationship are a source of a Metro Mirror relationship. If the consistency cannot be preserved, a full copy of the Metro Mirror relationship at the target of the FlashCopy relationship is performed. To preserve consistency, parallel flashes are performed (if possible) on both sites.

**Note:** This option is available only on IBM System Storage DS8000 storage systems with the required code levels installed.

#### **Attempt to preserve Metro Mirror consistency, but fail FlashCopy if Metro Mirror target consistency cannot be preserved**

This option prevents a full copy from being performed over the Metro Mirror link. Instead, parallel flashes are performed (if possible) on both sites. If the consistency cannot be preserved, the Flash for the FlashCopy relationships fails, and the data of the Metro Mirror relationship at the target of the FlashCopy relationship is not changed.

**Note:** This option is available only on System Storage DS8000 storage systems with the required code levels installed.

### **SAN Volume Controller / Storwize V7000 / Storwize V7000 Unified FlashCopy Options**

Select the FlashCopy options that you want to associate with this session.

### **Incremental**

Select this option to set up the relationship for recording changes to the H1 volume. Any subsequent FlashCopy operation for that session copies only the tracks that changed since the last flash. Incremental always assumes persistence.

### **Background Copy Rate**

Type the copy rate that the Storage System uses to perform the background copy of the FlashCopy role pair. You can specify a percentage between 0 and 100. The default is 50. Specifying 0 is equivalent to specifying the No-Copy option on a TotalStorage Enterprise Storage Server Model 800, System Storage DS8000, or System Storage DS6000 FlashCopy session.

You can modify this value at any time during the session. If the session is performing a background copy when you change the option, Tivoli Storage Productivity Center for Replication immediately modifies the background copy rate of the consistency group on the storage system. The storage system consistency group immediately starts by using this new rate to complete the background copy.

### **Basic HyperSwap Options**

Select the Basic HyperSwap options that you want to associate with this session.

If Tivoli Storage Productivity Center for Replication is running on z/OS, and volumes are attached by a Fibre Channel connection, Tivoli Storage Productivity Center for Replication can manage a HyperSwap session. With this option selected, a failure on the host accessible volumes triggers a HyperSwap, redirecting application input/output (I/O) to the secondary volumes.

These options are available only for Basic HyperSwap sessions:

#### **Disable HyperSwap**

Select this option to prevent a HyperSwap from occurring by command or event.

#### **On Configuration Error:**

##### **Partition the system(s) out of the sysplex**

Select this option to partition out of the sysplex when a new system is added to the sysplex and encounters an error in loading the configuration. Restart the system if you select this option.

##### **Disable HyperSwap**

Select this option to prevent a HyperSwap from occurring by command or event.

#### **On Planned HyperSwap Error:**

##### **Partition out the failing system(s) and continue swap processing on the remaining system(s)**

Select this option to partition out the failing system and continue the swap processing on any remaining systems.

##### **Disable HyperSwap after attempting backout**

Select this option to stop the HyperSwap action, and disable the HyperSwap commands or events.

### On Unplanned HyperSwap Error:

#### **Partition out the failing system(s) and continue swap processing on the remaining system(s)**

Select this option to partition out the failing systems and continue HyperSwap processing on the remaining systems when a new system is added to the sysplex and HyperSwap does not complete. You must restart the system if you select this option.

#### **Disable HyperSwap after attempting backout**

Select this option to stop the HyperSwap action, and disable the HyperSwap commands or events.

#### **Fail MM/GC if target is online (CKD only)**

Select this option to fail any session commands for a copy set if the session is online and if the target volume in the copy set is visible to a host.

### ESS/DS Metro Mirror Options

Select the Metro Mirror options that you want to associate with this session. These options are available only for TotalStorage Enterprise Storage Server Model 800, System Storage DS8000, or System Storage DS6000 storage systems in a Metro Mirror session:

#### **Reset Secondary Reserve**

Select this option to remove any persistent reserves that might be set on the target volumes of the copy sets being started when a Start command is issued for the session.

#### **Note:**

Before enabling the Reset Secondary Reserves option, be aware that this action causes the session to overwrite all data on the target volume.

#### **Fail MM/GC if target is online (CKD only)**

Select this option to fail any session commands for a copy set if the session is online and if the target volume in the copy set is visible to a host.

#### **Enable Hardened Freeze**

Select this option to enable the z/OS Input/Output Supervisor (IOS) to manage freeze operations. This option is enabled by default.

If you select the **Manage H1-H2 with HyperSwap** option for the session, the **Enable Hardened Freeze** option is ignored. IOS support for managing freeze operations is included with HyperSwap. The **Enable Hardened Freeze** option ensures data integrity if Tivoli Storage Productivity Center for Replication freezes and HyperSwap is not enabled for a session.

If you select the **Enable Hardened Freeze** option, the following actions can occur:

- IOS can freeze volumes regardless of whether the Tivoli Storage Productivity Center for Replication server is started or stopped.
- You can include z/OS system volumes such as paging, database, and WebSphere Application Server hierarchical file system (HFS) as Metro Mirror volumes in the session. When you select the **Enable Hardened Freeze** option, IOS manages the freeze

operations for all Metro Mirror volumes in the session, which prevents Tivoli Storage Productivity Center for Replication from freezing the volumes and possibly freezing itself. The **Enable Hardened Freeze** option does not enable IOS to manage freeze operations for Global Mirror volumes.

**Requirement:** The **Enable Hardened Freeze** option requires the z/OS address spaces Basic HyperSwap Management and Basic HyperSwap API. For instructions about how to start these address spaces, see the information about preparing to use Basic HyperSwap from z/OS in the *IBM Tivoli Storage Productivity Center for Replication for System z Installation and Configuration Guide*.

### **Metro Mirror Suspend Policy**

You must select either **Hold I/O after Suspend** or **Release I/O after Suspend** when a replication link suspends. A replication link suspends for various reasons. In some cases, it happens because the replication link is down or the auxiliary storage controller failed. In other cases, it might be the first failure in an eventual full failure at the primary site.

If your primary goal is zero data loss, specify **Hold I/O after Suspend**. Selecting this option means that no additional updates are made to storage until the entire scope of the failure can be determined. If you select this option, the systems by using that storage become unavailable until a decision is made about how to proceed. It might also require restarting the systems.

If your primary goal is availability, specify **Release I/O after Suspend**. This option enables workloads to continue running after all the replication links are suspended, maintaining a consistent copy of data at the remote site. If the failure spreads through the primary site after the workloads resume running and results in a site failure, data loss occurs. The I/O requests that are issued after the resume and before the failure at the primary site are lost. The storage at the secondary site remains consistent, however, and you can recover it there.

#### **Hold I/O after Suspend**

Select this option to block the application from writing while a consistent copy of the data is maintained on the remote site; however, it does not automatically release the application. This option keeps the source equal to the target. You must use the **Release I/O** command on the session or wait for the Hardware Freeze Timeout timer to expire before the application can continue to write to the source.

#### **Release I/O after Suspend**

Select this option to block writes to the application while a consistent copy of the data is formed on the remote site. This operation is followed immediately by releasing the block so that the application can continue writing to the source. This option allows for little application impact, but causes the source to potentially be different from the target.

This option is the default setting for all new sessions.

## DS FlashCopy Options for Role pair H2-I2

The following option is available only for System Storage DS8000 version 4.2 or later.

### Persistent

Select this option to keep FlashCopy pairs persistent on the hardware.

### Manage H1-H2 with HyperSwap

Select this option to trigger a HyperSwap, redirecting application I/O to the secondary volumes, when there is a failure on the host accessible volumes. For Metro Global Mirror sessions, the Global Mirror portion of the session continues to run uninterrupted.

Tivoli Storage Productivity Center for Replication can manage the H1-H2 sequence of a Metro Mirror or Metro Global Mirror session by using HyperSwap if Tivoli Storage Productivity Center for Replication is running on z/OS, and volumes are attached by a Fibre Channel connection.

### Notes:

- When this option is selected, the **Suspend H1-H2** command is available only if the Disable HyperSwap option is also selected.
- Setting this option automatically sets the Release IO after suspend Metro Mirror policy.

### Disable HyperSwap

Select this option to prevent a HyperSwap from occurring by command or event.

### On Configuration Error:

#### Partition the system(s) out of the sysplex

Select this option to partition out of the sysplex when a new system is added to the sysplex and encounters an error in loading the configuration. Restart the system if you select this option.

#### Disable HyperSwap

Select this option to prevent a HyperSwap from occurring by command or event.

### On Planned HyperSwap Error:

#### Partition out the failing system(s) and continue swap processing on the remaining system(s)

Select this option to partition out the failing system and continue the swap processing on any remaining systems.

#### Disable HyperSwap after attempting backout

Select this option to stop the HyperSwap action, and disable the HyperSwap commands or events.

### On Unplanned HyperSwap Error:

#### Partition out the failing system(s) and continue swap processing on the remaining system(s)

Select this option to partition out the failing systems and continue HyperSwap processing on the remaining systems when a new system is

added to the sysplex and HyperSwap does not complete. You must restart the system if you select this option.

#### **Disable HyperSwap after attempting backout**

Select this option to stop the HyperSwap action, and disable the HyperSwap commands or events.

#### **Manage H1-H2 with Open HyperSwap**

If volumes are attached to an IBM AIX host, Tivoli Storage Productivity Center for Replication can manage the H1-H2 sequence of a Metro Mirror session by using Open HyperSwap. If this option is selected, a failure on the host accessible volumes triggers a swap, which redirects application I/O to the secondary volumes. Only volumes that are currently attached to the host systems that are defined on the Tivoli Storage Productivity Center for Replication Host Systems panel are eligible for Open HyperSwap.

#### **Disable Open HyperSwap**

Select this option to prevent a swap from occurring by a command or event while keeping the configuration on the host system and all primary and secondary volumes coupled.

### **SAN Volume Controller / Storwize V7000 / Storwize V7000 Unified Metro Mirror Options**

Select the Metro Mirror options that you want to associate with this session. The following options are available only for storage systems that are in a Metro Mirror Failover/Failback with Practice session:

#### **Incremental**

Select this option to set up the relationship for recording changes to the practice volume (H2). All subsequent FlashCopy operations between the intermediate volume and the host volume copy only the data that changed since the previous FlashCopy operation. Incremental always assumes persistence.

#### **Background Copy Rate for H2-I2**

Type the copy rate that the Storage System uses to perform the background copy of the FlashCopy role pair. You can specify a percentage between 0 and 100. The default is 50. Specifying 0 is equivalent to specifying the No-Copy option on a TotalStorage Enterprise Storage Server Model 800, System Storage DS8000, or System Storage DS6000 FlashCopy session.

You can modify this value at any time during the session. If the session is performing a background copy when you change the option, Tivoli Storage Productivity Center for Replication immediately modifies the background copy rate of the consistency group on the storage system. The storage system consistency group immediately starts by using this new rate to complete the background copy.

### **ESS/DS Global Mirror Options**

Select the Global Mirror options that you want to associate with this session. These options are available only for TotalStorage Enterprise Storage Server Model 800, System Storage DS8000, and System Storage DS6000 storage systems in a Global Mirror session:

**Consistency group interval time (seconds)**

Type how often, in seconds, the Global Mirror session attempts to form a consistency group. When you reduce this value, it might be possible to reduce the data exposure of the session. A smaller interval value causes the session to attempt to create consistency groups more frequently, which might affect the storage systems (for example, by increasing the processing load and message traffic load).

**Recovery Point Objective Alerts**

Specify the length of time that you want to set for the recovery point objective (RPO) thresholds. The values determine whether a Warning or Severe alert is generated when the RPO threshold is exceeded for a role pair. The RPO represents the length of time in seconds of data exposure that is acceptable in the event of a disaster.

Use the following options to set the RPO threshold values. For both options, you can specify an RPO threshold of 0 - 65535 seconds. The default is 0 seconds, which specifies that no alerts are generated. If the Severe level threshold is set to a value other than 0, the Warning level threshold must be less than the Severe level threshold or set to 0.

**Warning level threshold (seconds)**

Type the number of seconds that you want to set for the warning level RPO threshold. If the RPO is greater than this value, an alert is generated.

**Severe level threshold (seconds)**

Type the number of seconds that you want to set for the severe level RPO threshold. If the RPO is greater than this value, an alert is generated and the session status changes to Severe.

**Reset Secondary Reserve**

Select this option to remove any persistent reserves that might be set on the target volumes of the copy sets being started when a Start command is issued for the session.

**Note:**

Before enabling the Reset Secondary Reserves option, be aware that this action causes the session to overwrite all data on the target volume.

**Fail MM/GC if target is online (CKD only)**

Select this option to fail any session commands for a copy set if the session is online and if the target volume in the copy set is visible to a host.

**DS FlashCopy Options for Role pair H2-I2**

The following options are available only for System Storage DS8000 version 4.2 or later.

**Persistent**

Select this option to keep FlashCopy pairs persistent on the hardware.

**No Copy**

Select this option if you do not want the hardware to write

the background copy until the source track is written to. Data is not copied to the H2 volume until the blocks or tracks of the I2 volume are modified. If you want a complete point-in-time copy of the I2 volume to be created on the H2 volume, do not use the **No Copy** option.

#### **DS FlashCopy Options for Role pair I2-J2**

The following option is available only for System Storage DS8000 version 4.2 or later.

##### **Reflash After Recover**

Select this option if you want to create a FlashCopy replication between the I2 and J2 volumes after the recovery of a Global Mirror session. If you do not select this option, a FlashCopy replication is created only between the I2 and H2 volumes.

#### **SAN Volume Controller / Storwize V7000 / Storwize V7000 Unified Global Mirror Options**

Select the Global Mirror options that you want to associate with this session. These options are available only for storage systems that are in a Global Mirror Failover/Failback with Practice session:

##### **Incremental**

Select this option to set up the relationship for recording changes to the practice volume (H2). All subsequent FlashCopy operations between the intermediate volume and the host volume copy only the data that changed since the previous FlashCopy operation. Incremental always assumes persistence.

##### **Background Copy Rate for H2-I2**

Type the copy rate that the Storage System uses to perform the background copy of the FlashCopy role pair. You can specify a percentage between 0 and 100. The default is 50. Specifying 0 is equivalent to specifying the No-Copy option on a TotalStorage Enterprise Storage Server Model 800, System Storage DS8000, or System Storage DS6000 FlashCopy session.

You can modify this value at any time during the session. If the session is performing a background copy when you change the option, Tivoli Storage Productivity Center for Replication immediately modifies the background copy rate of the consistency group on the storage system. The storage system consistency group immediately starts by using this new rate to complete the background copy.

#### **XIV Global Mirror Options**

Select the Global Mirror options that you want to associate with this session. These options are available only for the XIV systems in a Global Mirror Failover/Failback session:

##### **Recovery point objective threshold (seconds)**

Type the number of seconds that you want to set for the recovery point objective (RPO) threshold. RPO represents a measure of the maximum data loss that is acceptable in the event of a failure or unavailability of the master.

If the XIV system determines that the RPO is greater than this value, the session state becomes Severe. You can specify an RPO between 30 and 86400 seconds. The default is 30 seconds.

### **Synchronization schedule (HH:MM:SS)**

Select an interval for the creation of the XIV system synchronization schedule. The XIV system attempts to form consistent points of data by taking automatic snapshots of the volumes in the session at this interval. The default is **Minimum Interval**, which is 20 seconds.

If you select **Never**, synchronization is not scheduled and the XIV system does not create consistency groups. When the XIV system determines that the RPO threshold is passed, the session state becomes Severe.

### **ESS/DS Metro Global Mirror Options**

Select the Metro Global Mirror options that you want to associate with this session. These options are available only for TotalStorage Enterprise Storage Server Model 800, System Storage DS8000, or System Storage DS6000 storage systems in a Metro Global Mirror session:

#### **Consistency group interval time (seconds)**

Type how often, in seconds, the Metro Global Mirror session attempts to form a consistency group. When you reduce this value, it might be possible to reduce the data exposure of the session. A smaller interval value causes the session to attempt to create consistency groups more frequently, which might affect the storage systems (for example, by increasing the processing load and message traffic load).

#### **Recovery Point Objective Alerts**

Specify the length of time that you want to set for the recovery point objective (RPO) thresholds. The values determine whether a Warning or Severe alert is generated when the RPO threshold is exceeded for a role pair. The RPO represents the length of time in seconds of data exposure that is acceptable in the event of a disaster.

Use the following options to set the RPO threshold values. For both options, you can specify an RPO threshold of 0 - 65535 seconds. The default is 0 seconds, which specifies that no alerts are generated. If the Severe level threshold is set to a value other than 0, the Warning level threshold must be less than the Severe level threshold or set to 0.

#### **Warning level threshold (seconds)**

Type the number of seconds that you want to set for the warning level RPO threshold. If the RPO is greater than this value, an alert is generated.

#### **Severe level threshold (seconds)**

Type the number of seconds that you want to set for the severe level RPO threshold. If the RPO is greater than this value, an alert is generated and the session status changes to Severe.

#### **Reset Secondary Reserve**

Select this option to remove any persistent reserves that might be set on the target volumes of the copy sets being started when a Start command is issued for the session.

**Note:**

Before enabling the Reset Secondary Reserves option, be aware that this action causes the session to overwrite all data on the target volume.

**Fail MM/GC if target is online (CKD only)**

Select this option to fail any session commands for a copy set if the session is online and if the target volume in the copy set is visible to a host.

**Enable Hardened Freeze**

Select this option to enable the z/OS Input/Output Supervisor (IOS) to manage freeze operations. This option is enabled by default.

If you select the **Manage H1-H2 with HyperSwap** option for the session, the **Enable Hardened Freeze** option is ignored. IOS support for managing freeze operations is included with HyperSwap. The **Enable Hardened Freeze** option ensures data integrity if Tivoli Storage Productivity Center for Replication freezes and HyperSwap is not enabled for a session.

If you select the **Enable Hardened Freeze** option, the following actions can occur:

- IOS can freeze volumes regardless of whether the Tivoli Storage Productivity Center for Replication server is started or stopped.
- You can include z/OS system volumes such as paging, database, and WebSphere Application Server hierarchical file system (HFS) as Metro Mirror volumes in the session. When you select the **Enable Hardened Freeze** option, IOS manages the freeze operations for all Metro Mirror volumes in the session, which prevents Tivoli Storage Productivity Center for Replication from freezing the volumes and possibly freezing itself. The **Enable Hardened Freeze** option does not enable IOS to manage freeze operations for Global Mirror volumes.

**Requirement:** The **Enable Hardened Freeze** option requires the z/OS address spaces Basic HyperSwap Management and Basic HyperSwap API. For instructions about how to start these address spaces, see the information about preparing to use Basic HyperSwap from z/OS in the *IBM Tivoli Storage Productivity Center for Replication for System z Installation and Configuration Guide*.

**Metro Mirror Suspend Policy**

You must select either **Hold I/O after Suspend** or **Release I/O after Suspend** when a replication link suspends. A replication link suspends for various reasons. In some cases, it happens because the replication link is down or the auxiliary storage controller failed. In other cases, it might be the first failure in an eventual full failure at the primary site.

If your primary goal is zero data loss, specify **Hold I/O after Suspend**. Selecting this option means that no additional updates are made to storage until the entire scope of the failure can be determined. If you select this option, the systems by using that storage become unavailable until a decision is made about how to proceed. It might also require restarting the systems.

If your primary goal is availability, specify **Release I/O after Suspend**. This option enables workloads to continue running after all the replication links are suspended, maintaining a consistent copy of data at the remote site. If the failure spreads through the primary site after the workloads resume running and results in a site failure, data loss occurs. The I/O requests that are issued after the resume and before the failure at the primary site are lost. The storage at the secondary site remains consistent, however, and you can recover it there.

#### **Hold I/O after Suspend**

Select this option to block the application from writing while a consistent copy of the data is maintained on the remote site; however, it does not automatically release the application. This option keeps the source equal to the target. You must use the **Release I/O** command on the session or wait for the Hardware Freeze Timeout timer to expire before the application can continue to write to the source.

#### **Release I/O after Suspend**

Select this option to block writes to the application while a consistent copy of the data is formed on the remote site. This operation is followed immediately by releasing the block so that the application can continue writing to the source. This option allows for little application impact, but causes the source to potentially be different from the target.

This option is the default setting for all new sessions.

#### **Manage H1-H2 with HyperSwap**

Select this option to trigger a HyperSwap, redirecting application I/O to the secondary volumes, when there is a failure on the host accessible volumes. For Metro Global Mirror sessions, the Global Mirror portion of the session continues to run uninterrupted.

Tivoli Storage Productivity Center for Replication can manage the H1-H2 sequence of a Metro Mirror or Metro Global Mirror session by using HyperSwap if Tivoli Storage Productivity Center for Replication is running on z/OS, and volumes are attached by a Fibre Channel connection.

#### **Notes:**

- When this option is selected, the Suspend H1-H2 command is available only if the Disable HyperSwap option is also selected.
- Setting this option automatically sets the Release IO after suspend Metro Mirror policy.

#### **Disable HyperSwap**

Select this option to prevent a HyperSwap from occurring by command or event.

#### **On Configuration Error:**

##### **Partition the system(s) out of the sysplex**

Select this option to partition out of the sysplex when a new system is added to the sysplex and encounters an error in loading the configuration. Restart the system if you select this option.

### **Disable HyperSwap**

Select this option to prevent a HyperSwap from occurring by command or event.

### **On Planned HyperSwap Error:**

#### **Partition out the failing system(s) and continue swap processing on the remaining system(s)**

Select this option to partition out the failing system and continue the swap processing on any remaining systems.

#### **Disable HyperSwap after attempting backout**

Select this option to stop the HyperSwap action, and disable the HyperSwap commands or events.

### **On Unplanned HyperSwap Error:**

#### **Partition out the failing system(s) and continue swap processing on the remaining system(s)**

Select this option to partition out the failing systems and continue HyperSwap processing on the remaining systems when a new system is added to the sysplex and HyperSwap does not complete. You must restart the system if you select this option.

#### **Disable HyperSwap after attempting backout**

Select this option to stop the HyperSwap action, and disable the HyperSwap commands or events.

### **ESS / DS FlashCopy Options for Role pair H3-I3**

The following option is available only for System Storage DS8000 version 4.2 or later.

#### **No Copy**

Select this option if you do not want the hardware to write the background copy until the source track is written to. Data is not copied to the H3 volume until the blocks or tracks of the I3 volume are modified. If you want a complete point-in-time copy of the I3 volume to be created on the H3 volume, do not use the **No Copy** option.

## **Role pair status and progress**

In a session, a *role pair* is the association of two volume roles that take part in a copy relationship. Tivoli Storage Productivity Center for Replication provides detailed role pair status and progress messages for sessions.

The role pair status and progress messages are updated to provide a message that indicates what the session is doing at the time. By hovering over a progress bar, you can see specific information about the action running on the session. Some status messages might include an estimated time-to-completion for the action in hours and minutes.

Role pair status is not provided for the XIV system Snapshot sessions because role pairs are not used for these sessions.

The status messages are displayed in the Session Details and Role Pair Details page.

Table 85. Detailed status messages for Participating and Non-Participating role pairs

Supported session type	Status message
FlashCopy Metro Mirror Global Copy Global Mirror	Starting <i>role_pair_name</i> relationships on the hardware
Metro Mirror Global Mirror	Waiting for all pairs in the role pair <i>role_pair_name</i> to reach state of <i>state</i>
FlashCopy Metro Mirror Global Copy Global Mirror	Terminating all pairs in role pair <i>role_pair_name</i>
FlashCopy Metro Mirror Global Mirror	Recovering all pairs in role pair <i>role_pair_name</i>
Metro Mirror Global Copy Global Mirror	Suspending all pairs in role pair <i>role_pair_name</i>
FlashCopy	Background copy is running for role pair <i>role_pair_name</i>
Global Copy	Waiting for all pairs in role pair <i>role_pair_name</i> to become consistent
Global Copy	Waiting for all pairs in role pairs <i>role_pair_name</i> to complete the initial copy
FlashCopy	Waiting for all pairs in role pairs <i>role_pair_name</i> to complete FRR
Global Mirror	Waiting for all pairs in role pairs <i>role_pair_name</i> to join the Global Mirror session

## Viewing session properties

This topic describes how to view session properties.

To view a session's properties, perform the following steps:

1. In the navigation tree, select **Sessions**. The Sessions panel is displayed.
2. Click the name of the session with the properties you want to view.
3. Select **View/Modify Properties** from the **Actions** menu and click **Go**.

## Viewing session details

You can view detailed information about a session, including role pairs, error count, whether the session is recoverable, copying progress, session type, and the timestamp.

Perform these steps to view session details:

1. In the navigation tree, select **Sessions**.
2. Select the session that you want to view.
3. Select **View Details** from the **Actions** drop-down menu, and click **Go**.

## Viewing additional details for Global Mirror sessions

Additional detail information is available for Global Mirror sessions, including information about the Global Mirror master, consistency groups that have been formed, and data exposure.

Perform these steps to view additional details for Global Mirror sessions:

1. In the IBM Tivoli Storage Productivity Center for Replication navigation tree, select **Sessions**.
2. Select the Global Mirror session that you want to view.
3. Select **View Details** from the **Actions** drop-down menu, and click **Go**.
4. Click the **Global Mirror Info** tab. The following information is displayed on the tab:

### **Global Mirror Master**

Shows the name of the storage system acting as the Global Mirror master.

### **Last Master Consistency Group Time**

Shows the time that the last consistency group was formed

### **Master Time During Last Query**

Shows the time on the master storage device when the query was performed,

### **Data Exposure**

Shows the average exposure to potential data loss in seconds over the query interval.

### **Session ID**

Shows the Global Mirror session ID.

### **Master State**

Shows the state of the master session on the hardware.

### **Unsuccessful CGs since last successful CG**

Shows the number of consistency groups that have failed to form since the last successful consistency group was formed.

### **CG Interval Time**

Shows the interval time between attempts to form a consistency group.

### **Max Coordination Interval**

Shows the extended distance consistency maximum coordination interval.

### **Max CG Drain Time**

Shows the maximum time the consistent set of data is allowed to drain at the remote site before failing consistency group formation.

### **Unsuccessful CGS/Previous Query**

Shows the number of consistency groups and percentage of consistency groups that were unsuccessful since the previous query.

### **Unsuccessful CGS/Total**

Shows the total number of unsuccessful consistency groups and percentage of consistency groups that have failed.

### **Successful CGS/Previous Query**

Shows the number of consistency groups and percentage of consistency groups that were successful since the previous query.

**Successful CGS/Total**

Shows the total number of successful consistency groups and percentage of consistency groups that have been successful.

**Consistency Group Failure Messages**

Shows the failure messages that have occurred on the Global Mirror session that prevented the formation of a consistency group.

**Data Exposure chart**

Shows the data exposure values in seconds for the last 15 minutes or 24 hours.

**Highlight Data Exposure**

Use the following fields to define a value in seconds for which you want data exposure to be tracked in the **Data Exposure** chart.

**Show Data Exposure over**

Data exposure that is over the value that is entered in this field is shown in the **Data Exposure** chart.

**Show Data Exposure under**

Data exposure that is under the value that is entered in this field is shown in the **Data Exposure** chart.

## Viewing storage system details

You can view detailed information about storage system, including the name, location, type, vendor, and the status of all connections to the storage system.

Perform these steps to view storage system details:

1. In the navigation tree, select **Storage Systems**. The Storage Systems panel is displayed in the Storage Systems view.
2. Perform one of these steps to view details for a specific storage system:
  - Click the storage system ID.
  - Select the storage system, click **View storage system details** from the **Actions** list, and then click **Go**.

## Viewing storage connection details

You can view storage connection details and a list of all storage systems that are located behind the connection.

Perform these steps to view storage connection details:

1. In the navigation tree, select **Storage Systems**. The Storage Systems panel is displayed in the Storage Systems view.
2. Click the **Connections** tab.
3. Perform one of these steps to view details for a specific storage connection:
  - Click the storage connection ID.
  - Select the storage connection, click **View/modify Connection Details** from the actions list, and then click **Go**.

## Viewing volume details

You can view information about volumes such as the name of the volume, the capacity of the volume, and the type of volume.

1. In the navigation tree, select **Volumes**.
2. Select a storage.

3. Depending on the type of storage system, do one of the following actions:
  - a. Select **All IO Groups** or a specific I/O group.
  - b. Select **All Logical Storage Subsystems** or a specific logical storage subsystem.
  - c. Select **All Pools** or a specific pool.
4. Click **Perform Query**. Information about the volumes is displayed in a table.

## Viewing logical paths

You can view all logical paths that are defined on an IBM TotalStorage Enterprise Storage Server, IBM System Storage DS8000, or IBM System Storage DS6000 storage system.

Perform one of these procedures to view logical paths:

- From the ESS/DS Paths panel of IBM Tivoli Storage Productivity Center for Replication:
  1. In the navigation tree, select **ESS/DS Paths**. The ESS/DS Paths panel is displayed.
  2. Click the storage system ID to display logical paths for that storage system.
- From the Storage Systems panel:
  1. In the navigation tree, select **Storage Systems**. The Storage Systems panel is displayed in the Storage Systems view.
  2. Select an ESS, DS6000, or DS8000 storage system for which you want to view logical paths.
  3. Select **View Paths** from the **Select Action** list, and click **Go**. The ESS/DS Paths panel is displayed with a list of defined logical paths.

## Viewing console messages

This topic describes how to view the console and messages.

IBM Tivoli Storage Productivity Center for Replication provides detailed information about actions taken by users, errors that occur during normal operation, and hardware error indications.

From the graphical user interface, you can view console messages by selecting **Console** in the navigation tree. You can then click the link for the specific message code to get more information on the message.

You can also get detailed information and help for specific messages in the IBM Tivoli Storage Productivity Center information center at <http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp>.

---

## Security

The IBM Tivoli Storage Productivity Center for Replication authentication process uses a configured user registry from either the operating system or Lightweight Directory Access Protocol (LDAP) server. To perform a specific action and manage specific sessions in the IBM Tivoli Storage Productivity Center for Replication GUI or CLI, the user must also have the appropriate authorization. Authorization is granted by assigning a specific role to the user account or user group.

## Users and groups

For authentication and authorization, IBM Tivoli Storage Productivity Center for Replication uses users and groups that are defined in a configured user registry on the management server, which is associated with either the local operating system or a Lightweight Directory Access Protocol (LDAP) server.

IBM Tivoli Storage Productivity Center for Replication does not provide the capability to create, update, or delete users or groups in the user registry. To manage users or groups, you must use the appropriate tool associated with the user registry in which the users and groups are stored.

IBM Tivoli Storage Productivity Center for Replication uses roles to authorize users to manage certain sessions and perform certain actions.

For more information about authentication, see the information about single sign-on in the IBM Tivoli Storage Productivity Center documentation.

### Primary administrative ID

If you switch the authentication method, either from the local operating system to an LDAP server or vice versa, IBM Tivoli Storage Productivity Center for Replication removes all access to existing users and user groups. This occurs because the user IDs might not be on the same local operating system and the LDAP server; however, you must have at least one user ID that can log in to IBM Tivoli Storage Productivity Center for Replication.

When you change the authentication method using Tivoli Integrated Portal, you can specify a primary administrative ID for both local operating system and LDAP authentication. Use this primary administrator to log in to IBM Tivoli Storage Productivity Center for Replication and manually add user IDs requiring access to IBM Tivoli Storage Productivity Center for Replication.

You can log in to both IBM Tivoli Storage Productivity Center for Replication and IBM Tivoli Storage Productivity Center using the primary administrative ID and password.

You cannot use the following characters for the IBM Tivoli Storage Productivity Center for Replication administrative password:

- square brackets ([ and ])
- semicolon (;)
- backward slash (\)

## User roles

A *user role* is a set of privileges that is assigned to a user or user group to allow the user or user group to perform certain tasks and manage certain sessions.

To be assigned to a role, each user or group of users must have a valid user ID or group ID in the user registry on the management server.

Both individual users and a group of users can be assigned to a role. All users in a group are assigned the role of the group. If a user is assigned to one role as an individual and a different role as a member of a group, the user has access to the permissions of the role that has greater access.

Restricting access to sessions prevents unwarranted administrative access. This is especially useful in an open environment, where there can be many storage administrators who are responsible for their servers, applications, databases, file systems, and so on.

IBM Tivoli Storage Productivity Center for Replication provides a set of predefined user roles: monitor, session operator, and administrator.

## Monitor

Monitors can view the health and status in the IBM Tivoli Storage Productivity Center for Replication GUI and CLI; however, they cannot modify or perform any commands or actions.

Monitors can view the following information:

- All storage systems and storage system details
- All connections and connection details
- All sessions and session details
- All path information
- Management server status and details

## Operator

Session operators can manage sessions to which they have been assigned, including:

- Adding or removing a session. The user ID that created the session is automatically granted access to manage that session.
- Performing actions on an assigned session, such as start, flash, terminate, and suspend.
- Modifying session properties.
- Adding copy sets to a session. The session operator can add volumes to a copy set only when the volume is not protected and not in another session.
- Removing copy sets from a session.
- Adding Peer To Peer Remote Copy (PPRC) paths, and removing paths with no hardware relationships. PPRC paths are a common resource used in IBM Tivoli Storage Productivity Center for Replication sessions and also in an ESS, DS6000, or DS8000 storage-system relationship that is established between two common logical subsystems (LSSs).

**Note:** The session operator cannot issue a force removal of a path.

**Note:** A path can also be auto-generated when starting a session.

- Monitoring health and status, including viewing the following information:
  - All storage systems and storage system details
  - All connections and connection details
  - All sessions and session details
  - All path information
  - Management server status and details

**Note:** Session operators can make changes only to the volumes that they own. They are not able to make changes to volumes being managed by other users.

## Administrator

During installation of IBM Tivoli Storage Productivity Center for Replication, the installation wizard requests an ID to use for the initial administrator user ID.

Administrators have unrestricted access. They can manage all sessions and perform all actions associated with IBM Tivoli Storage Productivity Center for Replication, including:

- Granting permissions to users and groups of users.
- Adding or removing a session. The user ID that created the session is automatically granted access manage that session.
- Performing actions on all sessions, such as start, flash, terminate, and suspend.
- Modifying session properties.
- Adding and removing copy sets from a session. The administrator can add volumes to a copy set only when the volume is not protected and not in another session.
- Protecting volumes and removing volume protection.
- Adding or removing storage system connections.
- Modifying connection properties.
- Assigning or changing storage system locations.
- Adding PPRC paths and removing paths with no hardware relationships. PPRC paths are a common resource used in IBM Tivoli Storage Productivity Center for Replication sessions and also in an ESS, DS6000, or DS8000 storage-system relationship that is established between two common logical subsystems (LSSs).

**Note:** A path can also be auto-generated when starting a session.

- Managing management servers. The standby management server is a common resource that is available to multiple sessions.
- Packaging program error (PE) log files.
- Monitoring health and status, including viewing the following information:
  - All storage systems and storage system details
  - All connections and connection details
  - All sessions and session details
  - All path information
  - Management server status and details

**Important:** IBM Tivoli Storage Productivity Center supports multiple user roles, including the Superuser role. A superuser can perform all IBM Tivoli Storage Productivity Center functions. For IBM Tivoli Storage Productivity Center superusers to have full access to IBM Tivoli Storage Productivity Center for Replication, the Superuser group must be added to the IBM Tivoli Storage Productivity Center for Replication and assigned to the Administrator role. Then, you can manage the IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication products by groups, instead of by user IDs.

**Note:** Administrators cannot revoke their own administrative access rights.

## Adding the IBM Tivoli Storage Productivity Center for Replication Administrator role to the IBM Tivoli Storage Productivity Center Superuser group

If you use local operating system or Lightweight Directory Access Protocol (LDAP) authentication, you must add the IBM Tivoli Storage Productivity Center superuser group to IBM Tivoli Storage Productivity Center for Replication with administrator privileges.

**Prerequisite:** You must have Administrator privileges to perform this action.

Perform these steps to add the superuser group to IBM Tivoli Storage Productivity Center for Replication:

1. Log in to IBM Tivoli Storage Productivity Center as the superuser.
2. In the navigation tree, expand **Administrative Services > Configuration** and select **Role-to-Group Mappings**.
3. Locate the name of the superuser user group.
4. Log in to IBM Tivoli Storage Productivity Center for Replication using a user ID with administrator privileges.
5. In the navigation tree, select **Administration**. The Administration panel is displayed.
6. Click **Add Access**. The Add Access wizard is displayed.
7. Type the name of the superuser group in the **User or group names** field, and click **Next**.
8. Select the name of the superuser group, and click **Next**.
9. Select **Administrator privileges**, and click **Next**.
10. Click **Next** to confirm this action.
11. Click **Finish**.

## Granting access privileges for a user

You can assign user roles to an IBM Tivoli Storage Productivity Center for Replication user to grant access privileges to individual sessions and tasks.

Perform the following steps to authorize a user:

1. Create the user ID or group ID if it does not already exist in the user registry, either the operating system of the active management server or Lightweight Directory Access Protocol (LDAP) server.
2. Log in to IBM Tivoli Storage Productivity Center for Replication as a user with administrator privileges.
3. In the navigation tree, select **Administration**. The Administration panel is displayed.
4. Click **Add Access**. The Add Access wizard is displayed.
5. Type the name of the user to whom you want to give access, and click **Next**. The Select Users and Groups panel is displayed.

**Tip:** You can enter a partial name and use the \* wildcard character to represent zero or more characters.

6. Select one or more names from the list of found users.
7. Select the role to associate with this user.
8. If you selected the Operator role, select one or more session that this user can manage, and click **Next**.

9. Click **Next** to confirm this action.
10. Click **Finish**.

## Viewing access privileges for a user

You can view a list of all IBM Tivoli Storage Productivity Center for Replication user and their assigned roles. You can also view the assigned sessions for each user.

Perform the following steps to view access privileges for a user:

1. Log in to IBM Tivoli Storage Productivity Center for Replication as a user with administrator privileges.
2. In the navigation tree, select **Administration**. The Administration page is displayed with a list of IBM Tivoli Storage Productivity Center for Replication users and user groups and their associated role.
3. Select the user whose access privileges you want to view.
4. Select **View/Modify Access** from the **Actions** drop-down list, and click **Go**. The View/Modify Access panel is displayed. This panel shows the role assigned to the user and lists the sessions that the user can manage.
5. Click **Cancel**.

## Modifying access privileges for a user

You can change the user role and assigned sessions for an IBM Tivoli Storage Productivity Center for Replication user.

**Prerequisite:** You must have Administrator privileges to perform this action.

Perform the following steps to modify the access privileges for a user:

1. Log in to IBM Tivoli Storage Productivity Center for Replication as a user with administrator privileges.
2. In the navigation tree, select **Administration**. The Administration panel is displayed with a list of users and user groups and their associated role.
3. Select the user whose access privileges you want to view.
4. Select **View/Modify Access** from the **Select Action** drop-down list, and click **Go**. The View/Modify Access panel is displayed. This panel shows the role assigned to the user and lists the sessions that the user can manage.
5. Select the role to associate with this user.
6. If you selected the Operator role, select one or more session that this user can manage and click **Next**.
7. Click **OK**.

## Removing access privileges for a user

You can remove access privileges for an IBM Tivoli Storage Productivity Center for Replication user. When you remove access, the user ID cannot access the IBM Tivoli Storage Productivity Center for Replication GUI or run commands from the command line.

**Prerequisite:** You must have Administrator privileges to perform this action.

Perform the following steps to remove user access:

1. Log in to IBM Tivoli Storage Productivity Center for Replication as a user with administrator privileges.

2. In the navigation tree, select **Administration**. The Administration panel is displayed with a list of users and user groups and their associated role.
3. Select the user from which you want to remove access.
4. Select **Remove Access** from the **Actions** list, and click **Go**.

---

## Chapter 8. Reporting in the stand-alone GUI

Use Tivoli Storage Productivity Center reports to view detailed information about the storage resources in your environment. These reports are organized into different types and categories and provide both summary and detailed information depending on your needs.

Data in reports is based on statistical information accumulated by data collection schedules and stored in the database repository. You can select the specific systems, storage subsystems, switches, fabrics, NAS filers, clusters, disks, file systems, and even users upon which you want to report.

Reports are organized into report types and categories that you can expand to reveal additional subcategories of reporting. Many reports are also accessible through the topology viewer.

- **Reporting types:** system reports, batch reports, user ID reports, user-defined online reports
- **Report categories:** asset, availability, capacity, usage, usage violation, backup, storage subsystem performance, switch performance

Consider the following steps when determining how to best use Tivoli Storage Productivity Center reports:

1. Determine how you want to generate and view reports. See “Choosing a reporting type” for more information.
2. Identify which reports contain the most important information about your storage environment. See “Choosing a report category” on page 797 for more information.

---

### Choosing a reporting type

Use pre-defined (system reports), saved reports, batch reports, rollup reports, and user-defined reports, tables, and charts to view the information collected by monitoring and quota jobs. Tivoli Storage Productivity Center includes these different reporting types to provide you with the flexibility to view data about your storage resources according to the needs of your environment.

The following table describes the reporting types available in Tivoli Storage Productivity Center. Use this table to help determine how to best deliver and view reports about your storage resources.

Reporting type	Description	Location in the navigation tree
<b>User-defined online reports</b>	<p>These reports can be generated at any time during a product session and are only available for that session. Each manager within Tivoli Storage Productivity Center has a set of reports specific to that manager. For example, to view detailed reports about storage subsystems, access the reporting function within Disk Manager.</p> <p>See the following topics for more information about online reports:</p> <ul style="list-style-type: none"> <li>• “Working with user-defined online reports” on page 820</li> <li>• “Data Manager reports” on page 831</li> <li>• “Using Data Manager for Databases reports” on page 962</li> <li>• “Disk Manager reports” on page 990</li> <li>• “Fabric Manager reports” on page 1003</li> </ul>	<p>Data Manager &gt; Reporting</p> <p>Data Manager for Databases &gt; Reporting</p> <p>Disk Manager &gt; Reporting</p> <p>Fabric Manager &gt; Reporting</p>
<b>System reports</b>	<p>System reports are automatically generated by Tivoli Storage Productivity Center and contain some of the most common information about your monitored storage resources. These pre-defined reports enable you to view your storage enterprise data quickly and efficiently with one click. Data for these system reports are gathered every time that monitoring jobs are run against your storage resources.</p> <p>See the following topics for more information about online reports:</p> <ul style="list-style-type: none"> <li>• “System reports - Data” on page 1011</li> <li>• “System reports - Data Manager for Databases” on page 1025</li> <li>• “System Reports - Disk Manager” on page 1037</li> <li>• “System reports - Fabric Manager” on page 1054</li> </ul>	<p>IBM Tivoli Storage Productivity Center &gt; Reporting &gt; System Reports</p>
<b>User ID (saved) reports</b>	<p>Create saved reports when you want specific reports generated for you whenever you log in to a product session. This enables you to save reports that you can generate at any time without having to define your report criteria again. Saved reports are only visible to the user ID that created them.</p> <p>See “User ID (saved) reports” on page 1075 for more information.</p>	<p>IBM Tivoli Storage Productivity Center &gt; Reporting &gt; My Reports &gt; <i>user ID</i> Reports</p> <p>where <i>user ID</i> represents the IBM Tivoli Storage Productivity Center ID of the user that saved the report</p>

Reporting type	Description	Location in the navigation tree
Batch reports	<p>A batch report represents any Tivoli Storage Productivity Center report that you want to run on a regular basis and save its data to a file. You can view the information in a generated batch report file directly or import it into an application of your choice.</p> <p>To create a batch report, you must determine which Tivoli Storage Productivity Center report you want to generate, the schedule on which to generate the report, and the file to which to save its data.</p> <p>You can save the data generated for a batch report to any of the following file formats: CSV, HTML, formatted text, PDF chart, and HTML chart.</p> <p>See “Batch reports” on page 1061 for more information.</p>	IBM Tivoli Storage Productivity Center > Reporting > My Reports > Batch Reports
Rollup Reports	<p>Use rollup reports to view the storage information collected by the master Tivoli Storage Productivity Center server from its associated subordinate servers. Rollup reports enable you to have a network-wide perspective of storage usage in an environment where multiple Tivoli Storage Productivity Center servers are deployed and collecting storage metrics.</p> <p>See the following topics for more information about online reports:</p> <ul style="list-style-type: none"> <li>• “Rollup reports” on page 1075</li> <li>• “Tivoli Storage Productivity Center servers” on page 280</li> <li>• “Collecting storage statistics from Tivoli Storage Productivity Center servers” on page 342</li> </ul>	IBM Tivoli Storage Productivity Center > Reporting > Rollup Reports
Data Source reports	<p>Use these reports to view detailed information about the agents from which Tivoli Storage Productivity Center collects information about storage resources. Data sources include CIMOM agents, Storage Resource agents, Data agents, Fabric agents, VMWare, and subordinate Tivoli Storage Productivity Center servers.</p> <p>See Data Source reports for more information.</p>	IBM Tivoli Storage Productivity Center > Reporting > Data Source Reports

## Choosing a report category

IBM Tivoli Storage Productivity Center provides a number of categories for reports that help you identify which reports contain the information you want to view about your storage environment. Each category of report contains information gathered by different data collection and quota jobs.

The following table describes the reporting categories. Use this table to help determine which reports are most useful to you and which data collection jobs to run for those reports.

Report Category	Description	What data collection job should I run for this report?
<p><b>Asset reports</b></p>	<p>View itemized statistics about your storage resources in a hierarchical view that enables you to drill down to view those resources in greater detail.</p> <p><b>Location:</b> These reports are available in the following locations on the navigation tree:</p> <ul style="list-style-type: none"> <li>• Data Manager &gt; Reporting &gt; Asset</li> <li>• Data Manager for Databases &gt; Reporting &gt; Asset</li> <li>• IBM Tivoli Storage Productivity Center &gt; Reporting &gt; My Reports (if you save the definition of an online report it appears in this location)</li> <li>• Data Manager for Databases &gt; My Reports</li> </ul> <p><b>Example:</b> View information about a storage subsystem and drill down into its related storage pools, disks, volumes, and disk groups.</p> <p>See “Asset reports” on page 834 for more information about Asset reports.</p>	<p>Probes, Discovery</p> <p>Data for System-wide Users and Monitored Directory reports are gathered by Scans.</p>
<p><b>Availability reports</b></p>	<p>View availability statistics about your storage resources, both from a network point of view and from a computer uptime perspective.</p> <p><b>Location:</b> These reports are available in the following locations on the navigation tree:</p> <ul style="list-style-type: none"> <li>• Data Manager &gt; Reporting &gt; Availability</li> <li>• IBM Tivoli Storage Productivity Center &gt; Reporting &gt; My Reports (if you save the definition of an online report it appears in this location)</li> </ul> <p><b>Example:</b> Use a Computer Uptime report to determine the percentage of time that a computer was up, the number of times it was rebooted, and the total time it was down within a user-defined period of time.</p> <p>See “Availability Reports” on page 858 for more information about Availability reports.</p>	<p>Ping data: Pings</p> <p>Computer Uptime: Probes</p>

Report Category	Description	What data collection job should I run for this report?
<p>TPC-wide Storage Space</p>	<p>Examine storage capacities of storage resources at a file system, computer, or network level.</p> <p><b>Location:</b> These reports are available in the following locations on the navigation tree:</p> <ul style="list-style-type: none"> <li>• Data Manager &gt; Reporting &gt; TPC-wide Storage Space</li> <li>• Data Manager for Databases&gt; Reporting &gt; Capacity</li> <li>• IBM Tivoli Storage Productivity Center &gt; Reporting &gt; My Reports (if you save the definition of an online report it appears in this location)</li> <li>• Data Manager for Databases &gt; My Reports</li> </ul> <p><b>Example:</b> Identify how much storage space is being used on the file systems within your environment, and how much unused storage space is available.</p> <p>See “TPC-wide Storage Space Reports” on page 860 for more information about Capacity reports.</p>	<p>Probes</p>
<p>Usage reports</p>	<p>View information about the usage and growth of consumption of your storage resources, as well as select files against which to run an Tivoli Storage Productivity Center archive/backup job.</p> <p><b>Location:</b> These reports are available in the following locations on the navigation tree:</p> <ul style="list-style-type: none"> <li>• Data Manager &gt; Reporting &gt; Usage</li> <li>• Data Manager for Databases &gt; Reporting &gt; Usage</li> <li>• IBM Tivoli Storage Productivity Center &gt; Reporting &gt; My Reports (if you save the definition of an online report it appears in this location)</li> <li>• Data Manager for Databases &gt; My Reports (if you save the definition of an online report it appears in this location)</li> </ul> <p><b>Example:</b> Determine how much of the storage being used in your environment can be considered wasted space (orphaned, obsolete, or forbidden files).</p> <p>See “Usage Reports” on page 920 for more information about Usage reports.</p>	<p>Scans</p>

Report Category	Description	What data collection job should I run for this report?
Usage Violation reports	<p>View quota and constraint violations as well as select files for archive/backup jobs.</p> <p><b>Location:</b> These reports are available in the following locations on the navigation tree:</p> <ul style="list-style-type: none"> <li>• Data Manager &gt; Reporting &gt; Usage Violations</li> <li>• Data Manager for Databases &gt; Reporting &gt; Usage Violations</li> <li>• IBM Tivoli Storage Productivity Center &gt; Reporting &gt; My Reports (if you save the definition of an online report it appears in this location)</li> <li>• Data Manager for Databases &gt; My Reports (if you save the definition of an online report it appears in this location)</li> </ul> <p><b>Example:</b> Identify the users or groups of users that are using storage space on machines where they should not.</p> <p>See “Usage Violation reports” on page 927 for more information about Usage Violation reports.</p>	Scans, Quotas, Constraints
Backup reports	<p>Investigate the sizes of data that would be required to backup to achieve full backups, determine the amount of space required to perform an incremental backup of any or all of your data at any given point in time, and select files for archive/backup jobs.</p> <p><b>Location:</b> These reports are available in the following locations on the navigation tree:</p> <ul style="list-style-type: none"> <li>• Data Manager &gt; Reporting &gt; Backup</li> <li>• IBM Tivoli Storage Productivity Center &gt; Reporting &gt; My Reports (if you save the definition of an online report it appears in this location)</li> <li>• Data Manager for Databases &gt; My Reports (if you save the definition of an online report it appears in this location)</li> </ul> <p><b>Example:</b> Determine if you have enough storage space to perform a backup of your data (incremental or full).</p> <p>See “Backup reports” on page 929 for more information about Usage Violation reports.</p>	Scans

Report Category	Description	What data collection job should I run for this report?
<p><b>Monitored Computer Storage Space</b></p>	<p>Use these host-based reports to view the data that is collected by probes for computers, Network Attached Storage, and hypervisors. These reports contain detailed information about the consumption of file system space and enable you to relate that space back to external or internal storage without counting shared space multiple times.</p> <p><b>Location:</b> These reports are available in the following locations on the navigation tree:</p> <ul style="list-style-type: none"> <li>• Data Manager &gt; Reporting &gt; Monitored Computer Storage Space</li> <li>• IBM Tivoli Storage Productivity Center &gt; Reporting &gt; My Reports (if you save the definition of an online report it appears in this location)</li> </ul> <p>See “Monitored Computer Storage Space reports” on page 931 for more information about Monitored Computer Storage Space reports.</p>	<p>Probes</p>
<p><b>Storage subsystem reports</b></p>	<p>View storage capacity for a computer, file system, storage subsystem, volumes, array sites, ranks, and disks. These reports also enable you to view the relationships among the components of a storage subsystem.</p> <p><b>Location:</b> Disk Manager &gt; Reporting &gt; Storage Subsystems</p> <p><b>Example:</b> Determine if you have enough storage space to perform a backup of your data (incremental or full).</p> <p>See “Disk Manager reports” on page 990 for more information about Storage Subsystem reports.</p>	<p>Probes</p>
<p><b>Storage Subsystem Performance reports</b></p>	<p>View performance data for storage subsystems.</p> <p><b>Location:</b> Disk Manager &gt; Reporting &gt; Storage Subsystem Performance</p> <p><b>Example:</b> Check the performance rate for storage subsystem activities, such as read I/O rate, read data rate, total port I/O rate, etc.</p> <p>See “Disk Manager reports” on page 990 for more information about Storage Subsystem Performance Monitor reports.</p>	<p>Subsystem Performance Monitors</p>

Report Category	Description	What data collection job should I run for this report?
Switch Performance reports	<p>View performance data for fabric switches.</p> <p><b>Location:</b> Fabric Manager &gt; Reporting &gt; Switch Performance</p> <p><b>Example:</b> Check the performance rate for switch activities, such as port send packet rate, port send data rate, total port data rate, etc.</p> <p>See “Fabric Manager reports” on page 1003 for more information about Switch Performance Monitor reports.</p>	Switch Performance Monitors
Rollup reports: Asset, Capacity, Database Asset, Database Capacity	<p>View the storage information that has been collected by IBM Tivoli Storage Productivity Center servers through a single interface. These rollup reports enable you to have a consolidated perspective of storage usage in an environment where multiple IBM Tivoli Storage Productivity Center servers are deployed and collecting storage metrics.</p> <p><b>Location:</b> IBM Tivoli Storage Productivity Center &gt; Reporting &gt; Rollup Reports</p> <p><b>Example:</b> Check the disk capacity of all the computers monitored by different servers in your environment.</p> <p>See “Rollup reports” on page 1075 for more information about rollup reports.</p>	IBM Tivoli Storage Productivity Center Server Probes
Data Source reports	<p>Use data source reports to view detailed information about the agents from which Tivoli Storage Productivity Center collects information about storage resources. Data sources include CIMOM agents, Storage Resource agents, Data agents, Fabric agents, VMWare, and subordinate Tivoli Storage Productivity Center servers.</p> <p><b>Location:</b> IBM Tivoli Storage Productivity Center &gt; Reporting &gt; Data Source Reports</p> <p><b>Example:</b> View detailed information about the CIMOM Agents that have been added to Tivoli Storage Productivity Center as data sources.</p> <p>See “Data source reports - overview” on page 1133 for more information about data source reports.</p>	These reports are available for data sources that have been associated with Tivoli Storage Productivity Center.

## What can I find out using reports?

Learn about some of the key storage questions that you can answer by generating Tivoli Storage Productivity Center reports.

Use the following table to view a list of reports that can be generated to answer key questions about storage resources that are monitored by Tivoli Storage Productivity Center.

What do you want to know?	Which report answers this question?	Which schedule can I run to generate this report?
What hardware is currently being used within the enterprise?	Data Manager > Reporting > Asset > By <storage_resource_type>	Probes
How much storage space is being used?	Data Manager > Reporting > TPC-wide Storage Space > Consumed File System Space	Probes
Of the space that is being used, how much is wasted space? (orphaned, obsolete, or duplicate files)	Data Manager > Reporting > Usage > Files Data Manager > Reporting > Usage Violations > Constraint Violations	Scans
How much unused or unallocated storage space is available?	Data Manager > Reporting > TPC-wide Storage Space > Available File System Space	Probes
Is there enough space to do a backup of our data? (incremental or full)	Data Manager > Reporting > Backup > Backup Storage Requirements	Scans
Which files in the environment are at risk if a disaster hits?	Data Manager > Reporting > Backup > Most at Risk Files	Scans
What "forbidden files" are taking up storage space on the network?	Data Manager > Reporting > Usage Violations > Constraint Violations	Scans
Which user or group of users is consuming space on computers that they should not?	Data Manager > Reporting > Usage Violations > Quota Violations	Scans
How fast are storage resources being consumed?	Data Manager > Reporting > TPC-wide Storage Space > Consumed File System Space	Probes
Which user or business unit is consuming the most storage resources?	Data Manager > Reporting > Usage > Users Data Manager > Reporting > Usage > OS User Groups	Scans
Where is disk space reaching a critical shortage?	Data Manager > Reporting > TPC-wide Storage Space > Disk Space	Probes
Which devices have been experiencing the most use/traffic? Which devices have been experiencing the least use/traffic?	Data Manager > Reporting > Usage > Access Load	Scans
Based on historical consumption, how much storage space should be added and when should it be added?	Data Manager > Reporting > TPC-wide Storage Space > Available File System Space	Probes
What files have not been used within a certain time period?	Data Manager > Reporting > Usage > Files > Most Obsolete Files	Scans
What are the largest files or directories within the environment?	Data Manager > Reporting > Usage > Files > Largest Files	Scans

What do you want to know?	Which report answers this question?	Which schedule can I run to generate this report?
What are the most modified files within the environment?	Data Manager > Reporting > Usage > Access Load > Modification Time	Scans
Which computers are “up” or “down” within the environment?	Data Manager > Reporting > Availability > Ping	Pings
What hardware is most prone to error? (for example, disk defects)	Data Manager > Reporting > Asset > System-wide > Disks	Probes
Which file owners no longer exist in the environment?	Data Manager > Reporting > Usage > Files > Orphan files	Scans
How much storage space is an instance consuming?	<ul style="list-style-type: none"> <li>• <b>Oracle:</b> Data Manager for Databases &gt; Reporting &gt; Capacity &gt; Oracle &gt; Total Instance Storage</li> <li>• <b>SQL/Server:</b> Data Manager for Databases &gt; Reporting &gt; Capacity &gt; SQL/Server &gt; Total Instance Storage</li> <li>• <b>Sybase:</b> Data Manager for Databases &gt; Reporting &gt; Capacity &gt; Sybase &gt; Total Instance Storage</li> <li>• <b>UDB:</b> Data Manager for Databases &gt; Reporting &gt; Capacity &gt; UDB &gt; Total Instance Storage</li> </ul>	Probes

What do you want to know?	Which report answers this question?	Which schedule can I run to generate this report?
<p>Which user or business unit is consuming the most storage resources and on which instances are they consuming those resources?</p>	<p><b>Oracle:</b></p> <ul style="list-style-type: none"> <li>• Data Manager for Databases &gt; Reporting &gt; Usage &gt; Oracle &gt; Users &gt; Group by User Name, <i>or</i></li> <li>• Data Manager for Databases &gt; My Reports &gt; System Reports &gt; Oracle - User Database Space Usage</li> </ul> <p><b>SQL/Server:</b></p> <ul style="list-style-type: none"> <li>• Data Manager for Databases &gt; Reporting &gt; Usage &gt; SQL/Server &gt; Users &gt; Group by User Name, <i>or</i></li> <li>• Data Manager for Databases &gt; My Reports &gt; System Reports &gt; SqlServer - User Database Space Usage</li> </ul> <p><b>Sybase:</b></p> <ul style="list-style-type: none"> <li>• Data Manager for Databases &gt; Reporting &gt; Usage &gt; Sybase &gt; Users &gt; Group by User Name, <i>or</i></li> <li>• Data Manager for Databases &gt; My Reports &gt; System Reports &gt; Sybase - User Database Space Usage</li> </ul> <p><b>UDB:</b></p> <ul style="list-style-type: none"> <li>• Data Manager for Databases &gt; Reporting &gt; Usage &gt; UDB &gt; Users &gt; Group By User Name, <i>or</i></li> <li>• Data Manager for Databases &gt; My Reports &gt; System Reports &gt; UDB - User Database Space Usage</li> </ul>	<p>Scans</p>

## Report considerations and limitations

Keep in mind these considerations and limitations when viewing reports in Tivoli Storage Productivity Center.

### Data collection for reports

Some columns within reports might not be populated with data for the storage resources that you are monitoring. Columns are empty if you did not configure Tivoli Storage Productivity Center to discover or collect the information intended for that column. Use discovery, probe, ping, or scan schedules to ensure that you collect information for all the columns that appear in reports.

When you specify a start time for using performance monitor data in a report, the start time might not coincide with the start of a performance monitor data collection interval. If the requested start time is after the start of a data collection interval and the duration of the data collection interval is long enough so that it ends at or after the requested start time, Tivoli Storage Productivity Center includes all data from the collection interval that began before the requested start time. This data might include data collected before the start time that you specified. This processing ensures

that the maximum amount of available performance data is used. For example, if a performance monitor collects data every 20 minutes starting at 01:00, but you request performance data that starts at 1:15, Tivoli Storage Productivity Center still analyzes performance data that starts at 01:00 that has a duration of 20 minutes.

#### **Report charts that contain long path names**

If you generate charts for reports and these charts contain long path names or many segments, the text on the charts might overlap and make them difficult to read.

#### **Information about directories**

Before information about directories is displayed in reports, you must complete the following tasks:

1. Include directories that were discovered by Tivoli Storage Productivity Center in a directory group.
2. Include the directory group in a data collection scan.

After a scan schedule collects data about the directories in a directory group, information about the directories is displayed in By Directory reports

#### **Storage totals for Network-wide reports**

Tivoli Storage Productivity Center provides a number of network-wide reports that display storage totals based on the data collected from the monitored computers and storage subsystems in your network. Click the magnifying glass icon next to a row in a network-wide report to view the details about the computers that are included in those storage totals. However, the reports that you drill down into display information about computers only. Storage information about storage subsystems is not included in the values for reports that are shown when you drill down from a network-wide report.

For example, the Data Manager > Reporting > Capacity > Disk Capacity > Network-wide report displays disk capacity totals for the computers and storage subsystems in your network that are monitored by Tivoli Storage Productivity Center. However, when you click the magnifying glass icon next to a row in that report, the resulting report displays disk totals for computers only. This action might cause the totals displayed in the network-wide report to be larger than the totals reflected in the report that you drill down in to (if you have disks that are part of both computers and storage subsystems within your network).

#### **Report values for General Parallel File Systems (GPFS) file systems**

For reports that display information collected by scans, Tivoli Storage Productivity Center does not include statistics for GPFS snapshot directories and the files in those directories. Because of this issue, the values in these columns might be smaller than the actual numbers for the file systems.

For example, when viewing data collected by scans of GPFS file systems in the Data Manager > TPC-wide Storage Space > File System Space report, the values for the File Count, Directory Count, and File System Space columns might be smaller than the actual numbers for the file systems.

#### **IBM XIV Storage System reporting limitation for disk drives**

Tivoli Storage Productivity Center does not collect physical serial number information about the disk drives that are associated with the XIV system

devices. Therefore, any reports that display information about the XIV system do not include the physical serial numbers of the disk drives.

#### **Hitachi Data Systems storage subsystems limitations**

- There is a limitation within reports when Tivoli Storage Productivity Center collects information about Hitachi Data Systems (HDS) storage subsystems that are configured as storage virtualizers. Specifically, any reports that display a value for the Disk Unallocated Space column do not count the storage used by volumes that exist on external disks when the HDS is used as a virtualizer.
- Tivoli Storage Productivity Center does not support Logical Unit Size Expansion (LUSE) with Hitachi storage subsystems. Because of this limitation, Tivoli Storage Productivity Center might report a different number of volumes for a subsystem than is reflected in the HiCommand Device Manager (HDvM) when LUSE is used.

#### **Time zones for computers monitored by Data agents and Storage Resource**

**agents** The time zones of computers that are monitored by Storage Resource agents are shown as Greenwich mean time (GMT) offsets in Tivoli Storage Productivity Center reports. The time zones of computers that are monitored by Data agents are shown as the local time zone in Tivoli Storage Productivity Center reports. For example, a computer in Los Angeles shows the following time zones in the By Computer report in Asset reporting:

- If monitored by a Storage Resource agent: (GMT-8:00) GMT-8:00
- If monitored by a Data agent: (GMT-8:00) America/Los\_Angeles Time zone

#### **SQL access to data collected by Tivoli Storage Productivity Center for use in external reports and applications**

You can use the data collected by data collection jobs to create custom reports in external tools. Tivoli Storage Productivity Center provides a set of DB2<sup>®</sup> views that represent key data that was stored in the database repository. Use Structured Query Language (SQL) commands to retrieve the data in these views. Use this data in external tools such as Business Intelligence and Reporting Tools (BIRT), Microsoft Excel, and Tivoli Common Reporting. See *Planning to retrieve information from views in the database repository* topic in the *IBM Tivoli Storage Productivity Center and IBM Tivoli Storage Productivity Center for Replication Installation and Configuration Guide* for more information about how to use SQL to retrieve data for use in custom reports and tools.

#### **Storage Pools in EMC storage subsystems**

The data that Tivoli Storage Productivity Center collects about EMC storage subsystems is based on SMI-S standards. Within SMI-S model, different types of storage pools are defined and several subsystem attributes can be modeled as special pool types. Beside the pools that are available for volume creation, additional storage space from the EMC storage subsystem might be represented as a pool within the SMI-S model. Because of this representation, Tivoli Storage Productivity Center reports and CLI commands might display more pools for EMC storage subsystems than what is reported through the EMC Navisphere agent.

#### **Computers in a Windows domain**

Once computers are discovered in a domain, they remain in the database until three discoveries do not report them. If you remove the computer that is doing the discovery in a domain, no further discovery results are

processed by the server. Therefore, any remaining domain computers that were previously discovered continue to show their unreachable value in Unmanaged Computers reports.

### UDB reports

For UDB reports, the "User Name" and "Creator" columns represent the schema (not the operating system user) which is using the storage space. Each schema is associated with one operating system user. The reports show usage at the schema level.

### Reports display incorrect number of folders for Windows computers

On monitored computers that run Windows, the number of folders that is reported by Tivoli Storage Productivity Center might be different from the number of folders that is indicated by Windows Explorer. This situation occurs when settings on the computer indicate that files, folders, and drives are hidden. For example, the Data Manager > Reporting > Usage > files > File Summary > by Computer report might display a number of folders for a Windows computer that is less than the number of folders provided by Windows Explorer on that computer.

To ensure that the number of folders reported by Tivoli Storage Productivity Center more closely matches the number reported by Windows Explorer, complete the following steps:

1. On each of the Windows computers that you are monitoring, start Windows Explorer.
2. Navigate to the file system whose settings that you want to change.
3. Select **Folder and search options...** or **Folder options...** from the **Organize** or **View** menus.
4. Click the **View** tab.
5. In the **Advanced Settings** section, make the following changes:
  - Select **Show hidden files, folders, and drives**.
  - Clear **Hide protected operating system files**.
6. Run probe and scan data collection schedules on the computers.
7. View the reports that display the number of folders for Windows computers.

### Information about space efficient volumes

Keep in mind the following information about space-efficient volumes:

- A volume name or virtual disk in a report that is marked with an asterisk (\*) indicates that the volume or virtual disk is a space-efficient volume. The \* is not part of the actual volume or virtual disk name.
- Tivoli Storage Productivity Center does not include space efficient volumes when calculating the values for consumed and available space on DS8000 storage systems. Therefore, the values for these columns in Tivoli Storage Productivity Center reports might be different from the space that is available on DS8000 storage systems with space efficient volumes.
- Tivoli Storage Productivity Center does not display information about space-efficient volumes for IBM DS8000 storage systems in the following reports:
  - Disk Manager > Reporting > Storage Subsystems > Computer Views > By Filesystem/Logical Volume
  - Disk Manager > Reporting > Storage Subsystems > Storage Subsystem Views > Disks

### **The mapping of volumes to an ESX hypervisor might not display correctly**

When assigning and unassigning volumes to an ESX hypervisor, the mapping of the volumes might not display correctly in Tivoli Storage Productivity Center reports. For example, if you assign a volume to a hypervisor, unassign it, and then assign a different volume to the hypervisor, information about the original volume might still be displayed in the Correlated Storage Subsystem volume report that is available under Data Manager > Reporting > Asset > By Hypervisor.

To ensure that Tivoli Storage Productivity Center reports display the correct volume information, complete the following tasks before generating the reports:

- After unassigning a storage system volume from a hypervisor, use VMware vSphere Client to rescan the HBA.
- After assigning a new storage system volume to the hypervisor, use VMware vSphere Client to rescan the HBA.
- In Tivoli Storage Productivity Center, rerun probes for the computer, hypervisor, and storage system.

### **IBM Storwize V7000 Unified/IBM SONAS cluster names in reports**

In reports that display file level information for IBM Storwize V7000 Unified/IBM SONAS clusters, the storage system name is included with the cluster name in the Computer or Device column. The format of the column is `storagesystem_name: cluster_name`, where `storagesystem_name` is the name of the IBM Storwize V7000 Unified/IBM SONAS device that the cluster belongs to. For example, `subsystem-03.lab.austin.us.com:kq98n5d.acct` displays storage system `subsystem-03.lab.austin.us.com` that cluster `kq98n5d.acct` belongs to.

### **Pool space for NetApp filers**

For NetApp filers that are configured with block data, the values for pool space that are shown in reports are different from the values shown in a storage management tool for NetApp filers, such as FilerView. The values that are different include total pool space (capacity) and available pool space.

This discrepancy occurs because the pool space information that is collected by SMI-S agents for Tivoli Storage Productivity Center includes Write Anywhere File Layout (WAFL) and Snapshot reserve space, whereas tools like FilerView do not include this additional space.

---

## **Working with reports**

Learn how to drill down through reports, navigate report tabs, view historical trends in reports, and view reports as tables of data or as graphical charts. The ability to customize your view of reports provides you with the flexibility to get a very detailed look at your information or a very high level overview.

## **Generating and viewing reports**

Learn how to generate and view reports.

Each of the report types available in IBM Tivoli Storage Productivity Center are generated in different ways to provide you with the flexibility to meet your environment's changing needs. Click the following links to learn more about how to generate the different report types and determine what works best for your organization.

Report type	How to generate
User-defined online reports	"Generating reports" on page 820
System reports	"Generating and viewing system reports" on page 1010
User ID (saved) reports	"Creating a user-defined report" on page 1075
Batch reports	"Creating batch reports" on page 1062
Rollup reports	"Generating rollup reports" on page 1076

## Sorting report columns

Learn how to sort the columns in reports.

Reports appear in a tabular format and are comprised of rows and columns. You can scroll the report to view the entire report. Use the **View** menu to hide/show the navigation tree to increase the viewable area of the report. You can also drag the divider bar in the middle of the screen back and forth to reallocate the amount of space that is given each pane.

**To sort the columns or change the order of the columns in a report:**

- **Re-sorting columns.** To resort a column, click on the column header. The column will resort in ascending or descending order.
- **Moving columns.** To change a column order, press <Alt>, and then click and drag the column you want to move.

## Printing reports or charts

Learn how to print reports to a printer, a PDF, an HTML file, a CSV file, or a formatted text file.

You can print any IBM Tivoli Storage Productivity Center report or chart displayed in the content pane.

To print a report or chart, complete the following steps:

1. Generate the report you want.

2. Click **File > Print** or click  on the tool bar. A print window opens.

3. Select the output that you want:

- Select **Printer** to send the output directly to a printer
- Select **PDF file** to save the output as a PDF file
- Select **HTML file** to save the output as an HTML file
- Select **CSV file** to save the output as a comma delimited file. Select **Include Headers** to include column headers in the report output file. Select **Include Totals** to include the totals column in the report output file.
- Select **Formatted file** to save the output as a formatted text file

4. Click **Continue**.

- If you selected **Printer**, the Page Setup window opens. Specify any custom settings for the print job on the Page Setup window and click **OK**. The report or chart is printed to your default printer.
- If you selected **PDF file**, **HTML file**, **CSV file** or **Formatted file**, the Save As window opens. Select the location where you want to store the file and enter

a name for the file in the **File Name** field. Click **Save**. Depending on the file type you selected, the report or chart is saved as a PDF or HTML file.

## Including charts in reports

Learn how to create charts from the reports that you generate.

There are a large number of charts and chart types that can be generated from

reports. All reports that support charting will have a  button at the start of the report. Any row in a report that supports charting on that row will also have a

Many charts can be generated simultaneously from the same report. After generating a chart, return to the **Report** tab and choose another chart or another set of objects to generate a chart upon. Another **Chart** tab will be generated in addition to the existing tabs and you will be positioned to the new chart tab.

See “Generating charts” for information on how to generate charts from reports.

You can also customize the appearance of charts to determine how you want to present data. For example, you can create pie chart, bar chart, stacked bar chart, determine how many charts appear per page, specify time increments, and so on. See “Customizing charts” on page 814 for information on how to customize charts.

### Generating charts

Learn how to generate charts.

#### To view a chart of all of the rows in the table:

1. Click , which is at the start of the report. All reports that support charting will have this multi-colored pie chart icon at the start of the report.
2. Select the type of chart you would like to generate. The types of charts available will vary depending on the report. After you select the chart type, a new tab for that chart will appear in the content pane.

#### To generate a chart for just the element in that row:

- Click the chart icon for that report row.

#### To generate a chart for multiple, non-consecutive rows in a report:

1. Select rows in the report by holding down the control key (Ctrl key) on the keyboard while clicking on the desired rows.
2. Click a  button for any of the selected rows and select the type of chart you would like to generate. After you select the chart type, a new tab for that chart will appear in the content pane.

#### To generate a chart for a range of rows in a report:

1. Click on the first row in the range and then hold down the Shift and Ctrl while clicking on the end row in the range.

- Click a  button for any of the selected rows and select the type of chart you would like to generate. After you select the chart type, a new tab for that chart will appear in the content pane.

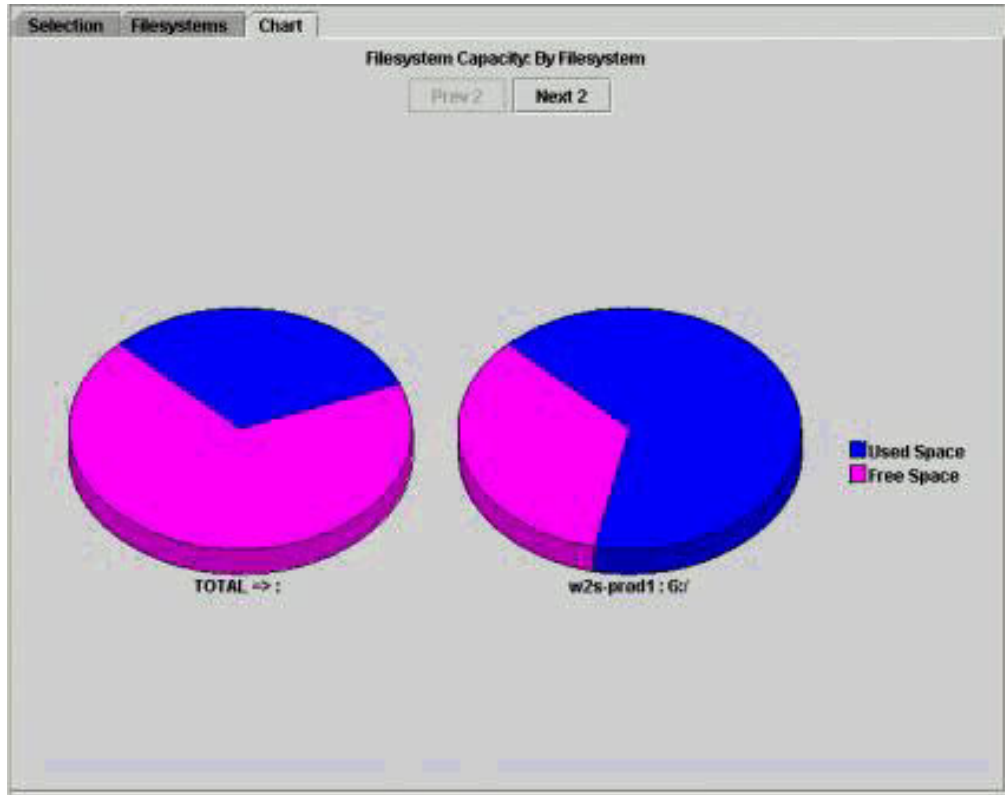

Figure 54. Chart Generation

## Customizing charts

Learn how to customize the appearance of charts.

While viewing a chart, you can customize its appearance using the Chart Customization window. This includes:

- Entering the title of a chart
- Determining the maximum number of charts or series that appear per screen
- Specifying how to show values for data points or areas
- Selecting a type for a chart such as a pie, bar, stacked bar, and 100% stacked bar
- Determining the orientation (vertical or horizontal) of a chart
- Specifying history chart settings such as trends and time increment values

To access this window from a chart, right-click on the chart and select **Customize this chart** from the pop-up menu. The Chart Customization window appears.

Use this window to customize the chart generated from a report, a report created in the Reporting facility, a batch report, user reports, and dashboard reports. You can use the settings on this window to:

- Customize the display of the current chart.

- Customize the display of the current chart and save those changes. If you save the customization settings for a report chart, that chart will use those settings whenever it is generated.

If a field on this window does not apply to a selected report it will appear as grayed out and cannot be edited. The following list describes the fields:

**Chart title**

Enter the name you want to give to the generated chart.

**Maximum number of charts or series per screen**

Select the maximum number of charts or series per page that should appear in the generated report from this list. For example, how many pie charts will appear on one page. When the number of charts that appear on one page exceeds the number in this field, the additional charts will be shown on a separate page. The most charts or series you can define to appear on a page is 30.

**Show values for data points or areas**

Determine how to display the data points/areas on a chart. You can choose to display the data points areas:

- Only when hovering - display values for data points on an online chart when the mouse hovers over an appropriate place on that chart
- Always - always display and print values for data points

**Graph charts**

Use the fields in this section to customize the appearance of graphs and charts.

**Chart type**

Select a type for the generated chart including:

- Pie Chart
- Bar Chart
- Stacked Bar
- 100% Stacked Bar

**Chart orientation**

Determine whether the chart graphic will appear vertically or horizontally on a page. You can set the orientation for the following chart types only: Bar Chart, Stacked Bar, and 100% Stacked Bar.

**Maximum number of series per graph**

Select the maximum number of series that should appear in one graph or chart. For example, how many slices will appear in one pie chart. When the number of series that appear in one graph exceeds the number in this field, the additional charts will be shown on a separate page. The default maximum is 12. The most series that can appear in one chart is 30.

**Note:** Disk Capacity batch reports always display one series per chart, and one chart per page.

**History Charts**

Use the fields in this section to customize the appearance of history charts.

**Show Trends**

Check this box if you want IBM Tivoli Storage Productivity Center to show a trend for the data in a history chart. The trend attempts to show future storage usage in a chart based on earlier usage.

**Time increment for x-axis**

Select which value to use for the time increment that appears on the x-axis of a history chart. You can select By Scan, Weekly, Monthly. For example, if you choose Monthly, the x-axis will measure storage usage in monthly increments.

**Restore Defaults**

Reset the values in the fields on this window to their original default settings.

**Apply** Apply the settings defined in this window to the current chart.

**Save** Apply the settings defined in this window to the current chart and save those settings. When the chart is generated in the future, it will automatically use the saved settings.

**Cancel**

Exit the window without applying or saving the settings in the window.

## Drilling down a report row

Learn how to drill down into report rows to view more detailed information about your storage resources.

Many of the rows that are presented in the generated reports allow you to drill down and get more reports of more detailed information. For example, if you are looking at a report on computers, you might be able to drill down on a row for a specific computer and generate a report for the file systems contained on that computer.

When detailed drill down is allowed within a report, there is a  icon for that

row. To drill down, simply click on  and a new tab with the drill down report will be generated and added to the tab dialog. You will then be positioned on that tab viewing the new detail report that you have generated.

## Navigating tabs

Learn how to navigate report tabs to view detailed sub reports.

As you generate reports and drill down on rows to generate detailed sub reports, the number of tabs in the Reporting window will grow. You can move about from tab to tab simply by clicking on the tab name.

Figure 55. Tabs

You can also return to the **Selection** tab and change your selection criteria to start all over again with a newly generated report at any time. If you change your selection criteria and generate a new report, all subsequent or dependent tabs (for example, drill down and chart tabs) are closed.

To close a tab, right-click on the tab name and select **Close** from the pop-up menu.

## Trending with historical data

Learn how to view trends related to the capacity and usage of your storage resources.

Use the trending of historical data to view patterns of your data across your entire network. For example, if you set up a graph that shows the disk capacity of a computer between January 1 and December 31, you can view "trended" data that will predict the disk capacity for that computer over the next 6 months. The trended data appears as a dashed line that is appended to the last probed or scanned data point.

The length of time for how far in the future that trended data will show is determined by 50% of the length of time displayed in the graph. For example, if the data in the non-trended portion of the graph displays data between January 1

and December 31, the predicted trend for that data will be shown for the next 6 months (January 1 to December 31 = 12 months, 50% of 12 months = 6 months trended). You can change the amount of time trended by changing the length of time of the graphed data using the **Limit days from** and **To** fields.

Before viewing trends in the data collected by IBM Tivoli Storage Productivity Center, use the history aggregator function to define and run jobs to sum data in the database repository for historical reporting purposes. For example, after running the history aggregator, you can view the sum of usage across multiple resources, by database.

To view a historical data, generate a report, right-click on the row or rows for which you want to view the data, and select an option from the menu.

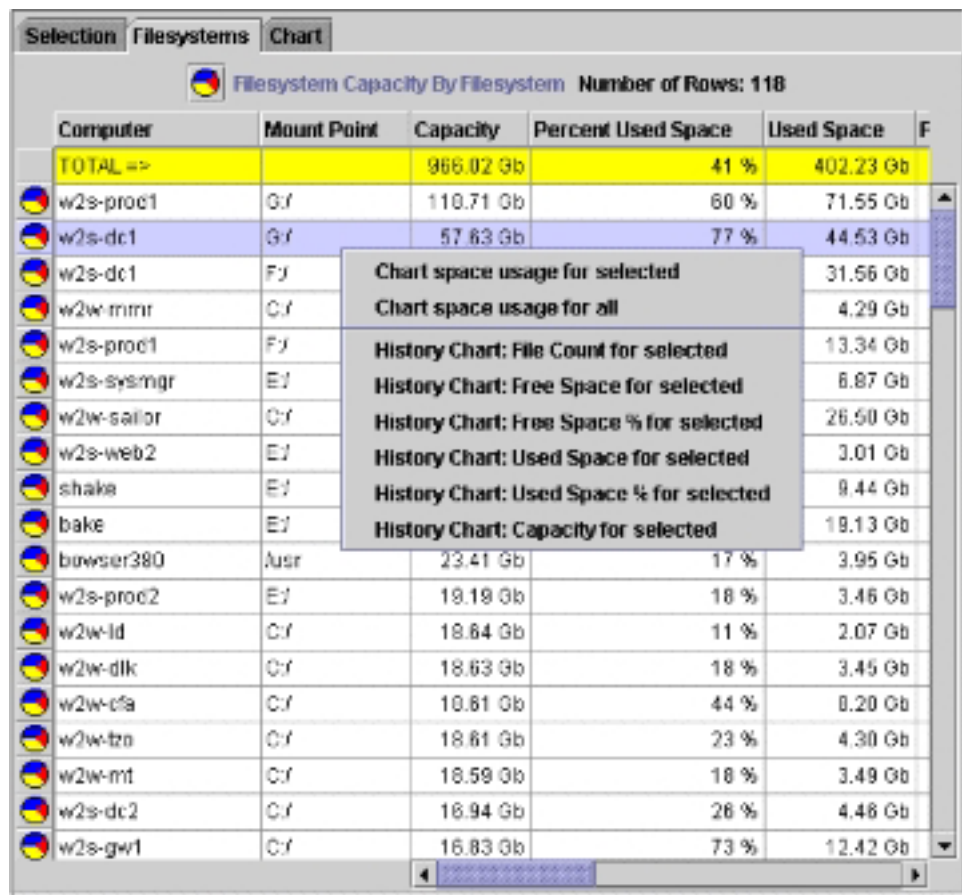

Figure 56. Trending with Historical Data

Depending on the type of report you generated, you can create the following history charts for the storage resources that you select:

History chart	Description
Free Space for Selected	Shows the free space available over a specified period of time. <sup>1</sup>
Free Space % for Selected	Shows the percentage of free space available over a specified period of time. <sup>1</sup>
Used Space for Selected	Shows used space over a specified period of time. <sup>1</sup>

History chart	Description
Used Space % for Selected	Shows percentage of used space over a specified period of time. <sup>1</sup>
Capacity for Selected	Shows capacity for selected over a specified period of time. <sup>1</sup>
Unallocated Space for Selected	Shows the unallocated space available for the selected resources over a specified period of time. <sup>1</sup>
Unallocated Space for All	Shows the unallocated space available for all the storage resources in the report over a specified period of time. <sup>1</sup>
File Count	Shows the number of files accessed or modified over a period of: <ul style="list-style-type: none"> <li>• 1 day</li> <li>• 1 day - 1 week</li> <li>• 1 week - 1 month</li> <li>• 1 month - 1 year</li> <li>• &gt; year</li> </ul>
File Count %	Shows the percentage of files accessed or modified over a period of: <ul style="list-style-type: none"> <li>• 1 day</li> <li>• 1 day - 1 week</li> <li>• 1 week - 1 month</li> <li>• 1 month - 1 year</li> <li>• &gt; year</li> </ul>
Size	Shows the size of files accessed or modified over a period of: <ul style="list-style-type: none"> <li>• 1 day</li> <li>• 1 day - 1 week</li> <li>• 1 week - 1 month</li> <li>• 1 month - 1 year</li> <li>• &gt; year</li> </ul>
Size %	Shows the percentage of file size accessed or modified over a period of: <ul style="list-style-type: none"> <li>• 1 day</li> <li>• 1 day - 1 week</li> <li>• 1 week - 1 month</li> <li>• 1 month - 1 year</li> <li>• &gt; year</li> </ul>

<sup>1</sup> The time options for data points in a chart are **By Aggregator**, **Weekly**, and **Monthly**. You can select one of these options from the list menu on the **History Chart** page for the report. (See Figure 57 on page 820.)

- Select **By Aggregator** to generate a chart in which its data points correspond to each time a history aggregator job is run. By default, the history aggregator runs daily at 3:30 a.m., so when you generate a history chart with this default setting there is a point in the chart for every day in the selected time range. If you change the schedule of the history aggregator, the points in the history chart that you generate change accordingly.
- Select **Weekly** to generate a chart that includes one data point for each week in the selected time range.
- Select **Monthly** to generate a chart that includes one data point for each month in the selected time range.

Figure 57 on page 820 shows a history chart for used space for a file system:

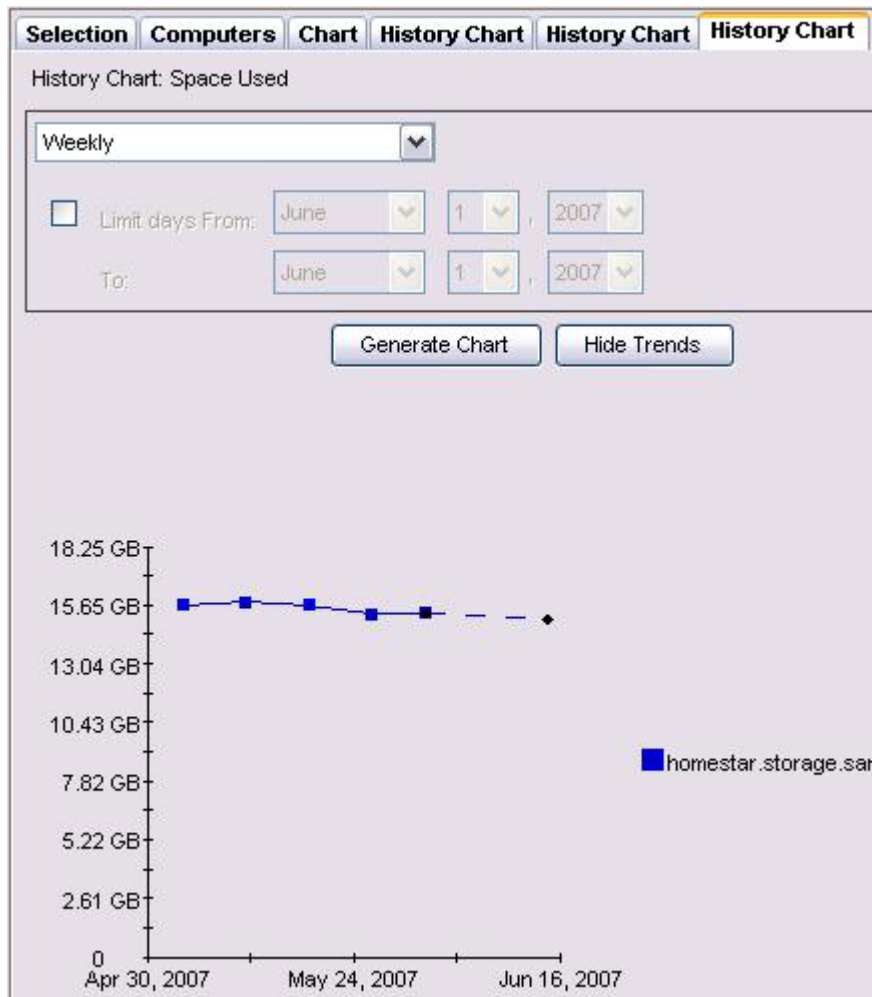

Figure 57. History Chart for File System Used Space

Select **File** → **Export data** to export history data to a comma delimited file (.csv). You can include or not include headers in the comma delimited file that you create. The column headings within the header reflect the type of report from which you are exporting history data.

## Working with user-defined online reports

Use the information in this section to learn how to generate and view online reports. These reports are available in the **Reporting** nodes under Data Manager, Data Manager for Databases, Disk Manager, and Fabric Manager.

### Generating reports

Learn how to generate and view online reports in Data Manager, Data Manager for Databases, Disk Manager, and Fabric Manager.

1. Expand the navigation tree to display the type of report you want to generate. For example, if you want to generate a disk capacity report, expand **Data Manager** > **Reporting** > **Capacity** > **Disk Capacity**.
2. Highlight a By Clause to determine how you want to view a report. For example, to view capacity information according to computer group, click **Reporting** > **Capacity** > **Disk Capacity** > **By Computer Group**. The **Selection** page is displayed.

3. Use the **Selection** page to select the profile to use when generating a report and determine what columns appear within a report. See “Selecting resources to appear on a report” on page 823 for information.
4. Click **Selection...** to select the objects that you want to report upon from the Select Resources window.
5. Click **Filter...** to further filter the objects that appear in a report. Filters enable you to apply general rules to the report based on the rows in that report. See “Filtering the resources that appear on a report” on page 825 for more information on filtering.
6. Use the **Available Columns** and **Included Columns** list boxes to determine what columns are displayed in a generated report.
7. Click **Generate Report**. A new tab will be added to the tab dialog representing the report that you generated.
8. Click the new tab to view the report. Reports are tabular in format and composed of rows and columns. You can scroll the report to view the entire report. Use the **View** menu to hide/show the navigation tree to increase the viewable area of the report or drag the divider bar in the middle of the screen back and forth to reallocate the amount of space that is given each pane.

### Defining options for a report

Learn how to customize a report before generating it.

Depending on the report that you want to generate and the level upon which you have chosen to report (for example, by computer, by filesystem, network wide, and so on), you are typically presented with a **Selection** page. For example, if you want to generate the Most Obsolete Files report, expand **Data Manager > Reporting > Usage > Files > Most Obsolete Files > By Computer**. Use the **Selection** page to:

- Select the profile to use when generating a report
- Select the resources (for example, computers, computer groups, storage subsystems, and so on) to display in a generated report
- Apply filters to the columns within a report (for example, show only the systems that contain over 80% used space) to determine what resources appear within the rows of a report
- Determine what columns appear within a report

The following table describes the interface elements that might appear on the **Selection** page (depending on the report that you want to generate):

Interface element	Description
<b>Profile</b> (Data Manager only)	This field indicates the profile to use when generating the report. If you just want to use the supplied default profile, then leave the field as is and generate the report. However, if you want to use a customized profile that you have set up for this reporting, choose that profile from the list.  Keep in mind that profiles control what statistics are gathered and also what files are included in that statistical analysis.

Interface element	Description
Return maximum of __ rows per <i>storage_resource</i>	<p>This field controls how many rows appear in a generated report. The value that appears as the <i>storage_resource</i> in this field depends on the selected By clause. For example, if you select <b>Data Manager &gt; Reporting &gt; Usage &gt; Files &gt; Most Obsolete Files &gt; By Computer</b>, you can enter <b>10</b> in the <b>Return maximum of __ rows per computer</b> field and to limit the number of rows in the report to only 10 obsolete files per computer. If you have set up scans to collect many more rows than that per computer, this is an effective and efficient way to control the size of the generated report.</p> <p>This field enables you to control the size of the report that is generated for different by clauses.</p>
Limit to this time range:	The fields in this section determine the date range from which to gather availability information for the objects that you select.
<b>Relate Computers to:</b> (Disk Manager - Storage Subsystem reports only)	<p>This field generates a report that shows the relationship between the computer and one of these options: storage subsystems, volumes, or disks.</p> <ul style="list-style-type: none"> <li>• Storage Subsystem. Choose this option to view the Storage Subsystems that the logical volumes within a computer are using.</li> <li>• volumes. Choose this option to show the volumes within a storage subsystem that the logical volumes within a computer are using.</li> <li>• Disks. Choose this option to show the disks within a disk array that the logical volumes within a computer are using.</li> </ul>
<b>Relate Filesystems/Logical Volumes to:</b> (Disk Manager - Storage Subsystem reports only)	<p>This field generates a report that shows the relationship between the file systems/logical volumes and one of these options: storage subsystems, volumes, or disks.</p> <ul style="list-style-type: none"> <li>• Storage Subsystem. Choose this option to view the storage subsystems on which a file system/logical volume is allocated.</li> <li>• volumes. Choose this option to view the volumes on which the file system/logical volume is allocated.</li> <li>• Disks. Choose this option to show the disks on which a file system/logical volume is allocated.</li> </ul>
<b>Relate Storage Subsystems to:</b> (Disk Manager - Storage Subsystem reports only)	<p>This field generates a report that shows the relationship between a storage subsystem and one of these options: computer or file system/logical volume.</p> <ul style="list-style-type: none"> <li>• Computer. Choose this option to view the computers that are using a storage subsystem.</li> <li>• Filesystem/Logical Volume. Choose this option to view the file systems/logical volumes that are using a storage subsystem.</li> </ul>
<b>Relate Volumess to:</b> (Disk Manager - Storage Subsystem reports only)	<p>This field generates a report that shows the relationship between a volume and one of these options: computer or file system/logical volume.</p> <ul style="list-style-type: none"> <li>• Computer. Choose this option to view the computers that are using a volume.</li> <li>• Filesystem/Logical Volume. Choose this option to view the file systems/logical volumes that are using a volume.</li> </ul>
<b>Relate Disks to:</b> (Disk Manager - Storage Subsystem reports only)	<p>This field generates a report that shows the relationship between a disk and one of these options: computer and file system/logical volume.</p> <ul style="list-style-type: none"> <li>• Computer. Choose this option to view the computers that are using a disk.</li> <li>• Filesystem/Logical Volume. Choose this option to view the file systems/logical volumes that are using a disk.</li> </ul>

Interface element	Description
Selection...	<p>This button is used to determine the storage resources (computers, file systems, logical volumes, storage subsystems, and so on) upon which you want to report. When you click <b>Selection...</b>, the Select Resources window opens. If you clear the check box for a resource on the Select Resource window, a push-pin icon displays on the <b>Selection...</b> button.</p> <p>If you are generating a Network-wide report, the <b>Selection...</b> button will be disabled because you have chosen to generate the report network wide, for all objects.</p>
Filter...	<p>Use this button to further select or restrict the values within the columns you want to include on a report. Filters enable you to apply general rules to the selected columns. When you click <b>Filter...</b>, the Edit Filter window opens.</p> <p>For example, select all computers with the name beginning with <i>w2s-*</i>, or select all file systems with percent used space <math>\geq</math> to a specific value.</p> <p>If a filter is defined for this report, a pushpin icon displays on the <b>Filter...</b> button.</p> <p><b>Note:</b> For storage entities that contain an asterisk (*) within their names, the * is used as a wildcard character if you select <b>LIKE</b> from the <b>Operator</b> menu on the Edit Filter panel. See “Filtering the resources that appear on a report” on page 825 for more information.</p>
Available Columns / Included Columns	<p>These panels display the columns that can be included or are already included in the generated report.</p> <ul style="list-style-type: none"> <li>• The <b>Available Columns</b> list displays the columns that you can include in the generated report that are not already included.</li> <li>• The <b>Included Columns</b> list displays the columns that will appear in the generated report. By default, all the columns for a report are listed in this list box and will be displayed in the generated report. You can highlight the columns and use the up and down arrows to rearrange columns in the report. The order of the items in this list determines the order in which the columns will appear in the generated report. The columns with grayed-out names are frozen columns. They cannot be selected, removed, or reordered.</li> </ul> <p>To include a column in a report:</p> <ol style="list-style-type: none"> <li>1. In the <b>Available Columns</b> list, click the name of the column. To select additional columns, press Shift and click the columns that you want to add or press Ctrl and click the first and last column to select a range of columns.</li> <li>2. Click the right-arrow button (&gt;&gt;) to add the columns to the <b>Included Columns</b> list.</li> </ol> <p>To remove a column in a report:</p> <ol style="list-style-type: none"> <li>1. In the <b>Included Columns</b> list, click the name of the column. To select additional columns, press Shift and click the columns that you want to add or press Ctrl and click the first and last column to select a range of columns.</li> <li>2. Click the left-arrow button (&lt;&lt;) to add the columns to the <b>Available Columns</b> list.</li> </ol>

## Selecting resources to appear on a report

Learn how to select the storage resources that will appear in a report.

Use the Select Resource window to determine the objects (computers, filesystems, logical volumes, storage subsystems, etc.) upon which you want to report. To select the resources on which you want to report:

1. Select the type of report you want to generate. For example, **Data Manager > Reporting > Capacity > Disk Capacity > By Disk.**
2. Click **Selection.** The Select Resources window opens.

Figure 58. Selection Resources window

The objects that appear in this window are determined by the report you are generating and the By Clause you selected. For example, if you choose to generate the report **Data Manager > Reporting > Capacity > Disk Capacity > By Disk**, the Select Resource window will display a list of computers and subsystems that you can include in the report.

When the Select Resource window is initially opened, all objects in the list are selected.

- If you would like to generate the report for all the objects that have been selected, click **OK**.
- To select/deselect individual objects in the selection list, simply select the check box for the object. When there is a check mark in the check box, then the object has been selected for inclusion in the report.

You can use **Select All** and **Deselect All** to quickly select and deselect all of the objects in the list.

**Note:** If you are generating a Network-wide report, the **Selection** button is disabled on the **Selection** tab because you have chosen to generate the report network wide, for all objects.

### Filtering the resources that appear on a report

Learn how to apply conditions to the columns in a report to further filter the resources that appear in a report.

Use the Edit Filter window to apply conditions to the columns within a report to further select or restrict objects on which you want to report. Filters enable you to apply general rules to the report. For example, you can show only the file systems that contain over 80% used space, or show computers that match "w2s-\*", or select all disks with percent used space  $\geq$  to a specific value. To filter the objects that appear in a report:

1. Select the type of report you want to generate. For example, **Data Manager > Reporting > TPC-wide Storage Space > Disk Space > By Disk**.
2. Click **Filter...** The Edit Filter window opens.

**Note:** For storage entities that contain an asterisk (\*) within their names, the \* is used as a wildcard character if you select **LIKE** from the **Operator** menu on this panel. For example, if you enter \*XYZ in the **Value 1** field and select **LIKE** from the **Operator** menu, the resulting report includes any entities named "\*XYZ", and also all entities whose names end with the letters "XYZ". To create a filter that includes only the storage entity named "\*XYZ" in the resulting report, enter \*XYZ in the **Value 1** field and select **IN** from the **Operator** menu.

The following table describes the interface elements that appear on the **Edit Filter** window:

Interface element	Description
<b>Add</b>	This button is used to specify multiple conditions for the filter. When you click <b>Add</b> , report columns will be displayed enabling you to define conditions for those columns.
<b>Delete All</b>	This button is used to delete all the conditions displayed on the table.

Interface element	Description
Case-sensitive string comparisons	This check box indicates that case-sensitive string comparisons should be done. Select this check box to ensure that values appearing in the generated report match the case of the values entered in the Value 1 and Value 2 fields.
Records must meet	<p>This field specifies how the conditions in the filter are grouped together.</p> <ul style="list-style-type: none"> <li>• <b>All conditions.</b> All of the entered conditions (rows on the dialog box), must be true in order for the record to show up as a row in the report.</li> <li>• <b>At least one condition.</b> At least one of the entered condition must be true in order for the record to show up as a row in the report.</li> </ul>
Column	<p>This field is used to select specific columns on which you want to define conditions. The list on this field shows the columns available for the report. As you select a column from the list, it is displayed on the table, and the column name is removed from all other lists.</p> <p>Click</p>  <p>to delete the column.</p>
Operator	This field is used to select the condition's operator. Not all operators apply to all the column data-types.

Interface element	Description
Value 1/ Value 2	<p>This field is used to specify fixed value(s) to be compared against the record's column value.</p> <p>Depending on the operator and data type, this field may be absent or display-only. If the field is display-only, an <b>Edit...</b> button will be enabled. If both this field and the <b>Edit...</b> button are enabled, this field allows shorthand value entry. If you click <b>Edit</b>, a window opens to provide more assistance in editing the value.</p> <p>A <b>Value 2</b> field will be present only for (NOT) BETWEEN.</p> <p>For certain columns that contain string text, you can:</p> <ul style="list-style-type: none"> <li>• put the string in quotes for the <b>LIKE</b> operator, or</li> <li>• use the = operator without quotes instead of <b>LIKE</b> (the default)</li> </ul> <p>For example, if you want to filter the Device Path (computer) column on the <b>Reporting → Storage Subsystems → Computer Views → By Filesystem/Logical Volume</b> report, you can search/filter on a name such as "Disk 1" or "Disk 2" with the <b>LIKE</b> operator. For the = operator, you can enter <b>Disk 1</b> or <b>Disk 2</b> with no quotes. <b>Note:</b> An asterisk is prepended to the names of space-efficient VDisks in the IBM Tivoli Storage Productivity Center database repository. When you use a filter to determine which volume names appear in a report, you must include the "*" as the first character in the filter value to ensure that those VDisks are included. For example, if you want to include VDisks whose name begins with "vdisk1", you must enter *vdisk1 in the <b>Value 1</b> field and select <b>LIKE</b> or <b>IN</b> from the <b>Operator</b> menu. If you select the <b>LIKE</b> operator, the *vdisk1 VDisk is included in the report, as well as other VDisks whose names end in "vdisk1".</p>
Edit	<p>This button is used to edit values pertaining to size, date, and for specific values used for IN, LIKE, etc. operators. Depending on the condition you are creating, a dialog box displays to help you to enter values that correspond to the condition.</p>
Selection...	<p>This button is used to determine the objects (computers, file systems, logical volumes, storage subsystems, etc.) upon which you want to report. The Select Resources window opens. If you clear the check box for a resource on the Select Resource window, a pushpin icon displays on the <b>Selection...</b> button.</p> <p>If you are generating a Network-wide report, the <b>Selection...</b> button will be disabled because you have chosen to generate the report network wide, for all objects.</p>
OK	<p>This button is used to save the filter. You are returned to the <b>Selection</b> tab. The <b>Filter</b> button will display a pushpin to indicate that a filter has been defined for the report.</p>
Cancel	<p>This button is used to return to the <b>Selection</b> tab without saving the filter.</p>

## Using reporting groups

A reporting group is a user-defined set of storage assets, monitoring groups, and reporting groups upon which you want to report.

Use reporting groups to view storage information about:

- Resources that appear in different monitoring groups. Because a resource can appear in only one monitoring group at a time, you can use reporting groups to include resources from different monitoring groups and view reports on them.
- A subset of resources within a monitoring group. For example, you can create a reporting group for a specific subset of computers with the Payroll monitoring group and generate a report containing information about those computers.
- Resources that appear in other reporting groups.
- A subset of resources within other reporting groups.

**Note:** Unlike monitoring groups, a resource can appear in one or more reporting groups.

You can create the following types of reporting group:

- Data Manager: **Computer, Filesystem**. Within a computer reporting group, you can include computer monitoring groups, specific computers, and other reporting groups. Within a file system reporting group, you can include file system monitoring groups, specific file systems, and other reporting groups.
- Data Manager for Databases: **Computer, Databases-Tablespaces**. Within a computer reporting group, you can include computer monitoring groups, specific computers, and other computer reporting groups. Within a databases-tablespaces reporting group, you can include databases-tablespace monitoring groups, specific databases or tablespaces, and other databases-tablespaces reporting groups.
- Disk Manager: **Storage Subsystems**. Within a storage subsystem reporting group, you can include storage subsystem monitoring groups, specific storage subsystems, and other storage subsystem reporting groups.

When you generate a report, storage statistics about a reporting group will appear in the corresponding "By Group" clause for that report. The following lists the reports that reflect reporting group information.

### Computer reporting groups (Data Manager and Data Manager for Databases )

The following reports display computer reporting group information:

- Data Manager > Reporting > Capacity reports, Data Manager for Databases > Reporting > Capacity reports
- Data Manager > Reporting > Usage reports, Data Manager for Databases > Reporting > Usage reports
- Data Manager > Reporting > Usage Violation reports, Data Manager for Databases > Reporting > Usage Violation reports
- Data Manager > Reporting > Backup reports
- IBM Tivoli Storage Productivity Center > Rollup Reports > Capacity
- IBM Tivoli Storage Productivity Center > My Reports > Batch Reports > Create Batch Report > Report page, select one of the following:
  - Capacity > capacity\_report\_type > By Computer Group
  - Usage > usage\_reporting\_type > By Computer Group

- Usage Violations > usage\_violation\_reporting\_type > By Computer Group
- Backup > backup\_reporting\_type > By Computer Group
- Rollup Reports > Capacity > capacity\_report\_type > By Computer Group
- Rollup Reports > Database Capacity > rdbms\_type > By Computer Group

### Filesystem reporting groups (Data Manager)

The following reports display filesystem reporting group information:

- Data Manager > Reporting > Capacity reports
- Data Manager > Reporting > Usage reports
- Data Manager > Reporting > Usage Violation > Constraint Violations reports
- Data Manager > Reporting > Backup reports
- IBM Tivoli Storage Productivity Center > My Reports > Batch Reports > Create Batch Report > Report page, select one of the following:
  - Capacity > capacity\_report\_type > By Filesystem Group
  - Usage > usage\_reporting\_type > By Filesystem Group
  - Usage Violations > Constraint Violations > By Filesystem Group
  - Backup > backup\_reporting\_type > By Filesystem Group

### Databases-Tablespaces reporting groups (Data Manager for Databases)

The following reports display databases reporting group and tablespaces reporting group information:

- Data Manager for Databases > Reporting > Capacity reports
- Data Manager for Databases > Reporting > Usage reports
- Data Manager for Databases > Reporting > Usage Violations > Database-Tablespace Quotas reports

### Storage subsystem reporting groups

The following reports display storage subsystem reporting group information:

- Data Manager > Reporting > Storage Subsystems > Storage Subsystem Views > By Storage System Group
- Data Manager > Reporting > Capacity > Disk Capacity > By Storage Subsystem Group
- IBM Tivoli Storage Productivity Center > My Reports > Batch Reports > Create Batch Report > Report page, select one of the following:
  - Storage Subsystems > Storage Subsystem Views > By Storage Subsystem Group
  - Capacity > Disk Capacity > By Storage Subsystem Group

## Creating a reporting group

To create a reporting group:

1. Expand **Reporting > Groups** under:
  - **Data Manager** to create computer and filesystem reporting groups.
  - **Data Manager for Databases** to create computer and databases-tablespaces reporting groups
  - **Disk Manager** to create storage subsystem reporting groups
2. Right click the type of group you want to create. A pop-up menu appears.

3. Select **Create <group type>** from the pop-up menu. The content pane displays a window for defining the group.
4. Define information about the group. See the IBM Tivoli Storage Productivity Center online Help for detailed information about the windows for creating a group.
5. Click **File > Save** to save the group definition. The group is saved to the database repository. You will now be able to generate and view reports based on these groups.

**Note:** You can define filters to select specific computers, filesystems, storage subsystems, tablespaces, and databases for a reporting group. Tivoli Storage Productivity Center uses these filters to dynamically include resources to the group as they are discovered within your environment. When defining dynamic filters for reporting groups, keep in mind that the filters you enter might or might not be case sensitive depending on the database under which the Tivoli Storage Productivity Center database repository is stored. For example:

- The dynamic filters you enter for reporting groups are case sensitive when the database repository is stored on Oracle, Sybase, and UDB/DB2.
- The dynamic filters you enter for reporting groups are not case sensitive when the database repository is stored on Microsoft SQL Server.

Keep in mind these case-sensitive issues when defining filters for reporting groups to prevent inaccurate reporting caused by unintended resources being included in reports.

## Editing a reporting group

To edit an existing reporting group:

1. Expand **Reporting > Groups** under:
  - **Data Manager** to edit computer and filesystem reporting groups.
  - **Data Manager for Databases** to edit computer and databases-tablespaces reporting groups
  - **Disk Manager** to edit storage subsystem reporting groups
2. Expand the type of the reporting group you want to edit. For example, expand **Disk Manager > Reporting > Groups > Storage Subsystem** to edit a storage subsystem reporting group.
3. Click the reporting group you want to edit. The content pane displays a window for editing the group.
4. Edit information about the group. See the IBM Tivoli Storage Productivity Center online Help for detailed information about the windows for creating a group.
5. Click **File > Save** to save the updated group definition.

**Note:** You can define filters to select specific computers, filesystems, storage subsystems, tablespaces, and databases for a reporting group. Tivoli Storage Productivity Center uses these filters to dynamically include resources to the group as they are discovered within your environment. When defining dynamic filters for reporting groups, keep in mind that the filters you enter might or might not be case sensitive depending on the database under which the Tivoli Storage Productivity Center database repository is stored. For example:

- The dynamic filters you enter for reporting groups are case sensitive when the database repository is stored on Oracle, Sybase, and UDB/DB2.
- The dynamic filters you enter for reporting groups are not case sensitive when the database repository is stored on Microsoft SQL Server.

Keep in mind these case-sensitive issues when defining filters for reporting groups to prevent inaccurate reporting caused by unintended resources being included in reports.

## Data Manager reports

Use Data Manager reports to view both overview and detailed information about your storage resources, including computers, disks, filesystems, storage subsystems, clusters, and users. These reports are constructed from the statistical information gathered by data collection jobs and accumulated in the database repository.

**Note:** You need to run appropriate data collection jobs on the storage resources before you generate reports. If you do not run the data collection jobs before generating reports, you might see inconsistent or inaccurate results.

### Data Manager - Report categories

Use the report categories within Data Manager to collect information about storage assets, availability, backup requirements, capacity, usage, usage violations, and monitored computer storage space.

The following table describes the categories of reports available in Data Manager.

Report Category	Use these reports to do the following	What job collects information for these reports?
<b>Asset reports</b>	View information about the agents, computers, disk controllers, hard disks, clusters, fabrics, storage subsystems, volumes, tape libraries, file systems, and general hardware inventory of storage assets within your environment.  See "Asset reports" on page 834 for more information about Asset reports.	Probes, discovery Data for System-wide Users and Monitored Directory reports are gathered by scans.
<b>Availability reports</b>	View information about the availability of your storage, both from a network point of view and from a computer up-time perspective. This allows you to see what percentage of the time the storage in your enterprise (or on particular server or group of servers), is off-network due to network problems or perhaps is unavailable due to system downtime.  See "Availability Reports" on page 858 for more information about Availability reports.	Ping data: pings  Computer uptime — probes
<b>TPC-wide Storage Space reports</b>	View storage capacity at a file system, computer, or entire network level. For a specific computer, group of computers, or all the computers in your enterprise, you can view the following: <ul style="list-style-type: none"> <li>• How much storage you have</li> <li>• How much storage is being used</li> <li>• What percentage of storage is free for expansion</li> </ul> See "TPC-wide Storage Space Reports" on page 860 for more information about Capacity reports.	Probes

Report Category		What job collects information for these reports?
Usage reports	<p><b>Use these reports to do the following</b></p> <p>View information about the usage and growth of the consumption of your storage. Use these reports to do the following:</p> <ul style="list-style-type: none"> <li>• View which servers and file systems are experiencing the heaviest (or lightest) load of data and storage access.</li> <li>• Identify wasted space by pinpointing files that are no longer needed or have not been accessed for the longest time.</li> <li>• Associate users with the amount of storage they are consuming on specific file systems, groups of file systems, specific computers, groups of computers, and throughout the entire network.</li> <li>• Select the files against which to run an IBM Tivoli Storage Manager archive/backup job. Tivoli Storage Manager protects your organization's data from hardware failures and other errors by storing backup and archive copies of data on offline storage.</li> </ul> <p>See "Usage Reports" on page 920 for more information about Usage reports.</p>	Scans
Usage Violation reports	<p>View information about the storage usage violations committed by users and user groups within your environment. Use these reports to do the following:</p> <ul style="list-style-type: none"> <li>• Create and enforce corporate storage usage policies. You can report on violations of quotas and constraints.</li> <li>• Select files in Constraint Violation reports against which to run an Tivoli Storage Manager archive or backup job.</li> <li>• Add files from Constraint Violation reports to an existing Tivoli Storage Manager archive or backup job.</li> </ul> <p>See "Usage Violation reports" on page 927 for more information about Usage Violation reports.</p>	Scans, Quotas, Constraints
Backup reports	<p>Investigate the sizes of data that would be required to backup to achieve full backups, determine the amount of space required to perform an incremental backup of any or all of your data at any given point in time, and select files for archive/backup jobs.</p> <p>See "Backup reports" on page 929 for more information about Usage Violation reports.</p>	Scans

<b>Report Category</b> <b>Monitored Computer Storage Space reports</b>	<b>Use these reports to do the following</b> Use these host-based reports to view the data that is collected by probes for computers, Network Attached Storage, and hypervisors. These reports contain detailed information about the consumption of file system space and enable you to relate that space back to external or internal storage without counting shared space multiple times.  See “Monitored Computer Storage Space reports” on page 931 for more information about Monitored Computer Storage Space reports.	<b>What job collects information for these reports?</b> Probes
---	---	---

## Using By clauses

Use the By clauses associated with Data Manager reports as a method for viewing the data in those reports from different perspectives.

As you drill down through Data Manager reports, there is a set of options that repeats for each report type. Use these *By Clauses* to generate variations of the reports with different perspectives and groupings of data.

The available By Clauses are described in the following table:

<b>By Clause</b>	<b>Description</b>
<b>By Directory</b>	Use this clause to select the directories that you want to include in a report.
<b>By Directory Group</b>	Use this clause to select the directory groups that you want to include in a report.
<b>By Disk</b>	Use this clause to select the disks that you want to include in a report.
<b>By Filesystem</b>	Use this clause to select the file systems that you want to include in a report.
<b>By Filesystem Group</b>	Use this clause to select the file system groups that you want to include in a report.
<b>By Cluster</b>	Use this clause to select the clusters or cluster resource groups that you want to include in a report. Cluster resource groups in a PowerHA or MSCS-clustered environment are listed as computers.
<b>By Computer</b>	Use this clause to select the computers that you want to include in a report.
<b>By Computer Group</b>	Use this clause to select the computer groups that you want to include in a report.
<b>By Storage Subsystem</b>	Use this clause to select the storage subsystems that you want to include in a report.
<b>By Domain</b>	Use this clause to select the Window Domains that you want to include in a report.
<b>Network Wide</b>	The reports and charts that you see are on all data, network wide. Use this view to generate a global view of the storage and storage usage for your whole enterprise.

## Asset reports

Use asset reports to view itemized statistics for your storage resources. Tivoli Storage Productivity Center provides a hierarchical view of your storage resources so that you can navigate to view your resources in greater detail.

The following section is a description of each of the report types that are under **Data Manager > Reporting > Asset**.

Asset Reporting Type	Description
<b>By Cluster</b>	View storage assets based on PowerHA or MSCS cluster membership. You can navigate to a cluster and view its nodes and cluster resource groups. For each cluster resource group, you can navigate to show its controllers, disks, file systems, logical volumes, and exports or shares. For a cluster node, you can view local resources.
<b>By Computer</b>	Navigate through storage assets in a hierarchical manner. You can navigate to a computer and show its controllers, disks, file systems, logical volumes, and directories. You can then navigate further to view more detailed information such as the disks that are under a specific controller or file systems that are under a disk.
<b>By Hypervisor</b>	Navigate through hypervisors in a hierarchical manner. You can use this report to navigate to and view details about the virtual machines, controllers, disks and file systems, or logical volumes.
<b>By IBM Storwize V7000 Unified/IBM SONAS</b>	Navigate through Storwize V7000 Unified or IBM SONAS clusters and directories in a hierarchical manner. You can use this report to navigate to and view details about the nodes, pools, Network Shared Disks, file systems, monitored directories, and exports that are associated with the clusters.
<b>By OS Type</b>	<p>View storage assets based upon the operating systems that are running on those storage servers. This report type provides a way to see what your operating system dependencies are throughout your organization.</p> <p>By navigating to any or each of these different supported operating system types, you can see how many of each server type you have and you can navigate to investigate the underlying storage.</p>
<b>By Storage Subsystem</b>	View storage capacity at a computer, file system, storage system, volume, and disk level. These reports also show the relationships between the components of a storage system.
<b>System Wide</b>	View storage assets as a whole, across the entire system. Use these reports to view lists of all of your disks, computers, file systems, Storage Resource agents and Data agents that are installed in your environment.

### By Cluster:

Use the "By Cluster" reports to navigate to a cluster to view its nodes and cluster resource groups.

- For a node, you can view its local resources, including controllers, disks, file systems, logical volumes, exports, shares, and directories.
  - For a cluster resource group, you can view controllers, disks, file systems, logical volumes, exports, and shares.
  - For a node, the number of processors that are reported are the logical processors. The amount of RAM that is reported is the available RAM.
1. Expand **Asset** → **By Cluster** node to display the nodes for each cluster that has been discovered and monitored by Data Manager.
  2. Click a node to view cluster information, or further expand the cluster node to navigate to greater detail.

### Cluster Information

Click the name of a cluster that appears under **Asset → By Cluster** to view information about that cluster such as:

- Name
- Domain
- IP address
- Discovered Time

### Controller Information

As you navigate to Asset Reporting By Cluster for a cluster node or cluster resource group, you can expand the assets under a controller, or you can select a controller to view its detailed information.

The name of the controller's computer is shown, as well as the driver name, instance number, bus number, address, and type of driver (for example, SCSI, IDE, etc).

**Note:** Host Bus Adapter (HBA) controllers must be connected to the SAN and see volumes in order to be displayed under the Controllers node.

### Disk Information

As you navigate to Asset Reporting By Cluster for a cluster node or cluster resource group, you can expand the assets under a disk, or you can select a disk to view its detailed information.

The disk detail information is shown in a tab dialog that is made of up three pages: **General**, **Paths**, and **Latest Probe**.

#### General page

Use the General page to view the computer name, the path name, SCSI Target ID, logical unit number, and the number of access paths. The disk information shown includes the hardware manufacturer of the disk, the model number of the disk, the firmware revision, the disk serial number, and the manufacture date along with the time when Data Manager discovered the disk. The page also includes a breakdown of how the disk is allocated, including the disk allocation point and the length of the allocation.

#### Latest Probe page

Use the Latest Probe page to view the information that was obtained by Data Manager about this disk during the most recent probe of that disk. This information on this page includes:

- Sector size and sector information
- the number of heads
- the number of cylinders
- the logical block size
- the capacity of the disk
- the RPM or revolutions per minute that the disk spins at
- the elapsed time the disk has been powered on
- spare blocks
- the current write protection setting
- the cache enabled setting
- whether failure is predicted for this disk
- the time and date of the last Probe
- the unallocated space
- the number of primary defects
- the number of grown defects
- the NonMedium errors

- the recorded operating temperature

Some of these values are manufacturer specific, so if they are unavailable, then you will see N/A for a value. Additional information about the breakdown of recovered errors, unrecovered errors, and the number of bytes broken down by Write, Read, and Verify is shown in this report. Also included are three SCSI disk bit settings that you can turn on/off and the change will actually be made to the disk settings the next time a probe is run on that disk. These include on/off settings for:

- Automatic read reallocation
- Automatic write reallocation
- Read continuous (no error correction)

### **Probe History page**

Use the Probe History page to view the history of probes that have been run on the disk you are reporting on. Each row on this report represents one time that a probe has been run against the disk. Each row shows what time the probe ran, the type of record (which could be daily, weekly or monthly), bytes written, bytes read, number of grown defects.

### **Filesystem and Logical Volume Information**

The Asset Reporting By Cluster Filesystem or Logical Volume information report contains two pages: **Filesystem** and **Logical Volume**.

#### **Filesystem page**

Use this page to view a pie chart that depicts used space and free space on the file system and includes the following information:

- Computer name
- File system type
- Use count
- Mount point
- Physical size of the file system
- Capacity of the file system
- The time and date of the last probe and scan
- When the file system was discovered on the system by Data Manager
- If the file system has been removed then a removed date/time will be shown

#### **Logical Volume page**

Use this page to view:

- The path name of the logical volume
- The capacity of the logical volume
- The use count
- The type of logical volume
- Whether it is a swap volume and mirrored
- A tree displaying the mapping of the logical volume on the disk area(s) that make up the logical volume

#### **Exports or Shares Information**

The Asset Reporting By Computer Exports or Shares information report includes the following information:

- the name of the computer the share is on
- the export name that it will be known by

- the path on the computer the share resides upon
- the protocol being used and the date and time that Data Manager discovered the export or share

### **Monitored Directory Information**

To view a report on a directory that you are monitoring, expand the **Monitored Directories** node on the navigation tree and select the directory on which you want to report. This information is available for clustered nodes, but not cluster resource groups.

The Asset Reporting By Cluster Monitored Directory report includes the following information:

- computer name the directory resides on
- name of the directory
- owner
- OS Group
- total size of the directory
- number of files in the directory
- count of subdirectories in the directory
- average file size
- access time
- modification time and creation time of the directory
- last scan time and the time that Data Manager discovered the directory
- file attributes that are set
- list of the Directory Groups that the directory is a part of

### **By Computer:**

Use the "By Computer" reports to navigate to a computer and view detailed information about its controllers, disks, file systems, logical volumes, and directories.

### **Computer Information**

As you navigate to Asset Reporting By Computer, you can expand the assets under a computer, or you can select a computer to view the details for that computer. The detailed report shows the following information:

- Computer
- Host ID: the identifier of the host computer in hexadecimal format. Currently, IBM Tivoli Storage Productivity Center collects Host ID information for Solaris computers only. All other platforms display GUID information in the Host ID column.
- Group and Domain
- Network Address, IP address
- Time zone
- Hardware manufacturer and model numbers
- Processor type
- Count and speed
- Amount of RAM
- Operating System (OS) information such as:
  - Type of OS and version
  - The storage attributes of the server
  - The computer disk capacity, unallocated space, and free space

### **Controller Information**

As you navigate to Asset Reporting By Computer, you can expand the assets under a controller, or you can select a controller to view the details

for that controller. The name of the computer controller is shown, as well as the driver name, instance number, bus number, address, and type of driver (for example, SCSI, IDE, and so on).

**Note:** Host Bus Adapter (HBA) controllers must be connected to the SAN and see volumes in order to be displayed under the Controllers subnode.

## Disk Information

As you navigate to Asset Reporting By Computer, you can expand the assets under a disk, or you can select a disk to view the details for that disk. The disk detail information is shown in a tab dialog that is made of up four tabs: **General**, **Paths**, **Latest Probe**, and **Probe History**.

### General page

The General page includes the computer name, the path name, SCSI Target ID, logical unit number, the number of access paths.

The disk information shown includes:

- The hardware manufacturer of the disk
- The model number of the disk
- The disk firmware revision
- The disk serial number
- The disk manufacture date
- Indicators that specify whether the disk is encrypted or encryptable
- The time when Data Manager discovered the disk

The tab also includes a breakdown of how the disk is allocated, including the disk allocation point and the length of the allocation.

**Paths** The **Paths** page shows the following information:

- Host
- OS type
- Path
- Controller
- Instance
- Bus number
- SCSI target id
- Logical unit number

### Latest Probe page

The **Latest Probe** page shows the information that was obtained by Data Manager about this disk during the most recent probe of that disk. This information on this tab includes:

- Sector size and sector information
- The number of heads
- The number of cylinders
- The logical block size
- The capacity of the disk
- The RPM or revolutions per minute that the disk spins at
- The elapsed time the disk has been powered on
- Spare blocks
- The current write protection setting
- The cache enabled setting
- Whether failure is predicted for this disk
- The time and date of the last Probe
- The unallocated space

- The number of primary defects
- The number of grown defects
- The NonMedium errors
- The recorded operating temperature

Some of these values are manufacturer-specific. If the values are unavailable, N/A is displayed.

Additional information about the breakdown of recovered errors, unrecovered errors, and the number of bytes broken down by Write, Read, and Verify is shown in this report.

Also included are three SCSI disk bit settings that you can turn on/off and the change will actually be made to the disk settings the next time a probe is run on that disk. These include on/off settings for:

- Automatic read reallocation
- Automatic write reallocation
- Read continuous (no error correction)

### **Probe History page**

The **Probe History** page shows the history of probes that have been run on the disk you are reporting on. Each row on this report represents one time that a probe has been run against the disk. Each row shows what time the probe ran, the type of record (which could be daily, weekly, or monthly), bytes written, bytes read, number of grown defects.

### **Volume Group Information**

Data Manager provides support for the following volume managers:

- Veritas Volume Manager (Solaris)
- Logical Volume Manager (AIX)

These volume managers allow you to group logical volumes and disks. As you navigate to Asset Reporting By Computer for an AIX or Solaris computer, you can expand the assets under a volume group to see the group disks and file systems or logical volumes.

You can also select a volume group to view detailed information about it. The group name is shown, as well as the type (LVM or Veritas), capacity, free space, number of volumes, number of disks, discovered time, and probe time.

### **File System / Logical Volume Information**

The Asset Reporting By Computer File System / Logical Volume information report contains two pages: **File System** and **Logical Volume**.

#### **File System page**

This page shows a pie chart depicting used space and free space on the file system and includes the following information:

- Computer name
- File system type
- Use count
- Mount point
- Physical size of the file system
- Capacity of the file system
- The time and date of the last probe and scan
- When the file system was discovered on the system by Data Manager

- If the file system has been removed, then a removed date/time is shown

Also shown for UNIX-based systems are:

- The maximum file count
- Used inodes
- Free inodes. Inodes are areas reserved for index entries within the UNIX file systems. For Windows computers, these values are zero.
- The amount of used space and free space is shown

### **Logical Volume page**

The information on this page includes:

- The path name of the logical volume
- The capacity of the logical volume
- The use count
- The type of logical volume
- Whether it is a swap volume and mirrored
- A tree displaying the mapping of the logical volume on the disk areas that make up the logical volume

### **Exports/Shares Information**

The Asset Reporting By Computer Exports/Shares information report includes the following information:

- The name of the computer the share is on
- The export name that it will be known by
- The path on the computer the share resides upon
- The protocol being used and the date/time that Data Manager discovered the export/share

### **Monitored Directory Information**

To view a report on a directory that you are monitoring, expand the **Monitored Directories** node on the navigation tree and select the directory on which you want to report.

**Note:** This information is not shown for cluster resource groups. The Asset Reporting By Computer Monitored Directory report includes the following information:

- Computer name the directory resides on
- Name of the directory
- Owner
- OS Group
- Total size of the directory
- Number of files in the directory
- Count of subdirectories in the directory
- Average file size
- Access time
- Modification time and creation time of the directory
- Last scan time and the time that Data Manager discovered the directory
- File attributes that are set
- List of the Directory Groups that the directory is a part of

The Asset Reporting By Computer Monitored Directory report includes the following information:

- Computer name the directory resides on
- Name of the directory

- Owner
- OS Group
- Totalsize of the directory
- Number of files in the directory
- Count of subdirectories in the directory
- Average file size
- Access time
- Modification time and creation time of the directory
- Last scan time and the time that Data Manager discovered the directory
- File attributes that are set
- List of the Directory Groups that the directory is a part of

#### **By OS Type:**

Use the "By OS Type Asset" report to view your storage assets based upon the operating systems under which they are running. This provides you with an easy way to see what your OS dependencies are throughout your organization. You can navigate to any of the storage resources that appear under an operating system node to access all of the same sub-reports that as described for other asset reports.

#### **By Storage Subsystem:**

Browse your storage subsystem assets in a hierarchical manner. Data Manager provides reports for individual storage subsystems and any disk array subsystems whose SMI-S Providers are CTP certified by SNIA for SMI-S 1.0.2 or later.

For disk array systems, you can view information about:

- Disk groups
- Array sites
- Ranks
- Storage pools
- Disks
- Volumes

For virtualization systems, you can view information about:

- SAN Volume Controller clusters
- Storwize V7000
- Storwize V7000 Unified
- Managed disk groups
- Managed disks
- Virtual disks
- Virtual disk copies

Keep in mind the following considerations:

- A volume name in a report that is marked with an asterisk (\*) indicates that the volume is a space-efficient volume. The \* is not part of the actual volume name.
- The total capacity value for storage pools in TotalStorage Enterprise Storage Server subsystems includes only the formatted (usable) capacity for storage pools.
- For the following storage systems, you can navigate from storage subsystems and show managed disks, managed disk groups, and virtual disks:
  - SAN Volume Controller
  - Storwize V7000

- Storwize V7000 Unified

For Storwize V7000 and Storwize V7000 Unified, you can also navigate from the internal disks node to view the internal storage on the system.

- Information that is displayed for managed disks and internal disks is the same as for storage subsystem disks. See “By Storage Subsystem” on page 841 for a description of the available views.
- Information that is displayed for virtual disks is the same as for storage subsystem volumes. See “By Storage Subsystem” on page 841 for a description of the available views.
- For IBM FAStT, HP StorageWorks, and the XIV system, you can navigate to storage subsystems and show storage pools, disks, and volumes.

**Note:** The total capacity value for storage pools in these storage subsystems includes raw (unconfigured) capacity—it does not include formatted/usable capacity.

- For Hitachi Data Systems TagmaStore subsystem, the relationship between a disk or volume is not displayed if the volume is using imported extents (virtual disks).

**Note:** The total capacity value for storage pools in HDS subsystems includes the formatted/usable capacity for storage pools only.

- Some of the columns in the totals row for these reports can count storage multiple times if the report includes the following:
  - A storage virtualizer like a SAN Volume Controller
  - The disk arrays that host the backend storage to a storage virtualizer like a SAN Volume Controller

In this situation, disks and logical unit numbers (LUNs) appear to belong to both a storage virtualizer like SAN Volume Controller and the disk arrays, and are counted multiple times in some of the columns in the totals row. To avoid this situation, filter the report to display only the storage virtualizer or the disk arrays. If this situation is unavoidable, then some of the columns in the totals row can be adjusted as follows:

1. Use the **Physical Disk Space** column to determine the actual physical disk space on all arrays. This disk space is not counted multiple times.
2. Sum the **Disk Space** column for the disk arrays and subtract this result from the totals row to determine the total backend storage for a virtualizer.
3. To prevent counting the backend volumes multiple times, subtract the **Backend Volume Space** column from the **Volume Space** column in the totals row to determine the amount of volume space.

See “Report considerations and limitations” on page 807 for additional information about reports.

### Disk Groups

When you expand the **Disk Group** node, the navigation tree shows a list of disk groups for the storage subsystem. You can expand the name of a disk group to view the disks and volume spaces within that disk group. Navigate through both Volume Spaces and Disks subnodes to view:

- Disks and volumes associated with a volume space
- Volumes with segments on a disk
- Disks containing segments from a volume
- Detailed information about a disk

### Array Sites

(IBM Tivoli Storage DS8000 only) When you expand the **Array Site** node, the navigation tree shows a list of array sites for the storage subsystem. Click **Array Site** to view a description of the information displayed about array sites. You can expand the name of an array site to view the ranks, storage pools, and disks associated with that array site.

### Storage Pools

When you expand the **Storage Pool** node, the navigation tree shows a list of storage pools for the storage subsystem. You can expand the name of a storage pool to view the disks and volumes within that storage pool, including:

- Volumes with segments on a disk
- Disks containing segments from a volume
- Detailed information about a disk

**Disks** When you expand the **Disks** node, the navigation tree shows a list of disks for the storage subsystem. You can expand the name of disk to view the volumes associated with that disk. Click the name of a volume associated with a disk to view detailed information about that volume.

### Volume Spaces

When you expand the **Volume Spaces** node, the navigation tree shows a list of volume spaces for the storage subsystem. You can expand the name of a volume space to view the disks and volumes within that volume space. Navigate through both the Disks and volumes subnodes to view:

- Volumes with segments on a disk
- Disks containing segments from a volume
- Detailed information about a disk
- Detailed information about a volume

### Volumes

When you expand the volumes node, the navigation tree shows a list of volumes for the storage subsystem. Click the name of a volume to view detailed information about that volume.

#### Note:

- Volume Reporting is not available for IBM FASTT FlashCopy logical drive and repository logical drive.
- After creating a volume on a storage subsystem, you must run a probe on that storage subsystem to collect accurate information about disk allocation.

### Managed Disk Groups

When you expand the Managed Disk Group node, the navigation tree shows a list of disk groups that are managed by the following storage systems:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

You can expand the name of a disk group to view the physical disks and virtual disks that are associated with it.

## Managed Disks

When you expand the Managed Disk node, the navigation tree shows a list of disks that are managed by the following storage systems:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

You can expand the name of a disk to view the virtual disks and any available internal disks that are associated with it.

## Virtual Disks and Virtual Disk Copies

There are three nodes in the navigation tree that are related to virtual disks (VDisks). These nodes might be included under the nodes for the SAN Volume Controllers in your environment:

- **Virtual Disks** (at the same level as **Managed Disk** and **Managed Disk Groups**): Expand this node to view a list of the logical disks that a cluster provides to the SAN. You can further expand each virtual disk (VDisk) to view its mirror copies (primary copies and additional copies).
- **Virtual Disks** (under **Managed Disk** and **Managed Disk Groups**): Expand this node to view the VDisks for which the primary copies are on the selected Managed Disk.
- **Virtual Disk Copies** (under **Managed Disk** and **Managed Disk Groups**): Expand this node to view all the virtual disk copies that are on the selected Managed Disk. The primary copies are not listed under this node because they are displayed under the **Virtual Disks** node.

### Tip:

- The **Virtual Disk Copies** node is displayed in the navigation tree only if a monitored SAN Volume Controller supports virtual disk mirrors. If it supports virtual disk mirrors, all virtual disks will have a related primary virtual disk copy regardless of whether the virtual disk is mirrored. This is because all virtual disks on a SAN Volume Controller that supports virtual disk mirrors are primary copies that can be updated to have mirrored disks or virtual disk copies.
- The icons for all virtual disk copies are shown as folders in the navigation tree because they represent logical extensions of a virtual disk.
- If the virtual disk is a virtual disk copy, the primary virtual disk copy is noted by -0 in the name of the logical volume, and all secondary copies are noted by a hyphen and a value larger than zero. If the virtual disk is not a virtual disk copy, only one logical volume is created and is noted by -0. The logical disk representation of a virtual disk should always exist, but if a probe is started for SAN Volume Controller 4.3.1 or later, the logical disk representation of the virtual disk expands to one or more logical volumes where virtual disk copies are represented by multiple logical volumes, and non-virtual disk copies are represented by a single logical volume.

## Internal Disks

Internal storage information about the Storwize V7000 or Storwize V7000 Unified systems in your environment is displayed in the **Internal Disks** nodes in the navigation tree:

### **Internal Disks (at the same level as Virtual Disks, Managed Disk, and Managed Disk Groups)**

Expand this node to view a list of the internal disks that a Storwize V7000 or Storwize V7000 Unified system provides to the SAN.

### **Internal Disks (under Managed Disk Groups > Managed Disk)**

The internal disks for this node are only displayed if there are internal disks that are available on the managed disk.

### **Internal Disks (under Managed Disk)**

The internal disks for this node are only displayed if there are internal disks available.

### **System-wide:**

Use "System-wide" reports to do the following tasks:

- View your storage assets as a whole across the entire system. You can view lists of all of your disks, computers, storage subsystems, disk/volume groups, disks, file systems, logical volumes, storage subsystem volumes, exports or shares, monitored directories, users, and OS users. Additionally, you can view aggregated reports based upon certain filters, such as grown defects per disk.
- View detailed information about Storage Resource agents and Data agents. Use these reports to monitor your agents and track their status.
- The **Selection** button is disabled for system-wide reports because all the monitored storage entities are automatically displayed for each report type. For example, all the computers monitored by IBM Tivoli Storage Productivity Center are displayed in the **System-wide > Computers** report.

**Note:** A volume name in a report that is marked with an asterisk (\*) indicates that the volume is a space-efficient volume. The \* is not part of the actual volume name. See "Report considerations and limitations" on page 807 for additional information about reports.

System-wide reports include options to navigate to storage resources for more detail, view charts of current statistics, and generate historical charts to show storage trends. The following icons are available on some system-wide reports:

#### **Chart icon**

Click this button to generate charts for the selected rows in the table. You can generate a chart based on the statistics currently displayed in the report, or you can generate a history chart that provides trending data for the selected storage subsystems. See Viewing historical trends for more information about history charts.

#### **Magnifying glass icon**

Click this button to view detailed information about a specific file system or logical volume in a row.

### **Agents reports**

Use these reports to track and monitor the Storage Resource agents and Data agents that are deployed in your environment. With this report, you can export a comma-separated file that contains the name and status of an agent. Specifically, use this report to perform the following tasks:

- View information about the agents deployed in your environment
- Perform actions against one or more agents shown in the report

Each agent that is shown in the report has a magnifying glass icon next to it. Click this icon to display detailed information about an agent (which is identical to the information on the **Administrative Services** → **Data Sources** → **Data/Storage Resource agents** node in the navigation tree).

You can also select one or more rows on the report and right-click to display a menu. Use the options in this menu to perform an action against multiple agents at the same time. The menu contains all the other operations available from the **Administrative Services** → **Data Sources** → **Data/Storage Resource agents** node in the navigation tree.

### **Computers reports**

Use these reports to view all the computers in the system, sorted in order of the time they were last booted, probed, or discovered. This information is valuable in environments where computers become more unreliable after they have been up and running for long periods of time.

### **Storage Subsystem reports**

Use these reports to view all your monitored storage subsystems and SAN Volume Controllers, sorted by their total capacity (By Disk Space) or alias (By Storage Subsystem).

### **Unmanaged Virtual Machines reports**

Use these reports to view detailed information about the unmanaged virtual machines in your environment. Each row in the report gives you information for each unmanaged virtual machine.

### **Virtual Machines With No VMware reports**

Use these reports to view detailed information about the virtual machines that have Storage Resource agents or Data agents installed but are not discovered through the VMWare data sources. Each row in the report gives you information for each virtual machine.

### **Disk/Volume Groups reports**

Data Manager provides support for the following volume managers:

- Veritas Volume Manager (Solaris)
- Logical Volume Manager (AIX)

These volume managers enable you to create groups of logical volumes and disks. Use these reports to view all your disk and volume groups, sorted by their computer (By Computer), storage capacity (By Disk/Volume Group Space) total freespace (By Available Disk/Volume Group Space), time when they were last probed (By Probe Time), and time when they were discovered (By Discovered Time).

### **Disks reports**

Use these reports to view all the disks in the system, sorted in order of how many recovered (By Recovered Errors) and unrecovered errors (By Unrecovered Errors) they have, time when they were probed (By Probe Time), and time when they were discovered (By Discovered Time).

Use the **Asset Reporting** → **System-wide** → **Disks** → **By Grown Defects** report to view the following information:

- All the disks in the system sorted in order of the number of grown defects they have on them
- What disks in your system are experiencing problems and might be in danger of an imminent failure

The **Asset Reporting** → **System-wide** → **Disks** → **By Primary Defects** report returns no data if disk defects are not detected. Use this report to view the following information:

- All the disks in the system sorted in order of the number of primary defects they have on them
- What disks in your system are in good condition and which ones are more or less defective

#### **File systems / Logical Volumes reports**

Use these reports to view detailed information about file systems and logical volumes on your monitored computers. A logical volume is a partition on a disk that does not have a file system (raw partition). Use these reports to view the following information:

- Available file system space on monitored computers.
- All the file systems in the system that is sorted in order of the amount of free space they have on them.
- Which file systems have less free space and might be in danger of running out of free space.
- Which file systems have too much free space and where space consolidation might be necessary.
- A list of virtual disk files which are not assigned to any of the virtual machines. This situation represents wasted storage capacity.
- The path from the file system on a virtual machine to the back-end storage volumes on a hypervisor or mapped to the hypervisor.
- The path from the file system on a virtual machine to the back-end storage volumes on an IBM SONAS or Storwize V7000 Unified system, or mapped to the IBM SONAS or Storwize V7000 Unified system.

**Note:** The values in the By Available File System Space report are based on data that is collected by probes. Probes collect space information as measured in blocks (1 block = 512 bytes). Tivoli Storage Productivity Center calculates file system space, including used space and free space, based on the number of blocks it retrieves from a probe. It multiplies the number of blocks by 512 and displays the resulting value in the report.

#### **Volumes reports**

Use these reports to view the following information:

- Information about the storage subsystems that host volumes
- Storage capacity of the volumes hosted by storage subsystems
- Information about the storage subsystems that host volumes sorted by the date/time when they were probed

#### **Exports or Shares report**

Use this report to view all the Exports or Shares in your environment, sorted in the order that they were discovered.

#### **Monitored Directories reports**

Use these reports to view all the monitored directories in the system, sorted in order of the amount of storage space they are taking up (By Space Used), the time when they were last scanned (By Scan Time), the time when they were discovered (By Discovered Time), and when they were removed (Removed Directories).

#### **Unmanaged Computers report**

Use this report to view all of the new computers that have been introduced

into your system and that do not have Storage Resource agents or Data agents installed on them. It also lists other computers that you have not put under Data Manager control.

#### **Users report**

Use this report to view all the users in your environment sorted in the order that they were discovered.

#### **OS User Groups report**

Use this report to view all the OS User Groups in your environment sorted in the order when they were discovered.

#### **By IBM Storwize V7000 Unified/IBM SONAS:**

Use "By IBM Storwize V7000 Unified/IBM SONAS" reports to navigate to the components of a Storwize V7000 Unified storage system or an IBM SONAS system. These components include the clusters, nodes, pools, Network Shared Disks, file systems, and exports that are associated with the storage system.

To view Storwize V7000 Unified or IBM SONAS asset reports, follow these steps:

1. Expand **Data Manager > Reporting > Asset > By IBM Storwize V7000 Unified/IBM SONAS**. The Storwize V7000 Unified storage systems or IBM SONAS systems that were discovered by Tivoli Storage Productivity Center are displayed.
2. Expand a storage system to view detailed information. The following tabbed pages are displayed:

##### **Storage Subsystem Details**

Use this page to view detailed information about the Storwize V7000 Unified storage system or the IBM SONAS system. The information available for the storage system includes the status, vendor, type and model, and the available and used space. You can also use this page to modify some information about the Storwize V7000 Unified storage system or the IBM SONAS system.

##### **File Module Details**

Use this page to view information about Storwize V7000 Unified.

You can view information about the components of the Storwize V7000 Unified storage system or the IBM SONAS system. When you click a component, report pages for that component are displayed.

#### *Storwize V7000 Unified or IBM SONAS - Cluster Information:*

This page shows general information about a selected cluster that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

Table 86. Information about clusters associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
Cluster	The name of the cluster. For Storwize V7000 Unified or IBM SONAS clusters, the storage system name is included with the cluster name in the Computer or Device column. The format of the column is storagesystem_name: cluster_name, where storagesystem_name is the name of the Storwize V7000 Unified or IBM SONAS device that the cluster belongs to. For example, subsystem-03.lab.austin.us.com: kq98n5d.acct displays storage system subsystem-03.lab.austin.us.com that cluster kq98n5d.acct belongs to.
Cluster ID	The identifier of the cluster.
Type	The cluster can be one or more of the following types:  <b>Interface</b> An interface cluster contains nodes that connect a system to an IP network for file-serving capabilities by using service protocols.  <b>Management</b> A management cluster contains nodes that are used to configure, administer, and monitor a system.  <b>Storage</b> A storage cluster contains nodes that provide the storage and file system for the data in a system.

*Storwize V7000 Unified or IBM SONAS - Node Information:*

This page shows general information about a selected node that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

Table 87. Information about nodes associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
Node	The name of the node.
Description	The description of the node.
IP Address	The IP address for the node.

Table 87. Information about nodes associated with a Storwize V7000 Unified storage system or an IBM SONAS system (continued)

Field Name	Description
Role	<p>The role of the node. The node can serve one or more of the following roles:</p> <p><b>Interface</b> An interface node connects a system to an IP network for file-serving capabilities by using service protocols.</p> <p><b>Management</b> A management node is used to configure, administer, and monitor a system.</p> <p><b>Storage</b> A storage node provides the storage and file system for the data in a system.</p>
Status	<p>The status of the node. The status can be one of the following values:</p> <p><b>Normal</b> The node is operating normally.</p> <p><b>Critical</b> The node is either not operating or an error occurred.</p> <p><b>Warning</b> At least one component of the node is not operating or an error occurred.</p> <p><b>Unreachable</b> Tivoli Storage Productivity Center cannot reach the node.</p>

*Storwize V7000 Unified or IBM SONAS - Pool Information:*

This page shows general information about a selected pool that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

Table 88. Information about pools associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
Pool	The name of the pool.
Capacity	The capacity of the pool.
Available Space	The amount of unused space that is in the pool.

*Storwize V7000 Unified or IBM SONAS - NSD Information:*

This page shows general information about a selected Network Shared Disk (NSD) that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

*Table 89. Information about a selected NSD associated with a Storwize V7000 Unified storage system or an IBM SONAS system*

Field Name	Description
NSD	The name of the NSD.
NSD ID	The identifier of the NSD.
Failover Group	The failure group that the NSD belongs to.
Type	The NSD type. The possible values are: <ul style="list-style-type: none"><li>• Metadata and Data</li><li>• Metadata Only</li><li>• Data Only</li></ul>
Pool	The pool that the NSD belongs to.
Status	The status of the NSD. The possible values are: <b>Normal</b> The NSD is operating normally. <b>Critical</b> The NSD is either not operating or an error occurred. <b>Warning</b> At least one component of the NSD is not operating or an error occurred. <b>Unreachable</b> Tivoli Storage Productivity Center cannot reach the NSD.
Disk Space	The total disk space for the NSD.
Available Space	The amount of unused disk space for the NSD.

*Storwize V7000 Unified - NSD Probe History:*

This page shows the probe history for a selected Network Shared Disk (NSD) that is associated with a Storwize V7000 Unified storage system.

The following information is displayed on this page.

*Table 90. Information about a selected NSD associated with a Storwize V7000 Unified storage system*

Field Name	Description
Time of Probe	The time that the probe ran.

Table 90. Information about a selected NSD associated with a Storwize V7000 Unified storage system (continued)

Field Name	Description
Record Type	The record type that is shown in the report. Valid values are: <ul style="list-style-type: none"> <li>• Daily</li> <li>• Weekly</li> <li>• Monthly</li> </ul>
Bytes Written	The total number of bytes that were written since the NSD was formatted or manufactured.
Bytes Read	The total number of bytes that were read since the NSD was formatted or manufactured.
Grown Defects	The number of defects that were detected on the NSD after the NSD was used.
Recovered Write Errors	The number of write errors that were successful on a subsequent attempt.
Unrecovered Write Errors	The number of write errors that were not successful on a subsequent attempt.
Recovered Read Errors	The number of read errors that were successful on a subsequent attempt.
Unrecovered Read Errors	The number of read errors that were not successful on a subsequent attempt.
Recovered Verify Errors	The number of verify errors that were successful on a subsequent attempt.
Unrecovered Verify Errors	The number of verify errors that were not successful on a subsequent attempt.
Non-Medium Errors	The number of errors that are not related to the physical disk platter, such as a mechanical problem in the head movement or communication errors.
Available Disk Space	The amount of unused space on the NSD.
Primary Defects	The number of defects on the NSD when the NSD was new.
Temperature	The temperature of the NSD in degrees Celsius.

*Storwize V7000 Unified - Correlated Storage Subsystem Volume:*

This page shows information about the relationship between a selected Network Shared Disk (NSD) and the associated virtual disk or volume that is on the Storwize V7000 Unified storage system.

The following information is displayed on this page.

Table 91. Information about the relationship between a selected NSD and an associated virtual disk or volume on a Storwize V7000 Unified storage system

Field Name	Description
Virtual Disk Name	The name of the virtual disk.

Table 91. Information about the relationship between a selected NSD and an associated virtual disk or volume on a Storwize V7000 Unified storage system (continued)

Field Name	Description
Unavailable Virtual Disk Space	The amount of storage space for Redundant Array of Independent Disks (RAID) or mirror redundancy.
Type	The organization of the virtual disk. Values are: <ul style="list-style-type: none"> <li>• Sequential</li> <li>• Striped</li> </ul>
RAID Level	The RAID level of the virtual disk. For example, 0, 1, 5, and so on.
Is Encryptable	Indicates whether the virtual disk is encryptable. If the virtual disk is encryptable, the virtual disk uses full disk encryption, but does not belong to a defined System Storage DS8000 or System Storage DS5000 encryption group. Values are: <ul style="list-style-type: none"> <li>• True (the virtual disk is encryptable)</li> <li>• False (the virtual disk is not encryptable)</li> </ul>
Is Encrypted	Indicates whether the virtual disk is encrypted. If the virtual disk is encrypted, the volume uses full disk encryption and belongs to a defined DS8000 or DS5000 encryption group. Values are: <ul style="list-style-type: none"> <li>• True (the virtual disk is encrypted)</li> <li>• False (the virtual disk is not encrypted)</li> </ul>
Easy Tier	Indicates whether Easy Tier is on or off for the virtual disk.
Easy Tier Status	Indicates the Easy Tier functions that are active for the virtual disk copy. Values are: <ul style="list-style-type: none"> <li>• Active (can move extents of this virtual disk copy for performance [automatic data placement])</li> <li>• Inactive (no Easy Tier function is active)</li> <li>• Measured (statistics are being gathered for the virtual disk copy, but no extents are moved)</li> </ul>
Tiers	The tier levels that are used by the virtual disk. Each tier is displayed as a row in a table.
Flash Copy	Indicates whether the virtual disk or copy is in a FlashCopy relationship and whether it is a FlashCopy source or a FlashCopy target. A virtual disk or copy that is not in a FlashCopy relationship is displayed with a None value, regardless of whether the virtual disk is on a system that supports FlashCopy.
Attributes	Indicates whether the disk is surfaced or not surfaced.

*Storwize V7000 Unified or IBM SONAS - File System Information:*

This page shows general information about a selected file system that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

*Table 92. Information about a selected file system associated with a Storwize V7000 Unified storage system or an IBM SONAS system*

<b>Field Name</b>	<b>Description</b>
Computer	The name of the computer that contains the file system.
File System Type	The file system type, which is General Parallel File System (GPFS).
Mount Point	The name or mount point of the file system (for example, /ibm/gpfs0, or /ibm/testfs).
Physical Space	The physical size of the file system.
File System Space	The capacity of the file system.
Probe Last Run	The date and time that the last probe ran for the file system.
Scan Last Run	The time that the last scan ran for the file system.
Discovered Time	The date and time that the file system was discovered.
Removed Time	The date and time that the file system was removed, if applicable.
Maximum File Count	The maximum number of files allowed on the file system.
Used I-Nodes	The number of used i-nodes in the file system.
Free I-Nodes	The number of free i-nodes within a file system.
Used Space	The amount of used storage space within a file system. The amount of used and free space is also shown in a chart on the page.
Free Space	The amount of unused storage space in the file system.

*Storwize V7000 Unified or IBM SONAS - File Set Information:*

This page shows general information about a selected file set that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

*Table 93. Information about a selected file set associated with a Storwize V7000 Unified storage system or an IBM SONAS system*

<b>Field Name</b>	<b>Description</b>
File Set	The name of the file set.

Table 93. Information about a selected file set associated with a Storwize V7000 Unified storage system or an IBM SONAS system (continued)

Field Name	Description
Path	The path for the file set. The path is displayed only if Linked is displayed in the <b>Status</b> field.
File System	The name of the file system that is associated with the file set.
Status	The status of the file system. Valid values are:  <b>Linked</b> The file set is linked to the file system that is displayed in the <b>File System</b> field.  <b>Unlinked</b> The file set is not linked to the file system that is displayed in the <b>File System</b> field.
Used Space	The amount of space that is used by the file set.
Used I-Nodes	The number of i-nodes that are used by the file set.

*Storwize V7000 Unified or IBM SONAS - Export Information:*

This page shows general information about a selected export that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

Table 94. Information about a selected export associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
Export or Share	The name of the export.
Cluster	The name of the cluster that the export is associated with.
Path	The name of the path for the export.
Discovered	The date and time that the export was discovered.
Active	Indicates whether the export is active or inactive within the cluster. Valid values are:  <b>Yes</b> The export is active.  <b>No</b> The export is inactive. If an export is inactive, it is included in the list of exports, but the data that is associated with the export cannot be accessed.

*Storwize V7000 Unified or IBM SONAS - Configured Protocol Information:*

This page shows the protocols for a selected export that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

Protocols are specified for an export when the export is created. The following protocols can be specified for an export:

- HTTP
- FTP
- Secure Copy Protocol (SCP)
- Network File System (NFS)
- Common Internet File System (CIFS)

For each protocol that is listed on this page, **Configured** or **Not Configured** is shown to designate whether the protocol has been specified for the export. In addition, the information in the following tables is provided for the NFS and the CIFS protocols when they are specified for the export.

### Protocol Type NFS

*Table 95. NFS protocols for a selected export associated with a Storwize V7000 Unified storage system or an IBM SONAS system*

Field Name	Description
Client Name	The name of the client that can access the NFS protocol. If an asterisk (*) is shown, the settings apply to multiple clients.
Read Only	Specifies whether the export is read only. If the export is read only, files cannot be modified or created on this export. Values are:  <b>Yes</b> Files cannot be modified or created. <b>No</b> Files can be modified or created.
Root Squash	Specifies whether root users on clients should be prevented from having privileged access to exported files. Values are:  <b>Yes</b> Root squash is enabled. <b>No</b> Root squash is not enabled.
Secure	Specifies whether NFS access to the export is secure. Values are:  <b>Yes</b> NFS is secure. <b>No</b> NFS is not secure.

### Protocol Type CIFS

*Table 96. CIFS protocols for a selected export associated with a Storwize V7000 Unified storage system or an IBM SONAS system*

Field Name	Description
Read Only	Specifies whether the export is read only. If the export is read only, files cannot be modified or created on this export. Values are:  <b>Yes</b> Files cannot be modified or created. <b>No</b> Files can be modified or created.

Table 96. CIFS protocols for a selected export associated with a Storwize V7000 Unified storage system or an IBM SONAS system (continued)

Field Name	Description
Browsable by Client	Specifies whether the export is hidden from the client. The export is not shown in the list of available exports. Values are:  <b>Yes</b> The export is not hidden from the client. <b>No</b> The export is hidden from the client.
Hide Objects with No Read Access	Specifies whether the export is excluded from lists of files and directories when the user does not have permission to those files and directories. Values are:  <b>Yes</b> The export is excluded. <b>No</b> The export is included.
Client/Group/SID	The client, group, or security identifier that can access the CIFS protocol.
Access	Specifies whether the client, group, or security identifier has access to the export. <ul style="list-style-type: none"> <li>• Allowed</li> <li>• Denied</li> </ul>
Value	Specifies the level of access that is granted to the client, group, or security identifier. Values are: <ul style="list-style-type: none"> <li>• Full</li> <li>• Read</li> <li>• Write</li> </ul>
Comment	A user-defined comment for the CIFS export. If a comment is not available, this field is blank.

*Storwize V7000 Unified or IBM SONAS - Monitored Directory Information:*

This page shows general information about a directory that is associated with a Storwize V7000 Unified storage system or an IBM SONAS system.

The following information is displayed on this page.

Table 97. Information about a directory associated with a Storwize V7000 Unified storage system or an IBM SONAS system

Field Name	Description
Computer	The name of the computer that contains the directory.
Directory	The name of the directory.
Owner	The owner of the directory.
OS Group	The operating system group that the directory belongs to.
Total Size	The total size of the directory.

Table 97. Information about a directory associated with a Storwize V7000 Unified storage system or an IBM SONAS system (continued)

Field Name	Description
File Count	The number of files in the directory.
Directory Count	The number of subdirectories in the directory.
Average File Size	The average size of the files in the directory.
Access Time	The date and time that the directory was last accessed.
Modification Time	The date and time that the directory was last modified.
Creation Time	The date and time that the directory was created.
Scan Time	The date and time that the directory was last scanned.
Discovered Time	The date and time that the directory was discovered.
Removed Time	The date and time that the directory was removed.
File attributes that are set	If any attributes were set for the files in the directory (for example, read only), the attributes are displayed. If no attributes were set, No File Attributes Are Set is displayed.
This Directory belongs to the following Directory Groups	A list of the directory groups that the directory belongs to.

## Availability Reports

Use Availability reports to monitor and report on the availability of your storage, both from a network point of view and from a computer uptime perspective.

Use these reports to view the percentage of time that the storage in your enterprise is off-network due to network problems or is unavailable due to system downtime. In a fast-paced business environment, 24x7 application availability is critical. These reports help you monitor the availability of the storage and data that back up your applications.

Reporting Type	Description
Ping	<p data-bbox="769 222 1446 478">Use the ping report to monitor how available your storage is on the network. To do this monitor, regularly scheduled pings are sent out from the Data server to all of the monitored computers in your environment. The Tivoli Storage Productivity Center server checks not only for whether a Storage Resource agent or Data agent is available on the network, but records the amount of time that the request was in transit. This information indicates the responsiveness of the various storage servers on the network as well.</p> <p data-bbox="769 510 1446 621">Use the <b>Report Filter Specification</b> section on the <b>Selection</b> panel to limit the time range of the information in a report. Check the <b>Limit To This Time Range</b> option and use the date selection fields to limit the time range for a report.</p> <p data-bbox="769 653 1284 678">A ping report shows the following information:</p> <ul data-bbox="769 688 1446 1052" style="list-style-type: none"> <li data-bbox="769 688 1052 714">• the name of a computer</li> <li data-bbox="769 724 1446 749">• percentage of time the computer is available on the network</li> <li data-bbox="769 760 1446 816">• number of pings that have been transmitted and the number that have been received</li> <li data-bbox="769 827 1446 911">• number of damaged requests and the average transit time for the request to go between the Tivoli Storage Productivity Center server and the computer that is being monitored</li> <li data-bbox="769 921 1036 947">• maximum transit time</li> <li data-bbox="769 957 1036 982">• minimum transit time</li> <li data-bbox="769 993 1446 1052">• report start time and report end time for each computer in the report</li> </ul> <p data-bbox="769 1073 1446 1150"><b>Note:</b> You can sort on any of these columns by clicking on the column name. You can also generate charts and drill down on each computer for more detail.</p>

Reporting Type	Description
Computer Uptime	<p data-bbox="737 222 1419 363">Use the computer uptime report to track the availability of the storage based upon the percentage of the time the computer that hosts that storage is down or not running. The Storage Resource agent or Data agent on the computer tracks this information and sends it to the server.</p> <p data-bbox="737 394 1390 420">A computer uptime report shows the following information:</p> <ul data-bbox="737 430 1398 699" style="list-style-type: none"> <li data-bbox="737 430 984 455">• name of a computer</li> <li data-bbox="737 466 1320 491">• percentage of time the computer is up and running</li> <li data-bbox="737 501 1230 527">• number of reboots that have been recorded</li> <li data-bbox="737 537 1357 594">• total amount of time the computer has been down and unavailable</li> <li data-bbox="737 604 1216 630">• average downtime that has been recorded</li> <li data-bbox="737 640 1398 699">• report start time and report end time for each computer in the report</li> </ul> <p data-bbox="737 720 1419 919"><b>Note:</b> Computer Uptime reports are not available for Storage Resource agents that are invoked using the non-daemon protocol for data collection. These reports do not contain data for computers on which non-daemon based Storage Resource agents are deployed. To collect computer uptime information using a Storage Resource agent, that agent must use a daemon service for runtime operation.</p> <p data-bbox="737 951 1419 1031">You can sort on any of these columns by clicking on the column name. You can also generate charts and drill down on each computer for more detail.</p>

### TPC-wide Storage Space Reports

Use these reports to view storage capacity of your resources at a file system, computer, or entire network level.

For a specific computer, group of computers, or all the computers in your enterprise, you can view the following:

- How much storage you have
- How much storage is being used
- What percentage of storage is free for expansion

Reporting Type	Description
Disk Space	<p>Use these reports to view and chart disk capacity, per disk, per computer, per computer group, per domain, and for the whole network. These reports include one row for each computer that shows the total amount of storage capacity on that computer and the associated computer and disk storage information.</p> <p>For detail on any computer in the report, click on the magnifying glass next to the report row. You can also click on the chart button within a report to view an easy-to-interpret bar chart, showing the total storage capacity of each computer that you have chosen to report on and chart. To get the exact amount of storage for a computer, simply position the cursor over the associated bar and a box will appear showing the total amount for the selected computer.</p> <p><b>Note:</b> To ensure the accuracy and consistency of the data that appears in Disk Capacity reports, run regularly scheduled probes against the hosts that import volumes and the storage subsystems upon which you want to report. You should run probes against storage subsystems after running them against any hosts.</p> <p>You can use the following By clauses to view disk space for the following storage entities: By Disk, By Storage Subsystem, By Cluster, By Computer, By Computer Group, By Domain, and Network-wide.</p>
File System Space	<p>Use these reports to view information for monitored file systems, including the total amount of storage capacity on those file systems and statistics for used space, free space, and total number of files. You can use the following By clauses to view file system space for the following storage entities: By Filesystem, By Filesystem Group, By Cluster, By Computer, By Computer Group, By Domain, Network-wide.</p>
Consumed File System Space	<p>Use these reports to view information about the amount of space consumed on a filesystem. You can use the following By clauses to view consumed file system space for the following storage entities: By Filesystem, By Filesystem Group, By Cluster, By Computer, By Computer Group, By Domain, Network-wide.</p>
Available File System Space	<p>Use Filesystem Used Space reports to view information about the amount of free space on a filesystem. You can use the following By clauses to view available file system space for the following storage entities: By Filesystem, By Filesystem Group, By Cluster, By Computer, By Computer Group, By Domain, Network-wide.</p>

### TPC-Wide Storage Space - Disk Space report:

Use this report to view and chart disk storage capacity at the following levels: by disk, by computer, by cluster, by storage system, by computer monitoring or reporting group, by storage system monitoring or reporting group, by domain, and for the whole network.

**Note:** The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

#### By Disk

Chart icon 

Click this button to generate charts about the capacity of disks that are displayed in the report.

Magnifying glass icon 

Click this button to view a more detailed report about the capacity of a disk.

## Device

Name of the device on which a disk resides. The following disks are displayed in this report:

- Computer disks that are internal to the computers monitored by IBM Tivoli Storage Productivity Center.
- Computer disks on virtual machines that are monitored by Tivoli Storage Productivity Center.
- Storage system disks on storage subsystems that are monitored by Tivoli Storage Productivity Center.
- Storage system disks that no longer exist after a probe of a storage system because information about that system was removed based on settings in the Removed Resource Retention panel.
- Back-end storage volumes that are not identified by Tivoli Storage Productivity Center as being assigned to a monitored storage system virtualizer.
- Computer disks that are not identified by Tivoli Storage Productivity Center as being assigned to a monitored storage system.

The following disks are not displayed in this report:

- Computer disks that are assigned to storage subsystems monitored by Tivoli Storage Productivity Center.
- Back-end storage volumes that are assigned to storage system virtualizers monitored by Tivoli Storage Productivity Center.

**Path** Name of a disk.

## Disk Space (Capacity)

Total storage capacity for a disk. Keep in mind the following information about the **TOTAL** row for this column:

- The value that appears in **TOTAL** row for this column includes the disk space of spare disks within a storage subsystem.
- The value that appears in the **TOTAL** row for this column does not include computer disk space that is on virtual machines monitored by Tivoli Storage Productivity Center.

**Note:** When using the stand-alone GUI, the Disk Space entries for Storwize V7000 virtualizers report the sum of backend capacity. Local disk space is not included. When using the web-based GUI, local disk space is included in the calculation of the total device disk space of Storwize V7000 virtualizers.

## Available Disk Space (Unallocated Space)

Amount of space on the disk that is not allocated to any logical volume (or volumes for disks within storage subsystems). This value does not include RAID overhead on storage subsystems that are identified by Tivoli Storage Productivity Center. The value that appears in the **TOTAL** row for this column includes the unallocated capacity of all disks within the storage system, including the capacity of spare disks.

## In Storage Subsystem

Indicates **Yes** when a disk is either of the following:

- An actual physical disk within a storage system that is monitored by Tivoli Storage Productivity Center.
- A back-end storage volume within a storage system virtualizer that is monitored by Tivoli Storage Productivity Center.

**Manufacturer**

Name of the manufacturer of a disk.

**Note:** The value **Unknown** is displayed in this column for IBM ESS storage subsystems.

**Model**

Model number of a disk.

**Note:** The value **Unknown** is displayed in this column for IBM ESS storage subsystems.

**Serial Number**

Serial number of a disk.

**Primary Defects**

Number of defects on the disk when it was new.

**Note:** Defect data is not collected for IBM TotalStorage Enterprise Storage Server, IBM FAStT, HP StorageWorks, Hitachi Data Systems storage subsystems.

**Grown Defects**

Number of defects detected on the disk since it was new.

**Note:** Defect data is not collected for TotalStorage Enterprise Storage Server, FAStT, HP StorageWorks, Hitachi Data Systems storage subsystems.

**Fibre Attached**

Indicates **Yes** when a disk is attached to a port that Tivoli Storage Productivity Center identifies as fibre.

**Mapped to Storage Subsystem**

Indicates **Yes** when a computer disk or a back-end storage volume can be mapped to a storage system.

**Detectable**

Indicates **Yes** when a disk is identified as being available to the server or the storage system following a successful probe.

**Is Virtual**

Indicates **Yes** when a disk resides on a computer that Tivoli Storage Productivity Center identifies as a virtual machine.

**Is Solid State**

Indicates **Yes** when a disk is on a solid-state drive.

**Is Encryptable**

Indicates **Yes** when a disk is encryptable.

**Is Encrypted**

Indicates **Yes** when a disk is encrypted.

**Tier** Indicates the tier level of a disk. Disks can have only one tier. For example, this column displays either the value **generic\_ssd** or **generic\_hdd**.

**By Storage Subsystem****Chart icon** 

Click this button to generate charts about the disk capacity of storage subsystems that are displayed in the report.

### Magnifying glass icon

Click this button to view a more detailed report about the capacity of disks associated with a storage system.

### Name

Name or alias of a storage system that contains the disks or the name or alias of a storage system virtualizer (for example, SAN Volume Controller) that manages the disks. This report does not display storage subsystems that have been discovered but not probed.

### Disk Space (Disk Capacity)

Total raw (unformatted) disk capacity of a storage system. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Capacity of spare disks identified on TotalStorage Enterprise Storage Server, DS8000, and IBM System Storage DS6000 storage subsystems.
- Capacity of storage system disks that become missing after a Tivoli Storage Productivity Center storage system probe.
- The value that appears in the **TOTAL** row for this column does not include spare disks in its calculation.

### Available Disk Space (Disk Unallocated Space)

Total unformatted disk freespace of a storage system. Tivoli Storage Productivity Center does not include the following storage space in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- RAID overhead on storage subsystems that are identified by Tivoli Storage Productivity Center.
- External back-end storage for TagmaStore subsystems.
- Storage space that is consumed by volumes that reside on external disks when Hitachi Data Systems (HDS) storage subsystems are configured as storage virtualizers.
- The value that appears in the **TOTAL** row for this column does not include spare disks in its calculation.

### Number of Disks

Total number of disks in a storage system. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- External back-end storage for TagmaStore subsystems.
- Disks in partner storage pools for NetApp storage devices.

**Note:** If you click the magnifying glass icon next to storage system, the resulting drill-down report generates a list of detectable storage system disks or back-end storage volumes only. Therefore, the total number of disks for each storage system drill-down report will equal this value.

### Number of Volumes (LUNs)

Total number of storage volumes in a storage system or the total number of virtual volumes that are virtual storage. This value does not include storage system volumes or virtual storage volumes that become missing after a storage system probe.

### **Volume Space (LUN Capacity)**

Total capacity of all storage system volumes or virtual storage volumes within a storage system. This value does not include capacity information for storage system volumes or virtual storage volumes that become missing after a storage system probe.

**Note:** For space-efficient FlashCopy volumes, the volume capacity is the amount of storage space requested for these volumes, not the actual allocated amount. This can result in discrepancies in the overall storage capacity reported for a storage system using space-efficient FlashCopy volumes. This also applies to the Total Usable Volume Space and Total FlashCopy Target Capacity calculations.

### **Consumable Volume Space (Usable LUN Capacity)**

Total amount of unique storage system volume space and virtual storage volume space on monitored storage system arrays that you can assign to servers within the network or are already assigned to servers within the network.

Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes or virtual storage volumes that are used as flash copy targets.
- Storage system volumes or virtual storage volumes that are identified as Business Continuance Volume extended (BCVx).
- Storage system volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database.
- Storage system volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage system virtualizers. For example, SAN Volume Controller.

**Note:** For FASTT, the XIV system, HP StorageWorks, and Hitachi Data Systems storage subsystems, the value in this column is the same as the value in the Volume Capacity column.

### **FlashCopy Target Volume Space (Capacity)**

Total amount of unique storage system volume space and virtual storage volume space on monitored storage system arrays that is identified as flash copy target space. Tivoli Storage Productivity Center does not include the following storage space in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are not used as flash copy targets.

### **Correlated Volume Space (LUN Capacity Visible to Data Manager)**

Total amount of storage system volume space or virtual storage volume space on systems where the systems disks are identified by Tivoli Storage Productivity Center as residing within a monitored storage system. This includes storage system volumes or virtual storage volumes identified as back-end storage volumes on monitored storage system virtualizers. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that are assigned to a monitored storage system but are not identified by Tivoli Storage Productivity Center as a disk residing within the storage system. Some reasons why these disks are not identified as residing within the storage system include:
  - Tivoli Storage Productivity Center does not support the identification of disks for some storage system types.
  - The connection of the disk to the storage system is lost and is no longer detectable during a probe.
- Storage system volumes or virtual storage volumes that are identified as Business Continuance Volume extended (BCVx).
- Storage system volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database.

#### **Volume Space Not Correlated (LUN Capacity not Visible to Data Manager)**

Total amount of unique storage system volume space and virtual storage volume space discovered on monitored storage system arrays that can be assigned or are assigned to systems within the network. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that reside within a monitored storage system.
- Storage system volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage system virtualizers.

#### **Unavailable Disk Space (Overhead)**

Amount of storage system volume or virtual storage volume space that is dedicated to redundancy. This value is dependent on the storage system SMI-S provider returning a valid RAID value that is used to determine the overhead. If the value is zero for a storage system, the overhead cannot be calculated.

This amount does not include storage space information from storage system volumes or virtual storage volumes that become missing after a storage system probe.

#### **Formatted Space (Capacity)**

Total amount of formatted storage space associated with the storage system that is used or can be used for system storage volumes or virtual storage volumes. This value is dependent on the storage system SMI-S provider returning a formatted value.

For some storage subsystems, this is the total managed space which includes space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the total size of the managed disk groups created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

#### **Formatted Space with No Volumes**

Total amount of formatted storage space associated with the storage system

that can be used for system storage volumes or virtual storage volumes. This value is dependent on the storage system SMI-S provider returning a formatted value.

For some subsystems, this value represents the remaining managed space that includes space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the space within the managed disk groups that does not include the size of the virtual disks created and the corresponding virtual disk extent overhead.

#### **Overall Unavailable Disk Space (Total Overhead)**

(TotalStorage Enterprise Storage Server, DS6000, and DS8000 storage systems only) Total amount of unformatted space within disk groups or array sites.

#### **Unformatted Disk Space**

This value does not apply to all storage subsystems. For FAS*T*, TotalStorage Enterprise Storage Server, DS6000, and DS8000 storage systems, this is the total raw disk space of any unformatted disk groups or array sites. This column displays *N/A* for the storage systems where this value is not applicable. For the XIV system, this value shows the physical (hard) space of the XIV system available for pool creation or expansion.

#### **Cache**

Amount of cache memory that is internal to the storage system.

**Note:** This column is blank for SAN Volume Controllers.

#### **Manufacturer**

Name of the manufacturer of a disk.

#### **Model**

Model number of a disk.

#### **Serial Number**

Serial number of a disk. This information is displayed for physical disks only. For MDisks, the value **Unknown** is displayed.

#### **Firmware Revision**

Microcode (OS) version.

#### **Assigned Volume Space (Subsystem Assigned LUN Capacity)**

Total storage system volume space within the storage system that is mapped or assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes that are not mapped or are not assigned to host systems.

#### **Unassigned Volume Space (Subsystem Unassigned LUN Capacity)**

Total storage system volume space within a storage system that is not mapped or not assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.

- Storage system volumes that are mapped or assigned to host systems.

#### **Unassigned and Available Formatted Disk Space (Subsystem Total Formatted Free Space)**

Total storage system space that is not mapped or not assigned to host systems and the total amount of formatted storage space associated with the storage system that can be used for system storage volumes.

This total amount of formatted storage space is dependent on the storage system SMI-S provider returning a formatted value. For some subsystems, this value represents the remaining managed space that might include space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are mapped or assigned to host systems.

#### **zOS Volume Space (zOS LUN Capacity)**

Total storage system space that is reserved for use on mainframe storage such as used by z/OS. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on open system server or non-mainframe storage.

#### **Open System Volume Space (Open System LUN Capacity)**

Total storage system space that is reserved for use on open system storage such as used by operating systems like LINUX, AIX, HP/UX, Oracle Solaris, and Windows. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on mainframe storage.

#### **Physical Disk Space (Capacity)**

Total amount of physical disk space discovered on the monitored storage system arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

#### **Backend Volume Space (Backend LUN Capacity)**

Total amount of storage system volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on a monitored storage system virtualizer (for example, SAN Volume Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.

- Storage system volumes or virtual storage volumes that are back-end disks on a storage system virtualizer that is not monitored.

**Configured Real Space (GB)**

Total amount of real available and formatted storage space in the storage pools that are associated with a storage subsystem.

**Available Real Space (GB)**

Amount of real storage space available to allocate to volumes in the storage pools that are associated with a storage subsystem.

**Tiers** Indicates the tiers that are used by the storage system. Each tier is delimited by a semi-colon (;). Possible values are: generic\_hdd, generic\_ssd

Information about tiers is available for SAN Volume Controller 6.1 and Storwize V7000 only. The value N/A is displayed in tier-related columns for other storage systems.

**Tier Capacities**

Total storage capacity for each tier that is used by the storage system. The capacity for each tier is delimited by a semi-colon (;).

**Tier Free Capacities**

Free storage capacity (available space) for each tier that is used by the storage system. The free capacity for each tier is delimited by a semi-colon (;).

**By Storage Subsystem Group**

**Chart icon** 

Click this button to generate charts about the disk capacity of storage subsystems in the groups that are displayed in the report.

**Magnifying glass icon** 

Click this button to view a more detailed report about the disk capacity of storage subsystems in a group.

**Creator**

ID of the user who created the storage system monitoring group or storage system reporting group.

**Group** Name of a group.

**Disk Space (Disk Capacity)**

Total raw (unformatted) disk capacity of the storage subsystems that are in a group. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Capacity of spare disks identified on TotalStorage Enterprise Storage Server, DS8000, and DS6000 storage systems.
- Capacity of storage system disks that become missing after a Tivoli Storage Productivity Center storage system probe.

**Available Disk Space (Disk Unallocated Space)**

Total unformatted disk free space of the storage subsystems that are in a group. Tivoli Storage Productivity Center does not include the following storage space in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- RAID overhead on storage subsystems that are identified by Tivoli Storage Productivity Center.

- External back-end storage for TagmaStore subsystems.
- Storage space that is consumed by volumes that reside on external disks when Hitachi Data Systems (HDS) storage subsystems are configured as storage virtualizers.

#### **Number of Disks**

Total number of disks in the storage subsystems that are in a group. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- External back-end storage for TagmaStore subsystems.
- Disks in partner storage pools for NetApp storage devices.

**Note:** If you click the magnifying glass icon next to storage system, the resulting drill-down report generates a list of detectable storage system disks or back-end storage volumes only. Therefore, the total number of disks for each storage system drill-down report will equal this value.

#### **Number of Volumes (LUNs)**

Total number of storage volumes in a storage system or the total number of virtual volumes that are virtual storage. This value does not include storage system volumes or virtual storage volumes that become missing after a storage system probe.

#### **Volume Space (LUN Capacity)**

Total capacity of all storage system volumes or virtual storage volumes within the storage system. This value does not include capacity information of storage system volumes or virtual storage volumes that become missing after a storage system probe.

**Note:** For space-efficient FlashCopy volumes, the volume capacity is the amount of storage space requested for these volumes, not the actual allocated amount. This can result in discrepancies in the overall storage capacity reported for a storage system using space-efficient FlashCopy volumes. This also applies to the Total Usable Volume Space and Total FlashCopy Target Capacity calculations.

#### **Consumable Volume Space (Usable LUN Capacity)**

Total amount of unique storage system volume space and virtual storage volume space on monitored storage system arrays in a group that you can assign to servers within the network or are already assigned to servers within the network.

Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes or virtual storage volumes that are used as flash copy targets.
- Storage system volumes or virtual storage volumes that are identified as Business Continuity Volume extended (BCVx).
- Storage system volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database.
- Storage system volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage system virtualizers. For example, SAN Volume Controller.

**Note:** For FAStT, the XIV system, HP StorageWorks, and Hitachi Data Systems storage subsystems, the value in this column is the same as the value in the Volume Space column.

#### **FlashCopy Target Volume Space (Capacity)**

Total amount of unique storage system volume space and virtual storage volume space on monitored storage system arrays in a group that is identified as flash copy target space. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are not used as flash copy targets

#### **Correlated Volume Space (LUN Capacity Visible to Data Manager)**

Total amount of storage system volume space or virtual storage volume space on systems where the systems disks are identified by Tivoli Storage Productivity Center as residing within the monitored storage subsystems in a group. This includes storage system volumes or virtual storage volumes identified as back-end storage volumes on monitored storage system virtualizers. Tivoli Storage Productivity Center does not include the following scenarios in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that are assigned to a monitored storage system but are not identified by Tivoli Storage Productivity Center as a disk residing within the storage system. Some reasons why these disks are not identified as residing within the storage system include:
  - Tivoli Storage Productivity Center does not support the identification of disks for some storage system types.
  - The connection of the disk to the storage system is lost and is no longer detectable during a probe.
- Storage system volumes or virtual storage volumes that are identified as Business Continuance Volume extended (BCVx).
- Storage system volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database.

#### **Volume Space Not Correlated (LUN Capacity not Visible to Data Manager)**

Total amount of unique storage system volume space and virtual storage volume space discovered on monitored storage system arrays in a group that can be assigned or are assigned to systems within the network. Tivoli Storage Productivity Center does not include the following in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that reside within a monitored storage system.
- Storage system volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage system virtualizers.

#### **Unavailable Disk Space**

Amount of volume or virtual storage volume space of storage subsystems in a group that is dedicated to redundancy. This value is dependent on the

storage system SMI-S provider returning a valid RAID value that is used to determine the overhead. If the value is zero for a storage system, the overhead cannot be calculated.

This amount does not include storage space information from storage system volumes or virtual storage volumes that become missing after a storage system probe.

#### **Formatted Space**

Total amount of formatted storage space associated with the storage subsystems in a group that is used or can be used for system storage volumes or virtual storage volumes. This value is dependent on the storage system SMI-S provider returning a formatted value.

For some storage subsystems, this is the total managed space which includes space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the total size of the managed disk groups created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

#### **Formatted Space with No Volumes**

Total amount of formatted storage space associated with the storage subsystems in a group that can be used for system storage volumes or virtual storage volumes. This value is dependent on the storage system SMI-S provider returning a formatted value.

For some subsystems, this value represents the remaining managed space that includes space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the space within the managed disk groups that does not include the size of the virtual disks created and the corresponding virtual disk extent overhead.

#### **Unformatted Disk Space**

This value does not apply to all storage subsystems. For FAStT, TotalStorage Enterprise Storage Server, DS6000, and DS8000 storage systems, this is the total raw disk space of any unformatted disk groups or array sites. For the XIV system, the total available physical (hard) space that is left for pool creation. This column displays N/A for the storage subsystems where this value is not applicable.

#### **Cache**

Amount of cache memory that is internal to the storage subsystems in the group.

**Note:** This column does not include values for SAN Volume Controllers.

#### **Assigned Volume Space (Subsystem Assigned LUN Capacity)**

Total volume space of the storage subsystems within a group that is mapped or assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.

- Storage system volumes that are not mapped or are not assigned to host systems.

#### **Unassigned Volume Space (Subsystem Unassigned LUN Capacity)**

Total volume space of the storage subsystems in a group that is not mapped or not assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes that are mapped or assigned to host systems.

#### **zOS Volume Space (zOS LUN Capacity)**

Total space of storage subsystems in a group that is reserved for use on mainframe storage such as used by z/OS. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on open system server or non-mainframe storage.

#### **Open System Volume Space (Open System LUN Capacity)**

Total space of the storage subsystems in a group that is reserved for use on open system storage such as used by operating systems such as Linux, AIX, HP/UX, Oracle Solaris, and Windows. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on mainframe storage.

#### **Physical Disk Space (Capacity)**

Total amount of physical disk space on the storage system arrays that are in a group. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

#### **Backend Volume Space (Backend LUN Capacity)**

Total amount of storage system volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on the monitored storage system virtualizers (for example, SAN Volume Controller) that are in a group. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are back-end disks on a storage system virtualizer that is not monitored.

## By Cluster

### Chart icon

Click this button to generate charts about the disk capacity of the clusters that are displayed in the report.

### Magnifying glass icon

Click this button to view a more detailed report about the capacity of disks in a cluster.

## Cluster

Name of a cluster.

**Note:** For Storwize V7000 Unified or IBM SONAS clusters, the storage system name is included with the cluster name in the Computer or Device column. The format of the column is `storagesystem_name: cluster_name`, where `storagesystem_name` is the name of the Storwize V7000 Unified or IBM SONAS device that the cluster belongs to. For example, `subsystem-03.lab.austin.us.com: kq98n5d.acct` displays storage system `subsystem-03.lab.austin.us.com` that cluster `kq98n5d.acct` belongs to.

## Disk Space (Total Capacity)

Total amount of unique disk storage space for the computers in a cluster. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value in this column:

- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

### Note:

- If the computer is an IBM SAN File System client, then this value will also include the capacity of any storage system volumes visible to this computers that are owned by the SAN File System.
- The drill-down reports for each computer generates a list of detectable computer disks only. Therefore, the total capacity of disks for each computer drill-down report will equal this value.

## Available Disk Space (Total Unallocated Space)

Total amount of unique disk storage space for a computer that is not allocated to any logical volume on the computer. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on computers that have not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

**Note:** If the computer is a SAN File System client, then this value does not include the unallocated space on any storage system volumes visible to it that are owned by the SAN File System.

## Owned Disk Space (Capacity)

Total amount of unique disk storage space for computers in a cluster that is owned by those computers. If Data Manager determines that a disk is configured for a different host, that disk's capacity is not counted in this

column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on computers that have not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

**Note:**

- If the computer is a SAN File System client, this value does not include the capacity of any volumes that are visible to it that are owned by the SAN File System.
- If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads from the host ID. If this does not agree with the local host ID, the disk is classified as belonging to a different (Solaris) host.

**Owned Available Disk Space (Owned Unallocated Space)**

Total amount of unique disk storage space for computers in a cluster that is not allocated to any logical volume within the computers and is owned by the computers. If Data Manager determines that a disk is configured for a different computer, that disk's unallocated space is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on computers that have not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

If the computer is a SAN File System client, then this value excludes the unallocated space on any storage system volumes visible to it that are owned by the SAN File System.

If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product will examine the Veritas disk-label and read off the host-ID. If this does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

**Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)**

Total amount of unique disk space on the computers in a cluster that is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that reside behind a fibre channel port.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Non-Fibre Channel Attached Available Disk Space (Total Other Attached Unallocated Space)**

Total amount of disk storage space on the computers in a cluster that is not allocated to any logical volume within the computers and is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that reside behind a fibre channel port.
- Computer disks on a computer that has not been probed.

- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Fibre Channel Attached Disk Space (Total Fibre Channel Attached Capacity)**

Total amount of unique disk space on the computers in a cluster that is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that do not reside behind a fibre channel port.
- Computer disks that reside behind a fibre channel port that is not identified by a Storage Resource agent or Data agent.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Unallocated Space)**

Total amount of disk storage space on the computers in a cluster that is not allocated to any logical volume within the computers and is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that do not reside behind a fibre channel port.
- Computer disks that reside behind a fibre channel port that is not identified by a Storage Resource agent or Data agent.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**By Computer**

**Chart icon** 

Click this button to generate charts about the disk capacity of the computers that are displayed in the report.

**Magnifying glass icon** 

Click this button to view a more detailed report about the disks on a computer.

**Computer**

Name of a computer.

**Disk Space (Total Capacity)**

Total amount of unique disk storage space for a computer. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

**Note:**

- The value that appears in the **TOTAL** row for this column does not include disks on virtual machines where the Storage Resource agent or Data agent is installed.
- If the computer is a SAN File System client, then this value will also include the capacity of any storage system volumes visible to this computers that are owned by the SAN File System.
- The drill-down reports for each computer generates a list of detectable computer disks only. Therefore, the total capacity of disks for each computer drill-down report will equal this value.

#### **Available Disk Space (Total Unallocated Space)**

Total amount of unique disk storage space for a computer that is not allocated to any logical volume on the computer. Tivoli Storage Productivity Center does not include the following disks from in its calculation of the value in this column:

- Computer disks on computers that have not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

**Note:** If the computer is a SAN File System client, then this value does not include the unallocated space on any storage system volumes visible to it that are owned by the SAN File System.

#### **Owned Disk Space (Capacity)**

Total amount of unique disk storage space for a computer that is owned by that computer. If Data Manager determines that a disk is configured for a different host, that disk's capacity is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on computers that have not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

If the computer is a SAN File System client, this value does not include the capacity of any volumes that are visible to it that are owned by the SAN File System.

If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads from the host ID. If this does not agree with the local host ID, the disk is classified as belonging to a different (Solaris) host.

#### **Owned Available Disk Space (Owned Unallocated Space)**

Total amount of unique disk storage space for a computer that is not allocated to any logical volume within the computer and is owned by the computer. If Data Manager determines that a disk is configured for a different computer, that disk's unallocated space is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on computers that have not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

**Note:**

- If the computer is a SAN File System client, then this value excludes the unallocated space on any storage system volumes visible to it that are owned by the SAN File System.
- If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product will examine the Veritas disk-label and read off the host-ID. If this does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

**Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)**

Total amount of unique disk space on a computer that is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that reside behind a fibre channel port.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Non-Fibre Channel Attached Available Disk Space (Total Other Attached Unallocated Space)**

Total amount of disk storage space for a computer that is not allocated to any logical volume within the computer and is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that reside behind a fibre channel port.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Fibre Channel Attached Disk Space (Total Fibre Channel Attached Capacity)**

Total amount of unique disk space on a computer that is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that do not reside behind a fibre channel port.
- Computer disks that reside behind a fibre channel port that is not identified by a Storage Resource agent or Data agent.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Unallocated Space)**

Total amount of disk storage space on a computer that is not allocated to any logical volume within the computer and is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that do not reside behind a fibre channel port.
- Computer disks that reside behind a fibre channel port that is not identified by a Storage Resource agent or Data agent.
- Computer disks on a computer that has not been probed.

- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**OS Type**

Operating system running on a computer.

**Network Address**

Network address of a computer.

**IP Address**

IP address of a computer.

**Time Zone**

Time zone in which a computer is running.

**CPU Architecture**

Architecture of the processor (for example, IA32).

**By Computer Group**

**Chart icon** 

Click this button to generate charts about the disk capacity of computers in the groups that are displayed in the report.

**Magnifying glass icon** 

Click this button to view a more detailed report about the disk capacity of computers in a group.

**Creator**

Creator of a computer monitoring group or computer reporting group.

**Group**

Name of a group.

**Disk Space (Total Capacity)**

Total amount of unique disk storage space for the computers in a group. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that are on a virtual machine monitored by Tivoli Storage Productivity Center.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

**Available Disk Space (Total Unallocated Space)**

Total amount of unique disk storage space for computers in a group that is not allocated to any logical volume on the computers. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on computers that have not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

**Note:** If the computer is a SAN File System client, then this value does not include the unallocated space on any storage system volumes visible to it that are owned by the SAN File System.

### **Owned Disk Space (Capacity)**

Total amount of unique disk storage space for computers in a group that is owned by those computers. If Data Manager determines that a disk is configured for a different host, that disk's capacity is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on a cluster of virtual machines that is monitored by Tivoli Storage Productivity Center.
- Computer disks on computers that have not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

#### **Note:**

- If the computer is a SAN File System client, this value does not include the capacity of any volumes that are visible to it that are owned by the SAN File System.
- If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads from the host ID. If this does not agree with the local host ID, the disk is classified as belonging to a different (Solaris) host.

### **Owned Available Disk Space (Owned Unallocated Space)**

Total amount of unique disk storage space for the computers in a group that is not allocated to any logical volume within the computer group and is owned by a computer within the group. If Data Manager determines that a disk is configured for a different computer, that disk's unallocated space is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on computers that have not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

#### **Note:**

- If the computer is a SAN File System client, then this value excludes the unallocated space on any storage system volumes visible to it that are owned by the SAN File System.
- If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product will examine the Veritas disk-label and read off the host-ID. If this does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

### **Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)**

Total amount of unique disk space on the computers in a group and is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that reside behind a fibre channel port.
- Computer disks discovered on virtual machine servers where the Storage Resource agent or Data agent is installed.
- Computer disks on a computer that has not been probed.

- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Non-Fibre Channel Attached Available Disk Space (Total Other Attached Unallocated Space)**

Total amount of disk storage space on the computers in a group that is not allocated to any logical volume within the computers and is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that reside behind a fibre channel port.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Fibre Channel Attached Disk Space (Total Fibre Channel Attached Capacity)**

Total amount of unique disk space on the computers in a group that is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that do not reside behind a fibre channel port.
- Computer disks that reside behind a fibre channel port that is not identified by a Storage Resource agent or Data agent.
- Computer disks discovered on virtual machine servers where the Storage Resource agent or Data agent is installed.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Unallocated Space)**

Total amount of disk storage space on the computers in a group that is not allocated to any logical volume within the computers and is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that do not reside behind a fibre channel port.
- Computer disks that reside behind a fibre channel port that is not identified by a Storage Resource agent or Data agent.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**By Domain**

**Chart icon** 

Click this button to generate charts about the disk capacity of the computers in a domain.

**Magnifying glass icon** 

Click this button to view a more detailed report about the disk capacity of computers in a domain.

**Domain**

Name of a domain.

**Disk Space (Capacity)**

Total amount of unique disk storage space for the computers in a domain. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

**Available Disk Space (Unallocated Space)**

Total amount of unique disk storage space for computers in a domain that is not allocated to any logical volume on the computers. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on computers that have not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

**Network-wide****Chart icon** 

Click this button to generate charts about the disk capacity across a network.

**Magnifying glass icon** 

Click this button to view a more detailed report about the disk capacity of computers in a network.

**Disk Space (Capacity)**

Total amount of internal physical disk space on monitored storage system arrays and disk space on monitored systems that are not storage system volumes. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system disks or computer disks that become missing after a probe.
- Back-end storage volumes that are not identified by Tivoli Storage Productivity Center as being assigned to a monitored storage system virtualizer.
- Computer disks that are identified by Tivoli Storage Productivity Center as being assigned to a monitored storage system.
- Computer disks that reside within a virtual machine server where the Storage Resource agent or Data agent is installed.

**Consumed File System Space (Filesystem Used Space)**

Total amount of unique file system storage space that is used or consumed by the systems where the Storage Resource agent or Data agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.

- File systems on discovered hypervisors that are assigned to discovered virtual machines where the Storage Resource agent or Data agent is installed.
- File systems on discovered virtual machines where the Storage Resource agent or Data agent is installed, but the hypervisor for the virtual machine has not been discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

#### **Available File System Space (Filesystem Free Space)**

Total amount of unique file system storage space that is not used or available to the systems where the Storage Resource agent or Data agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

#### **Raw Volume Space**

Total amount of storage system volume space that is the following:

- Assigned or mapped to hosts.
- Storage system volume space on a system that it is monitored by Tivoli Storage Productivity Center.
- Logical volume space on hosts that do not reside within a storage system monitored by Tivoli Storage Productivity Center.

#### **Unavailable Disk Space (Overhead)**

Total amount of storage system volume space that is identified as the following:

- For RAID or mirror redundancy on a storage system.
- As storage system volume space used for replication targets.
- As logical volume space on hosts that is for RAID or mirror redundancy on those hosts.

#### **Available Disk Space (Unallocated Space)**

Total amount of disk space that does not include the following from the network capacity:

- Network Raw Volume Space
- Network Overhead
- Network Unknown Volume Space

#### **Unknown Storage Subsystem Volume Space (Unknown LUN Capacity)**

Total amount of storage system volume space that is not mapped or assigned to a host and is not identified as residing on a host that has been probed by a Storage Resource agent or Data agent.

#### **TPC-Wide Storage Space - File System Space report:**

Use these reports to view detailed information about the storage capacity of file systems on machines in your environment. You can view this information in

different ways using the following By clauses: by filesystem, by filesystem group, by cluster, by computer, by computer group, by domain, and for the entire network.

**Note:** The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

### By Filesystem

#### Chart icon

Click this button to generate charts about the storage space for a file system.

#### Computer

Name of the computer on which a file system resides.

#### Mount Point

Name or mount point (UNIX/Linux) of the file system (for example, c:\, d:\, /opt, /export/home, etc.). The file systems displayed in this report include the following:

- File systems on virtual machines that are monitored by IBM Tivoli Storage Productivity Center.
- File systems on hypervisors that are monitored by Tivoli Storage Productivity Center.
- File systems that become missing after a probe.

#### File System Space (Capacity)

Amount of file system storage space for a file system.

#### Note:

- The value that appears in the **TOTAL** row for this column does not include file systems on virtual machines where the Storage Resource agent or Data agent is installed.
- The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the df command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

#### Detectable

Indicates **Yes** when a file system is identified as being available to the server following a successful probe.

#### Percent Used Space

Percentage of file system storage space that is used within a file system.

#### Consumed File System Space (Used Space)

Amount of used storage space within a file system. On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead). Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.

- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

The value that appears in the **TOTAL** row for this column represents the difference between the **TOTAL** values in the **File System Space** and **Available File System Space** columns. If the calculated value for the **TOTAL** row is negative, the column displays 0.

The **TOTAL** row does not add the used space coming from VMWare computers. See the *VMWare capacity reports* topic in the *Planning* chapter of the *Tivoli Storage Productivity Center Installation and Configuration Guide* for information about how file system and disk capacity are calculated in this report for VMWare computers. This topic is also available in the *Planning* section of the *Tivoli Storage Productivity Center Information Center*.

The value that appears in the **TOTAL** row for this column does not include the following file systems:

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent or Data agent has been installed.
- File systems on discovered virtual machine servers where the Storage Resource agent or Data agent is installed, but the hypervisor for the virtual machine servers has not been discovered and the total used space exceeds the capacity of the total file system capacity.

#### **Available File System Space (Free Space)**

Amount of unused storage space within a file system.

#### **File Count**

Total number of files within a file system. This value does not include files on file systems that have not been scanned.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

#### **Directory Count**

Total number of directories within a file system. This value does not include directories on file systems that have not been scanned.

#### **Percent Used Inodes**

Percentage of used Inodes within a file system.

#### **Used Inodes**

Number of used Inodes within a file system.

#### **Free Inodes**

Number of free Inodes within a file system.

#### **Volume Group**

Volume group to which a logical volume belongs. If the volume is not part of a volume group this column displays N/A.

#### **Logical Volume Space (Logical Volume Allocation)**

Logical volume space used by the logical volume containing the file system.

**Disk Detectable**

Indicates **Yes** when a file system's logical volume is identified as having an underlying host disk.

**By Filesystem Group****Chart icon** 

Click this button to generate charts about the capacity of file systems in file system monitoring groups or file system reporting groups.

**Magnifying glass icon** 

Click this button to view more detailed information about the capacity of file systems in a file system monitoring group or file system reporting group.

**Creator**

ID of the user who created a group.

**Group** Name of a file system monitoring group or file system reporting group.

**File System Space (Capacity)**

Amount of file system storage space for the file systems in a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on virtual machines where the Storage Resource agent or Data agent is installed.
- File systems that become missing after a probe.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

**Percent Used Space**

Percentage of total file system storage space that is used within a group.

**Consumed File System Space (Used Space)**

Total amount of used file system storage space within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on hypervisors that are assigned to virtual machine servers where the Storage Resource agent or Data agent is installed if both the virtual machine file systems and hypervisor file systems reside within the group.
- File systems on virtual machine servers where the Storage Resource agent or Data agents are deployed, but the hypervisor for the virtual machine servers has not been discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems on virtual machine servers that are in a group without the underlying hypervisor file systems, and the total used space exceeds the capacity of the total file system capacity.
- File systems that become missing after a probe.

- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

#### **Available File System Space (Free Space)**

Total amount of unique file system storage space that is not used or is available within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are not mounted.

#### **File Count**

Total number of files within a group. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

#### **Directory Count**

Total number of directories within a group. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

#### **Percent Used Inodes**

Percentage of used Inodes within a group.

#### **Used Inodes**

Number of used Inodes within a group.

#### **Free Inodes**

Number of free Inodes within a group.

#### **By Cluster**

#### **Chart icon**

Click this button to generate charts about the used file system space for a cluster.

#### **Magnifying glass icon**

Click this button to view more detailed information about the used storage space on file systems that are in a cluster.

**Cluster**

Name of cluster.

**File System Space (Capacity)**

Total amount of unique file system storage space in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

**Percent Used Space**

Percentage of total file system storage space that is used within a cluster.

**Consumed File System Space (Used Space)**

Total amount of unique file system storage space that is used or consumed by the file systems in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

**Available File System Space (Free Space)**

Total amount of unique file system storage space that is not used or is available in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**File Count**

Total number of files within a cluster. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by an agent.

When monitoring computers where the Windows operating system is installed, the number of files indicated in this column might be lower than the number of files reported by the operating system.

### Directory Count

Total number of directories within a cluster. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by an agent.

When monitoring computers where the Windows operating system is installed, the number of folders indicated in this column might be higher than the number of folders that is reported by the operating system.

### Percent Used Inodes

Percentage of used Inodes within a cluster.

### Used Inodes

Number of used Inodes within a cluster.

### Free Inodes

Number of free Inodes within a cluster.

### By Computer

#### Chart icon

Click this button to generate a chart about the used file system storage space of the computers that are displayed in the report.

#### Magnifying glass icon

Click this button to view a more detailed report about the used file system storage space on a computer.

### File System Space (Capacity)

Total amount of unique file system storage space that was discovered on the computer where the Storage Resource agent or Data agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

#### Note:

- The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.
- The value that appears in the **TOTAL** row for this column does not include file systems on virtual machines where the Storage Resource agent or Data agent is installed.
- The drill-down reports for each computer will generate a list of detectable file systems only. Therefore, the total capacity of file systems for each computer drill-down report will equal this value.

### Percent Used Space

Percentage of total file system storage space that is used within a computer.

### Consumed File System Space (Used Space)

Amount of unique file system storage space that is used or consumed by the computer where the Storage Resource agent or Data agent is installed. On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead). Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

The value that appears in the **TOTAL** row for this column represents the difference between the **TOTAL** values in the **File System Space** and **Available File System Space** columns. If the calculated value for the **TOTAL** row is negative, the column displays 0.

The **TOTAL** row does not add the used space coming from VMWare computers. See the *VMWare capacity reports* topic in the *Planning* chapter of the *Tivoli Storage Productivity Center Installation and Configuration Guide* for information about how file system and disk capacity are calculated in this report for VMWare computers. This topic is also available in the *Planning* section of the *Tivoli Storage Productivity Center Information Center*.

The value that appears in the **TOTAL** row for this column does not include the following file systems:

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent or Data agent has been installed.
- File systems on discovered virtual machine servers where the Storage Resource agent or Data agent is installed, but the hypervisor for the virtual machine servers has not been discovered and the total used space exceeds the capacity of the total file system capacity.

### Available File System Space (Free Space)

Total amount of unique file system storage space that is not used or is available to a computer. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

### File Count

Total number of files within a computer. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the **File Count** column is 200.

#### **Directory Count**

Total number of directories within a computer. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

#### **Percent Used Inodes**

Percentage of used Inodes within a computer.

#### **Used Inodes**

Number of used Inodes within a computer.

#### **Free Inodes**

Number of free Inodes within a computer.

#### **By Computer Group**

##### **Chart icon**

Click this button to generate charts about the used file system storage space for a computer monitoring group or computer reporting group.

##### **Magnifying glass icon**

Click this button to view more detailed information about the file systems in a computer monitoring group or computer reporting group.

#### **Creator**

ID of the user who created a group.

**Group** Name of a computer monitoring group or computer reporting group.

#### **File System Space (Capacity)**

Amount of file system storage space for the computers in a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on virtual machines where the Storage Resource agent or Data agent is installed.
- File systems that become missing after a probe.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

### **Percent Used Space**

Percentage of total file system storage space that is used within a group.

### **Consumed File System Space (Used Space)**

Total amount of used file system storage space within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on hypervisors that are assigned to virtual machine servers where the Storage Resource agent or Data agent is installed if both the virtual machine file systems and hypervisor file systems reside within the group.
- File systems on virtual machine servers where the Storage Resource agent or Data agent is installed, but the hypervisor for the virtual machine servers has not been discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems on virtual machine servers that are in a group without the underlying hypervisor file systems, and the total used space exceeds the capacity of the total file system capacity.
- File systems that become missing after a probe.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

### **Available File System Space (Free Space)**

Total amount of unique file system storage space that is not used or is available within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are not mounted.

### **File Count**

Total number of files within a group. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** For groups that contain Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the **File Count** column is 200.

### **Directory Count**

Total number of directories within a group. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.

- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Percent Used Inodes**

Percentage of used Inodes within a group.

**Used Inodes**

Number of used Inodes within a group.

**Free Inodes**

Number of free Inodes within a group.

**By Domain**

**Chart icon** 

Click this button to generate charts about the file system used space for a domain.

**Magnifying glass icon** 

Click this button to view more detailed information about the file system used space of computers that are in a domain.

**Domain**

Name of a domain.

**File System Space (Capacity)**

Total amount of unique file system storage space that was discovered on the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

**Percent Used Space**

Percentage of total file system storage space that is used within a domain.

**Consumed File System Space (Used Space)**

Total amount of unique file system storage space that is used or consumed by the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

### Available File System Space (Free Space)

Total amount of unique file system storage space that is not used or is available to the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server
- File systems that are not mounted.

### File Count

Total number of files within a domain. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

### Directory Count

Total number of directories within a domain. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

### Percent Used Inodes

Percentage of used Inodes within a domain.

### Used Inodes

Number of used Inodes within a domain.

### Free Inodes

Number of free Inodes within a domain.

### Network-wide

#### Chart icon

Click this button to generate a chart about the file system used space in a network.

#### Magnifying glass icon

Click this button to view more detailed information about the file system used space in a network.

### File System Space (Capacity)

Total amount of unique file system storage space that was discovered on

the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agent or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

### **Percent Used Space**

Percentage of total file system storage space that is used within a network.

### **Consumed File System Space (Used Space)**

Total amount of unique file system storage space that is used or consumed by the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

### **Available File System Space (Free Space)**

Total amount of unique file system storage space that is not used or is available to the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server
- File systems that are not mounted.

### **File Count**

Total number of files within a network. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, Tivoli Storage Productivity Center calculates both the number of files and the number of

directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

**Directory Count**

Total number of directories within a network. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Percent Used Inodes**

Percentage of used Inodes within a network.

**Used Inodes**

Number of used Inodes within a network.

**Free Inodes**

Number of free Inodes within a network.

**TPC-Wide Storage Space - Consumed File System Space report:**

Use these reports to view detailed information about the used storage space in file systems on computers in your environment. You can view this information in different ways using the following By clauses: by filesystem, by filesystem group, by cluster, by computer, by computer group, by domain, and for the entire network.

**Note:** The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

**By Filesystem****Chart icon** 

Click this button to generate charts about the used space information for a file system.

**Computer**

Name of the computer on which a file system resides.

**Mount Point**

Name or mount point (UNIX/Linux) of the file system (for example, c:\, d;\, /opt, /export/home, etc.). The file systems displayed in this report include the following:

- File systems on virtual machines that are monitored by IBM Tivoli Storage Productivity Center.
- File systems on hypervisors that are monitored by Tivoli Storage Productivity Center.
- File systems that become missing after a probe.

**Consumed File System Space (Used Space)**

Amount of used storage space within a file system. On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

The value that appears in the **TOTAL** row for this column does not include the following file systems:

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent or Data agent has been installed.
- File systems on discovered virtual machine servers where the Storage Resource agent or Data agent is installed, but the hypervisor for the virtual machine servers has not been discovered and the total used space exceeds the capacity of the total file system capacity.

**Detectable**

Indicates **Yes** when a file system is identified as being available to the server following a successful probe.

**Percent Used Space**

Percentage of file system storage space that is used within a file system.

**Available File System Space (Free Space)**

Amount of unused storage space within a file system.

**File System Space (Capacity)**

Amount of file system storage space for a file system.

**Note:**

- The value that appears in the **TOTAL** row for this column does not include file systems on virtual machines where the Storage Resource agent or Data agent is installed.
- The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

**File Count**

Total number of files within a file system. This value does not include files on file systems that have not been scanned.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, IBM Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

**Directory Count**

Total number of directories within a file system. This value does not include directories on file systems that have not been scanned.

**Percent Used Inodes**

Percentage of used Inodes within a file system.

**Used Inodes**

Number of used Inodes within a file system.

**Free Inodes**

Number of free Inodes within a file system.

**Volume Group**

Volume group to which a logical volume belongs. If the volume is not part of a volume group this column displays N/A.

**Logical Volume Space (Allocation)**

Logical volume space used by the logical volume containing the file system.

**Disk Detectable**

Indicates **Yes** when a file system's logical volume is identified as having an underlying host disk.

**By Filesystem Group****Chart icon** 

Click this button to generate charts about the used file system storage space in a file system monitoring group or file system reporting group.

**Magnifying glass icon** 

Click this button to view more detailed information about the used file system storage space in a file system monitoring group or file system reporting group.

**Creator**

ID of the user who created a group.

**Group** Name of a file system monitoring group or file system reporting group.

**Consumed File System Space (Used Space)**

Total amount of used file system storage space within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on hypervisors that are assigned to virtual machine servers where the Storage Resource agent or Data agent is installed if both the virtual machine file systems and hypervisor file systems reside within the group.
- File systems on virtual machine servers where the Storage Resource agent or Data agent is installed, but the hypervisor for the virtual machine servers has not been discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems on virtual machine servers that are in a group without the underlying hypervisor file systems, and the total used space exceeds the capacity of the total file system capacity.
- File systems that become missing after a probe.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

**Percent Used Space**

Percentage of total file system storage space that is used within a group.

**Available File System Space (Free Space)**

Total amount of unique file system storage space that is not used or is available within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.

- File systems that are not mounted.

### **File System Space (Capacity)**

Amount of file system storage space for the file systems in a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on virtual machines where the Storage Resource agent or Data agent is installed.
- File systems that become missing after a probe.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

### **File Count**

Total number of files within a group. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, IBM Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

### **Directory Count**

Total number of directories within a group. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

### **Percent Used Inodes**

Percentage of used Inodes within a group.

### **Used Inodes**

Number of used Inodes within a group.

### **Free Inodes**

Number of free Inodes within a group.

## By Cluster

### Chart icon

Click this button to generate charts about the used file system space for a cluster.

### Magnifying glass icon

Click this button to view more detailed information about the used storage space on file systems that are in a cluster.

### Cluster

Name of cluster.

### Consumed File System Space (Used Space)

Total amount of unique file system storage space that is used or consumed by the file systems in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

### Percent Used Space

Percentage of total file system storage space that is used within a cluster.

### Available File System Space (Free Space)

Total amount of unique file system storage space that is not used or is available in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

### File System Space (Capacity)

Total amount of unique file system storage space in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

### **File Count**

Total number of files within a cluster. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

When monitoring computers where the Windows operating system is installed, the number of files indicated in this column might be lower than the number of files reported by the operating system.

### **Directory Count**

Total number of directories within a cluster. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

When monitoring computers where the Windows operating system is installed, the number of folders indicated in this column might be higher than the number of folders that is reported by the operating system.

### **Percent Used Inodes**

Percentage of used Inodes within a cluster.

### **Used Inodes**

Number of used Inodes within a cluster.

### **Free Inodes**

Number of free Inodes within a cluster.

### **By Computer**

#### **Chart icon**

Click this button to generate charts about the used file system storage space of the computers that are displayed in the report.

#### **Magnifying glass icon**

Click this button to view a more detailed report about the used file system storage space on a computer.

### **Computer**

Name of the computer on which a file system resides.

### **Consumed File System Space (Used Space)**

Total amount of unique file system storage space that is used or consumed by the computer where the Storage Resource agent or Data agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

### **Percent Used Space**

Percentage of total file system storage space that is used within a computer.

### **Available File System Space (Free Space)**

Total amount of unique file system storage space that is not used or is available to a computer. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

### **File System Space (Capacity)**

Total amount of unique file system storage space that was discovered on the computer where the Storage Resource agent or Data agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

### **Note:**

- The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.
- The value that appears in the **TOTAL** row for this column does not include file systems on virtual machines where the Storage Resource agent or Data agent is installed.
- The drill-down reports for each computer will generate a list of detectable file systems only. Therefore, the total capacity of file systems for each computer drill-down report will equal this value.

### **File Count**

Total number of files within a computer. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, IBM Tivoli Storage Productivity Center calculates both the number of files and the

number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

#### **Directory Count**

Total number of directories within a computer. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

#### **Percent Used Inodes**

Percentage of used Inodes within a computer.

#### **Used Inodes**

Number of used Inodes within a computer.

#### **Free Inodes**

Number of free Inodes within a computer.

#### **By Computer Group**

##### **Chart icon**

Click this button to generate charts about the used file system storage space for a computer monitoring group or computer reporting group.

##### **Magnifying glass icon**

Click this button to view more detailed information about the file systems in a computer monitoring group or computer reporting group.

#### **Creator**

ID of the user who created a group.

**Group** Name of a computer monitoring group or computer reporting group.

#### **Consumed File System Space (Used Space)**

Total amount of used file system storage space within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on hypervisors that are assigned to virtual machine servers where the Storage Resource agent or Data agent is installed if both the virtual machine file systems and hypervisor file systems reside within the group.
- File systems on virtual machine servers where the Storage Resource agent or Data agent is installed, but the hypervisor for the virtual machine servers has not been discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems on virtual machine servers that are in a group without the underlying hypervisor file systems, and the total used space exceeds the capacity of the total file system capacity.
- File systems that become missing after a probe.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

### Percent Used Space

Percentage of total file system storage space that is used within a group.

### Available File System Space (Free Space)

Total amount of unique file system storage space that is not used or is available within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are not mounted.

### File System Space (Capacity)

Amount of file system storage space for the computers in a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on virtual machines where the Storage Resource agent or Data agent is installed.
- File systems that become missing after a probe.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

### File Count

Total number of files within a group. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** For groups that contain Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, IBM Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

### Directory Count

Total number of directories within a group. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

### Percent Used Inodes

Percentage of used Inodes within a group.

**Used Inodes**

Number of used Inodes within a group.

**Free Inodes**

Number of free Inodes within a group.

**By Domain****Chart icon** 

Click this button to generate charts about the file system used space for a domain.

**Magnifying glass icon** 

Click this button to view more detailed information about the file system used space of computers that are in a domain.

**Consumed File System Space (Domain)**

Name of a domain.

**Used Space**

Total amount of unique file system storage space that is used or consumed by the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

**Percent Used Space**

Percentage of total file system storage space that is used within a domain.

**Available File System Space (Free Space)**

Total amount of unique file system storage space that is not used or is available to the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server
- File systems that are not mounted.

**File System Space (Capacity)**

Total amount of unique file system storage space that was discovered on the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

#### **File Count**

Total number of files within a domain. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, IBM Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

#### **Directory Count**

Total number of directories within a domain. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

#### **Percent Used Inodes**

Percentage of used Inodes within a domain.

#### **Used Inodes**

Number of used Inodes within a domain.

#### **Free Inodes**

Number of free Inodes within a domain.

#### **Network-wide**

##### **Chart icon**

Click this button to generate charts about the file system used space in a network.

##### **Magnifying glass icon**

Click this button to view more detailed information about the file system used space in a network.

#### **Consumed File System Space (Used Space)**

Total amount of unique file system storage space that is used or consumed by the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

#### **Percent Used Space**

Percentage of total file system storage space that is used within a network.

#### **Available File System Space (Free Space)**

Total amount of unique file system storage space that is not used or is available to the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server
- File systems that are not mounted.

#### **File System Space (Capacity)**

Total amount of unique file system storage space that was discovered on the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

#### **File Count**

Total number of files within a network. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, IBM Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

**Directory Count**

Total number of directories within a network. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Percent Used Inodes**

Percentage of used Inodes within a network.

**Used Inodes**

Number of used Inodes within a network.

**Free Inodes**

Number of free Inodes within a network.

**TPC-Wide Storage Space - Available File System Space report:**

Use these reports to view detailed information about the available storage space in file systems on systems in your environment. You can view this information in different ways using the following By clauses: by filesystem, by filesystem group, by cluster, by computer, by computer group, by domain, and for the entire network.

**Note:** The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

**By Filesystem****Chart icon** 

Click this button to generate a chart about the used space information for a file system.

**Computer**

Name of the computer on which a file system resides.

**Mount Point**

Name or mount point (UNIX/Linux) of a file system (for example, c:\, d:\, /opt, /export/home, etc.). The file systems displayed in this report include the following:

- File systems on virtual machines that are monitored by IBM Tivoli Storage Productivity Center.
- File systems on hypervisors that are monitored by Tivoli Storage Productivity Center.
- File systems that become missing after a probe.

**Available File System Space (Free Space)**

Amount of unused storage space within a file system.

**Detectable**

Indicates **Yes** when a file system is identified as being available to the server following a successful probe.

**Percent Available File System Space (Percent Free Space)**

Percentage of file system storage space that is unused within a file system.

### Consumed File System Space (Used Space)

Amount of used storage space within a file system. On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

The value that appears in the **TOTAL** row for this column does not include the following file systems:

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent or Data agent has been installed.
- File systems on discovered virtual machine servers where the Storage Resource agent or Data agent is installed, but the hypervisor for the virtual machine servers has not been discovered and the total used space exceeds the capacity of the total file system capacity.

### File System Space (Capacity)

Amount of file system storage space for a file system.

#### Note:

- The value that appears in the **TOTAL** row for this column does not include file systems on virtual machines where the Storage Resource agent or Data agent is installed.
- The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

### File Count

Total number of files within a file system. This value does not include files on file systems that have not been scanned.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, IBM Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

### Directory Count

Total number of directories within a file system. This value does not include directories on file systems that have not been scanned.

### Percent Used Inodes

Percentage of used Inodes within a file system.

### Used Inodes

Number of used Inodes within a file system.

### Free Inodes

Number of free Inodes within a file system.

### Volume Group

Volume group to which a logical volume belongs. If the volume is not part of a volume group this column displays **N/A**.

**Logical Volume Space (Allocation)**

Logical volume space used by the logical volume containing the file system.

**Disk Detectable**

Indicates **Yes** when a file system's logical volume is identified as having an underlying host disk.

**By Filesystem Group****Chart icon** 

Click this button to generate charts about the used file system storage space in a file system monitoring group or file system reporting group.

**Magnifying glass icon** 

Click this button to view more detailed information about the used file system storage space in a file system monitoring group or file system reporting group.

**Creator**

ID of the user who created a group.

**Group** Name of a file system monitoring group or file system reporting group.

**Available File System Space (Free Space)**

Total amount of unique file system storage space that is not used or is available within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are not mounted.

**Percent Available File System Space (Percent Free Space)**

Percentage of total file system storage space that is not used or available within a group.

**Consumed File System Space (Used Space)**

Total amount of used file system storage space within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on hypervisors that are assigned to virtual machine servers where the Storage Resource agent or Data agent is installed if both the virtual machine file systems and hypervisor file systems reside within the group.
- File systems on virtual machine servers where the Data agents installed, but the hypervisor for the virtual machine servers has not been discovered and the total used space exceeds the capacity of the total file system capacity.
- File systems on virtual machine servers that are in a group without the underlying hypervisor file systems, and the total used space exceeds the capacity of the total file system capacity.
- File systems that become missing after a probe.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

### File System Space (Capacity)

Amount of file system storage space for the file systems in a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on virtual machines where the Storage Resource agent or Data agent is installed.
- File systems that become missing after a probe.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

### File Count

Total number of files within a group. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, IBM Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

### Directory Count

Total number of directories within a group. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

### Percent Used Inodes

Percentage of used Inodes within a group.

### Used Inodes

Number of used Inodes within a group.

### Free Inodes

Number of free Inodes within a group.

### By Cluster

#### Chart icon

Click this button to generate a chart about the used file system space for a cluster.

### Magnifying glass icon

Click this button to view more detailed information about the used storage space on file systems that are in a cluster.

### Cluster

Name of cluster.

### Available File System Space (Free Space)

Total amount of unique file system storage space that is not used or is available in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

### Percent Available File System Space (Percent Free Space)

Percentage of total file system storage space that is available within a cluster.

### Consumed File System Space (Used Space)

Total amount of unique file system storage space that is used or consumed by the file systems in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

### File System Space (Capacity)

Total amount of unique file system storage space in a cluster. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

### File Count

Total number of files within a cluster. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.

- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by an agent.

When monitoring computers where the Windows operating system is installed, the number of files indicated in this column might be lower than the number of files reported by the operating system.

#### **Directory Count**

Total number of directories within a cluster. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by an agent.

When monitoring computers where the Windows operating system is installed, the number of folders indicated in this column might be higher than the number of folders that is reported by the operating system.

#### **Percent Used Inodes**

Percentage of used Inodes within a cluster.

#### **Used Inodes**

Number of used Inodes within a cluster.

#### **Free Inodes**

Number of free Inodes within a cluster.

#### **By Computer**

##### **Chart icon**

Click this button to generate a chart about the used file system storage space of the computers that are displayed in the report.

##### **Magnifying glass icon**

Click this button to view a more detailed report about the used file system storage space on a computer.

#### **Computer**

Name of the computer on which a file system resides.

#### **Available File System Space (Free Space)**

Total amount of unique file system storage space that is not used or is available to a computer. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

#### **Percent Available File System Space (Percent Free Space)**

Percentage of total file system storage space that is available within a computer.

#### **Consumed File System Space (Used Space)**

Total amount of unique file system storage space that is used or consumed by the computer where the Storage Resource agent or Data agent is

installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

### **File System Space (Capacity)**

Total amount of unique file system storage space that was discovered on the computer where the Storage Resource agent or Data agent is installed. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

#### **Note:**

- The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.
- The value that appears in the **TOTAL** row for this column does not include file systems on virtual machines where the Storage Resource agent or Data agent is installed.
- The drill-down reports for each computer will generate a list of detectable file systems only. Therefore, the total capacity of file systems for each computer drill-down report will equal this value.

### **File Count**

Total number of files within a computer. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, IBM Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

**Directory Count**

Total number of directories within a computer. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Percent Used Inodes**

Percentage of used Inodes within a computer.

**Used Inodes**

Number of used Inodes within a computer.

**Free Inodes**

Number of free Inodes within a computer.

**By Computer Group****Chart icon** 

Click this button to generate charts about the used file system storage space for a computer monitoring group or computer reporting group.

**Magnifying glass icon** 

Click this button to view more detailed information about the file systems in a computer monitoring group or computer reporting group.

**Creator**

ID of the user who created a group.

**Group** Name of a computer monitoring group or computer reporting group.

**Available File System Space (Free Space)**

Total amount of unique file system storage space that is not used or is available within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are not mounted.

**Percent Available File System Space (Percent Free Space)**

Percentage of total file system storage space that is available within a group.

**Consumed File System Space (Used Space)**

Total amount of used file system storage space within a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on hypervisors that are assigned to virtual machine servers where the Storage Resource agent or Data agent is installed if both the virtual machine file systems and hypervisor file systems reside within the group.
- File systems on virtual machine servers where the Storage Resource agent or Data agent is installed, but the hypervisor for the virtual machine servers has not been discovered and the total used space exceeds the capacity of the total file system capacity.

- File systems on virtual machine servers that are in a group without the underlying hypervisor file systems, and the total used space exceeds the capacity of the total file system capacity.
- File systems that become missing after a probe.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

#### **File System Space (Capacity)**

Amount of file system storage space for the computers in a group. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems on virtual machines where the Storage Resource agent or Data agent is installed.
- File systems that become missing after a probe.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

#### **File Count**

Total number of files within a group. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** For groups that contain Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, IBM Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

#### **Directory Count**

Total number of directories within a group. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

#### **Percent Used Inodes**

Percentage of used Inodes within a group.

#### **Used Inodes**

Number of used Inodes within a group.

**Free Inodes**

Number of free Inodes within a group.

**By Domain****Chart icon** 

Click this button to generate charts about the file system used space for a domain.

**Magnifying glass icon** 

Click this button to view more detailed information about the file system used space of computers that are in a domain.

**Domain**

Name of a domain.

**Available File System Space (Free Space)**

Total amount of unique file system storage space that is not used or is available to the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server
- File systems that are not mounted.

**Percent Available File System Space (Percent Free Space)**

Percentage of total file system storage space that is available within a domain.

**Consumed File System Space (Used Space)**

Total amount of unique file system storage space that is used or consumed by the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

**File System Space (Capacity)**

Total amount of unique file system storage space that was discovered on the computers within a domain. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data

agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space** + **Free Space**, the difference representing the space wasted due to the system overhead.

### File Count

Total number of files within a domain. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, IBM Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

### Directory Count

Total number of directories within a domain. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

### Percent Used Inodes

Percentage of used Inodes within a domain.

### Used Inodes

Number of used Inodes within a domain.

### Free Inodes

Number of free Inodes within a domain.

### Network-wide

#### Chart icon

Click this button to generate a chart about the file system used space in a network.

#### Magnifying glass icon

Click this button to view more detailed information about the file system used space in a network.

### Available File System Space (Free Space)

Total amount of unique file system storage space that is not used or is available to the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server

- File systems that are not mounted.

#### **Percent Available File System Space (Percent Free Space)**

Percentage of total file system storage space that is available within a network.

#### **Consumed File System Space (Used Space)**

Total amount of unique file system storage space that is used or consumed by the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

#### **File System Space (Capacity)**

Total amount of unique file system storage space that was discovered on the computers within a network. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Note:** The value in this column might be greater than **Used Space + Free Space** on some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the `df` command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Capacity** field is greater than or equal to the value of **Used Space + Free Space**, the difference representing the space wasted due to the system overhead.

#### **File Count**

Total number of files within a network. Tivoli Storage Productivity Center does not include the following files in its calculation of the value for this column:

- Files on file systems that become missing after a probe.
- Files on file systems that are not mounted.
- Files on file systems that have not been scanned by a Storage Resource agent or Data agent.

**Note:** On Windows computers, AIX systems, and systems using IBM General Parallel File System (GPFS) for file management, IBM Tivoli Storage Productivity Center calculates both the number of files and the number of directories for the value in this column. For example, if a Windows computer contains 150 files and 50 directories, the number in the File Count column is 200.

### **Directory Count**

Total number of directories within a network. Tivoli Storage Productivity Center does not include the following directories in its calculation of the value for this column:

- Directories on file systems that become missing after a probe.
- Directories on file systems that are not mounted.
- Directories on file systems that have not been scanned by a Storage Resource agent or Data agent.

### **Percent Used Inodes**

Percentage of used Inodes within a network.

### **Used Inodes**

Number of used Inodes within a network.

### **Free Inodes**

Number of free Inodes within a network.

## **Usage Reports**

Use Usage reports to view the usage and growth of the consumption of your storage. You can view these reports based on specific filesystems and computers, groups of filesystems and computers, or throughout your entire enterprise. These reports help you project storage consumption for the future and maximize the current storage assets that you have in place by eliminating wasted space and making the most of the space you have.

Use these reports to do the following:

- View which servers and filesystems are experiencing the heaviest (or lightest) load of data and storage access.
- Identify wasted space by pinpointing files that are no longer needed or have not been accessed for the longest time.
- Associate users with the amount of storage they are consuming on specific filesystems, groups of filesystems, specific computers, groups of computers, and throughout the entire network.
- Select the files against which to run an IBM Tivoli Storage Manager archive/backup job. Tivoli Storage Manager protects your organization's data from hardware failures and other errors by storing backup and archive copies of data on offline storage.

**Access Load reports:** Use Access Load reports to view which machines and file systems within your environment are experiencing the heaviest (or lightest) load of data and storage access.

### **Access Time reports**

Use Access Time reports to view and chart the amount of data and the number of files that have been accessed during the last day, the last week, the last month, the last year, and over. You can view this information at the directory level, the file system level, the computer level, at the domain level, and for the entire network.

The following report shows a single pie chart that depicts all of the data across the entire enterprise, giving you an easy way to see how much of your corporate data is accessed every day, every week, and even data that has not been accessed in over a year.

Figure 59. Usage Reporting—Access Load—Access Time—Chart Network Wide

### Modification Time reports

Use Modification Time reports to view and chart the amount of data and the number of files that have been modified during the last day, the last week, the last month, the last year, and over. You can view this information at the directory level, the file system level, the computer level, at the domain level, and for the entire network.

The following report shows a single pie chart that depicts all of the data across the entire enterprise, allowing you to see how much of your corporate data is modified every day, every week, and even data that has not been modified in over a year.

Figure 60. Usage Reporting—Access Load—Modification Time—Chart Network Wide

### Creation Time reports

Use Creation Time reports to view and chart the amount of data and the number of files that have been created during the last day, the last week,

the last month, the last year, and over. You can view this information at the directory level, the file system level, the computer level, at the domain level, and for the entire network.

**Note:** Because scans do not collect creation time information for the files stored on UNIX machines, creation time reports do not contain any data for the non-Windows machines in your environment.

**Files reports:** Use Files Reports to report on the files found on the storage in your environment during the Data Manager scan process. During the scan process, Data Manager gathers statistics on your files and attributes about the files. Select the files against which to run an IBM Tivoli Storage Manager archive or backup job. See “Archive and backup functions” on page 484 for information on how to create archive and backup jobs from the files shown in a Files report. The information gathered can be reported on in a variety of ways using this facility:

#### **Largest Files reports**

Use these reports to view information about the largest files in your environment. Largest Files reports enable you to do the following:

- Generate reports that contain detailed information about the largest files found in your environment. You can view reports on the largest files in the following ways: by directory, by directory group, by file system, by file system group, by cluster, by computer, by computer group, by domain, and for the entire network.

**Note:** The number of files that are gathered and stored in the repository is dependent upon the number that you specify in the profile that you use during scanning. The default profile gathers information on the 20 largest files. You can select a profile for the report by clicking the **Profile** list box.

- Select files against which to run an Tivoli Storage Manager archive or backup job. See “Archive and backup functions” on page 484 for information on how to create archive/backup jobs from the files shown in a Files report.
- Add files to an existing Tivoli Storage Manager archive/backup job. See “Archive and backup functions” on page 484 for information on how to add files from reports to an archive/backup job.

#### **Duplicate Files reports**

Use these reports to view information about the files found in your environment during a scan that contain duplicate file names. Duplicate Files reports enable you to do the following:

- Generate reports on the files found in your environment during a scan that contain duplicate file names. Use this report to view a list of files that might no longer be needed and could be wasting storage space. You can use the data generated in a duplicate files report to view a list of files that might no longer be needed and could be wasting storage space. You can view reports on duplicate files in the following ways: by directory, by directory group, by file system, by file system group, by cluster, by computer, by computer group, by domain, and for the entire network.

**Note:** The number of files that are gathered and stored in the repository is dependent upon the number that you specify in the profile that you

use during scanning. The default profile gathers information on the 20 largest files. You can select a profile for the report by clicking the **Profile** list box.

- Select files against which to run an Tivoli Storage Manager archive or backup job. See “Archive and backup functions” on page 484 for information on how to create archive and backup jobs from the files shown in a Files report.
- Add files to an existing Tivoli Storage Manager archive or backup job. See “Archive and backup functions” on page 484 for information on how to add files from reports to an archive or backup job.

Before generating a Duplicate Files report for environments that contain a large amount of files (i.e., environments that might contain over 100,000 duplicate files), we recommend you tune the Data Manager repository. To do this, run the appropriate RDBMS utility to collect statistics on the repository tables. Run the following utilities depending on the RDBMS where the repository is stored:

- UDB: runstats
- Oracle: analyze
- Microsoft SQL Server: update stats
- Sybase: update stats

Run the appropriate utility against all the tables in the repository schema you specified during the installation process.

To generate the data for a duplicate files report, you can either create a constraint that will save filenames for *n* number of violation files, or run a scan that includes one or all of the following existing profiles:

- TPCUser.Largest Files
- TPCUser.Largest Orphans
- TPCUser.Most at Risk
- TPCUser.Most Obsolete

There is not a specific Duplicate Files profile that collects information on all duplicate files in a file system. The filenames that are triggered by the previously listed profiles or constraints will be saved to the repository and the duplicate files report is generated from the data gathered from the scan or constraint.

For example, create a scan using the Largest Files profile to collect information on the 100 largest files. The 100 largest files are saved in the `t_stat_file` table in the repository. If five duplicate files were saved as a result of being flagged by the Largest File Profile, then those files will be reported as duplicates in the Duplicate file Report.

### **Most Obsolete Files reports**

Use these reports to view information about the files found in your environment that have not been accessed in the longest period of time. Most Obsolete Files reports enable you to do the following:

- Generate reports on the files found in your environment that have not been accessed in the longest period of time. It is very likely that many of these files are no longer needed, at least online, and could be wasting space. You can view reports on the largest files in the following ways: by directory, by directory group, by file system, by file system group, by cluster, by computer, by computer group, by domain, and for the entire network.

**Note:** The number of files that are gathered and stored in the repository is dependent upon the number that you specify in the profile that you use during scanning. The default profile gathers information on the 20 largest files. You can select a profile for the report by clicking the **Profile** list box.

- Select files against which to run a Tivoli Storage Manager archive or backup job. See “Archive and backup functions” on page 484 for information on how to create archive/backup jobs from the files shown in a Files report.
- Add files to an existing Tivoli Storage Manager archive or backup job. See “Archive and backup functions” on page 484 for information on how to add files from reports to an archive or backup job.

### Orphan Files reports

Use these reports to view information about files that are owned by users that are no longer active in the environment. Orphan files reporting enables you to do the following:

- Generate reports on files that are owned by users that are no longer active in the environment. It is very likely that many of these files are no longer needed and could be wasting space. You can view reports on orphan files in the following ways: by directory, by directory group, by file system, by file system group, by cluster, by computer, by computer group, by domain, and for the entire network.

You can also generate reports on the oldest orphan files that have not been accessed for the longest periods of time, as well as largest orphan files.

**Note:** The number of files that are gathered and stored in the repository is dependent upon the number that you specify in the profile that you use during scanning. The default profile gathers information on the 20 largest files. You can select a profile for the report by clicking the **Profile** list box.

- Select files against which to run a Tivoli Storage Manager archive or backup job. See “Archive and backup functions” on page 484 for information on how to create archive and backup jobs from the files shown in a Files report.
- Add files to an existing Tivoli Storage Manager archive or backup job. See “Archive and backup functions” on page 484 for information on how to add files from reports to an archive or backup job.

### File Size Distribution reports

Use these reports to view information about the distribution of file sizes across storage resources. Use File Size Distribution reports to generate reports that show the distribution of file sizes on a specific directory, a file system, a computer, the domain, or across your entire network.

The following report shows a single pie chart for each computer in the report.

Figure 61. Usage Reporting—Files—File Size Distribution—File Count Chart Tab

Each pie chart depicts the number of files that fall into each file size bucket that are described in the legend. For example, the blue portion of the pie represents the number of files on each computer that are smaller than 1024 bytes long. This gives you an easy way to get a quick grasp of what are the size distribution of your data files.

### File Summary reports

Use these reports to view general information about the files in your environment. Use File Summary reports generate overview information for files, also at the directory level, the file system level, the computer level, the domain level or for the whole network.

This report shows you the following (for each entity at the level you are reporting by):

- The total size of the files
- The number of files
- The number of directories
- The average file size

### File Types reports

Use these reports to view information about the storage usage of different file types in your environment. File Types reports enable you to generate reports on the file types found in your environment during a scan. The scan that collects data for these reports must use the TPCUser.Summary By File Type profile. For example, when you run a scan using the TPCUser.Summary By File Type profile, Data Manager will collect storage usage information about such file types as .exe, .zip, .sys, .pdf, .doc, .dll, .wav, .mp3, .avi, etc. Each of these file types is represented by its own row in the generated reports.

Use these reports to do the following:

- Relate the space used by applications to the total capacity and used space. For example, you can use these reports to view the total amount of storage consumed by Adobe Acrobat files and Lotus Notes mail databases.
- View which applications are consuming the most space across a given set of storage resources

You can view these reports in the following ways:

- **Group by Resource.** These reports organize data by storage resource (for example, file system, computer, cluster, etc.) and space used.
- **Group by File Type.** These reports organizes data by file type and space used. They show where the most spaced used by each type of file resides.

### Archive/Backup jobs from reports:

Use the Archive/Backup function from Reporting to define an archive or backup job to run against the files that you select from specified reports.

Tivoli Storage Manager protects your organization's data from hardware failures and other let you back up specified files. These files are not excluded in the include-exclude list and meet the requirement for serialization in the backup copy group of the management class assigned to each file. An incremental backup enables you to back up new or changed files or directories from a client domain or from specified directories or files. These directories or files are not excluded in the include-exclude list and meet the requirements for frequency, mode, and serialization as defined by a backup copy group of the management class assigned to each file. See *IBM Tivoli Storage Manager Client User's Guide* for more information about Tivoli Storage Manager archives and backups.

This function enables you to select a specific file or group of files from Data Manager reports that you want to archive or back up using the Tivoli Storage Manager tool.

Archive/backup is run from **Data Manager -> Reporting**. You cannot create archive and backup jobs from the Archive/Backup node - rather you create these jobs by selecting files from the previously listed reports or the reports that you create. Each archive and backup that you create from reports appears as a node under the Archive/Backup node. The reports that contain files against which you can run an archive or backup job include:

- **Data Manager -> Reporting -> Usage -> Files -> Largest Files**
- **Data Manager -> Reporting -> Usage -> Files -> Most Obsolete Files**
- **Data Manager -> Reporting -> Usage -> Files -> Orphan Files**
- **Data Manager -> Reporting -> Usage -> Files -> Duplicate Files**
- **Data Manager -> Reporting -> Backup -> Most at Risk Files ->**
- **Data Manager -> Reporting -> Usage Violations -> Constraint Violations**

You can also run an archive or backup job from a report you create.

### Note:

See *Creating Archive/Backup jobs in Reporting* for information about how to create an archive or backup job from the files shown in reports.

### **Directories reports:**

Use Directories reports to report upon the directories found on the storage in your environment during the scan process. During the scan process, Data Manager gathers a vast number of statistics on your directories and a number of attributes about the directories. Before you can view information about directories in these reports, you must do the following:

1. Use the **Monitoring → Groups → Directory** function to create directory groups that contain the directories upon which you want to report.
2. Include the directory groups you created in scans.
3. Schedule and run the scans that contain the directory groups (and directories) upon which you want to report.

### **Largest Directories reports**

Use Largest Directories reports to view reports on the  $n$  largest directories found in your environment:

- for specific directories
- on specific computers or groups of computers
- on specific file systems or groups of file systems
- in specific domains
- on the entire network

The number of largest (or the value of  $n$  in finding the  $n$  largest directories), is determined by the profile that you use for doing the reporting. When you define a profile in the **Monitoring → Profiles** node, you specify the number of largest directories upon which to collect information. When you generate a Largest Directories report, you can select what profile to use.

### **Monitored Directory Space reports**

Use Monitored Directory reports to report on the monitored directories that you have included in a group via the **Monitoring → Groups → Directory** facility and included in a scan. During the scan process, Data Manager gathers a number of statistics on your directories and a number of attributes about the directories.

**Users reports:** Use Users Reports to view information about the users that are found as file owners in your environment. These reports provide an easy and convenient way to view and aggregate storage resource consumption by owner across directories, file systems, computers, domains, and across your entire network.

**OS User Groups reports:** OS User Groups reports give you the exact same capabilities as the reports under Users reports. The only difference is that you are doing your analysis of OS User Groups as opposed to actual single users.

### **Usage Violation reports**

Use Usage Violation reports to view information about quota and constraint violations.

Usage Violation reports enable you to:

- Create and enforce corporate storage usage policies based on reports that show quota and constraint violations.

Use quotas to control how much storage a user, or a group of users, can consume on a filesystem or group of filesystems, a computer or group of computers, and throughout the entire network. Use Constraints to set policies

about which types of files, owners, and file sizes are allowed on a filesystem or group of file systems, a computer or group of computer, and throughout the entire network.

- Select files in Constraint Violation reports against which to run an IBM Tivoli Storage Manager archive/backup job. See “Archive and backup functions” on page 484 for information on how to create archive/backup jobs from the files shown in a Files report.
- Add files from Constraint Violation reports to an existing Tivoli Storage Manager archive or backup job. See “Create an archive/backup job” on page 485 for information on how to add files from reports to an archive/backup job.

**Constraint Violations reports:** Constraint Violations reporting enables you to do the following:

- View the files that have violated a constraint. The report shows one row for each Constraint. The row shows the detail of the constraint and the violating space totals for the files that violate the constraint. You can view reports on the files that violate constraints in the following ways: by file system, by file system group, by computer, by computer group, by domain, and by constraint.
- Select files against which to run an Tivoli Storage Manager archive or backup job. See the “Archive and backup functions” on page 484 section for information on how to create archive and backup jobs from the files shown in a Files report.
- Add files to an existing Tivoli Storage Manager archive or backup job. See the “Archive and backup functions” on page 484 section for information on how to add files from reports to an archive or backup job.

**Quota Violations reports:** Use Quota Violations reports to report on the quotas that you have defined and see how much space is being used by the various entities that have quotas defined upon them.

Quotas can be defined on either of two categories of users: on a specific user or group of users that you have defined within either Users or on OS User Groups. The two categories are described in the following list:

**User** This allows you to define a quota on a user or group of users. The users are the owners of the files that Data Manager finds as it scans your systems.

#### **OS User Group**

This allows you to define a quota on an OS user group or group of OS user groups. OS user groups are defined outside the tool and are found by Data Manager as it scans your systems.

Within each of those categories, you can define quotas at any one of following three levels:

#### **Network**

This allows you to define quotas on users or groups of users at the entire network level. This enables you to control how much any single user or group of users is using on all of the storage throughout your enterprise.

#### **Computer**

This allows you to define quotas on users or groups of users at the computer level. This enables you to control how much any single user or group of users is using on a single computer, or on any given group of computers.

## Filesystem

This allows you to define quotas on users or groups of users at the file system level. This enables you to control how much any single user or group of users is using on a single file system, or on any given group of file systems.

## All Quotas reports

Use All Quotas reports to report on all quotas that have been violated, including those at the network level, computer level, and file system level. The **Selection** tab allows you to select upon what users you wish to do quota reporting.

The **Objects** tab shows you for each user and computer and file system:

- how much space is being used
- what the Quota threshold is
- what the percentage of the Quota that is being consumed

This gives you a simple way to analyze how much space is being used relative to the Quotas that you have defined on your systems and users.

## Network-wide Quotas reports

Use Network-wide Quota reports to view all the network-wide quotas that have been violated by users and OS user groups in your environment. Information about the quotas that appear on these reports includes the amount of space being used, the threshold value, and the percentage over the threshold value. You can view these reports sorted by user, by OS user group, and by the creator of the quota.

## Computer Quotas reports

Use Computer Quota reports to view all the computer quotas that have been violated by users and OS user groups in your environment. Information about the quotas that appear on these reports includes the amount of space being used, the threshold value, and the percentage over the threshold value. You can view these reports sorted by user, by OS user group, and by the creator of the quota.

## Filesystem Quotas reports

Use Filesystem Quota reports to view all the computer quotas that have been violated by users and OS user groups in your environment. Information about the quotas that appear on these reports includes the amount of space being used, the threshold value, and the percentage over the threshold value. You can view these reports sorted by user, by OS user group, and by the creator of the quota.

## Backup reports

Use Backup reports to identify the most at risk files in your enterprise that are not backed up properly. Critical data that is not backed up might expose you to costly losses of information.

Backup reports also enable you to:

- Investigate the sizes of data that would be required to backup to achieve full backups of any subset of your enterprise (including the whole enterprise).
- Determine the amount of space required to perform an incremental backup of any or all of your data at any given point in time.

- Select files in Most at Risk Files reports against which to run an IBM Tivoli Storage Manager archive/backup job.
- Add files from Most at Risk Files reports to an existing Tivoli Storage Manager archive/backup job.

**Most At Risk Files reports:** Most At Risk Files reporting enables you to do the following:

- View the files that have the earliest modification time, but have not been backed up since they were modified. This can alert you to a dangerous situation where you may have vulnerable data that could be lost and not recovered due to lack of backups.
- Select files against which to run an IBM Tivoli Storage Manager archive or backup job. See the “Archive and backup functions” on page 484 section for information on how to create archive or backup jobs from the files shown in a Files report.
- Add files to an existing Tivoli Storage Manager archive or backup job. See the “Archive and backup functions” on page 484 section for information on how to add files from reports to an archive or backup job.

**Modified Files not Backed Up reports:** Use Modified Files not Backed Up reports to view the numbers of files that have the earliest modification time, but have not been backed up since they were modified. This can alert you to a dangerous situation where you may have vulnerable data that could be lost and not recovered due to lack of backups.

**Backup Storage Requirements reports:** Use Backup Storage Requirements reports to determine, at a network, domain computer, file system, or directory level, how much storage will be required to do backups. You can determine how much storage will be required to do both full backups and to do incremental backups.

Reporting Type	Description
<b>Full Backup Size</b>	Use Full Backup Size reports to view how much space it will take to do full backups of specific computers, file systems, directories, groups of those entities, domains, and the entire network.
<b>Incremental Backup Size</b>	(Windows only) Use this report to view the total size of all the files that have not been backed up since the last scan. You can generate this report by Directory, by Directory Group, by Filesystem, by Filesystem Group, by Computer, by Computer Group, by Domain and Network Wide. This allows you to see for any of these levels, how much data would need to be backed up for any of these desired time intervals. This is useful for backup sizing and can be used to determine appropriate backup groups and sets for timing your backups.

Reporting Type	Description
<b>Incremental Range Sizes</b>	<p>Use this report to determine how much storage space you would need to back up data that has been modified in the last day, week, month, two months, three months, six months, nine months, or year. For example, if you want to back up the files that have been modified in the last 3 months only, generate this report and view the values in the "Last Modified &lt;= 3 months" column to determine 1) how many files changed and 2) how much storage those changed files are consuming.</p> <p>You can generate this report by Directory, by Directory Group, by Filesystem, by Filesystem Group, by Cluster, by Computer, by Computer Group, by Domain and Network Wide. This allows you to see for any of these levels, how much data would need to be backed up for any of these desired time intervals. This is useful for backup sizing and can be used to determine appropriate backup groups and sets for timing your backups.</p>

## Monitored Computer Storage Space reports

Use these host-based reports to view the data that is collected by probes for computers, network attached storage, and hypervisors. These reports contain detailed information about the consumption of file system space and enable you to relate that space back to external or internal storage without counting shared space multiple times.

Monitored computer storage space reports are organized into the following categories:

### Disk Storage

Use these reports to view information about disks that reside on computers monitored by IBM Tivoli Storage Productivity Center. This includes information about storage subsystem disks, known disks with serial numbers, or unknown disks without serial numbers.

### Non-Disk Storage

Use these reports to view information about storage space that does not reside on computer disks that are monitored by Tivoli Storage Productivity Center. This type of storage includes the following:

- Storage that resides on a remote mount or a network attached server.
- Storage that is temporarily allocated to processor memory.

You must perform the following actions before viewing these reports:

- Run a probe against the storage entities upon which you want to report.
- If you want to generate By Computer Group, By Filesystem Group, and By Storage Subsystem Group reports, perform the following tasks:
  - Create computer monitoring group and file system monitoring groups using the **Data Manager > Monitoring > Groups** node and then probe them.
  - Create storage subsystem monitoring group using the **Disk Manager > Monitoring > Groups** node and probe them.
  - Create a computer reporting group or file system reporting group using the **Data Manager > Reporting > Groups** and **Disk Manager > Reporting > Groups** node. Probe the entities in the group.
  - Create a subsystem reporting group using the **Disk Manager > Reporting > Groups** node. Probe the storage subsystems in the group.

## Related Topics

- See Common storage space values to view descriptions of the common storage space values that appear in these reports.

## Monitored Computer Storage Space reports - Storage entities:

Monitored Computer Storage Space reports display information about storage entities that you probe. Use this topic to view descriptions of those entities.

You can use Monitored Computer Storage Space reports to view information about the following storage entities:

### Computer

Computer that is monitored by a Storage Resource agent or Data agent. This computer can be a single host, a virtual machine, or a hypervisor. A hypervisor is a machine that hosts one or more virtual machines.

### Disk on a storage subsystem

Computer disk that originates from a storage subsystem. If the disk's storage subsystem is not monitored by IBM Tivoli Storage Productivity Center, that storage subsystem is represented by a portion of the serial number of the disk. If the storage subsystem is monitored by Tivoli Storage Productivity Center, that storage subsystem is represented by the name collected by a probe.

### Disk not on a storage subsystem with a serial number

Computer disk that Tivoli Storage Productivity Center is unable to determine if it originates from a storage subsystem. Tivoli Storage Productivity Center is able to extract the serial number of that disk.

### Disk not on a storage subsystem without a serial number

A valid computer disk for which Tivoli Storage Productivity Center is unable to do the following:

- Determine if the disk originates from a storage subsystem.
- Extract the serial number of the disk.

### Disk Group

A collection of disk drives on a computer.

### File System

Storage entity that creates, removes, and modifies files on a computer. File systems can be shared among monitored computers and span portions of different disks. If a file system spans disk entities, then there will be a single logical volume beneath it that describes how the file system is spanned.

### (Parent) Logical Volume

Logical representation of a volume that spans many logical volumes. If there is no file system created on this logical volume, information about the parent logical volume is displayed in the reports.

### (Child) Logical Volume

Logical representation of a volume that spans one or more portions of a single or multiple disks. This entity helps determine how the parent logical volumes and file systems are allocated on the disks. If there is no file system created on this logical volume, or there is no parent logical volume for this logical volume, the child logical volume is displayed in the reports.

**Non-Disk Storage**

Storage space that does not reside on a computer disk. This includes storage residing on a remote mount or a network attached server and storage that is temporarily allocated to processor memory.

**Volume Group**

A collection of logical volumes on a computer.

**Virtual Machine (VM) Disk File**

Storage entity that represents a computer disk on a computer that is a virtual machine.

**Virtual Machine File System (VMFS)**

Storage entity that creates, removes, and modifies VM Disk files on a computer that is a hypervisor hosting one or more virtual machines.

**Monitored Computer Storage Space reports - Common storage space values:**

Monitored Computer Storage Space reports provide detailed storage space information about the computers probed by IBM Tivoli Storage Productivity Center. Use this topic to view descriptions of the common storage values that appear in these reports.

You can view the following storage space information in Monitored Computer Storage Space reports:

**Space** Total amount of storage space for the entity that a row represents:

- For file system rows, this is the total logical volume space where a file system resides.
- For logical volume rows, this is the total logical volume space.
- For computer disk rows, this is the total disk space of a computer disk.
- For computer space rows, this is the total storage subsystem volume space on a computer.
- For storage subsystem space rows, this is the total storage subsystem volume space on all monitored computers.

**Consumed Space**

Amount of consumed storage space for the entity that a row represents:

- For file system rows, this is the space that is consumed by data that can be accessed by the end user of a computer.
- For logical volume rows, this is the space that can be consumed by a file system, but is not yet consumed by a file system.
- For computer disk rows, this is the space that is consumed by the file systems and logical volumes on a disk.
- For computer space rows, this is the storage subsystem volume space that is consumed on a monitored computer.
- For storage subsystem space rows, this is the storage subsystem volume space that is consumed on all monitored computers.

**Available Space**

Amount of available storage space for the entity that a row represents:

- For file system rows, this is the space that is available for consumption.
- For logical volume rows, this value is zero (0) because no file system has been created on the logical volume that would help determine the amount of available space.

- For computer disk rows, this is the space that is available on the file systems on a computer disk and the space on a computer disk not yet allocated to a logical volume.
- For computer space rows, this is the storage subsystem volume space that is available for consumption on a computer.
- For storage subsystem space rows, this is the storage subsystem volume space that is available for consumption on all monitored computers.

### **Unavailable Space**

Amount of unavailable storage space for the entity that a row represents:

- For file system rows, this space is unavailable for consumption because it is reserved by the software RAID level on the underlying logical volume and is required for data that is used by the operating system to maintain a file system.
- For logical volume rows, this space is unavailable because it is reserved for the software RAID level of a logical volume.
- For computer disk rows, this is the space that is unavailable on the file systems and the logical volumes on a computer disk.
- For computer space rows, this is the storage subsystem volume space that is unavailable on a computer.
- For storage subsystem space rows, this is the storage subsystem volume space that is unavailable on all monitored computers.

### **Monitored Computer Storage Space - Disk Storage reports:**

Use these reports to view information about disks residing within computers that are monitored by IBM Tivoli Storage Productivity Center. This includes information about storage subsystem disks, known disks with serial numbers, and unknown disks without serial numbers.

Disk Storage reports are organized into the following categories:

#### **All Disk Storage**

Use these reports to view information about all the disks residing on computers that are monitored by Tivoli Storage Productivity Center.

#### **Disk Storage On Storage Subsystems**

Use these reports to view information about disks that Tivoli Storage Productivity Center has identified as storage subsystem volumes.

#### **Disk Storage Not On Storage Subsystems**

Use these reports to view information about disks that Tivoli Storage Productivity Center has not identified as storage subsystem volumes.

### **Related Topics**

- See Common storage space values to view descriptions of the common storage space values that appear in these reports.

*Disk Storage - All Disk Storage reports:*

Use these reports to view information about all the disks residing on computers that are monitored by IBM Tivoli Storage Productivity Center.

See All Disk Storage reports - Column Descriptions for descriptions of all the columns that appear in All Disk Storage reports.

Use By clauses to filter the entities that appear in a report. For example, if you want to view an All Disk Storage report that displays specific computers, select **By Computer** and use the **Selection** and **Filter** options to determine which computers appear in that report.

You can customize the information in each report by relating the monitored entities to other storage. The following options for relating entities to storage in these reports includes the following:

- Use the **Relate To:** options in the By Computer, By Computer Group, and By Disk/Volume Group reports to relate storage entities to the following storage:
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space
  - Computer Disk Space
  - Distributed Computer Disk Space
- Use the **Relate To:** options in the By File System/Logical Volume and By File System Groups reports to relate storage entities to the following storage:
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space

*All Disk Storage reports - Column Descriptions:*

Use these reports to view information about all the disks residing on computers that are monitored by IBM Tivoli Storage Productivity Center. Use this topic to view descriptions of the columns that appear in these reports.

The following buttons and columns appear in the By clauses of All Disk Storage reports:

**Note:** Not all of the following columns appear in each By clause.

#### **Selection...**

Click this button to select the specific entities that you want to include in the report. For example, in the **By Filesystem/Logical Volume** report, click this button to select the specific file systems or logical volumes upon which you want to report.

**Filter** Click this button to apply conditions to the columns within a report to further select or restrict the entities that you want to include in the report.

#### **Relate <entity> To:**

Select how you want to relate monitored storage entities in the report to other storage.

### Magnifying glass icon

This button appears on all **By <entity> Group** reports. Click this button to view a more detailed report about the entities in a group.

### Available Disk Space

Amount of space on a disk that is available for use. For computer groups, this is the amount of space on disks that is available for use by the computers in a group. For disk and volume groups, this is the external disk space available for use within those groups.

This space includes the file system space that is available on the disk and the space that is not allocated to a logical volume. For example, unpartitioned space.

The XIV system GUI and the XIV system command-line interface (CLI) report sizes in GB of disks, volumes, pools, and so on, based on  $10^9$ . Tivoli Storage Productivity Center reports sizes in GB based on  $2^{30}$ . For example, a volume showing a size of 17 GB in the XIV system GUI is reported as 16 GB (XIV GB size \* 1000 \* 1000 \* 1000 / 1024 / 1024 / 1024 rounded to the nearest GB) in Tivoli Storage Productivity Center.

### Available Disk/Volume Group Space

Amount of available space in a disk group or volume group.

### Available File System/Logical Volume Space

Amount of space on the file system or logical volume that is available for use. For computers groups, this is the amount of space on file systems or logical volumes that is available for use by the computers within those groups. For file system groups, this is the amount of space on file systems or logical volumes within those groups that can be consumed. For disk groups and volume groups, this is the external logical volume or file system space available for use within those groups.

### Computer

Name of a computer where a disk, file system, logical volume, or disk group is located.

### Computer OS Type

The operating system running on a computer.

### Consumed Disk Space

Amount of space on a disk that is consumed. For computer groups, this is the amount of disk consumed by the computers within those groups. For disk and volume groups, this is the external disk space consumed within those groups.

This space includes the file system space that is consumed on a disk. If a logical volume on this disk space has no file system, then this space includes the consumed portion of the logical volume that has been allocated to the disk.

### Consumed Disk/Volume Group Space

Amount of consumed disk or volume group space.

### Consumed File System or Logical Volume Space

Amount of space on the file system or logical volume consumed by the computer on a disk. For computer groups, this is the amount of space on file systems or logical volumes that is consumed by the computers within those groups. For file system groups, this is the amount of space on file systems or logical volumes within those groups that is consumed. For disk

groups and volume groups, this is the external logical volume or file system space consumed within those groups.

### **Correlated**

Indicates **Yes** if Tivoli Storage Productivity Center is able to relate the host storage directly to a storage subsystem. You can relate this correlated storage back to the actual storage subsystem storage for a more detailed view of how the host storage is allocated.

If a computer disk, file system, or logical volume appears in the Disk Storage On Storage Subsystem reports but is not correlated, it might be the result of the following reasons:

- The storage subsystem was not probed. Run a probe to collect data about the storage subsystem then generate this report.
- The storage subsystem storage was unassigned from the host storage, but the host has not been probed. Run a probe to collect data about the host then generate this report.
- The storage subsystem storage was not correctly identified by a probe of the host. If this is the problem, check the probe log of the host for messages relating to SCSI command errors and the probe results of the storage subsystem.

### **Creator**

ID of the user who created a group.

### **Disk Path**

Path name of a disk as seen by the computer.

### **Disk Space**

Total amount of space allocated to a computer disk. For computer groups, this is the total amount of space allocated to the disks on the computers within those groups. For disk and volume groups, this is the external disk space within the disk group or volume group.

### **Note:**

- This space is distributed across the hypervisor disk space from where the virtual machine disk's file resides. The portion of space identified to a particular external hypervisor disk is reported only. This is true for all space values in this report.
- The XIV system GUI and the XIV system command-line interface (CLI) report sizes in GB of disks, volumes, pools, and so on, based on  $10^9$ . Tivoli Storage Productivity Center reports sizes in GB based on  $2^{30}$ . For example, a volume showing a size of 17 GB in the XIV system GUI is reported as 16 GB ( $\text{XIV GB size} * 1000 * 1000 * 1000 / 1024 / 1024 / 1024$  rounded to the nearest GB) in Tivoli Storage Productivity Center.

### **Disk/Volume Group Name**

Name of a disk group or volume group where a logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

### **Disk/Volume Group Space**

Total amount of disk group or volume group space. This is space inclusive of all storage space and applies to all space values related to disk groups or volume groups.

### **Disk/Volume Group Type**

Type of a disk group.

**Fibre Attached**

Indicates **Yes** when Tivoli Storage Productivity Center determines that a disk is behind a fibre channel adapter port.

**File System Type**

Type of a file system, such as NTFS.

**File System/Logical Volume Path**

Name of a file system or logical volume path.

**Group** Name of a group.

**Grown Defects**

Number of defects detected on the disk since it was new.

**Hypervisor Name**

Name of the hypervisor where a virtual machine was created. This column displays **N/A** if not applicable to a disk.

**Logical Volume Space**

Total amount of space allocated to the logical volume on a disk. For computer groups, this is the total amount of space allocated to the logical volumes on disks within those groups. For file system groups, this is the total amount of space allocated to the logical volumes within those groups. For disk groups and volume groups, this is the external logical volume space within those groups.

This space includes the file system space on the disk reported if the entity displayed is a file system. The actual size of the file system on the disk reported is in addition to the consumed and available space.

**Note:** When relating a monitored entity to distributed file system/logical volume space, the space is distributed across the disks where a logical volume or file system resides. The portion identified to a disk is reported only.

**(Disk) Manufacturer**

The manufacturer of a disk.

**Mapped to Storage Subsystem**

Indicates **Yes** if Tivoli Storage Productivity Center has identified a disk as being located on a storage volume from a storage subsystem. The storage subsystem might not be monitored by Tivoli Storage Productivity Center.

**(Disk) Model**

Model number of a disk.

**Number of Disks**

Number of disks in a computer group. For disk groups and volume groups, this is the number of external disks within those groups.

**Number of File Systems/Logical Volumes**

Number of logical file systems or logical volumes within a group. For disk groups and volume groups, this is the number of external logical file systems or logical volumes within those groups.

The logical volumes underlying the file systems are not counted for the value in the column.

**Overallocated**

Indicates **Yes** if Tivoli Storage Productivity Center is unable to uniquely identify disk storage across more than one host. Check the probe log of the host for messages relating to SCSI command errors.

**Path Type**

Path type of the entity being reported: file system or a logical volume.

**Primary Defects**

Number of defects on the disk when it was new.

**Shared**

Indicates **Yes** if a file system or logical volume is shared by more than one computer.

**Serial Number**

Serial number of a disk.

**Unavailable Disk Space**

Amount of space on the disk not available to be consumed. For the computer groups, this is the amount of space on disks that is not available to be consumed by the computers in a group. For disk and volume groups, this is the external disk space that is not available for use within those groups.

This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

**Unavailable Logical Volume Space**

Amount of space on a logical volume that is not available for use by a computer. For computer groups, this is the amount of space on logical volumes that is not available for use by the computers within those groups. For file system groups, this is the amount of space on the logical volumes within those groups that is not available for use. For disk groups and volume groups, this is the external logical volume space that is not available for use within those groups.

This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

**VM Disk File**

Virtual machine disk's file on a monitored hypervisor that represents the disk on the virtual machine. This column displays **N/A** if not applicable to a disk.

**VMFS Disk**

Hypervisor disk where the virtual machine disk resides. This column displays **N/A** if not applicable to a disk.

**Note:** If a virtual machine disk's file spans multiple hypervisor disks, duplicate entries for the virtual machine disk are generated. If the report is distributed, the space is distributed across the hypervisor disks that are not external.

**VFMS Mount Point**

Hypervisor file system's mount point where the virtual machine disk's file resides. This column displays **N/A** if not applicable to a disk.

**Related Topics**

- All Disk Storage reports overview
- See Storage entities to view descriptions of the storage entities that appear in these reports.
- See Common storage space values to view descriptions of the common storage space values that appear in these reports.

*Disk Storage - Disk Storage on Storage Subsystems reports:*

Use these reports to view information about computer disks that IBM Tivoli Storage Productivity Center has identified as storage subsystem volumes.

See Disks On Storage Subsystems - Column Descriptions for descriptions of all the columns that appear in Disk Storage on Storage Subsystem reports.

Use By clauses to filter the entities that appear in a report. For example, if you want to view a report that displays specific computers, select **By Storage Subsystem** and use the **Selection** and **Filter** options to determine which storage subsystems appear in the generated report.

You can customize the information in each By clause by relating the monitored entities to other storage. The following options for relating storage entities (storage subsystems, computers, groups, file systems, logical volumes, disk groups, volume groups) to other storage in these reports includes the following:

- Use the **Relate Storage Subsystems To:** options in the By Storage Subsystem and By Storage Subsystem Group reports to relate storage subsystems to the following storage:
  - Computer Space
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space
  - Computer Disk Space
  - Distributed Computer Disk Space
- Use the **Relate Computers To:** and **Relate Disk/Volume Group To:** options in the By Computer, By Computer Group, and By Disk/Volume Group reports to relate storage computers, computer groups, disk groups, or volume groups to the following storage:
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space
  - Computer Disk Space
  - Distributed Computer Disk Space
  - Storage Subsystem Space (not available for disk groups and volume groups)
- Use the **Relate FileSystems/Logical Volumes To:** options in the By File System/Logical Volume and By Filesystem Group reports to relate file systems or logical volumes to the following storage:
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space

### Considerations

Keep in mind the following considerations when generating Disk Storage on Storage Subsystems reports:

#### **By Storage Subsystem (Relate Storage Subsystems To: File System/Logical Volume Space, Distributed File System/Logical Volume Space)**

Duplicate entries appear in By Storage Subsystem reports for file systems or logical volumes that span multiple storage subsystems. The storage space shown in the report is adjusted in the totals. The storage space values include space that is not storage subsystem storage if a file system or logical volume spans disks that are both storage subsystem disks and other storage disks.

When relating storage subsystems or computers to distributed file system/logical volume space, the reports displays duplicate entries for file systems or logical volumes that span multiple disks, but the displayed storage space unique. The values for storage space exclude space that is not storage subsystem storage if a file system or logical volume spans disks that are both storage subsystem disks and other storage disks.

#### **By Storage Subsystem (Relate Storage Subsystems To: Computer Disk Space, Distributed Computer Disk Space)**

Duplicate entries appear in these reports for virtual machines whose disks spans multiple hypervisor disks. The storage space shown in the report is adjusted in the totals. The storage space values include space that is not storage subsystem storage if the file system on a virtual machine spans hypervisor disks that are external or if the file system spans other storage disks.

When relating storage subsystems or computers to distributed computer disk space, this report displays duplicate entries for virtual machines whose disks spans multiple hypervisor disks, but the storage space shown in the report is unique. The storage space values exclude space that is not storage subsystem storage if the virtual machine disk's file system spans hypervisor disks that are external or the virtual machine disk's file system spans other storage disks.

#### **By XIV system**

The XIV system GUI and the XIV system command-line interface (CLI) report sizes in GB of disks, volumes, pools, and so on, based on  $10^9$ . Tivoli Storage Productivity Center reports sizes in GB based on  $2^{30}$ . For example, a volume showing a size of 17 GB in the XIV system GUI is reported as 16 GB (XIV GB size \* 1000 \* 1000 \* 1000 / 1024 / 1024 / 1024 rounded to the nearest GB) in Tivoli Storage Productivity Center.

#### **Related Topics**

Keep in mind the following considerations when generating Disk Storage on Storage Subsystems reports:

- Disks On Storage Subsystems - Column Descriptions
- Monitored Computer Storage Space reports overview
- See Storage entities to view descriptions of the storage entities that appear in these reports.
- See Common storage space values to view descriptions of the common storage space values that appear in these reports.

*Disks On Storage Subsystems - Column Descriptions:*

Use these reports to view information about disks on monitored computers that IBM Tivoli Storage Productivity Center has identified as storage subsystem volumes.

The following buttons and columns appear in the By clauses of Disks On Storage Subsystems reports:

**Note:** Not all of the following columns appear in each By clause.

#### **Selection...**

Click this button to select the specific entities that you want to include in

the report. For example, in the **By Storage Subsystem** report, click this button to select the specific storage subsystems upon which you want to report.

**Filter** Click this button to apply conditions to the columns within a report to further select or restrict the entities that you want to include in the report.

**Relate <entity> To:**

Select how you want to relate monitored storage entities in the report to other storage. See *Disk Storage - Disk Storage Not On Storage Subsystems* reports for more information.

**Magnifying glass icon** 

This button appears on all **By <entity> Group** reports. Click this button to view a more detailed report about the entities in a group.

**Available Disk Space**

Amount of disk space on a storage subsystem that is available for a computer to consume. For computer groups, this is the amount of space on disks that is available for use by the computers within those groups. For storage subsystem groups, this is the amount of space on disks that is available for use by the storage subsystems within those groups. For disk and volume groups, this is the external disk space available for use within those groups.

This space includes the file system space that is available on the disk and the space that has not been allocated to a logical volume.

**Available Disk/Volume Group Space**

Amount of available space in a disk group or volume group.

**Available File System/Logical Volume Space**

Amount of space on the file system or logical volume that is available for use by the computer on a storage subsystem. For computers groups and storage subsystem groups, this is the amount of space on file systems or logical volumes that is available for use on storage subsystems by the entities within those groups. For file system groups, this is the amount of space on file systems or logical volumes within those groups that can be consumed. For disk groups and volume groups, this is the external logical volume or file system space available for use within those groups.

**Computer**

Name of a computer where a disk, file system, logical volume, or disk group is located.

**Computer OS Type**

The operating system running on a computer.

**Consumed Disk Space**

Amount of disk space on a storage subsystem that is consumed by a computer. For storage subsystem groups, this is the amount of consumed disk space within those groups. For computer groups, this is the amount of disk space consumed by the computers those groups. For disk and volume groups, this is the external disk space consumed within those groups.

This space includes the file system space that is consumed on a disk. If a logical volume on this disk space has no file system, then this space includes the consumed portion of the logical volume that has been allocated to the disk.

**Consumed Disk/Volume Group Space**

Amount of consumed disk or volume group space.

**Consumed File System/Logical Volume Space**

Amount of space on the file system or logical volume that is consumed by the computer on a storage subsystem. For computer groups and storage subsystem groups, this is the amount of space on file systems or logical volumes that is consumed by the entities within those groups. For file system groups, this is the amount of storage subsystem space on file systems or logical volumes within those groups that is consumed. For disk groups and volume groups, this is the external logical volume or file system space consumed within those groups.

**Correlated**

Indicates **Yes** if Tivoli Storage Productivity Center is able to relate the host storage directly to a storage subsystem. You can relate this correlated storage back to the actual storage subsystem storage for a more detailed view of how the host storage is allocated.

If a computer disk, file system, or logical volume appears in the Disk Storage On Storage Subsystem reports but is not correlated, it might be the result of the following reasons:

- The storage subsystem was not probed. Run a probe to collect data about the storage subsystem then generate this report.
- The storage subsystem storage was unassigned from the host storage, but the host has not been probed. Run a probe to collect data about the host then generate this report.
- The storage subsystem storage was not correctly identified by a probe of the host. If this is the problem, check the probe log of the host for messages relating to SCSI command errors and the probe results of the storage subsystem.

**Creator**

ID of the user who created a group.

**Disk Path**

Path name of a disk as seen by the computer.

**Disk Space**

Total disk space on a storage subsystem seen by a computer. For computer groups, this is the total disk space within those groups that is associated with storage subsystems. For storage subsystem groups, this is the total disk space on the storage subsystems within those groups. For disk and volume groups, this is the external disk space within the disk group or volume group.

**Note:** This space is distributed across the hypervisor disk space from where the virtual machine disk's file resides. The portion of space identified to a particular external hypervisor disk is reported only. This is true for all space values in this report.

**Disk/Volume Group Name**

Name of a disk group or volume group where a logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

**Disk/Volume Group Space**

Total amount of disk group or volume group space. This is space inclusive of all storage space and applies to all space values related to disk groups or volume groups.

**Disk/Volume Group Type**

Type of a disk group. For example, a volume group might be LVM or Veritas. This column displays **N/A** if a disk group or volume group does not exist on a disk.

**Fibre Attached**

Indicates **Yes** when Tivoli Storage Productivity Center determines that a disk is behind a fibre channel adapter port.

**File System Type**

Type of a file system, such as NTFS.

**File System/Logical Volume Path**

Name of a file system or logical volume path.

**Group** Name of a group.**Grown Defects**

Number of defects detected on the disk since it was new.

**Hypervisor Name**

Name of the hypervisor where a virtual machine was created. This column displays **N/A** if not applicable to a disk.

**Logical Volume Space**

Total amount of space allocated to the logical volume on a disk. For computer groups, this is the total logical volume space in computer groups that is associated with storage subsystems. For storage subsystem groups, this is the total logical volume space on the storage subsystems within those groups. For file system groups, this is the total amount of space allocated to the logical volumes within those groups. For disk groups and volume groups, this is the external logical volume space within those groups.

This space includes the file system space on the disk reported if the entity displayed is a file system. The actual size of the file system on the disk reported is in addition to the consumed and available space.

**Note:** When relating a monitored entity to distributed file system/logical volume space, the space is distributed across the disks where a logical volume or file system resides. The portion identified to a disk is reported only.

**(Disk) Manufacturer**

The manufacturer of a disk.

**Mapped to Storage Subsystem**

Indicates **Yes** if Tivoli Storage Productivity Center has identified a disk as being located on a storage volume from a storage subsystem. The storage subsystem might not be monitored by Tivoli Storage Productivity Center.

**(Disk) Model**

Model number of a disk.

**Number of Disks**

Number of disks assigned to a storage subsystem or group. For disk

groups and volume groups, this is the number of external disks within those groups. For NetApp storage devices, this number does not include disks in partner storage pools.

**Number of File Systems/Logical Volumes**

Number of logical file systems or logical volumes within a group. For disk groups and volume groups, this is the number of external logical file systems or logical volumes within those groups.

The logical volumes underlying the file systems are not counted for the value in the column.

**Overallocated**

Indicates **Yes** if Tivoli Storage Productivity Center is unable to uniquely identify disk storage across more than one host. Check the probe log of the host for messages relating to SCSI command errors.

**Path Type**

Path type of the entity being reported: file system or a logical volume.

**Primary Defects**

Number of defects on the disk when it was new.

**Shared**

Indicates **Yes** if a file system or logical volume is shared by more than one computer.

**Serial Number**

Serial number of a disk.

**Storage Subsystem Manufacturer**

The manufacturer of a storage subsystem.

**Storage Subsystem Type**

The type of storage subsystem.

**Unavailable Disk Space**

Amount of disk space on the storage subsystem that is not available for a computer to consume. For the computer groups, this is the amount of space on disks that is not available to be consumed by the computers within those groups. For the storage subsystem groups, this is the amount of space on disks that is not available to be consumed within those groups. For disk and volume groups, this is the external disk space that is not available for use within those groups.

This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

**Unavailable Logical Volume Space**

Amount of space on the logical volume that is not available for use by the computer on a storage subsystem. For computer groups and storage subsystem groups, this is the amount of space on logical volumes that is not available for use by the entities within those groups. For file system groups, this is the amount of space on the logical volumes within those groups that is not available for use. For disk groups and volume groups, this is the external logical volume space that is not available for use within those groups.

This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

### VM Disk File

Virtual machine disk's file on a monitored hypervisor that represents the disk on the virtual machine. This column displays **N/A** if not applicable to a disk.

### VMFS Disk

Hypervisor disk where the virtual machine disk resides. This column displays **N/A** if not applicable to a disk.

**Note:** If a virtual machine disk's file spans multiple hypervisor disks, duplicate entries for the virtual machine disk are generated. If the report is distributed, the space is distributed across the hypervisor disks that are not external.

### VFMS Mount Point

Hypervisor file system's mount point where the virtual machine disk's file resides. This column displays **N/A** if not applicable to a disk.

### Related Topics

- See Common storage space values to view descriptions of the common storage space values that appear in these reports.

*Disk Storage - Disk Storage Not On Storage Subsystems reports:*

Use these reports to view information about computer disks that IBM Tivoli Storage Productivity Center has not identified as storage subsystem volumes.

These reports are organized into the following categories:

#### Disks With Serial Numbers

These reports display information about non-storage subsystem disks that Tivoli Storage Productivity Center has identified with a valid serial number.

#### Disks Without Serial Numbers

These reports display information about non-storage subsystem disks that Tivoli Storage Productivity Center has not identified with serial numbers that uniquely identify those disks. This might occur on internal disks within a hypervisor and virtual machines that have storage created from internal disks within a hypervisor. If this problem occurs for other types of storage, check the probe log of the host for messages relating to SCSI command errors.

See Disks Not On Storage Subsystems - Column Descriptions for descriptions of all the columns that appear in Disk Storage Not On Storage Subsystems reports.

Use **By** clauses to filter the entities that appear in a report. For example, if you want to view a Disk Storage Not On Storage Subsystems report that displays specific computers, select **By Computer** and use the **Selection** and **Filter** options to determine which computers appear in that report.

You can customize the information in each **By** clause by relating the monitored entities to other storage. The following options for relating storage entities

(computers, computer groups, file systems, file system groups, logical volumes, disk groups, volume groups) to other storage in these reports includes the following:

- Use the **Relate Computers To:** and **Relate Disk/Volume Group To:** options in the By Computer, By Computer Group, and By Disk/Volume Group reports to relate computers, computer groups, disk groups, and volume groups to the following storage:
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space
  - Computer Disk Space
  - Distributed Computer Disk Space
- Use the **Relate FileSystems/Logical Volumes To:** options in the By File System/Logical Volume and By Filesystem Group reports to relate file systems or logical volumes to the following storage:
  - File System or Logical Volume Space
  - Distributed File System or Logical Volume Space

#### *Disks Not On Storage Subsystems - Column Descriptions:*

Use Disks Not On Storage Subsystems reports to view information about disk storage that is not associated with storage subsystems. IBM Tivoli Storage Productivity Center has not identified the disks in this report as storage subsystem volumes. Use this topic to view descriptions of the columns that appear in these reports.

The following buttons and columns appear in the By clauses of Disks Not On Storage Subsystems reports:

**Note:** Not all of the following columns appear in each By clause.

#### **Selection...**

Click this button to select the specific entities that you want to include in the report. For example, in the **By Filesystem/Logical Volume** report, click this button to select the specific file systems or logical volumes upon which you want to report.

**Filter** Click this button to apply conditions to the columns within a report to further select or restrict the entities that you want to include in the report.

#### **Relate <entity> To:**

Select how you want to relate monitored storage entities in the report to other storage. See Disk Storage - Disk Storage Not On Storage Subsystems reports for more information.

### Magnifying glass icon

This button appears on all **By <entity> Group** reports. Click this button to view a more detailed report about the entities in a group.

### Available Disk Space

Amount of space on a disk that is available for use by a computer. For computer groups, this is the amount of space on disks that is available for use by the computers in a group. For disk and volume groups, this is the external disk space available for use within those groups.

This space includes the file system space that is available on the disk and the space that has not been allocated to a logical volume.

### Available Disk/Volume Group Space

Amount of available space in a disk group or volume group.

### Available File System/Logical Volume Space

Amount of space on the file system or logical volume that is available for use on a disk. For computers groups, this is the amount of space on file systems or logical volumes that is available for use by the computers within those groups. For file system groups, this is the amount of space on file systems or logical volumes within those groups that can be consumed. For disk groups and volume groups, this is the external logical volume or file system space available for use within those groups.

### Computer

Name of a computer where a disk, file system, logical volume, or disk group is located.

### Computer OS Type

The operating system running on a computer.

### Consumed Disk Space

Amount of space on a disk that is consumed. For computer groups, this is the amount of disk consumed by the computers in those groups. For disk and volume groups, this is the external disk space consumed within those groups.

This space includes the file system space that is consumed on a disk. If a logical volume on this disk space has no file system, then this space includes the consumed portion of the logical volume that has been allocated to the disk.

### Consumed Disk/Volume Group Space

Amount of consumed disk or volume group space.

### Consumed File System/Logical Volume Space

Amount of space on the file system or logical volume consumed by the computer on a disk. For computer groups, this is the amount of space on file systems or logical volumes that is consumed by the computers within those groups. For file system groups, this is the amount of space on file systems or logical volumes within those groups that is consumed. For disk groups and volume groups, this is the external logical volume or file system space consumed within those groups.

### Creator

ID of the user who created a group.

### Disk Path

Path name of a disk as seen by the computer.

**Disk Space**

Total amount of space allocated to a computer disk. For computer groups, this is the total amount of space allocated to the disks on the computers within those groups. For disk and volume groups, this is the external disk space within the disk group or volume group.

**Note:** This space is distributed across the hypervisor disk space from where the virtual machine disk's file resides. The portion of space identified to a particular external hypervisor disk is reported only. This is true for all space values in this report.

**Disk/Volume Group Name**

Name of a disk group or volume group where a logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

**Disk/Volume Group Space**

Total amount of disk group or volume group space. This is space inclusive of all storage space and applies to all space values related to disk groups or volume groups.

**Disk/Volume Group Type**

Type of a disk group. For example, a volume group might be LVM or Veritas. This column displays **N/A** if a disk group or volume group does not exist on a disk.

**Fibre Attached**

Indicates **Yes** when Tivoli Storage Productivity Center determines that a disk is behind a fibre channel adapter port.

**File System Type**

Type of a file system, such as NTFS.

**File System/Logical Volume Path**

Name of a file system or logical volume path.

**Group** Name of a group.**Grown Defects**

Number of defects detected on the disk since it was new.

**Hypervisor Name**

Name of the hypervisor where a virtual machine was created. This column displays **N/A** if not applicable to a disk.

**Logical Volume Space**

Total amount of space allocated to the logical volume on a disk. For computer groups, this is the total amount of space allocated to the logical volumes on disks within those groups. For file system groups, this is the total amount of space allocated to the logical volumes within those groups. For disk groups and volume groups, this is the external logical volume space within those groups.

This space includes the file system space on the disk reported if the entity displayed is a file system. The actual size of the file system on the disk reported is in addition to the consumed and available space.

**Note:** When relating a monitored entity to distributed file system/logical volume space, the space is distributed across the disks where a logical volume or file system resides. The portion identified to a disk is reported only.

**(Disk) Manufacturer**

The manufacturer of a disk.

**(Disk) Model**

Model number of a disk.

**Number of Disks**

Number of disks in a computer group. For disk groups and volume groups, this is the number of external disks within those groups.

**Number of File Systems/Logical Volumes**

Number of logical file systems or logical volumes within a group. For disk groups and volume groups, this is the number of external logical file systems or logical volumes within those groups.

The logical volumes underlying the file systems are not counted for the value in the column.

**Overallocated**

Indicates **Yes** if Tivoli Storage Productivity Center is unable to uniquely identify disk storage across more than one host. Check the probe log of the host for messages relating to SCSI command errors.

**Path Type**

Path type of the entity being reported: file system or a logical volume.

**Primary Defects**

Number of defects on the disk when it was new.

**Shared**

Indicates **Yes** if a file system or logical volume is shared by more than one computer.

**Serial Number**

Serial number of a disk.

**Unavailable Disk Space**

Amount of space on the disk not available to be consumed. For the computer groups, this is the amount of space on disks that is not available to be consumed by the computers in a group. For disk and volume groups, this is the external disk space that is not available for use within those groups.

This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

**Unavailable Logical Volume Space**

Amount of space on a logical volume that is not available for use by a computer. For computer groups, this is the amount of space on logical volumes that is not available for use by the computers within those groups. For file system groups, this is the amount of space on the logical volumes within those groups that is not available for use. For disk groups and volume groups, this is the external logical volume space that is not available for use within those groups.

This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

**VM Disk File**

Virtual machine disk's file on a monitored hypervisor that represents the disk on the virtual machine. This column displays **N/A** if not applicable to a disk.

### VMFS Disk

Hypervisor disk where the virtual machine disk resides. This column displays **N/A** if not applicable to a disk.

**Note:** If a virtual machine disk's file spans multiple hypervisor disks, duplicate entries for the virtual machine disk are generated. If the report is distributed, the space is distributed across the hypervisor disks that are not external.

### VFMS Mount Point

Hypervisor file system's mount point where the virtual machine disk's file resides. This column displays **N/A** if not applicable to a disk.

### Disk Storage - Non-Disk Storage reports:

Use these reports to view information about storage space that does not reside on disks that are monitored by IBM Tivoli Storage Productivity Center. This includes storage that resides on a remote mount or a network attached server and storage that is temporarily allocated to processor memory.

Use **By** clauses to filter the entities that appear in a report. For example, if you want to view a report that displays specific computers, select **By Computer** and use the **Selection** and **Filter** options to determine which computers appear in the generated report.

The following **By** clauses are available for Non-Disk Storage reports:

- By Computer
- By Computer Group
- By Filesystem/Logical Volume
- By Filesystem Group
- By Disk/Volume Group

You can customize the information in each **By** clause by relating the monitored entities to other storage. The following options for relating storage entities (computers, computer groups, file systems, file system groups, logical volumes, disk groups, volume groups) to other storage in these reports includes the following:

- File System or Logical Volume Space
- Distributed File System or Logical Volume Space

### Related Topics

- Monitored Computer Storage Space reports overview

- See Common storage space values to view descriptions of the common storage space values that appear in these reports.

*Non-Disk Storage - By Computer report, By Filesystem/Logical Volume report:*

Use these reports to view information about non-disk storage. This includes storage that resides on a remote mount or a network attached server and storage that is temporarily allocated to processor memory. Select **By Computer** if you want to determine which computers are displayed in the report. Select **By Filesystem/Logical Volume** if you want to determine which file systems or logical volumes appear in the report.

**Selection...**

For the **By Computer** reports, click this button to select the specific computers upon which you want to report. For the **By Filesystem/Logical Volume** reports, click this button to select the specific file systems or logical volumes upon which you want to report.

**Filter** Click this button to apply conditions to the columns within a report to further select or restrict computers or file system/logical volumes upon which you want to report.

**Relate <entity> To:**

Select how you want to relate computers or file systems in the report to other storage entities. See JDisk Storage - Non-Disk Storage reports for more information.

**Computer**

Name of a computer.

**File System/Logical Volume Path**

Name of a file system or logical volume path.

**Note:** Each monitored file system or logical volume path is displayed only once in this report because if the storage space is not distributed (there are no underlying disks), then there is no need to report distribution.

**Logical Volume Space**

Total amount of space allocated to the logical volume on a disk. This space includes the file system space if the entity displayed is a file system. The actual size of the file system is in addition to the consumed and available space.

**Note:** When relating computers to distributed file system/logical volume space, the space is distributed across the logical volumes where the file system or parent logical volume resides. The portion identified to a particular file system or parent logical volume is reported only. If a file system does not have an underlying logical volume, the logical volume space is the size of that file system.

**Consumed File System/Logical Volume Space**

Amount of space on a file system or logical volume that is consumed by a computer.

**Available File System/Logical Volume Space**

Amount of space on a file system or logical volume that is available for use by a computer.

**Unavailable Logical Volume Space**

Amount of space on the logical volume that is not available for use by a computer. This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

**Computer OS Type**

Operating system running on a computer.

**Disk/Volume Group Name**

Name of a disk or volume group where the logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

**Disk/Volume Group Type**

Type of a disk or volume group where the logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

**File System Type**

Type of a file system, such as NTFS.

**Path Type**

Path type of an entity: file system or a logical volume.

**Shared**

Indicates **Yes** if a file system or logical volume is shared by more than one computer.

*Non-Disk Storage - By Computer Group report, By Filesystem Group report:*

Use these reports to view information about non-disk storage. This includes storage that resides on a remote mount or a network attached server and storage that is temporarily allocated to processor memory. Select **By Computer Group** if you want to determine which computer groups are displayed in the report. Select **By Filesystem Group** if you want to determine which file system groups appear in the report.

**Selection...**

For the **By Computer Group** reports, click this button to select the specific computer groups upon which you want to report. For the **By Filesystem Group** reports, click this button to select the specific file system group upon which you want to report.

**Filter** Click this button to apply conditions to the columns within a report to further select or restrict groups upon which you want to report.

**Relate <entity> To:**

Select how you want to relate groups in the report to other storage entities. See Disk Storage - Non-Disk Storage reports for more information.

A unique row appears for each group in this report.

**Magnifying glass icon** 

Click this button to view a more detailed report about the computers or file systems in a group.

**Creator**

ID of the user who created the group.

**Group** Name of a group.

**Logical Volume Space**

Total amount of space allocated to the computers or file systems in a group. This space includes the file system space if the entity displayed is a file system. The actual size of the file system is in addition to the consumed and available space.

**Note:** When relating groups to distributed file system/logical volume space, this space is distributed across the disks from where the logical volume or file system reside. This is true for all space values in the Distributed File System/Logical Volume Space report.

**Consumed File System/Logical Volume Space**

Amount of space on file systems or logical volumes within a group that is consumed.

**Available File System/Logical Volume Space**

Amount of space on file systems or logical volumes within a group that can be consumed.

**Unavailable Logical Volume Space**

Amount of space on the logical volumes in a group that is not available for use. This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

**Number of File Systems/Logical Volumes**

Number of file systems or logical volumes in a group.

*Non-Disk Storage - By Computer report, By Filesystem/Logical Volume report:*

Use these reports to view information about non-disk storage. This includes storage that resides on a remote mount or a network attached server and storage that is temporarily allocated to processor memory. Select **By Computer** if you want to determine which computers are displayed in the report. Select **By Filesystem/Logical Volume** if you want to determine which file systems or logical volumes appear in the report.

**Selection...**

For the **By Computer** reports, click this button to select the specific computers upon which you want to report. For the **By Filesystem/Logical Volume** reports, click this button to select the specific file systems or logical volumes upon which you want to report.

**Filter** Click this button to apply conditions to the columns within a report to further select or restrict computers or file system/logical volumes upon which you want to report.

**Relate <entity> To:**

Select how you want to relate computers or file systems in the report to other storage entities. See JDisk Storage - Non-Disk Storage reports for more information.

**Computer**

Name of a computer.

**File System/Logical Volume Path**

Name of a file system or logical volume path.

**Note:** Each monitored file system or logical volume path is displayed only once in this report because if the storage space is not distributed (there are no underlying disks), then there is no need to report distribution.

**Logical Volume Space**

Total amount of space allocated to the logical volume on a disk. This space includes the file system space if the entity displayed is a file system. The actual size of the file system is in addition to the consumed and available space.

**Note:** When relating computers to distributed file system/logical volume space, the space is distributed across the logical volumes where the file system or parent logical volume resides. The portion identified to a particular file system or parent logical volume is reported only. If a file system does not have an underlying logical volume, the logical volume space is the size of that file system.

**Consumed File System/Logical Volume Space**

Amount of space on a file system or logical volume that is consumed by a computer.

**Available File System/Logical Volume Space**

Amount of space on a file system or logical volume that is available for use by a computer.

**Unavailable Logical Volume Space**

Amount of space on the logical volume that is not available for use by a computer. This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

**Computer OS Type**

Operating system running on a computer.

**Disk/Volume Group Name**

Name of a disk or volume group where the logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

**Disk/Volume Group Type**

Type of a disk or volume group where the logical volume or file system was created. This column displays **N/A** if a disk group or volume group does not exist on a disk.

**File System Type**

Type of a file system, such as NTFS.

**Path Type**

Path type of an entity: file system or a logical volume.

**Shared**

Indicates **Yes** if a file system or logical volume is shared by more than one computer.

*Non-Disk Storage - By Computer Group report, By Filesystem Group report:*

Use these reports to view information about non-disk storage. This includes storage that resides on a remote mount or a network attached server and storage that is temporarily allocated to processor memory. Select **By Computer Group** if you want to determine which computer groups are displayed in the report. Select **By Filesystem Group** if you want to determine which file system groups appear in the report.

**Selection...**

For the **By Computer Group** reports, click this button to select the specific computer groups upon which you want to report. For the **By Filesystem Group** reports, click this button to select the specific file system group upon which you want to report.

**Filter** Click this button to apply conditions to the columns within a report to further select or restrict groups upon which you want to report.

**Relate <entity> To:**

Select how you want to relate groups in the report to other storage entities. See Disk Storage - Non-Disk Storage reports for more information.

A unique row appears for each group in this report.

**Magnifying glass icon** 

Click this button to view a more detailed report about the computers or file systems in a group.

**Creator**

ID of the user who created the group.

**Group** Name of a group.**Logical Volume Space**

Total amount of space allocated to the computers or file systems in a group. This space includes the file system space if the entity displayed is a file system. The actual size of the file system is in addition to the consumed and available space.

**Note:** When relating groups to distributed file system/logical volume space, this space is distributed across the disks from where the logical volume or file system reside. This is true for all space values in the Distributed File System/Logical Volume Space report.

**Consumed File System/Logical Volume Space**

Amount of space on file systems or logical volumes within a group that is consumed.

**Available File System/Logical Volume Space**

Amount of space on file systems or logical volumes within a group that can be consumed.

**Unavailable Logical Volume Space**

Amount of space on the logical volumes in a group that is not available for use. This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

**Number of File Systems/Logical Volumes**

Number of file systems or logical volumes in a group.

*Disk Storage on Storage Subsystems reports - By Disk/Volume Group:*

Use this report to view information about non-disk storage. This includes storage that resides on a remote mount or a network attached server and storage that is temporarily allocated to processor memory. This report enables you to determine which disk groups or volume groups are displayed.

**Selection...**

Click this button to select the specific disk groups or volume groups upon which you want to report.

**Filter** Click this button to apply conditions to the columns within a report to further select or restrict disk groups or volume groups upon which you want to report.

**Relate Disk/Volume Group To:**

Select how you want to relate the non-disk storage in disk groups or volume groups to other storage entities. See Disk Storage - Non-Disk Storage reports for more information.

A unique row appears for each disk group or volume group.

**Magnifying glass icon** 

Click this button to view a more detailed report about the disk or file system within the disk group or volume group.

**Disk/Volume Group Name**

Name of a group.

**Disk/Volume Group Type**

Type of a group. For example, a volume group might be LVM or Veritas.

**Computer**

Name of the computer where a disk group or volume group resides.

**Computer OS Type**

Operating system running on a computer.

**Disk/Volume Group Space**

Total amount of disk group or volume group space. This is space inclusive of all storage space and applies to all space values related to disk groups or volume groups.

**Consumed Disk/Volume Group Space**

Amount of consumed disk group or volume group space.

**Available Disk/Volume Group Space**

Amount of available disk group or volume group space.

**Logical Volume Space**

External logical volume space within a disk group or volume group.

**Consumed File System/Logical Volume Space**

External logical volume or file system space that is consumed within a disk group or volume group.

**Available File System/Logical Volume Space**

External logical volume or file system space that is available for use within a disk group or volume group.

**Unavailable Logical Volume Space**

External logical volume space that is not available for use within a disk group or volume group. This space is used for logical volume overhead and is reserved by the operating system to manage a file system.

**Number of File Systems/Logical Volumes**

Number of external logical file systems or logical volumes within a disk or volume group. The logical volumes underlying the file systems are not counted.

## **Additional reporting support and information**

Learn about the additional storage devices upon which you can report within Data Manager.

**IBM FAStT Subsystem support:** The IBM FAStT subsystem reporting feature further extends the subsystem reporting capabilities of Data Manager. You can use the Reporting facility to view information about the capacity, allocation, and volumes of an IBM FAStT subsystem. You can view IBM FAStT subsystem information by using the following menu options to generate reports:

- **Reporting** → **Asset** → **By Storage Subsystem** → <IBM FAStT subsystem name>
- **Reporting** → **Asset** → **System-wide** → **Storage Subsystems**

- **Reporting → Asset → System-wide → Volumes**
- **Reporting → Asset → System-wide → Disks**

**Note:** Data Manager shows an incorrect value for the **Storage Pool Free Space** column in IBM FAStT subsystem reports (for example, **Asset → By Storage Subsystem → <FAStT\_subsystem\_name>**, and **Asset → System-wide → Storage Subsystems**). The value for **Storage Pool Free Space** in these reports reflects the space from one Free Capacity node rather than all the free space within the defined arrays on a FAStT subsystem.

**Hitachi Data Systems Subsystem support:** Use the Reporting facility to report on Hitachi Data Systems (HDS) storage subsystems. You can view reports that contain information about the capacity, allocation, and volumes of an HDS subsystem.

Any storage pools or volumes created using the HDS **HiCommand** software will not be reported through the HDS CIMOM provider. **HiCommand** is the native interface for HDS subsystems. If you configure an HDS subsystem through **HiCommand**, IBM Tivoli Storage Productivity Center will not be able to gather information about storage pools and volumes from that subsystem. The HDS CIM agent provider will return all storage pools created through the **HiCommand** interface as a single pool containing all of the **HiCommand** created pools. This single pool is always reported as Raid 5.

**Note:** Data Manager does not report on the raw capacity of disks internal to the HDS subsystem. Information on the internal disks of the HDS subsystem is not available through the CIMOM interface provided by the Hitachi HiCommand Device Manager.

You can view HDS storage subsystem information by using the following menu options to generate reports:

- **Reporting → Asset → By Storage Subsystem → <HDS subsystem name>**
- **Reporting → Asset → System-wide → Storage Subsystems**
- **Reporting → Asset → System-wide → Volumes**
- **Reporting → Asset → System-wide → Disks**
- **Reporting → TPC-wide Storage Space → Disk Space**

**HP StorageWorks Subsystem support:** Use the Reporting facility to report on HP StorageWorks storage subsystems. You can view reports that contain information about the capacity, allocation, and volumes of an HP StorageWorks subsystem.

You can view HP StorageWorks storage subsystem information by using the following menu options to generate reports:

- **Reporting → Asset → By Storage Subsystem → <HP StorageWorks subsystem name>**
- **Reporting → Asset → System-wide → Storage Subsystems**
- **Reporting → Asset → System-wide → Volumes**
- **Reporting → Asset → System-wide → Disks**

**IBM Tivoli Storage SAN File Systems support:** You can also perform scans and probes to gather information about IBM Tivoli Storage SAN File Systems and generate reports based on that information using the Reporting facility. You can view information gathered by probes of the SAN File System by using the following menu options to generate reports:

- **Reporting** → **Asset** → **By OS Type** → **IBM SAN File System**
- **Reporting** → **Asset** → **By Computer**
- **Reporting** → **TPC-wide Storage Space** → **File System Space**
- **Reporting** → **TPC-wide Storage Space** → **Consumed File System Space**
- **Reporting** → **TPC-wide Storage Space** → **Available File System Space**

**Note:** Due to the complexity of the SAN File System, the values displayed for total capacity, used space and free space in the Capacity and Asset reports might not be accurate. The values displayed are the values returned by the probe or scane and they may not represent actual values for your SAN File System. Use the SAN File System admin console to obtain the actual values.

You can view information gathered by scans of the SAN File System by using the following menu options to generate reports:

- **Reporting** → **Usage**
- **Reporting** → **Usage Violations**
- **Reporting** → **Backup**

Refer to the *Creating Directory Groups* section in the *Monitoring* chapter for more information about how to configure SAN File System support within the Reporting facility.

#### **Report Array, Loop, and Adapter Pair for IBM TotalStorage Enterprise Storage Server Disk Groups support:**

Disk Manager provides report information on Array, Loop, and Adapter Pairs for TotalStorage Enterprise Storage Server Disk Groups. This information is available when managing an TotalStorage Enterprise Storage Server through IBM CIM Agent (ICAT) for TotalStorage Enterprise Storage Server version 1.2.0.13. Contact IBM Customer Support to obtain IBM CIM Agent for TotalStorage Enterprise Storage Server version 1.2.0.13.

You can view Array, Loop, and Adapter Pair information by using the menu option **Reporting** → **Asset Reporting** → **By Storage Subsystem** to generate reports.

#### **Conversion of volume sizes by IBM Tivoli Storage Productivity Center:**

Tivoli Storage Productivity Center uses 1024 bytes to represent a kilobyte. However, some element managers use 1000 bytes to represent a kilobyte. When reporting volume sizes, Tivoli Storage Productivity Center converts base-1000 values to base-1024 values.

The following table shows the byte values that are associated with base-1024 and base-1000 systems:

Unit	Abbreviation	Bytes in base-1024	Bytes in base-1000
Kilobyte	KB in base-1024	$2^{10}$ or 1024	$10^3$ or 1000
	kB in base-1000 <sup>see note</sup>		
Megabyte	MB	$1024^2$ or 1,048,576	$10^6$ or 1,000,000
Gigabyte	GB	$1024^3$ or 1,073,741,824	$10^9$ or 1,000,000,000
Terabyte	TB	$1024^4$ or 1,099,511,627,716	$10^{12}$ or 1,000,000,000,000

**Note:** In SI Metric Style, the abbreviation of the prefix kilo is lowercase k. IBM distinguishes between lowercase k (meaning 1000 or  $10^3$ ) and uppercase K (meaning 1024 or  $2^{10}$ ). Therefore, KB means 1024 bytes, and kB means 1000 bytes.

You can verify the volume size reported by Tivoli Storage Productivity Center against the size reported by element managers that use a base-1000 system. For example, suppose an element manager reports the size of a volume as 62,000 MB. Use the following calculations to verify the total number of base-1024 GB as reported by Tivoli Storage Productivity Center:

1. Multiply the volume size reported by the element manager by the number of bytes in a base-1000 MB:  
 $62,000 \text{ MB} \times 1,000,000 \text{ bytes per MB} = 62,000,000,000 \text{ bytes}$
2. Divide the result by the number of bytes in a base-1024 MB:  
 $62,000,000,000 \text{ bytes} / 1,048,576 \text{ bytes per MB} = 59,127.81 \text{ MB}$
3. Divide the quotient by the number of MB in a base-1024 GB:  
 $59,127.81 \text{ MB} / 1024 \text{ MB per GB} = 57.74 \text{ GB}$

Tivoli Storage Productivity Center reports the volume size as 57.74 GB.

### VMware capacity reports:

You must probe both the ESX Server and the Storage Resource agent on the virtual machines before you can generate accurate reports for disk and file system capacity.

The TOTAL row in the capacity report shows the capacity for the file system or the disk capacity. The total includes virtualized disks, virtual machines, non-virtualized disks, and non-virtualized machines.

For example, you have an ESX Server that has a capacity of 100 GB and 60 GB is allocated to the virtual machine. The virtual machine uses 5 GB of space. Both the ESX Server (H1) and the virtual machine (VC1) are probed. You also have a physical machine (PC1) that is probed. The capacity is shown in the report, as follows:

Column heading	Capacity	Used space (calculated as Capacity minus Free Space)	Free space
TOTAL	130 GB	25 GB	105 GB
H1	100 GB	60 GB	40 GB
VC1	60 GB	5 GB	55 GB
PC1	30 GB	20 GB	10 GB

If you probed the physical machine (PC1) and the virtual machine (VC1) but did not probe the ESX Server (hypervisor), the capacity is shown as follows:

Column heading	Capacity	Used Space (calculated as Capacity minus Free Space; negative values are shown as 0)	Free Space
TOTAL	30 GB	0 GB	65 GB

Column heading	Capacity	Used Space (calculated as Capacity minus Free Space; negative values are shown as 0)	Free Space
PC1	30 GB	20 GB	10 GB
VC1	60 GB	5 GB	55 GB

If you probed the hypervisor (H1) and the physical machine (PC1) but did not probe the virtual machine (VC1), the capacity is shown as follows:

Column heading	Capacity	Used Space (calculated as Capacity minus Free Space)	Free Space
TOTAL	130 GB	80 GB	50 GB
H1	100 GB	60 GB	40 GB
PC1	30 GB	20 GB	10 GB

If you have an ESX Server that has devices that are directly attached to the virtual machine, the file system capacity created on the virtual machine is not added in the TOTAL row.

For example, the file system capacity shown in the table is based on the following factors:

- The file system (FS1) created on the hypervisor has a capacity of 100 GB and uses 60 GB of space.
- The file system (FS1) created from internal storage on the hypervisor (H1) has a capacity of 60 GB and uses 5 GB of space.
- The file system (FS2) on the device that is directly attached to the virtual machine (VC1) has a capacity of 5 GB and uses 4 GB of space.
- The file system created on the physical machine (PC1) has a capacity of 30 GB and uses 20 GB of space.

Column heading	Capacity	Used Space (calculated as Capacity minus Free Space)	Free Space
TOTAL	130 GB	24 GB	106 GB
H1 FS1	100 GB	60 GB	40 GB
VC1 FS1	60 GB	5 GB	55 GB
VC1 FS2	5 GB	4 GB	1 GB
PC1 FS1	30 GB	20 GB	10 GB

## Data Manager for Databases reports

Use Data Manager for Databases for reports to view both overview and detailed information about your RDBMS storage resources, including instances, tablespaces, databases, devices, containers, data files, fragments, tables, control files, redo logs,

archive log directories, users. These reports are constructed from the statistical information gathered by data collection jobs and accumulated in the database repository.

## Using Data Manager for Databases reports

Learn how to use Data Manager for Databases reports to view information about the instances, tablespaces, databases, devices, containers, data files, fragments, tables, control files, redo logs, archive log directories, and users within your environment.

### Before you begin:

Learn about information you should know before generating and viewing Data Manager for Databases reports.

Before you can use reports to view detailed information about tables in an RDBMS, you must have 1) defined a table group that contains the tables about which you want to view storage information and 2) scheduled and run a scan against that table group. See “Working with groups of resources” on page 373 for information about using groups. See “Collecting storage usage and trending information” on page 346 for information about scans and how to create them.

### Data Manager for Databases - Report Categories:

Use the report categories within Data Manager for Databases reports to collect information about RDBMS storage assets, capacity, usage, and usage violations.

The following table describes the categories of reports available in Data Manager for Databases.

Report Category	Use these reports to do the following tasks	What job collects information for these reports?
Asset Reports	<p>View the information gathered by probes. While running probes, Data Manager for Databases itemizes the information for each type of database.</p> <ul style="list-style-type: none"> <li>• Oracle: instances, table spaces, tables, data files, control files, redo logs, and archive log directories</li> <li>• SQL Server: instances, databases, tables, and data files</li> <li>• Sybase: instances, devices, databases, tables, and fragments.</li> <li>• UDB: instances, databases, table spaces, tables, containers, and users</li> </ul>	Probes

Report Category	Use these reports to do the following tasks	What job collects information for these reports?
Capacity Reports	<p>View the storage capacity of different entities within an RDBMS. Specifically, use Capacity reports to view:</p> <ul style="list-style-type: none"> <li>• <b>Instance storage capacity within all DBMSs.</b> If you are monitoring the instances for different DBMSs, you can use the <b>All DBMSs</b> node to view a summary of the storage capacity for all those instances in a single view.</li> <li>• <b>Oracle databases</b> <ul style="list-style-type: none"> <li>– How much storage you have for instances</li> <li>– How much storage is being used for data files</li> <li>– What percentage of storage for a data file is free for expansion</li> </ul> </li> <li>• <b>SQL Server databases</b> <ul style="list-style-type: none"> <li>– How much storage you have for instances</li> <li>– How much storage is being used for data files</li> <li>– What percentage of storage for a data file is free for expansion</li> </ul> </li> <li>• <b>Sybase databases</b> <ul style="list-style-type: none"> <li>– How much storage you have for instances</li> <li>– How much storage is being used for devices</li> <li>– What percentage of storage for a device is free for expansion</li> <li>– How much storage is being used for fragments</li> <li>– What percentage of storage for a fragment is free for expansion</li> </ul> </li> <li>• <b>UDB databases</b> <ul style="list-style-type: none"> <li>– How much allocated storage you have for a UDB Instance and the objects it contains</li> <li>– How much storage is being used for a UDB Instance and the objects it contains</li> <li>– What percentage of UDB storage is free for expansion</li> </ul> </li> </ul> <p>The Capacity reporting function provides you with the ability to view the storage capacity, used space, and free space for your RDBMS objects in a single view.</p>	Probes

Report Category	Use these reports to do the following tasks	What job collects information for these reports?
Usage Reports	<p>Monitor and report on the usage and growth of the consumption of your DBMS storage:</p> <ul style="list-style-type: none"> <li>• <b>Storage usage within all DBMSs.</b> If you are monitoring the multiple DBMSs, use this node to view common storage usage information for databases, table spaces, tables, and users across all monitored DBMSs.</li> <li>• <b>Oracle databases</b> <ul style="list-style-type: none"> <li>– View detailed information for table spaces including their total size, used space, empty used space, # of tables and indexes, and so on.</li> <li>– Identify the tables consuming the most space within your environment.</li> <li>– Identify the segments with the most extents and most empty used space.</li> <li>– Associate users with the amount of storage they are consuming on specific databases, table spaces, groups of table spaces, specific computers, groups of computers, and throughout the entire network.</li> </ul> </li> <li>• <b>SQL Server databases</b> <ul style="list-style-type: none"> <li>– View detailed information for databases including their total size, used space, empty used space, # of tables and indexes, and so on.</li> <li>– Identify the tables consuming the most space within your environment.</li> <li>– Associate users with the amount of storage they are consuming on specific databases, groups of databases, specific computers, groups of computers, and throughout the entire network.</li> </ul> </li> <li>• <b>Sybase databases</b> <ul style="list-style-type: none"> <li>– View detailed information for databases including their total size, used space, empty used space, # of tables and indexes, and so on.</li> <li>– Identify the tables consuming the most space within your environment.</li> <li>– Associate users with the amount of storage they are consuming on specific databases, groups of databases, specific computers, groups of computers, and throughout the entire network.</li> </ul> </li> <li>• <b>UDB databases</b> <ul style="list-style-type: none"> <li>– View detailed information for table spaces including their total size, used space, empty used space, # of tables and indexes, and so on.</li> <li>– Identify the tables consuming the most space within your environment. You can view this information at the table space, database, and computer level, as well as at a network-wide level.</li> <li>– Associate users with the amount of storage they are consuming on specific databases, table spaces, groups of table spaces, specific computers, groups of computers, and throughout the entire network.</li> </ul> </li> </ul>	Scans
Usage Violation Reports	Create and enforce corporate storage usage policies. You can report on violations of quotas that are set at the network-wide, instance, table space, and database levels.	Scans, Quotas

### Reporting on RDBMS Objects:

Learn about the RDBMS objects upon which you can report using Data Manager for Databases reports.

The following table lists the RDBMS objects whose storage usage is monitored by Data Manager for Databases.

Oracle	SQL Server	Sybase	DB2/UDB
Instances	Instances	Instances	Instances
Databases	Databases	Devices	Databases
Tablespaces	Datafiles	Databases	Tablespaces
Datafiles	Tables	Fragments	Containers
Tables	Indexes	Tables	Tables
Indexes	Log Files	Indexes	Indexes
Extents			
Segments			
Redo Log files			
Control Files			
Archive Log			
Directories			

**Note:**

1. Each of the major reporting categories in the Reporting facility can be expanded in the navigation tree to reveal additional sub-categories of reporting. Some of the nodes within the reporting tree will appear only if you set up access for the RDBMS to which that node applies. For example, if you set up for monitoring Oracle and SQL Server instances only, nodes representing the other RDBMSs supported by Data Manager for Databases (such as Sybase and UDB) will not appear within the navigation tree. If you have set up access for only one RDBMS, the **All DBMSs** node will also not be available in some nodes.
2. Data Manager for Databases does not currently support the monitoring of clustered database applications.

**Using By clauses:**

Use the By clauses associated with Data Manager for Databases reports as a method for viewing the data in those reports from different perspectives.

As you drill down through Data Manager for Databases's reports, you will notice a set of options that repeats for each report type. These *By Clauses* allow you to generate variations of the reports with different perspectives and groupings of the data. Some of the available By Clauses are described in the following table:

By Clause	Description
<b>By DBMS Type</b>	Use this clause to select the DBMS that you want to report upon.
<b>By Instance</b>	Use this clause to select the instances that you want to report upon and the report that will be generated based upon those instances.
<b>By Device (Sybase only)</b>	Use this clause to select the devices that you want to report upon and the report that will be generated based upon those devices.
<b>By Database</b>	Use this clause to select the database that you want to report upon and the report that will be generated based upon those databases.
<b>By Tablespace</b>	Use this clause to select the tablespaces that you want to report upon and the report that will be generated based upon those tablespaces.
<b>By Tablespace Group</b>	Use this clause to select the tablespace groups that you want to report upon and the report that will be generated based upon those tablespace groups.

By Clause	Description
<b>By Fragments (Sybase only)</b>	Use this clause to select the fragments that you want to report upon and the report that will be generated based upon those fragments.
<b>By Container (UDB only)</b>	Use this clause to select the containers that you want to report upon and the report that will be generated based upon those containers.
<b>By Computer</b>	Use this clause to select the computers that you want to report upon and the report that will be generated based upon those computers.
<b>By Computer Group</b>	Use this clause to select the computer groups that you want to report upon and the report that will be generated based upon those computer groups.
<b>By User</b>	Use this clause to select the users that you want to report upon and the report that will be generated based upon those users.
<b>Network Wide</b>	The reports and charts that you see will be generated on all data, network wide. This allows you to get a global view of the storage and storage usage for your whole enterprise.

## Asset reports

Use Asset reports to view information about the instances, devices, databases, tablespaces, tables, containers, data files, fragments, control files, redo logs, and archive log directories, and general hardware inventory of RDBMS storage assets within your environment.

While running probes and scans, Data Manager for Databases itemizes your RDBMS storage assets and provides a hierarchical view of that information so you can drill down to view your those assets in greater detail. You can view information about RDBMS storage resources through the following views:

Asset Reporting View	Use these reports to...
<b>Asset &gt; By Computer</b>	View the instances and their related objects based upon the computers on which they reside.
<b>Asset &gt; By DBMS Type</b>	This node appears if you are using Data Manager for Databases to monitor more than one RDBMS. Expand this node to view asset information about instances organized according to their DBMS.
<b>Asset &gt; System-wide</b>	Investigate all of your instances, databases, tablespaces, tables, container, data files, users and other assets for your <i>entire</i> system. <b>Note:</b> (UDB only) For the <b>All DBMSs</b> reports available under the <b>Asset &gt; System-wide</b> reporting nodes, the Database-Tablespaces view shows information about UDB tablespaces only.

### By Computer, By DBMS Type:

Learn about the reports available within the **By Computer** and **By DBMS Type** nodes within Asset reporting.

Asset Report Type	Use these reports to...	What's in these reports?
<b>By Computer</b> By Computer > <i>machine_name</i> > <i>instance/database_name</i>	Drill down through your DBMS storage assets in a hierarchical manner according to the computers on which they reside or the DBMS to which they belong.	Depending on the DBMS of the Instance you want to view, you can drill down and expose its: <ul style="list-style-type: none"> <li>• Tablespaces</li> <li>• Databases</li> <li>• Devices</li> <li>• Monitored tables</li> <li>• Containers</li> <li>• Data files</li> <li>• Fragments</li> <li>• Control files</li> <li>• Redo logs</li> <li>• Archive log directories</li> </ul>
<b>By DBMS Type</b> By DBMS Type > <i>dbms_type</i> > <i>instance/database_name</i>		

Asset Report Type	Use these reports to...	What's in these reports?
<b>Instance Information</b>  <b>By Computer</b>  By Computer > <i>machine_name</i> > <i>instance_name</i>  <b>By DBMS Type</b>  By DBMS Type > <i>dbms_type</i> > <i>instance_name</i>	View information about all of your monitored instances. Specifically, you can view information about the following information based upon DBMS type:  <b>SQL Server</b> <ul style="list-style-type: none"> <li>• Databases</li> <li>• Monitored Tables</li> <li>• Data Files</li> </ul> <b>Oracle</b> <ul style="list-style-type: none"> <li>• Tablespaces</li> <li>• Monitored Tables</li> <li>• Data Files</li> <li>• Control Files</li> <li>• Redo Logs</li> <li>• Archive Log Directories</li> </ul> <b>Sybase</b> <ul style="list-style-type: none"> <li>• Devices</li> <li>• Databases</li> <li>• Monitored Tables</li> <li>• Fragments</li> </ul> <b>UDB</b> <ul style="list-style-type: none"> <li>• Instances</li> <li>• Databases</li> <li>• Tablespaces</li> <li>• Tables</li> <li>• Containers</li> <li>• Users</li> </ul>	<b>SQL Server</b> <ul style="list-style-type: none"> <li>• RDBMS Type, Name, Version, Loginid</li> <li>• Number of Databases, Number of Datafiles, Number of Log Files</li> <li>• Total Size of all Storage, Capacity of Data Files, Free Space of Data Files, Capacity of Log Files, Free Space of Log Files</li> <li>• Probe Status, Last Probe Time</li> </ul> <b>Oracle</b>  <i>Database Information tab</i> <ul style="list-style-type: none"> <li>• Name, Owner, Block Size, Log Mode, Status</li> <li>• Maximum Number of Instances, Number of Tablespaces, Maximum Number of Data Files, Number of Data Files, Maximum Number of Log Files, Number of Log Files</li> <li>• Total Size of all Storage, Capacity Of Data Files, Free Space of Data Files</li> <li>• Create Time, Discovered Time, Dropped Time</li> </ul> <i>Instance Information tab</i> <ul style="list-style-type: none"> <li>• RDBMS Type, Name, Version, Home Directory, Loginid, Port, Probe Status</li> <li>• Last Probe Time, Last Start Time, Discovered Time</li> </ul> <b>Sybase</b> <ul style="list-style-type: none"> <li>• RDBMS Type, Name, Version, Home Directory, Loginid, Port</li> <li>• Number of Databases, Number of Devices, Number of Fragments, Number of Log Fragments</li> <li>• Total Size of all Storage, Mirror Overhead, Capacity of Data Fragments, Free Space in Data Fragments, Capacity of Log Fragments, Free Space in Log Fragments</li> <li>• Probe Status, Last Probe Time</li> </ul> <b>UDB</b> <ul style="list-style-type: none"> <li>• RDBMS Type, Name, Version, Home Directory, Loginid, Port</li> <li>• Number of Tablespaces, Number of Containers, Number of Log Files</li> <li>• Total Size of all Storage, Container Capacity, DMS Container Free Space, Total Size of all Log Files</li> <li>• Probe Status, Last Probe Time</li> </ul>

Asset Report Type	Use these reports to...	What's in these reports?
<b>Oracle Detailed Instance Information</b> <b>By Computer</b> By Computer > <i>machine_name</i> > <i>instance_name</i>	View information about the objects associated with a selected Oracle Instance.	<ul style="list-style-type: none"> <li>• <b>Tablespaces:</b> When you expand the <b>Tablespaces</b> node, click the name of a tablespace to view information about that tablespace and its related data file.</li> <li>• <b>Monitored Tables:</b> When you expand the <b>Monitored Tables</b> node, click on the name of a table to view its information. Only the tables that belong to Table Groups included in scans will be available to view through this node.</li> <li>• <b>Data Files:</b> Click the <b>Data Files</b> node, click the name of a data file to view information about the data files associated with the Instance, including: Data File Path, Used Space, Percent Used, Free Space, Total Size, Coalesced Extents, Minimum Free Extent Size, Maximum Free Extent Size, and Create Time.</li> <li>• <b>Control Files:</b> Click this node to view information on the control files associated with the Instance, including the File Name (full path) and File Size.</li> <li>• <b>Redo Logs:</b> Click this node to view information on the redo logs associated with the Instance.               <ul style="list-style-type: none"> <li>– for Log Group: Sequence Number, Status, Archived, Total Size</li> <li>– for Log File: File Name (full path)</li> </ul> </li> <li>• <b>Archive Log Directories:</b> Click this node to view information on the archive log directory associated with the Instance, including Directory Name, Size of Files, File Count, Status, Last Failure Time.</li> </ul>
<b>SQL Server Detailed Instance Information</b> <b>By Computer</b> By Computer > <i>machine_name</i> > <i>server_name</i> <b>By DBMS Type</b> By DBMS Type > SQL/Server > <i>server_name</i>	View information about the objects associated with a selected SQL Server Instance.	<ul style="list-style-type: none"> <li>• <b>Databases:</b> When you expand the <b>Databases</b> node, click the name of a Database to view information about that database, its related data file, and its related log file.</li> <li>• <b>Monitored Tables:</b> When you expand the <b>Monitored Tables</b> node, click on the name of a table to view its information including the computer, instances, and database on which is resides, as well as its creator, total size, empty used space, index size, number of indexes, row count, etc.</li> </ul> <p>Only the tables that belong to table groups included in scans will be available to view through this node.</p> <ul style="list-style-type: none"> <li>• <b>Data Files:</b> Click the <b>Data Files</b> node, click the name of a data file to view information about the data files associated with the Instance, including: Data File Path, Used Space, Percent Used, Free Space, Total Size, Coalesced Extents, Minimum Free Extent Size, Maximum Free Extent Size, and Create Time.</li> </ul>

Asset Report Type	Use these reports to...	What's in these reports?
<b>Sybase Detailed Instance Information</b> <b>By Computer</b> By Computer > <i>machine_name</i> > <i>instance_name</i> <b>By DBMS Type</b> By DBMS Type > Sybase > <i>instance_name</i>	view information about the objects associated with a selected Sybase Instance.	<ul style="list-style-type: none"> <li>• <b>Devices:</b> Click this node to view information about the Device associated with the Instance, including its name, computer on which it resides, path, free space, percent free, used space, total size, fragments, mirror path, etc.</li> <li>• <b>Databases:</b> When you expand the <b>Databases</b> node, click the name of a Database to view information about that database, its device information, and its related fragment information.</li> <li>• <b>Monitored Tables:</b> When you expand the <b>Monitored Tables</b> node, click on the name of a table to view its information including the computer, instances, and database on which it resides, as well as its creator, total size, empty used space, index size, number of indexes, row count, etc.</li> </ul> <p>Only the tables that belong to table groups included in scans will be available to view through this node.</p> <ul style="list-style-type: none"> <li>• <b>Fragments:</b> Click this node to view about the Fragments associated with the Instance including the computer, instances, and database on which they resides as well as their path, used space, percent used, free space, total size, data type, etc.</li> </ul>

**Asset Report Type****Sybase**

Asset &gt; System-wide &gt; Sybase

**What's in these reports?**

- **Instances:** Expand the **Instances** node and click the sorting method by which you want to view instances.
    - By Instance: sort based on Instance name
    - By Version: sort based on the version of the DBMS under which an Instance is running
    - By Probe Time: sort based upon when an Instance was last probed
  - **Devices:** Expand this node and click the sorting method by which you want to view information about devices within your environment.
    - By Device: sort based on device name
    - By Freespace: sort based on the amount of free space on a device
    - By Total Size: sort based on the total size of a device
    - By Fragments: sort based upon the number of fragments for a device
    - By Discovered Time: sort based upon when a device was discovered
    - Dropped Devices: sort based upon dropped devices
  - **Databases:** Expand this node and click the sorting method by which you want to view information about databases within your environment.
    - By Database: sort based on database name
    - By Freespace: sort based on the amount of free space on a database
    - By Total Size: sort based on the total size of a database
    - By Table Count: sort based upon the number of tables in the database
    - By Scan Time: sort based upon when a database was last scanned
    - By Discovered Time: sort based upon when a database was discovered
    - By Last Dump Time: sort based on the date/time when devices were last dumped
    - Dropped Databases: sort based upon dropped databases
  - **Fragments:** Expand this node and click the sorting method by which you want to view information about fragments.
    - By Fragments: sort based on fragment name
    - By Free Space: sort based upon the free space in fragments
    - By Total Size: sort based on the total size of fragments
    - By Discovered Time: sort based upon when fragments were discovered
  - **Tables:** Expand the **Tables** node and click the sorting method by which you want to view tables. Only the tables that belong to Table Groups included in scans will appear within the reports viewed through this node.
    - By Table: sort based on table name
    - By Number of Indexes: sort based upon the number of indexes associated with a table
    - By Total Size: sort based on the total size of a table
    - By Row Count: sort based upon the number of rows in a table
    - By Chained Row Count: sort based upon the number of chained rows in a table
    - By Discovered Time: sort based upon when a table was discovered
    - Dropped Tables: sort based upon dropped tables
  - **Users:** Expand the **Users** node and click the sorting method by which you want to view the users who are consuming space on the monitored Sybase instances.

## Capacity reports

Use Capacity reports to view the storage capacity, used space, and free space for your RDBMS objects.

Capacity enable you to view storage capacity at the computer, instance, database, device, fragment, container, and data file level. For a specific Instance, computer, group of computers, database, group of databases, tablespace, group of tablespaces, datafiles, containers, fragments, or all the computers in your enterprise, you can view the following:

- How much storage you have for a DBMS and the objects it contains
- How much storage is being used for a DBMS and the objects it contains
- What percentage of DBMS storage is free for expansion

### All DBMSs Capacity reports:

Use these reports to view storage capacity information about the different RDBMS instances that you are monitoring within your environment.

Capacity Reporting View	Use these reports to...
Capacity > All DBMSs > Total Instance Storage	<p>If you have multiple RDBMSs that you monitor using Data Manager, use this node to view detailed storage information about the different RDBMS instances within your environment.</p> <p>Depending on the RDBMS of the instance you want to view, use this report to view information about its:</p> <ul style="list-style-type: none"> <li>• RDBMS instance</li> <li>• RDBMS type</li> <li>• total size</li> <li>• file capacity</li> <li>• file free space</li> <li>• DB-TS count</li> <li>• file count</li> <li>• log file count</li> </ul>

## Oracle Capacity reports:

Use these reports to view storage capacity information about the Oracle instances that you are monitoring within your environment.

- By Computer Group: view the desired storage information organized by computer group
- Network-wide: view the desired storage information for your entire network

## Use these reports to...

This node appears if you are using Data Manager for Databases to monitor SQL Server instances. Expand this node to view the following information:

- **Total Instance Storage.** Generate a report under this node to view detailed information about SQL Server instances, including:
    - total size
    - data file capacity
    - data file free space
    - log file capacity
    - log file free space
    - database count
    - data file count
    - log file count
  - **Data File Used Space.** Generate a report under this node to view detailed information about the storage usage of datafiles associated with the databases in an Instance, including:
    - database
    - data used space
    - percent used
    - data free space
    - data size
    - log used space
    - log percent used
    - log free space
    - log size
    - number data files
  - **Data File Free Space.** Generate a report under this node to view detailed information about the storage free space of datafiles associated with the databases in an Instance, including:
    - database
    - data free space
    - percent free
    - data used space
    - data size
    - log free space
    - log percent used
    - log used space
    - log size
    - number data files
- 

### Sybase Capacity reports:

Use these reports to view storage capacity information about the Sybase instances that you are monitoring within your environment.

---

## Capacity Reporting View

### Sybase

Capacity > Sybase

#### By Clauses for these reports:

- By Device: sort based on Device name
- By Instance: sort based on Instance name
- By Fragments: sort based upon fragments
- By Database: sort a report by database name
- By Database Group: view the desired storage information organized by database group
- By Datafile: sort based on file name
- By Computer: sort based on the computer where the object's Instance resides
- By Computer Group: view the desired storage information organized by computer group
- Network-wide: view the desired storage information for your entire network

## Use these reports to...

This node appears if you are using Data Manager for Databases to monitor Sybase instances. Expand this node to view the following information:

- **Total Instance Storage.** Generate a report under this node to view detailed information about Sybase instances, including:
    - total device size
    - mirrored device size
    - device free space
    - data fragment capacity
    - data fragment free space
    - log fragment capacity
    - log fragment free space
    - device count
    - database count
    - fragment count
    - log fragment count
  - **Device Used Space.** Generate a report under this node to view detailed information about the storage usage of devices associated with instances, including:
    - Instance
    - device path
    - used space
    - percent used
    - free space
    - total size
    - number fragments
    - mirror path
    - number devices
  - **Device Free Space.** Generate a report under this node to view detailed information about the storage free space of devices associated instances, including:
    - Instance
    - device path
    - free space
    - percent free
    - used space
    - total size
    - number fragments
    - low, high
    - mirror path
    - number devices
-

---

**Capacity Reporting View****Use these reports to...**

Sybase (continued)

- **Fragment Used Space.** Generate a report under this node to view detailed information about the storage usage of fragments associated with databases, including:
    - Instance
    - fragment path
    - database
    - data used space
    - percent used
    - data free space
    - data size
    - data type
    - log used space
    - log percent used
    - log free space
    - log size
    - number fragments
  - **Fragment Free Space.** Generate a report under this node to view detailed information about the storage free space of fragments associated databases, including:
    - Instance
    - fragment path
    - database
    - data free space
    - percent free
    - data used space
    - data size
    - log free space
    - log used space
    - log percent used
    - log used space
    - log size
    - number fragments
- 

**UDB Capacity reports:**

Use these reports to view storage capacity information about the UDB instances that you are monitoring within your environment.

---

## Capacity Reporting View

### UDB

Capacity > UDB

**By Clauses** for these reports:

- By Container: sort based on Container name
- By Tablespace: sort based on Tablespace name
- By Database: sort a report by database name
- By Database Group: view the desired storage information organized by database group
- By Instance: sort based on Instance name
- By Computer: sort based on the computer where the object's Instance resides
- By Computer Group: view the desired storage information organized by computer group
- Network-wide: view the desired storage information for your entire network

## Use these reports to...

This node appears if you are using Data Manager for Databases to monitor UDB instances. Expand this node to view the following information:

- **Total Instance Storage.** Generate a report under this node to view detailed information about UDB instances, including:
    - total size
    - container capacity
    - container free space
    - log file capacity
    - tablespace count
    - container count
    - log file count
    - log mode
  - **Container Used Space.** Generate a report under this node to view detailed information about the storage usage of containers associated with a tablespace, including:
    - Instance
    - database
    - tablespace
    - container node
    - container name
    - used space
    - percent used
    - free space
    - total size
    - container type
    - status
    - discovered time
  - **Container Free Space.** Generate a report under this node to view detailed information about the storage free space of containers associated with a tablespace, including:
    - Instance
    - database
    - tablespace
    - container node
    - container name
    - free space
    - percent free
    - used space
    - total size
    - container type
    - status
    - discovered time
- 

## Usage reports

Use Usage reports to monitor and report on the usage and growth of the storage consumption for your databases, tablespaces, tables, segments, and users.

Use these reports to do the following:

- View detailed information for tablespaces and databases including their total size, used space, empty used space, # of tables and indexes, etc.
- Identify the tables consuming the most space within your environment. You can view this information at the tablespace, database, and computer level, as well as at a network-wide level.
- (Oracle) Identify the segments with the most extents and most empty used space. You can view this information at the tablespace, database, and computer level, as well as at a network-wide level.
- Associate users with the amount of storage they are consuming on specific databases, groups of databases, tablespaces, groups of tablespaces, specific computers, groups of computers, and throughout the entire network.

### All DBMS Usage reports:

Use these reports to view storage usage information about the different RDBMS instances that you are monitoring within your environment.

Usage Reporting View	Use these reports to...
Usage > All DBMSs	If you have multiple RDBMSs that you monitor using Data Manager, use this node to view detailed storage information about the different RDBMS instances within your environment.
Usage > All DBMSs > Databases-Tablespaces	view storage usage statistics about the databases and tablespaces with your monitored DBMSs. Some of the information you can view through these reports includes: <ul style="list-style-type: none"> <li>• database name, tablespace name</li> <li>• computer</li> <li>• Instance</li> <li>• Instance type</li> <li>• total size</li> <li>• used space</li> <li>• empty used space</li> <li>• table count</li> <li>• index count</li> <li>• other count</li> </ul>
Usage > All DBMSs > Tables	view storage usage statistics about the tables with your monitored DBMSs. Some of the information you can view through these reports includes the following: <ul style="list-style-type: none"> <li>• Largest tables</li> <li>• Total size</li> <li>• Creator</li> <li>• Table name</li> <li>• Empty used space</li> <li>• Index size</li> <li>• Row count</li> <li>• Chained row count</li> </ul>

---

**Usage Reporting View**

Usage &gt; All DBMSs &gt; Users

**Use these reports to...**

associate users with the amount of storage they are consuming on specific DBMS objects, specific computers, groups of computers, and throughout the entire network.

- **Group by User Name:** select the users and then the resources on which you want to report storage consumption.

For example, when setting up a report to view user storage consumption on an Oracle or UDB tablespace, you must do the following:

- Select the users upon which you want to report
- Select the tablespaces whose storage consumption by the selected users you want to view

- **Group by Resource:** select the resources and then the users on which you want to report storage consumption.

For example, when setting up a report to view storage consumption on Oracle or UDB tablespaces for users, you must do the following:

- Select the tablespaces upon which you want to report
  - Select the users whose storage consumption on the selected tablespaces you want to view
- 

**Oracle Usage reports:**

Use these reports to view storage usage information about the Oracle tablespaces, tables, segments, and users that you are monitoring within your environment.

**Usage Reporting View****Oracle**

Usage &gt; Oracle

**By Clauses** for these reports:

- By Database—sort a report by database name
- By Tablespace—sort a report by tablespace name
- By Tablespace Group—view the desired storage information organized by tablespace group
- By Table—sort a report by table name
- By Table Group—view the desired storage information organized by table group
- By Computer—sort based on the computer where the object's Instance resides
- By Computer Group—view the desired storage information organized by computer group
- Network-wide—view the desired storage information for your entire network

**Use these reports to...**

This node appears if you are using Data Manager for Databases to monitor Oracle instances. Expand this node to view the following information:

- **Tablespaces.** View detailed information for tablespaces including the following:
    - Instance
    - Database
    - Total size
    - Used space
    - Empty used space
    - Freelist blocks
    - Table count
    - Index count
  - **Tables.** Identify the tables consuming the most space within your environment. You can view this information at the tablespace, database, and computer level, as well as at a network-wide level. Some of the information in these reports includes the following:
    - Table name
    - Total size
    - Empty used space
    - Index size
    - Freelist blocks
    - Number partitions
    - Number indexes
    - Number segments
    - Number extents
    - Percent free, used
-

---

**Usage Reporting View****Oracle**

Usage → Oracle

**By Clauses** for these reports:

- By Database—sort a report by database name
- By Tablespace—sort a report by tablespace name
- By Tablespace Group—view the desired storage information organized by tablespace group
- By Table—sort a report by table name
- By Table Group—view the desired storage information organized by table group
- By Computer—sort based on the computer where the object's Instance resides
- By Computer Group—view the desired storage information organized by computer group
- Network-wide—view the desired storage information for your entire network

**Use these reports to...**

This node appears if you are using Data Manager for Databases to monitor Oracle instances. Expand this node to view the following information:

- **Segments.** Identify the segments with the most extents and most empty used space. Some of the information in these reports includes the following:
    - Number extents
    - Segment name, creator
    - Tablespace
    - Parent name, creator
    - Total size
    - Empty used space
    - Number extents
    - Freelist blocks, groups
  - **Users.** Associate users with the amount of storage they are consuming on specific databases, tablespaces, groups of tablespaces, specific computers, groups of computers, throughout the entire network, and applied Quotas. Some of the information included in these reports includes the following:
    - Computer, instance, database, tablespace
    - Total size
    - Empty used space
    - Table count
    - Index count
    - Largest segment, 2nd largest segment
    - Segment sizes: <50Kb, 500Kb-100Mb, 1Mb-10Mb, 10Mb-100Mb, 100Mb-500MB, 500Mb-1Gb, >1Gb
    - Quota name
    - Percent of Quota
    - Quota threshold
- 

**SQL Server Usage reports:**

Use these reports to view storage usage information about the SQL Server databases, tables, and users that you are monitoring within your environment.

## Usage Reporting View

### SQL Server

Usage > SQL/Server

**By Clauses** for these reports:

- By Instance: sort based on Instance name
- By Database: sort a report by database name
- By Database Group: view the desired storage information organized by database group
- By Computer: sort based on the computer where the object's Instance resides
- By Computer Group: view the desired storage information organized by computer group
- Network-wide: view the desired storage information for your entire network
- By User Quota: sort based upon the users to which Quotas are applied. A user who has not violated a quota will not appear in this report.

## Use these reports to...

This node appears if you are using Data Manager for Databases to monitor storage usage on SQL Server instances. Expand this node to view the following information:

- **Databases.** Generate a report under this node to view detailed information about the storage on SQL Server databases, including the following:
    - Total size
    - Used space
    - Empty used space
    - Table count
    - Index count
  - **Tables.** Identify the tables consuming the most space within your environment. You can view this information at the table, database, and computer level, as well as at a network-wide level. Some of the information in these reports includes the following:
    - Table name
    - Total size
    - Empty used space
    - Index count
    - Row count
  - **Users.** Associate users with the amount of storage they are consuming on specific databases, groups of databases, specific computers, groups of computers, throughout the entire network, and applied Quotas . Some of the information in these reports includes the following:
    - Computer, instance, database
    - Total size
    - Empty used space
    - Table count
    - Index count
    - Largest object, 2nd largest object
    - Object sizes: <50Kb, 500Kb-100Mb, 1Mb-10Mb, 10Mb-100Mb, 100Mb-500MB, 500Mb-1Gb, >1Gb
    - Quota name
    - Percent of Quota
    - Quota threshold
- 

## Sybase Usage reports:

Use these reports to view storage usage information about the Sybase databases, tables, and users that you are monitoring within your environment.

---

## Usage Reporting View

### Sybase

Usage > Sybase

- By Database: sort a report by database name
- By Database Group: view the desired storage information organized by database group
- By Computer: sort based on the computer where the object's Instance resides
- By Computer Group: view the desired storage information organized by computer group
- Network-wide: view the desired storage information for your entire network
- By User Quota: sort based upon the users to which Quotas are applied. A user who has not violated a quota will not appear in this report.

## Use these reports to...

This node appears if you are using Data Manager for Databases to monitor storage usage on Sybase instances. Expand this node to view the following information:

- **Databases.** Generate a report under this node to view detailed information about the storage on Sybase databases, including the following:
    - Database name, computer, instance
    - Total size
    - Used space
    - Empty used space
    - Table count
    - Index count
  - **Tables.** Identify the tables consuming the most space within your environment. You can view this information at the table, database, and computer level, as well as at a network-wide level. Some of the information in these reports includes the following:
    - Table name, database, computer, Instance, creator
    - Total size
    - Empty used space
    - Index size
    - Maximum rows per page
    - Expected row size
    - Fill factor
    - Page gap
    - Average row length
    - Row count
  - **Users.** Associate users with the amount of storage they are consuming on specific databases, groups of databases, specific computers, groups of computers, throughout the entire network, and applied Quotas. Some of the information included in these reports includes the following:
    - Computer, instance, database
    - Total size
    - Empty used space
    - Table, index count
    - Largest object, 2nd largest object
    - Object sizes: <50Kb, 500Kb-100Mb, 1Mb-10Mb, 10Mb-100Mb, 100Mb-500MB, 500Mb-1Gb, >1Gb
    - Quota name
    - Percent of Quota
    - Quota threshold
- 

### UDB reports:

Use these reports to view storage usage information about the UDB tablespaces, tables, and users that you are monitoring within your environment.

---

## Usage Reporting View

### UDB

Usage > UDB

- By Tablespace: sort a report by tablespace name
- By Tablespace Group: view the desired storage information organized by tablespace group
- By Database: sort a report by database name
- By Instance: sort a report by Instance name
- By Computer: sort based on the computer where the object's Instance resides
- By Computer Group: view the desired storage information organized by computer group
- Network-wide: view the desired storage information for your entire network

## Use these reports to...

This node appears if you are using Data Manager for Databases to monitor storage usage on UDB instances. Expand this node to view the following information:

- **Tablespaces.** Generate a report under this node to view detailed information about the storage on UDB tablespaces, including the following:
  - Database name, computer, instance
  - Total size
  - Used space
  - Empty used space
  - Table count
  - Index count
- **Tables.** Identify the tables consuming the most space within your environment. You can view this information at the table, database, and computer level, as well as at a network-wide level. Some of the information in these reports includes the following:
  - Table name, database, computer, Instance, creator
  - Total size
  - Empty used space
  - Index size
  - Maximum rows per page
  - Expected row size
  - Fill factor
  - Page gap
  - Average row length
  - Row count

**Note:** When viewing reports under the **Monitored Tables** node, keep in mind that a table will appear in this report if: 1) it is included in the definition of a table group and 2) the table group in which it is included is defined as part of a scan.

- **Users.** Associate users with the amount of storage they are consuming on specific UDB instances, tablespaces, groups of tablespaces, computers, groups of computers, and throughout the entire network. Some of the information included in these reports includes the following:
  - Computer, instance
  - Total size
  - Empty used space
  - Table, index count
  - Largest object, 2nd largest object
  - Object sizes: <50Kb, 500Kb-100Mb, 1Mb-10Mb, 10Mb-100Mb, 100Mb-500MB, 500Mb-1Gb, >1Gb
  - Quota name
  - Percent of Quota
  - Quota threshold

---

## Usage Violation reports

Use Usage Violation reports to view information about quota violations and help enforce corporate storage usage policies.

With quotas, you can control how much storage a user, or a group of users, can consume on the following:

- Database or group of databases
- Tablespace or group of tablespaces
- Instance

- Throughout the entire network

The following table contains information about Usage Violation reports:

Usage Violation Reporting Type	Use these reports to...	What's in these reports?
<b>Quota Violations</b> Usage Violations > Quota Violations	identify the quota violations within the environment	
<b>All Quotas</b> Usage Violations > Quota Violations > All Quotas	view all the quotas and quota violations in the environment <ul style="list-style-type: none"> <li>• <b>By User.</b> View information about the users who have violated quotas.</li> <li>• <b>By User Quota.</b> View information about the quotas that have been violated.</li> </ul>	<ul style="list-style-type: none"> <li>• User name</li> <li>• RDBMS type</li> <li>• Instance</li> <li>• Database-tablespace</li> <li>• Space used</li> <li>• Threshold</li> <li>• % of threshold</li> <li>• Number of violations</li> <li>• Quota creator</li> <li>• Quota name</li> <li>• Quota type</li> </ul>
<b>Network Wide Quotas</b> Usage Violations > Quota Violations > Network-wide Quotas	view quota violations at the network-wide level <ul style="list-style-type: none"> <li>• <b>By User.</b> View information about the users who have violated quotas.</li> <li>• <b>By User Quota.</b> View information about the quotas that have been violated and which users have violated them.</li> </ul>	<ul style="list-style-type: none"> <li>• User name</li> <li>• Space used</li> <li>• Threshold</li> <li>• % of threshold</li> <li>• Number of violations</li> <li>• Quota creator</li> <li>• Quota name</li> <li>• Quota type</li> </ul>
<b>Instance Quotas</b> Usage Violations > Quota Violations > Instance Quotas	view quota violations at the Instance level <ul style="list-style-type: none"> <li>• <b>By Instance.</b> View Instance quota violations sorted by Instance</li> <li>• <b>By Computer.</b> View Instance quota violations sorted by computer</li> <li>• <b>By Computer Group.</b> View Instance quota violations sorted by computer group</li> <li>• <b>By User.</b> View Instance quota violations sorted by users</li> <li>• <b>By User Quota.</b> View Instance quota violations sorted by quota</li> </ul>	<ul style="list-style-type: none"> <li>• Computer</li> <li>• RDBMS type</li> <li>• Group creator (by group clauses only)</li> <li>• Group name (by group clauses only)</li> <li>• Instance</li> <li>• Database-tablespace</li> <li>• User name</li> <li>• Space used</li> <li>• Threshold</li> <li>• % of threshold</li> <li>• Number of violations</li> <li>• Quota creator</li> <li>• Quota name</li> <li>• Quota type</li> </ul>

Usage Violation Reporting Type	Use these reports to...	What's in these reports?
<b>Database-Tablespace Quotas</b> Usage Violations > Quota Violations > Database-Tablespace Quotas	view quota violations at the tablespace level <ul style="list-style-type: none"> <li>• <b>By Database-Tablespace.</b> View quota violations sorted by the database or tablespace name on which the violation occurred</li> <li>• <b>By Database-Tablespace Group.</b> View quota violations sorted by the database or tablespace group in which the violation occurred</li> <li>• <b>By Instance.</b> View database or tablespace quota violations sorted by Instance</li> <li>• <b>By Computer.</b> View database or tablespace quota violations sorted by computer</li> <li>• <b>By Computer Group.</b> View database or tablespace quota violations sorted by computer group</li> <li>• <b>By User.</b> View database or tablespace quota violations sorted by users</li> <li>• <b>By User Quota.</b> View database or tablespace quota violations sorted by quota</li> </ul>	<ul style="list-style-type: none"> <li>• Computer</li> <li>• Group creator (by group clauses only)</li> <li>• Group name (by group clauses only)</li> <li>• Instance</li> <li>• Database-tablespace</li> <li>• User name</li> <li>• Space used</li> <li>• Threshold</li> <li>• % of threshold</li> <li>• Number of violations</li> <li>• Quota creator</li> <li>• Quota name</li> <li>• Quota type</li> </ul>

## Data Manager for Chargeback reports

Use invoices generated by Data Manager for Chargeback to charge users or groups of users for storage usage within a storage environment.

See “Working with invoices” on page 613 for information about how to use Data Manager for Chargeback to generate invoices.

## Disk Manager reports

Use Disk Manager reports to view the relationships among the components of a storage subsystem and the storage capacity for a computer, filesystem, storage subsystem, volume, Array Sites, Ranks, and disk.

### Reporting on storage subsystems

Learn how to use Disk Manager to report on storage subsystems.

These reports also enable you to view the relationships among the components of a storage subsystem. Storage-subsystems reports use data gathered by probes.

To ensure the accuracy and consistency of the data that appears in storage-subsystem reports, run regularly scheduled probes against the hosts that use or import volumes, and the storage subsystems upon which you want to report. You should run probes against storage subsystems after running them against any host.

- A disk must be partitioned before it is considered a logical volume by Disk Manager. If a disk is not partitioned, it will not be included in a file system or logical volumes report.

- Before you begin, you might want to refer to *Generating and viewing reports*. That section provides information on reports that applies all IBM Tivoli Storage Productivity Center reports. It describes the types of reports: system, user-defined, and batch. It also describes how to save reports and how to customize reports, such as filtering information and displaying the information in chart form.

You can view storage subsystem reports in the following ways:

**Disks** Use these reports to view and chart the storage capacity of storage subsystem disks. Use **By** clauses to filter the storage entities that appear in a report. For example, if you want to view a report that displays specific disks, select **By Disk**; if you want to view the disks of specific storage subsystems, select **By Storage Subsystems**.

#### **Volumes**

Use these reports to view and chart the storage capacity of storage subsystem volumes. Use the **By Storage Subsystem** and **By Storage Subsystem Group** clauses to filter the storage entities that appear in a report; use the **By Volume Space** and **By Probe Time** clauses to sort the volumes that appear in a report according to when a volume was probed or the capacity of a volume.

#### **Storage Pools**

Use these reports to view and chart the storage capacity of storage pools. Use **By** clauses to filter the storage entities that appear in a report. For example, if you want to view a report that displays information about the storage pools for specific storage systems, select **By Storage Subsystem**.

#### **Array Sites**

Use these reports to view information about the array sites that reside on storage subsystems. Use **By** clauses to filter the storage entities that appear in a report. For example, if you want to view a report that displays about the array sites for specific groups of storage subsystems, select **By Storage Subsystem Group**.

#### **Disk Groups**

Use these reports to view information about the disk groups that reside on storage subsystems. Use the **By** clauses to filter the storage entities that appear in a report. For example, if you want to view a report that displays about the disk groups for specific storage subsystems, select **By Storage Subsystem**.

**Ranks** Use these reports to view information about the ranks that reside on storage subsystems. Use the **By** clauses to filter the storage entities that appear in a report. For example, if you want to view a report that displays about the ranks for specific groups of storage subsystems, select **By Storage Subsystem Group**.

#### **Computer Views**

Use these reports to view the relationships between the computer and the storage subsystems, volumes, and disks in your environment. The information is gathered from the computer's viewpoint. Note that, for reporting purposes, *computer* is defined as anything that is running Tivoli Storage Productivity Center.

**Restriction:** These reports are available only if the following steps were done:

- A Storage Resource agent or Data agent is installed on a machine where a volume is surfaced
- A probe has been run against the machine where the volume is located
- A probe has been run against the storage subsystem or IBM SAN Volume Controller cluster

#### **By Computer**

These reports view relationships between the computer and the storage subsystems, volumes, or disks in your environment. To generate a report by computer, select the **By Computer** node and choose an item from the **Relate Computers to:** field.

For example, to retrieve information on computers in your environment and their volumes, select the **By Computer** node and then choose **By volumes**. These settings will generate a report detailing all computers with agents on them, which use volumes from the monitored storage subsystems.

#### **By Computer Group**

These reports view relationships between the computer groups (both monitoring and reporting groups) and the storage subsystems, volumes, or disks in your environment. To generate a report by computer group, select the **By Computer group** node and choose an item from the **Relate Computers to:** field.

For example, to retrieve information on computers in a group that use storage from monitored storage subsystems, select the **By Computer Group** node and then choose **Storage Subsystems** from the **Relate Computers to:** field. These settings will generate a report detailing all computers in groups with agents on them, which use volumes from the monitored storage subsystems.

#### **By Filesystem/Logical Volume**

These reports will view the relationships between the filesystems or logical volumes and the storage subsystems, volumes, and disks in your environment. To generate a report for the relationship you want to view, select the **By Filesystem/Logical Volume** node and choose an item from the **Relate Filesystem/Logical Volume to:** field.

For example, to retrieve information on filesystems or logical volumes that use storage from monitored storage subsystems, select the **By Filesystem/Logical Volume** node and choose **By Storage Subsystems**. These settings will generate a report detailing all filesystems or logical volumes which use storage from monitored storage subsystems.

#### **By Filesystem Group**

Use this report to view the relationships between the filesystem groups (both monitoring and reporting) and the storage subsystems, volumes, and disks in your environment. To generate a report for the relationship you want to view, select the **By Filesystem Group** node and choose an item from the **Relate Filesystem/Logical Volume to:** field.

For example, to retrieve information on filesystems in a group that use storage from monitored storage subsystems, select the **By Filesystem Group** node and choose **Storage Subsystems** from the **Relate Filesystem/Logical Volume to:** field. These settings will

generate a report detailing all filesystems in a group which use storage from monitored storage subsystems.

### Storage Subsystem Views

Use these reports to view the relationships among the storage-subsystem components (storage subsystems, volumes, and disks) to the computers and file systems or logical volumes in your environment.

**Note:** These reports are available only if the following steps have been performed:

- A Data agent or Storage Resource agent is installed on a system where a volume is surfaced
- A probe has been run against the system where the volume is located
- A probe has been run against the storage subsystem or IBM SAN Volume Controller cluster
- For IBM XIV Storage System, there is no relationship between storage disks, pools, and volumes because of the unique storage disk distribution and architecture.

#### By Storage Subsystem

These reports view the relationships between the storage subsystems and the computers and file systems or logical volumes in your environment. To generate a report for the relationship you want to view, select the **By Storage Subsystem** node and choose an item from the **Relate Storage Subsystem to:** field.

For example, to view all storage subsystems which have storage being used by computers in the environment, select **By Storage Subsystem** and choose **Computers**. These settings will generate a report detailing all storage subsystems which have storage being used by computers in the environment.

#### By Storage Subsystem Group

These reports view the relationships between storage subsystem groups (both monitoring and reporting) and the computers and file systems or logical volumes in your environment. To generate a report for the relationship you want to view, select the **By Storage Subsystem Group** node and choose an item from the **Relate Storage Subsystem to:** field.

For example, to view all storage subsystem groups that have storage being used by computers in the environment, select **By Storage Subsystem Group** and choose **Computers** from the **Relate Storage Subsystem to:** field. These settings will generate a report detailing all storage subsystem groups that have storage being used by computers in the environment.

#### By Volume

Use this report to view the relationships between the volumes and the computers and file systems or logical volumes in your environment. To generate a report for the relationship you want to view, select the **By Volume** node and then choose an item from the **Relate Volumes to:** field.

For example, to get a listing of all volumes in the environment on which file systems or logical volumes have been created, select **By Volume** and choose **Filesystems/Logical Volumes** from the **Relate**

**Volumes to:** field. These settings will generate a report detailing all volumes in the environment on which file systems or logical volumes have been created.

To get a listing of all volumes in the environment which are being used by computers in the environment, select **By Volume** and choose **Computers**. These settings will generate a report detailing all volumes in the environment which are being used by computers in the environment.

**Disks** Use this report to view the relationships between disks and the computers and file systems or logical volumes in your environment. To generate a report for the relationship you want to view, select the **Disks** node and then choose an item from the **Relate Disks to:** field.

For example, to get a listing of all storage subsystem disks in the environment on which file systems or logical volumes have been created, select **Disks** and choose **Filesystems/Logical Volumes**. These settings will generate a report detailing all storage subsystem disks in the environment on which file systems or logical volumes have been created.

#### **Volume to HBA Assignment**

Use these reports to view all the logical unit numbers (volumes) of each probed storage subsystem that has been assigned to at least one host bus adaptor (HBA) port world wide name (WWN). These reports only retrieve data from machines that have HBAs.

The HBA is a fibre channel and volumes are physically attached to the storage subsystem.

#### **By Storage Subsystem**

This report shows all the volumes of each probed storage subsystem that has been assigned to at least one HBA Port WWN. This report is sorted by storage subsystem name.

#### **By Volume Space**

This report views all the volumes of each probed storage subsystem that has been assigned to at least one HBA Port WWN. This report is sorted by volume space.

#### **Not on Monitored Computers**

This report shows only volumes that have been assigned to HBA Port WWNs on hosts with no Storage Resource agent or Data agent installed on them.

#### **Not Visible to Monitored Server**

Use this report to find volumes that have been assigned to hosts with Storage Resource agents or Data agents, but not configured. This report can be used to generate a list of all volumes that need to be configured before they are used.

#### **Volume to Backend Volume Assignment By Volume**

Use this report to view the relationships between the virtual disks (including mirror copies) and managed disks that are associated with a virtualizer storage subsystem, such as the SAN Volume Controller, and the back-end storage volumes that are associated with those managed disks.

**Note:** A virtual disk with one mirror copy appears as one row in the table on this page. A virtual disk with multiple mirror copies appears in multiple rows in the table. Each row represents one of the copies.

**Important:** Some of the columns in the totals row for these reports can count storage multiple times if the report includes the following:

- A storage virtualizer like a SAN Volume Controller
- The disk arrays that host the backend storage to a storage virtualizer like a SAN Volume Controller

In this situation, disks and logical unit numbers (LUNs) appear to belong to both a storage virtualizer like SAN Volume Controller and the disk arrays, and are counted multiple times in some of the columns in the totals row. To avoid this situation, filter the report to only display the storage virtualizer or the disk arrays. If this situation is unavoidable, then some of the columns in the totals row can be adjusted as follows:

1. Use the **Physical Disk Space** column to determine the actual physical disk space on all arrays. This disk space is not counted multiple times.
2. Sum the **Disk Space** column for the disk arrays and subtract this result from the totals row to determine the total backend storage for a virtualizer.
3. To prevent counting the backend volumes multiple times, subtract the **Backend Volume Space** column from the **Volume Space** column in the totals row to determine the amount of volume space.

In the topology of a subsystem, the **Backend Volume Space** column displays the total amount of back-end space available to the subsystem. This is the total capacity of the managed disks on the SAN Volume Controller, not the internal disk storage space. In other reports, Backend Volume Space refers to the space that a storage subsystem makes available to a storage virtualizer. These reports include:

- Reports generated through Data Manager.
- Reports generated through Disk Manager.
- Rollup reports.
- **Data Manager > Reporting > Asset > By Storage Subsystem** reports.

## Generating storage-subsystem reports

Learn how to generate a storage subsystem report.

These reports are available only if the following steps have been performed:

1. An agent is installed on a machine where a volume is surfaced.
2. A probe has been run against the machine where the volume is located.
3. A probe has been run against the storage subsystem or SAN Volume Controller cluster.

To generate a storage-subsystems report, do the following:

1. In the navigation tree, expand **Disk Manager > Reporting > Storage Subsystems**.
2. Do one of the following:
  - a. In the navigation tree, expand **Computer Views** and click one of the following:
    - By Computer
    - By Computer Group
    - By Filesystem/Logical Volume

- By Filesystem Group
- b. In the navigation tree, expand **Storage Subsystems Views** and click one of the following:
    - By Storage Subsystem
    - By Storage Subsystem Group
    - By Volume
    - Disks
  - c. In the navigation tree, expand **Volume to HBA Assignment** and click one of the following:
    - By Storage System
    - By Volume Space
    - Not On Monitored Computers
    - Not Visible to Monitored Computers
  - d. In the navigation tree, expand **Volume to Backend Volume Assignment** and click the following:
    - By Volume
3. The **Storage Subsystem Performance** pane for your selected storage subsystem opens the Select Resources pane. All valid available resources are listed in Included Columns. In Available Columns and Included Columns, use  and  to select the columns you want to include in your report.
  4. Filters can be applied to the selected columns. In the **Report Filter Specification** area, the **Filter** button opens the **Edit Filter** window.
    - a. Click **Add** to add a column to the filter list. The columns will be added in the order they appear on your report.
    - b. Click **Delete** to delete all columns. Click the X for an individual column to delete it.
    - c. In the **Records Must Meet** area, select **All Conditions** or **At Least One Condition**.
    - d. Type the condition value in the **Value 1** text field.
      - If the text field is greyed-out, click **Edit**.
      - If you wish to add additional values for the same column using the same operator, click **Edit**.
    - e. Select the Operator.
      - If you select the BETWEEN or NOT BETWEEN operators, two value text fields will open for a lower-limit value and an upper-limit value. Click **Edit** to enter the upper-limit value and lower-limit value. You must input values in both **Value 1** and **Value 2** fields, if shown.
      - For numeric columns, such as Free Space, a pull-down menu at the end of the each field assists you with numerical units.
    - f. Once your selections have been made, click **OK**.
  5. Click **Generate Report**. The report appears under a new tab window. If there is no data, as in if a probe has not been run, the window will say "No Data To Display."
  6. Click **File > Save**. The report is saved under **IBM Tivoli Storage Productivity Center > My Reports**. Reports can be regenerated from that node.

To change the parameters for your report, or create a new report of the same type, do the following:

1. Click the **Selection** tab before closing the Storage Subsystem Performance window. Make the necessary changes.
2. Click **Generate Report**.
3. Click **File > Save** and enter the name of the new report.
4. Click **OK**.

## **Creating a storage subsystem performance report**

Learn how to create a storage-subsystem performance report.

Before you can view a performance report on a storage subsystem, that subsystem must have been discovered and had performance data successfully collected. For more information on storage-subsystem discovery, see “Discover storage subsystem, tape library, and fabric information with CIM agents” on page 333.

For a complete list of metrics available for performance reports, see “Performance metrics” on page 1468.

1. In the navigation tree pane, expand **Disk Manager > Reporting > Storage Subsystem Performance**.
2. Click the type of performance report that you want to view. You can choose from the following performance reports:

### **By Storage Subsystem**

This report contains performance information for storage subsystems.

### **By Controller**

This report contains performance information for controllers.

### **By I/O Group**

This report contains performance information for I/O groups.

### **By Node**

This report contains historical performance data for SAN Volume Controller (SVC) nodes.

### **By Array**

This report contains performance information for arrays.

### **By Managed Disk Group**

This report contains performance information for managed-disk groups.

### **By Volume**

This report contains performance information for volumes.

### **By Managed Disk**

This report contains performance information for managed disks.

### **By Port**

This report contains performance information for ports.

In the content pane, the Selection page opens.

3. Select from the following options to customize the report:

### **Selection button**

Click this button to determine the resources upon which you want to report, such as the storage subsystems, the fibre-channel ports, and so forth. The Select Resources window displays. The type of resources displayed for selection depends on the type of report you selected. For example, if you selected a By Storage Subsystem report, all displayed

resources will be storage subsystems. If you clear the box for a resource on the Select Resources window, a pushpin icon displays on the Selection button.

### **Filter button**

Click this button to further defines the data that you want to include in the report. Filters enable you to apply general rules to the report. When you click this button, the Edit Filter window displays.

For example, to select only data associated with subsystems that have a name ending with "123-IBM", select the "Subsystem" column, the "LIKE" operator, and type "\*123-IBM" (without the quotation marks) in the Value 1 field. To select only data which has a Read I/O Rate greater than 0, select the "Read I/O Rate (overall)" column, the ">" operator, and type "0" (without the quotation marks) in the Value 1 field.

If a filter is defined for this report, a pushpin icon displays on the **Filter** button.

### **Time range selectors**

All performance reports display historical performance data. Use the time range selectors to specify the exact time range that you want the report to cover. Click one of the following radio buttons to select the type of historical report you want:

#### **Display latest performance data**

This report contains only the latest available performance data for the selected resources. Note that even the latest data available might still be somewhat old, depending on whether data was recently collected for the resources. Including the time column in the report will help you determine how old the latest available data actually is. Regardless of the age of the data, clicking this button ensures that only a single row (representing a single point in time) for each selected resource is included in the report. If no data has ever been collected for a particular resource, then that resource is not included in the report. If no data has ever been collected for any resource, then the resulting report will be empty.

#### **Display historic performance data using absolute time**

This report contains only data that falls within a specific time range. Select the time range using the **From** and **To** selectors. The specified from and to values are interpreted as inclusive. The resulting report contains all the performance data that is available within the specified time range, for each selected resource. This means that the data can consist of potentially many rows per resource, each with a unique timestamp. If no data has been collected for a particular resource during the specified time range, that resource is not included in the report. If no data has been collected for any resource during the specified time range, then the resulting report will be empty.

To determine which historical performance records fall within the specified time range, the **beginning timestamp** of the collection intervals is used for comparison. If an historical record contains performance data for an interval of time from 1:00 PM to 1:05 PM, that record would be included in the report for a time range of 1:00 PM to 8:00 PM. However, that same record would not be included if a time range of 1:02 PM

to 8:02 PM was specified, because it is the beginning of the time period (for example, 1:00 PM in this example) that is used to determine inclusion in the specified time interval.

### **Display historic performance data using relative time**

This report contains only data that falls within a specific time range extending backward from the current date and time. Specify the number of days in the desired time range, using the **days ago until now** field. The report will be exactly the same as a report using absolute time, with the **To** selector set to the current date and time, and the **From** selector set to the current date and time minus the number of **days ago until now**.

Note that the same criteria applies as if determining which historical performance records fall within the specified time range. Only the beginning timestamp of the collection intervals is used for comparison. This means that data for the current hour or the current day is not included in the report when selecting hourly or daily summation data, because data for the current hour or current day is only saved in the database when the hour or day is complete. As an alternative, consider using the first radio button, **Display latest performance data**, to see a report showing the most recent daily summation data.

### **Summation Level**

Use this selector to select which type of performance data records to include in the report. The Tivoli Storage Productivity Center Performance Manager collects and stores three different types of performance data:

#### **By sample**

Represents the most detailed data. There is usually one sample record per resource for every **n** minutes, where **n** is the performance monitor interval length that was specified when the monitor was defined. Each sample represents the average performance of the resource over those **n** minutes. A sample record with a timestamp of **t** will be saved at time **t+n**. In other words, the beginning of each **n** minute time interval is used for display and for time range matching.

#### **Hourly**

Represents an hourly average of the performance of the specified resources. There will be one hourly record written every hour, per resource. Each such record will be written at or shortly after each hour mark on the (device) clock. For example, a record with a timestamp of 12:00 PM and interval length of 1 hour will be written at 1:00 PM.

#### **Daily**

Represents a daily average of the performance of the resources. There will be one daily record written every day, per resource. Each daily record will be written at or shortly after midnight, according to the device clock. For example, a record with a timestamp of April 21, 12:00 AM and interval length of 24 hours will be written on April 22, 12:00 AM.

Note that hourly and daily records are usually retained in the database for longer periods of time, compared to By Sample records. As a result, if a generated report indicates that sample data is no longer available for a particular time range in the past, it is possible that the sample

data has already been purged, in which case you can try generating the report using hourly or daily summation levels.

Be aware that when selecting a time range using the **Display historic performance data using relative time** radio button, it is necessary to select the length of the range in days. This can lead to unexpected results when also selecting the daily summation level. Remember that a daily record is not written until the day is complete, which means that at any given time during the day, the current day's data does not yet exist in the database. Therefore, selecting the daily summation level as well as a relative time range of **n days ago until now**, will usually result in n-1 records being returned per resource, assuming that at least n-1 days worth of data has been previously collected for those resources. Specifying a relative time range of **1 days ago until now** will result in an empty report.

**Note:** The user interface displays the date and time of data in the Tivoli Storage Productivity Center server time zone, but the daily and hourly aggregations are calculated based on the device time zones. Hourly records are written at the end of each hour according to the devices' clocks and the daily records are written at midnight according to the devices' clocks, but both are displayed according to the Tivoli Storage Productivity Center server's clock. For example, if a subsystem clock is one hour ahead of the Tivoli Storage Productivity Center server clock, the hourly data for 5:00 PM according to the device's clock is displayed as 4:00 PM in the user interface and the daily data for 12:00 AM according to the device's clock is displayed as 11:00 PM of the previous day.

### **Available Columns, Included Columns**

Use these items to specify which columns to include and which columns to exclude from the generated report.

#### **Available Columns**

Displays the columns that you can include in the generated report that are not already included. If a column appears in the **Included Columns** list box, it will not appear in the **Available Columns** list box.

#### **Included Columns**

Displays the columns that will appear in the generated report. By default, all columns for a report are listed in this list box and will be displayed in the generated report. You can highlight the columns and use the up and down arrows to rearrange the order of the columns in the report. The order of the items in this list box determines the order in which the columns will appear in the generated report. The columns with grayed-out names are the frozen columns, which cannot be selected, removed, or reordered for this type of report.

If a column appears in the **Available Columns** list box, it will not appear in the **Included Columns** list box.

To exclude a column from a report, click the name of the column in the **Included Columns** list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the left-arrow button (<<). The selected columns are removed from the **Included Columns** list box, and will appear in the **Available Columns** list box.

To include a column in a report, click the name of the column in the Available Columns list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the right-arrow button (>>). The selected columns will be removed from the **Available Columns** list box, and will appear in the **Included Columns** list box.

To rearrange the order of columns that will appear in the generated report, click the name of a column in the **Available Columns** list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the up-arrow button (^) or the down-arrow button (v) to move the selected columns up or down in the list, relative to the other columns.

4. Click **Generate Report**. A new tab opens and displays the report.

5. Optional: To view the report in chart format, click , specify charting options, and then click **OK**. Right-click on the chart and select **Customize this Chart** to further customize how the chart is displayed.

6. Optional: To save the report settings to generate later, click  and enter a name for the report. The report is saved under the IBM Tivoli Storage Productivity Center node. See “Filtering the resources that appear on a report” on page 825 for instructions on modifying saved report settings.

If the report is greater than 2500 rows, a dialog box will appear which will allow you to retrieve additional rows by clicking **Display More Rows**. An additional 2500 rows will be retrieved from the server and displayed on the panel for each click of the button. Do not try to display too much data or there is the possibility of running out of memory.

## Generating constraint violation reports

Learn how to generate a storage subsystem performance report.

### Creating constraint violation reports:

Learn how to how to create constraint violation reports.

1. In the navigation tree pane, expand **Disk Manager > Reporting > Storage Subsystem Performance**.

2. Click **Constraint Violations**. The constraint violation report selection page appears in the content pane.

3. If you want to limit the report to a particular time period, select **Limit to this time range** and specify the time period.

4. Click **Selection** to choose which storage subsystems to include in the report.

5. Click **Filter** to modify the filter used in generating the report.

6. Customize the performance report. By default, all supported metrics are included. Click to move the selected metric up in the list and to move the selected metric down in the list.

a. In the **Included Columns** list, select a metric and click  to remove it from the report.

b. To change the order in which the columns appear in the report, select a

metric and click either  or .

7. Click **Generate Report**. The **Constraint Violations** tab opens and displays the report.

The report might show information about DS6000, DS8000, TotalStorage Enterprise Storage Server, SAN Volume Controller, and other subsystems all on the same report. By default, the report displays one subsystem per row. Results are aggregated for the current day.

#### Viewing detailed constraint violation information:

Learn how to view detailed information about constraint violations.

Before you can view detailed information about constraint violations, you must generate a constraint violation report (see “Creating constraint violation reports” on page 1001).

1. Click on the **Constraint Violations** tab to view the report. The report might show information about DS6000, DS8000, TotalStorage Enterprise Storage Server, SAN Volume Controller, and other subsystems all on the same report. By default, the report displays one subsystem per row. Results are aggregated for the current day.

2. Click  to view a detailed report of that subsystem.

3. Click , specify charting options, and then click **OK** to view the report in chart form. Right-click on the chart and select **Customize this Chart** to further customize how the chart is displayed.

#### Viewing affected volumes and affected hosts:

Learn how to view information on volumes and related hosts affected by constraint violations.

Before you can view affected volumes and hosts information, you must generate a constraint violation report (see “Creating constraint violation reports” on page 1001) and view detailed information on a subsystem (see “Viewing detailed constraint violation information”).

1. Click  for a constraint violation to display the Affected Volumes Selection page.
2. Under Volumes, select whether you want the report to show all volumes or only the most active volumes associated with the subsystem and component and type in the maximum number of volumes to display in the report.
3. Under Performance Data, select whether you do not want the report to display performance data for the volumes or you do want the report to display historic performance data for volumes.
4. Customize the performance report. By default, all supported metrics are included. Click to move the selected metric up in the list and to move the selected metric down in the list.
  - a. In the **Included Columns** list, select a metric and click  to remove it from the report.

- b. To change the order in which the columns appear in the report, select a

metric and click either

or

5. Click **Generate Report**.

## Fabric Manager reports

Fabric reports provide you with both overview and detailed information about your fabrics, switches, and ports. The reports are based on information collected by probes and performance monitors. You can view reports as tables of data or as graphical charts. You can use pre-defined Fabric system reports or define your own switch performance reports for information by port or by constraint violations.

Before you can generate a report you need to gather information about your fabrics. You can do this through monitoring jobs, and discoveries.

### Creating switch performance reports

After performance monitors are in operation, you can generate switch performance reports. The procedure is similar for each report.

“Creating a switch performance monitor” on page 377 describes how to create performance monitors for fabric switches.

For both reports, use the **Selection** tab to specify switches to report, report columns to include, and filters to apply. When you click **Generate Report**, the **Ports** page or **Constraint Violations** page is created and displays the report.

1. Expand **Fabric Manager** → **Reporting** → **Switch Performance**.
2. Click **By Switch**, **By Port** or **By Constraint Violations**. In the content pane, the Selection page opens.
3. Select from the following options to customize the report:

#### Selection button

Click this button to determine the resources upon which you want to report. The Select Resources window displays. The type of resources displayed for selection depends on the type of report you selected. If you clear the box for a resource on the Select Resources window, a pushpin icon displays on the Selection button.

#### Filter button

Click this button to further defines the data that you want to include in the report. Filters enable you to apply general rules to the report. When you click this button, the Edit Filter window displays.

For example, to select only data associated with switches that have a name ending with "123-IBM", select the "Switch" column, the "LIKE" operator, and type "\*123-IBM" (without the quotation marks) in the **Value 1** field.

If a filter is defined for this report, a pushpin icon displays on the **Filter** button.

#### Time range selectors

All performance reports display historical performance data. Use the time range selectors to specify the exact time range that you want the report to cover. Click one of the following radio buttons to select the type of historical report you want:

### Display latest performance data

This report contains only the latest available performance data for the selected resources. Note that even the latest data available might still be somewhat old, depending on whether data was recently collected for the resources. Including the time column in the report will help you determine how old the latest available data actually is. Regardless of the age of the data, clicking this button ensures that only a single row (representing a single point in time) for each selected resource is included in the report. If no data has ever been collected for a particular resource, then that resource is not included in the report. If no data has ever been collected for any resource, then the resulting report will be empty.

### Display historic performance data using absolute time

This report contains only data that falls within a specific time range. Select the time range using the **From** and **To** selectors. The specified from and to values are interpreted as inclusive. The resulting report contains all the performance data that is available within the specified time range, for each selected resource. This means that the data can consist of potentially many rows per resource, each with a unique timestamp. If no data has been collected for a particular resource during the specified time range, that resource is not included in the report. If no data has been collected for any resource during the specified time range, then the resulting report will be empty.

To determine which historical performance records fall within the specified time range, the **beginning timestamp** of the collection intervals is used for comparison. If an historical record contains performance data for an interval of time from 1:00 PM to 1:05 PM, that record would be included in the report for a time range of 1:00 PM to 8:00 PM. However, that same record would not be included if a time range of 1:02 PM to 8:02 PM was specified, because it is the beginning of the time period (for example, 1:00 PM in this example) that is used to determine inclusion in the specified time interval.

### Display historic performance data using relative time

This report contains only data that falls within a specific time range extending backward from the current date and time. Specify the number of days in the desired time range, using the **days ago until now** field. The report will be exactly the same as a report using absolute time, with the **To** selector set to the current date and time, and the **From** selector set to the current date and time minus the number of **days ago until now**.

Note that the same criteria applies as if determining which historical performance records fall within the specified time range. Only the beginning timestamp of the collection intervals is used for comparison. This means that data for the current hour or the current day is not included in the report when selecting hourly or daily summation data, because data for the current hour or current day is only saved in the database when the hour or day is complete. As an alternative, consider using the first radio button, **Display latest performance data**, to see a report showing the most recent daily summation data.

## Summation Level

Use this selector to select which type of performance data records to include in the report. The Tivoli Storage Productivity Center Performance Manager collects and stores three different types of performance data:

### By sample

Represents the most detailed data. There is usually one sample record per resource for every **n** minutes, where **n** is the performance monitor interval length that was specified when the monitor was defined. Each sample represents the average performance of the resource over those **n** minutes. A sample record with a timestamp of **t** will be saved at time **t+n**. In other words, the beginning of each **n** minute time interval is used for display and for time range matching.

### Hourly

Represents an hourly average of the performance of the specified resources. There will be one hourly record written every hour, per resource. Each such record will be written at or shortly after each hour mark on the (device) clock. For example, a record with a timestamp of 12:00 PM and interval length of 1 hour will be written at 1:00 PM.

**Daily** Represents a daily average of the performance of the resources. There will be one daily record written every day, per resource. Each daily record will be written at or shortly after midnight, according to the device clock. For example, a record with a timestamp of April 21, 12:00 AM and interval length of 24 hours will be written on April 22, 12:00 AM.

Note that hourly and daily records are usually retained in the database for longer periods of time, compared to By Sample records. As a result, if a generated report indicates that sample data is no longer available for a particular time range in the past, it is possible that the sample data has already been purged, in which case you can try generating the report using hourly or daily summation levels.

Be aware that when selecting a time range using the **Display historic performance data using relative time** radio button, it is necessary to select the length of the range in days. This can lead to unexpected results when also selecting the daily summation level. Remember that a daily record is not written until the day is complete, which means that at any given time during the day, the current day's data does not yet exist in the database. Therefore, selecting the daily summation level as well as a relative time range of **n days ago until now**, will usually result in **n-1** records being returned per resource, assuming that at least **n-1** days worth of data has been previously collected for those resources. Specifying a relative time range of **1 days ago until now** will result in an empty report.

**Note:** The user interface displays the date and time of data in the Tivoli Storage Productivity Center server time zone, but the daily and hourly aggregations are calculated based on the device time zones. Hourly records are written at the end of each hour according to the devices' clocks and the daily records are written at midnight according to the the devices' clocks, but both are displayed according to the Tivoli Storage Productivity Center server's clock. For example, if a subsystem

clock is one hour ahead of the Tivoli Storage Productivity Center server clock, the hourly data for 5:00 PM according to the device's clock is displayed as 4:00 PM in the user interface and the daily data for 12:00 AM according to the device's clock is displayed as 11:00 PM of the previous day.

### Available Columns, Included Columns

Use these items to specify which columns to include and which columns to exclude from the generated report.

#### Available Columns

Displays the columns that you can include in the generated report that are not already included. If a column appears in the **Included Columns** list box, it will not appear in the **Available Columns** list box.

#### Included Columns

Displays the columns that will appear in the generated report. By default, all columns for a report are listed in this list box and will be displayed in the generated report. You can highlight the columns and use the up and down arrows to rearrange the order of the columns in the report. The order of the items in this list box determines the order in which the columns will appear in the generated report. The columns with grayed-out names are the frozen columns, which cannot be selected, removed, or reordered for this type of report.

If a column appears in the **Available Columns** list box, it will not appear in the **Included Columns** list box.

To exclude a column from a report, click the name of the column in the **Included Columns** list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the left-arrow button (<<). The selected columns are removed from the **Included Columns** list box, and will appear in the **Available Columns** list box.

To include a column in a report, click the name of the column in the **Available Columns** list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the right-arrow button (>>). The selected columns will be removed from the **Available Columns** list box, and will appear in the **Included Columns** list box.

To rearrange the order of columns that will appear in the generated report, click the name of a column in the **Available Columns** list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the up-arrow button (^) or the down-arrow button (v) to move the selected columns up or down in the list, relative to the other columns.

4. Click **Generate** to run the report.

The report is displayed in the **Ports** tab. You can display the information in

chart form by clicking  .

5. Click **File** → **Save as** to save the report in the <user-id> **Reports** node.

## Switch Performance:

Use the Switch Performance report to generate and view reports that provide information about the free and occupied ports on the switches in your SAN. These reports provide information about the port connections and status, as well as the port and switch IDs, data and packet transfer rates, and other details. This report can be generated only for switches that have had performance monitors run on them.

The following list describes the columns that are on the Switch Performance report. All of the columns in the report are for display only.

### Switch

The ID of the switch.

**Time** The date and time of the data collection.

### Interval

The size of the sample interval, in seconds.

### Port Send Packet Rate

The rate at which packets are sent through this port.

### Port Receive Packet Rate

The rate at which packets are received through this port.

### Total Port Packet Rate

The total rate at which packet operations are performed through this port.

### Port Send Data Rate

The rate at which data is sent through this port.

### Port Receive Data Rate

The rate at which data is received through this port.

### Total Port Data Rate

The total rate at which data is processed through this port.

### Port Peak Send Data Rate

The peak rate at which data is sent through this switch.

### Port Peak Receive Data Rate

The peak rate at which data is received through this switch.

### Port Send Packet Size

The size of the data block that is sent out through this switch.

### Port Receive Packet Size

The size of the data block that is received in through this switch.

### Overall Port Packet Size

The total size of the data block that is transferred by the switch.

### Error Frame Rate

The rate at which error frames are generated by the switch.

### Dumped Frame Rate

The rate at which frames are dumped by the switch.

### Link Failure Rate

The rate at which failed links are generated by the switch.

## Fabric Performance Report - By Port:

Click  to display detailed information per computer in a **Network** tab. The **Network** tab displays a file summary by computer.

The following list describes the columns that are on the Fabric Performance Report - By Port report, and are for display only.

**Port** The ID of the port.

**WWPN**

The World Wide Port Name (WWPN) of the selected port.

**Slot** The number for the blade that the port is on.

**Index** The unique number for the port across the whole switch.

**Time** The date and time of the data collection.

**Interval**

The size of the sample interval, in seconds.

**Port Send Packet Rate**

The average number of packets sent per second, by a particular port over a particular time interval. A send operation is a read operation processed, or a write operation initiated by the particular port.

**Port Receive Packet Rate**

The average number of packets received per second, by a particular port over a particular time interval. A receive operation is a write operation processed, or a read operation initiated by the particular port.

**Total Port Packet Rate**

The average number of packets sent and received per second, by a particular port over a particular time interval.

**Port Send Data Rate**

The average number of megabytes sent per second, by a particular port over a particular time interval.

**Port Receive Data Rate**

The average number of megabytes received per second, by a particular port over a particular time interval.

**Total Port Data Rate**

The average number of megabytes transferred per second, by a particular port over a particular time interval.

**Port Peak Send Data Rate**

The peak number of megabytes sent per second, by a particular port over a particular time interval.

**Port Peak Receive Data Rate**

The peak number of megabytes received per second, by a particular port over a particular time interval.

**Port Send Packet Size**

The size of the data block that is sent out through this switch.

**Port Receive Packet Size**

The size of the data block that is received in through this switch.

**Overall Port Packet Size**

The total size of the data block that is transferred by the switch.

**Error Frame Rate**

The rate at which error frames are generated by the switch.

**Dumped Frame Rate**

The rate at which frames are dumped by the switch.

**Link Failure Rate**

The rate at which failed links are generated by the switch.

**Loss of Sync Rate**

The average number of times per second that synchronization was lost after the last reset of the device, for a particular component over a particular time interval.

**Loss of Signal Rate**

The average number of times per second that the signal was lost after the last reset of the device, for a particular component over a particular time interval.

**CRC Error Rate**

The average number of frames received per second in which the CRC in the frame did not match the CRC computed by the receiver, for a particular component over a particular time interval.

**Short Frame Rate**

The average number of frames received per second that were shorter than 28 octets (24 header + 4 CRC), not including any start of frame/end of frame bytes, for a particular component over a particular time interval.

**Long Frame Rate**

The average number of frames received per second that were longer than 2140 octets (24 header + 4 CRC + 2112 data), not including any start of frame/end of frame bytes, for a particular component over a particular time interval.

**Encoding Disparity Error Rate**

The average number of disparity errors received per second, for a particular component over a particular time interval.

**Discarded Class3 Frame Rate**

The average number of class-3 frames per second that were discarded by a particular component over a particular time interval.

**F-BSY Frame Rate**

The average number of F-BSY frames per second that were generated by a particular component over a particular time interval.

**F-RJT Frame Rate**

The average number of F-RJT frames per second that were generated by a particular component over a particular time interval.

**Constraint Violations:**

If you have defined switch performance alerts you can also generate the Constraint Violations report.

Click  to display detailed information per computer in a **Network** tab. The **Network** tab displays a file summary by computer.

The following list describes the columns that are on the Top Switch Ports Packet Rate Performance report. The columns are for display only and are not editable.

**Switch**

The ID of the switch.

**Total Port Data Rate Threshold**

The total rate at which data is processed through this port.

**Link Failure Rate Threshold**

The rate at which failed links are generated by the switch.

**Error Frame Rate Threshold**

The rate at which error frames are generated by the switch.

**Total Port Packet Rate Threshold**

The total rate at which the packet operations are performed through this port.

## Tape Manager reports

You can perform the following tape library reporting tasks:

- Create and view asset reports using data collected from your tape libraries; these reports can include such information as the library identifier and the status of the library
- Create and view capacity reports using data collected from your tape libraries; these reports can include such information as the number of drives in a library, the number of tape slots, the number of occupied tape slots

---

## System reports

Use the information in this section to learn how to generate and view system reports. These reports are available in the **IBM Tivoli Storage Productivity Center > Reporting > System Reports** and **Data Manager for Databases > My Reports > System Reports** nodes in the navigation tree. Data for system reports are gathered every time that monitoring jobs are run against your storage resources.

## Generating and viewing system reports

Learn how to generate system reports, drill down through and filter their data, and generate charts.

To display a report, complete the following steps:

1. Expand **IBM Tivoli Storage Productivity Center > My Reports > System Reports > <manager>**.
2. Click the name of the report you want to view. The report will appear in the content pane. To regenerate a report, select the report name, right-click, and select **Regenerate Report**.

Many of the rows that are presented in the generated system reports enable you to:

- drill down into a row to get more detailed information
- view report information in a chart format

**To drill down for more detailed report information:**

- Click  on the desired row. The drill down report is displayed and a new tab representing that report is added to the tabs on the report.

### To view report information in a chart format:

- Click  on the desired row. The chart is displayed and a new tab representing that chart is added to the tabs on the report.

You can customize the charts that you generate from system reports by using the Chart Customization window. You can access this window by right-clicking on a system report chart and selecting **Customize this chart** from the pop-up menu. See “Customizing charts” on page 814 for information on how to customize a system report chart.

### To filter the data displayed on a report:

Click the **Filter** button, which displays an Edit Filter window. In this window, specify criteria for records (for example, Capacity in Data Reports), operators (for example, =) and values for each "column" (whatever you want to type). For example, in the Disk Space Summary report, you can specify only disks with a capacity greater than 70 GB.

If you change any element of a report definition (for example, the maximum number of rows in the report), you can save the new report definition (and regenerate it later) by clicking **File** → **Save** and then typing a name for the report. The report is saved with the name you specify under the *user\_id's Reports* node.

## System reports - Data

Use these predefined reports to view statistics about your storage resources.

### Access Time Summary

This report provides a summary of the number of files in your environment and when they were last accessed (for example, created or modified) during the last day, the last week, the last month, the last two months, the last three months, the last six months, the last nine months, the last year, and over a year.

The following list describes the columns that are on the Access Time Summary report. All of the fields on the report are for display only and are not editable.

#### **Last Accessed <= 1 day**

The number and total size of the files that were accessed within the last day.

#### **Last Accessed 1 day — 1 week**

The number and total size of the files that were accessed between 1 day and 1 week ago.

#### **Last Accessed 1 week — 1 month**

The number and total size of the files that were accessed between 1 week and 1 month ago.

#### **Last Accessed 1 month — 2 months**

The number and total size the files that were accessed between 1 month and 2 months ago.

#### **Last Accessed 2 months — 3 months**

The number and total size of the files that were accessed between 2 – 3 months ago.

#### **Last Accessed 3 months — 6 months**

The number and total size of the files that were accessed between 3 – 6 months ago.

**Last Accessed 6 months — 9 months**

The number and total size of the files that were accessed between 6 – 9 months ago.

**Last Accessed 9 months — 1 year**

The number and total size of the files that were accessed between 9 months and 1 year ago.

**Overall File Count**

Total number of files across a network.

**Overall File Size**

Total size of the space consumed by the files on a network.

**Average Age**

Average age of files on a network measured by days, hours, minutes, seconds.

- To view any of the following charts, click  above the report and select the corresponding option from the pop-up menu:

- pie chart of storage space distribution for a selected row
- pie chart of file counts for a selected row
- pie chart of storage space distribution for all the rows on the report
- pie chart of file counts for all the rows on a report
- history chart of file counts
- history chart of file count by percent
- history chart of file sizes
- history chart of files size by percent

- To view a pie chart of file access times, click  to left of a report row.

- To view detailed file access times for the computers on the network, click  to the left of a report row.

**Disk Space Summary**

This report shows storage capacity for the whole network. You can drill down through this report to view storage capacity for each of the following levels: per disk, per computer, per cluster, per computer group, and per domain.

The following list describes the columns that are on the Disk Space Summary report. All of the fields on the report are for display only and are not editable.

**Disk Space**

Total storage capacity of the disks on the computers within a network.

**Consumed File System Space**

Amount of used storage space on the file systems within a network.

**Available File System Space**

Amount of unused storage space on the file systems within a network.

**Raw Volume Space**

Space on host-side logical volumes that is not occupied by file systems.

**Unavailable Disk Space**

Amount of storage subsystem volume or virtual storage volume space that is dedicated to redundancy. This value is dependent on the storage

subsystem SMI-S provider returning a valid RAID value that is used to determine the overhead. If the value is zero for a storage subsystem, the overhead cannot be calculated. This amount does not include storage space information from storage subsystem volumes or virtual storage volumes that become missing after a storage subsystem probe.

### **Available Disk Space**

Space that is assigned to a (monitored) host that is not part of any logical volume.

### **Unknown Storage Subsystem Volume Space**

Volume space of unknown usage.

- To view any of the following charts click  at the top of the report and select the corresponding option from the pop-up menu:
  - pie chart of network space distribution
  - pie chart of network row
  - history chart of the free space for a network
  - history chart of the percentage of free space for a network
  - history chart of the storage capacity on a network
- To view a pie chart of disk capacity, click  to the left of a report row.
- To view detailed disk capacity for the computers on a network, click the  to the left of a report row.

## **Access File Summary**

This report provides overview information for files in your storage environment.

The Access File Summary report provides overview information for files by directory, directory group, file system, file system group, cluster, computer, computer group, domain, and for the entire network. Through this report you can view historically the number of files for each resource in the report. The historical chart can be generated to show daily, weekly, or monthly history.

The following list describes the columns that are on the Access File Summary report. All of the fields on the report are for display only.

### **File Size**

Total size of the storage space consumed by the files on a network.

### **File Count**

Total number of files on a network.

### **Directory Count**

Total number of directories on a network.

### **Average File Size**

Average storage space consumed by each of the files on a network.

### **File System Space**

Total storage capacity of the files on a network.

- To view any of the following charts click  at the top of the report and select the corresponding option from the pop-up menu:
  - History chart of storage space usage for a selected row

- History chart of file counts for a selected row
- To view a history chart of the storage space consumed by files on a network, click  to the left of a report row.

- To view detailed file storage usage for the computers on the network, click  to the left of a report row.

## Storage Access Times

This report shows when files were last accessed.

The following list describes the columns that are on the Storage Access Times report. All of the fields on the report are for display only.

### Computer

Name of a computer against which the report was run.

### Last Accessed <= 1 day

Number of files that were accessed within the last 24 hours and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

### Last Accessed 1 day - 1 week

Number of files that were accessed between 1 day to 1 week previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

### Last Accessed 1 week - 1 month

Number of files that were accessed between 1 week to 1 month previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

### Last Accessed 1 month - 2 months

Number of files that were accessed between 1 month to 2 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

### Last Accessed 2 months - 3 months

Number of files that were accessed between 2 months to 3 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

### Last Accessed 3 months - 6 months

Number of files that were accessed between 3 months to 6 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

### Last Accessed 6 months - 9 months

Number of files that were accessed between 6 months to 9 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

### Last Accessed 9 months - 1 year

Number of files that were accessed between 9 months to 1 year previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

### Last Accessed > 1 year

Number of files that were accessed over one year previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes).

**Overall File Count**

Total of all the counts.

**Overall File Size**

Total of all the sizes.

**Average Age**

Average time since the file was last accessed.

To view graphical information about specific computers' access times, click

. A new tab displaying a chart for each selected computer is displayed.

**Disk Defects**

This report shows any disk defects that are on the monitored computers.

The following list describes the columns that are on the Disk Defects report. All of the fields on the report are for display only and are not editable.

**Device**

Name of the computer containing a disk defect.

**Path** Full path to the location of a disk defect.

**Primary Defects**

Number of defects on the disk when it was new.

**Manufacturer**

Name of the manufacturer of the disk drive containing the disk defect.

**Model** Model number of the disk drive containing a disk defect.

**In Storage Subsystem**

Indicates Yes when a disk is an actual physical disk within the storage subsystem.

**RPM** Speed that the disk turns (revolutions per minute).

**Read Cache**

Hardware caching turned on/off for reads.

**Write Cache**

Hardware caching turned on/off for writes.

**Failure Predicted**

Disk predicts a failure.

**Probe Last Run**

Date and time when the last probe was run.

**Discovered Time**

Date and time when a disk defect was discovered.

**Disk Space**

Storage capacity of the disk drive containing a defect.

**Available Disk Space**

Amount of unused storage space on the disk drive containing a defect.

**Grown Defects**

Number of defects detected by the disk since new.

**Recovered Errors**

Number of errors (read, write, verify) from which the disk was able to recover.

**Unrecovered Errors**

Number of errors (read, write, verify) from which the disk was not able to recover.

**Bytes Written**

Number of bytes written to the disk.

**Bytes Read**

Number of bytes read from the disk.

**Automatic Write Reallocation**

Disk attempts to move the data sector on the disk in the event of a write error.

**Desired Automatic Write Reallocation**

Change automatic write allocation on the next probe.

**Automatic Read Reallocation**

Disk attempts to move the data sector on the disk in the event of a read error.

**Desired Automatic Read Reallocation**

Change automatic read allocation on the next probe.

**Read Continuous (no error correction)**

No error correction (setting is ON=no error correction).

**Desired Read Continuous (no error correction)**

Change automatic read continuous on the next probe.

**Detectable**

Indicates Yes when a storage volume is identified as being available to the storage subsystem following a successful probe.

**Is Virtual**

Indicates Yes when a disk is identified as being available to the server or the storage subsystem.

**Mapped to Storage Subsystem**

Indicates Yes when a computer disk or a backend storage volume can be mapped to a storage subsystem.

**To view more information for a specific computer:**

- Click  . Detailed information regarding the computer will be available in three tabs:
  - **General tab.** This tab displays general information about the computer, such as computer information, discovered date and time, disk allocation information, and so on.
  - **Latest Probe tab.** This tab displays information about the latest probe, and provides information such as sector size, probe last run, primary and grown defects, and so on.
  - **Probe History tab.** This tab displays probe history for the selected machine, and provides information such as probe times, record type, bytes written, and so on.

**Storage Modification Times**

This report shows information about files within the network that were modified with certain time frames.

The Storage Modification Times report provides information about files within the network that were modified:

- within the last 24 hours
- between 24 hours and one week previous
- between one week to one month previous
- between one month to two months previous
- between two months to three months previous
- between three months to six months previous
- between six months to nine months previous
- between nine months to one year previous
- more than one year previous

The following list describes the columns that are on the Storage Modification Times report. All of the fields on the report are for display only.

**Last Modified <= 1 day**

Number of files that were modified in the last 24 hours and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

**Last Modified 1 day - 1 week**

Number of files that were modified between 1 day to 1 week previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

**Last Modified 1 week - 1 month**

Number of files that were modified between 1 week to 1 month previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

**Last Modified 1 month - 2 months**

Number of files that were modified between 1 month to 2 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

**Last Modified 2 months - 3 months**

Number of files that were modified between 2 months to 3 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

**Last Modified 3 months - 6 months**

Number of files that were modified between 3 months to 6 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

**Last Modified 6 months - 9 months**

Number of files that were modified between 6 months to 9 months previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

**Last Modified 9 months - 1 year**

Number of files that were modified between 9 months to 1 year previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

**Last Modified > 1 year**

Number of files that were modified over a year previous and the total physical size of those files (measured in kilobytes, megabytes, or gigabytes)

**Overall File Count**

Sum of the files

**Overall File Size**

Sum of the size of the files

**Average Age**

Average age since files were modified

To view graphical information about storage modification times, click . A new tab displaying a chart for the network is displayed.

**Most At Risk Files**

This report provides information on files that were modified the longest time ago and were not backed-up or archived since they were modified.

The following list describes the columns that are on the Most At Risk Files report. All of the fields on the report are for display only and are not editable.

**Modification Time**

Date and time when an at risk file was last modified

**Computer**

Name of the computer where an at risk file is stored

**Filesystem**

Filesystem where an at risk file is stored

**Path** Full path to the location of an at risk file

**Filename**

The name of the at risk file

**Owner**

ID of the user who owns an at risk file

**OS User Group**

OS User group of the user who owns an at risk file

**Logical Size**

Logical size of an at risk file

**Physical Size**

Physical size of an at risk file (measured in kilobytes, megabytes, or gigabytes)

**Access Time**

Date and time when an at risk file was last accessed

**Create Time**

Date and time when an at risk file was created

**To view more information about a specific file:**

- Click . Detailed information regarding the file is displayed in a **File Detail** tab. The **File Detail** tab displays more information for the specific file and provides information such as file ownership, modification and creation time, and any file attributes that were set.

## Most Obsolete Files

This report provides information about files that have not been accessed or modified for the longest period of time.

The following list describes the columns that are on the Most Obsolete Files report. All of the fields on the report are for display only and are not editable.

### Access Time

Date and time when an obsolete file was last accessed

### Computer

Name of the computer where an obsolete file is stored

### Filesystem

Filesystem where an obsolete file is stored

**Path** Full path to the location of an obsolete file

### Filename

File name of an obsolete file

### Owner

ID of the user who owns an obsolete file

### OS User Group

OS User Group to which the owner of the obsolete file belongs

### Logical Size

Logical size of an obsolete file

### Physical Size

Physical size of an obsolete file (measured in kilobytes, megabytes, or gigabytes)

### Modification Time

Date and time when an obsolete file was last modified

### Create Time

Date and time when an obsolete file was created

## Viewing more information about a specific file

Click . Detailed information regarding the file is displayed in a **File Detail** tab. The **File Detail** tab displays more information for the specific file and provides information such as file ownership, modification and creation time, and any file attributes that are set.

## Oldest Orphaned Files

This report provides information about files that have the oldest creation date and no longer have owners who are registered as users on the computer or network.

The following list describes the columns that are on the Oldest Orphaned Files report. All of the fields on the report are for display only.

### Access Time

Date and time when an orphaned file was last accessed

### Computer

Name of the computer where an orphaned file is stored

### Filesystem

Filesystem where an orphaned file is stored

**Path** Full path to the location of an orphaned file

**Filename**  
File name of an orphaned file

**Owner**  
Operating system internal ID of the user who owned the orphaned file. This is the internal ID that the operating system uses to identify the user, and *not* the user ID

**OS User Group**  
OS User group to which the owner of an orphaned file belongs

**Logical Size**  
Logical size of an orphaned file

**Physical Size**  
Physical size of an orphaned file (measured in kilobytes, megabytes, or gigabytes)

**Modification Time**  
Date and time when an orphaned file was last modified

**Create Time**  
Date and time when an orphaned file was created

**To view more information for a specific file:**

- Click . Detailed information regarding the file is displayed in a **File Detail** tab. The **File Detail** tab displays information about a specific file such as file ownership, modification and creation time, and any file attributes that are set.

## **User Quota Violations**

This report shows which users have violated a Data Manager storage usage quota.

The following list describes the columns on the User Quota Violations report. All the fields on the report are for display only.

**Quota Creator**  
Creator of a quota

**Quota Name**  
Name of a quota

**Computer**  
Computer that violated a quota

**Filesystem**  
File system that violated a quota

**User Name**  
ID of the user that violated a quota

**Space Used**  
Total amount of space used

**Threshold**  
Threshold defined by a quota

**% of Threshold**  
Percentage of quota; always > 100

**Number of Violations**  
Number of violations by a user

**Quota Type**

Type of quota: Network Wide, Filesystem, or Computer

**Computer Storage Availability**

This report provides information about the availability of computers within your environment.

If the computer is not available (determined by a ping), the storage is likely not available for use. The following list describes the fields that are on the Storage Availability report. All of the fields on the report are for display only.

**Computer**

Name of the computer

**% Available**

Percentage of successful pings

**Transmitted**

Number of pings transmitted

**Received**

Number of responses from the ping

**Damaged**

Number of responses with errors

**Avg Transit Time**

Average time to send and receive a response from a ping

**Max Transit Time**

Maximum time it took to send and receive response from a ping

**Min Transit Time**

Minimum time it took to send and receive response from a ping

**Report Start Time**

Start time of information in this row

**Report End Time**

End time of information

To view the ping history for a specific computer, click . A new tab displaying ping history information for the selected computer is displayed.

**Computer Disk Space**

This report provides storage capacity information about each computer within your environment.

The following list describes the columns that are on the Computer Disk Space report. All of the fields on the report are for display only.

**Computer**

Name of a computer against which the report was run

**Disk Space**

Total storage capacity for a computer

**Available Disk Space**

Amount of unused storage space on a computer (not in file systems seen by this operating system)

### **Owned Disk Space**

Total amount of unique disk storage space for computers in a cluster that is owned by those computers. If Tivoli Storage Productivity Center determines that a disk is configured for a different host, that disk's capacity is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on computers that have not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

#### **Note:**

- If the computer is an IBM SAN File System client, this value does not include the capacity of any volumes that are visible to it that are owned by the SAN File System.
- If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads from the host ID. If this does not agree with the local host ID, the disk is classified as belonging to a different (Solaris) host.

### **Owned Available Disk Space**

Total amount of unique disk storage space for computers in a cluster that is not allocated to any logical volume within the computers and is owned by the computers. If Data Manager determines that a disk is configured for a different computer, that disk's unallocated space is not counted in this column. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on computers that have not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from the computer.

If the computer is an IBM SAN File System client, then this value excludes the unallocated space on any storage subsystem volumes visible to it that are owned by the SAN File System.

If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product will examine the Veritas disk-label and read off the host-ID. If this does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

### **Non-Fibre Channel Attached Disk Space**

Total amount of unique disk space on the computers in a cluster that is not attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that reside behind a fibre channel port.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

### **Non-Fibre Channel Attached Available Disk Space**

Total amount of disk storage space on the computers in a cluster that is not allocated to any logical volume within the computers and is not attached

through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that reside behind a fibre channel port.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

#### **Fibre Channel Attached Disk Space**

Total amount of unique disk space on the computers in a cluster that is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that do not reside behind a fibre channel port.
- Computer disks that reside behind a fibre channel port that is not identified by a Storage Resource agent or Data agent.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

#### **Fibre Channel Attached Available Disk Space**

Total amount of disk storage space on the computers in a cluster that is not allocated to any logical volume within the computers and is attached through a fibre channel port. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks that do not reside behind a fibre channel port.
- Computer disks that reside behind a fibre channel port that is not identified by a Storage Resource agent or Data agent.
- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

#### **OS Type**

Operating system running on a computer

#### **Network Address**

Network address of a computer

#### **IP Address**

IP address of a computer

#### **Time Zone**

Time zone in which a computer is running

#### **CPU Architecture**

Instruction set architecture on the machine where an agent is running

### **Available File System Space**

This report shows the total amount of unused storage across a network.

The following list describes the columns on the Total Freespace report. All the fields on the report are for display only.

#### **Available File System Space**

Total amount of available storage space available on a network.

**Percent Available File System Space**

Percentage of total space that is unused on a network.

**Consumed File System Space**

Amount of used storage space on a network.

**File System Space**

Total amount (capacity) of storage space on a network.

**File Count**

Total number of files on a network.

**Directory Count**

Total number of directories on a network.

**Percent Free Inodes**

Percentage of free Inodes on a network.

**Used Inodes**

Number of used Inodes on a network.

**Free Inodes**

Number of free Inodes on a network.

**User Space Usage**

This report provides information about storage statistics related to users within your environment.

The following list describes the columns on the User Space Usage report. All the fields on the report are for display only.

**User Name**

ID of a user

**File Size**

Total amount of space used by a user

**File Count**

Number of files owned or created by a user

**Directory Count**

Number of directories owned or created by a user

**Largest File**

Largest file owned by a user

**2nd Largest File**

Second-largest file owned by a user

**Files < 1KB**

Number and total space usage of files under 1KB in size

**Files 1KB - 10KB**

Number and total space usage of files between 1KB and 10KB in size

**Files 10KB - 100KB**

Number and total space usage of files between 10KB and 100KB in size

**Files 100KB - 1MB**

Number and total space usage of files between 100KB and 1MB in size

**Files 1MB - 10MB**

Number and total space usage of files between 1MB and 10MB in size

**Files 10MB - 100MB**

Number and total space usage of files between 10MB and 100MB in size

**Files 100MB - 500MB**

Number and total space usage of files between 100MB and 500MB in size

**Files > 500MB**

Number and total space usage of files over 500MB in size

**Wasted Space**

This report provides information about storage statistics on non-OS files not accessed in the first year and orphan files.

The following list describes the columns on the Wasted Space-File Summary by Computer report. All the fields on the report are for display only.

**File Size**

Total amount of space used by the obsolete and orphan files

**File Count**

Total number of obsolete and orphan files

**Directory Count**

Total number of orphan directories

**Average File Size**

Average size of obsolete and orphan files

**File System Space**

Amount of storage space available on a storage subsystem.

To view more information for a specific file, click . Detailed information per computer will be displayed in a **Network** tab. The **Network** tab displays file summary by computer.

## System reports - Data Manager for Databases

Use these predefined reports to view statistics about your RDBMS storage resources. These reports are available in the **Data Manager for Databases > My Reports > System Reports** node of the navigation tree.

**All DBMS - Database Storage By Computer**

This report shows storage information about the databases in your environment sorted by the computers on which they are stored.

The following list describes the columns that are displayed in the All DBMS Database Storage By Computer report.

**Computer**

Name of the computer where the databases are located.

**Total Size**

Amount of space that is consumed by the databases on the computers.

**File Capacity**

Storage capacity of the data files within the databases.

**File Free Space**

Amount of free space that is available on the data files within the databases.

**DB-TS Count**

Number tablespaces that are associated with the databases.

**File Count**

Number of data files that are associated with the tablespaces in the databases.

**Log File Count**

Number of log files that are associated with the databases.

**All DBMS - User Database Space Usage**

This report shows information about the RDBMS storage space consumed by users across the network.

The following list describes the columns that appear on the All DBMS - User Database Space Usage report:

**User Name**

Name of a user upon whose storage usage information was collected.

**Total Size**

Amount of space consumed by the objects that are owned by the user.

**Empty Used Space**

Amount of empty used space that resides on the objects that are owned by the user.

**Table Count**

Number of tables that are owned by the user.

**Index Count**

Number of indexes that are owned by the user.

**Other Count**

Number of other objects owned by the user.

**Largest Object**

Size of the largest object owned by the user.

**2nd Largest Object**

Size of the second largest object owned by the user.

**Segment Size < 50KB**

Number and total space usage of objects owned by the user that are under 50KB in size.

**Segment Size 50KB - 500KB**

Number and total space usage of objects owned by the user that are between 50KB and 500KB in size.

**Segment Size 500KB - 1Mb**

Number and total space usage of objects owned by the user that are between 500KB and 1MB in size.

**Segment Size 1Mb - 10Mb**

Number and total space usage of objects owned by the user that are between 1MB and 10MB in size.

**Segment Size 10Mb - 100Mb**

Number and total space usage of objects owned by the user that are between 10MB and 100MB in size.

**Segment Size 100Mb - 500Mb**

Number and total space usage of objects owned by the user that are between 100MB and 500MB in size.

**Segment Size 500Mb - 1GB**

Number and total space usage of objects owned by the user that are between 500MB and 1GB in size.

**Segment Size > 1Gb**

Number and total space usage of objects owned by the user that are over 1GB in size.

**All DBMS - User Database Quota Violations**

This report provides information on the users who violated any storage usage thresholds defined in quotas.

The following list describes the columns that are on the All DBMS - User Database Quota Violations report.

**Quota Creator**

ID of the user who created the quota

**Quota Name**

Name of the quota

**Computer**

Name of the computer where the quota violation occurred

**RDBMS type**

RDBMS to which an instance belongs, for example, Oracle, SQL Server, Sybase, or UDB

**Instance**

Name/SID of the Oracle Instance, SQL Server server, Sybase server, or UDB Instance where the quota violation occurred

**Database-Tablespace**

Name of the database where the tablespace resides and name of the tablespace whose quota was violated

**User Name**

ID of the user who violated the quota

**Space Used**

Amount of space consumed by the user

**Threshold**

Threshold of used space defined within the quota

**% of Threshold**

Percentage of space by which the user violated the quota

**Number of Violations**

Number of violations for the user

**Quota Type**

The type of quota: Database-Tablespace, Instance, or Network-wide

**Oracle - Database Storage By Computer**

This report shows storage information about the databases in your environment sorted by the computers on which they are stored.

The following list describes the columns that are in the Oracle - Database Storage By Computer report.

**Computer**

Name of the computer where the databases are located.

**Total Size**

Amount of space consumed by the databases on the computers.

**Data File Capacity**

Storage capacity of the data files within the databases.

**Data File Free space**

Amount of free space available on the data files within the databases.

**Tablespace Count**

Number tablespaces associated with the databases.

**Data File Count**

Number of data files associated with the tablespaces in the databases.

**Log File Count**

Number of log files associated with the databases.

**Oracle - Total Database Freespace**

This report provides information on the total free space for data files at a network-wide level, as well as the percentage of free space, the total used space, number of free extents, and number of data files on a network. This report is available for Oracle and Microsoft SQL Server.

**Free Space**

Amount of free space on all data files in the network.

**Percent Free**

Percent of free space available on the data files in the network.

**Used Space**

Amount of used space on the data files in the network.

**Total Size**

Total size of data files in the network.

**Free Extents**

Number of free extents on the data files in the network.

**Coalesced Extents**

Number of coalesced extents on the databases in the network.

**Minimum Free Extent Size**

Minimum size of a free extent in a database.

**Maximum Free Extent Size**

Maximum size of a free extent in a database.

**Number Data Files**

Number of data files on the databases in the network.

**Oracle - User Database Space Usage**

This report shows information about the RDBMS storage space consumed by users across the network.

The following list describes the columns that appear on the Oracle - User Database Space Usage report:

**User Name**

Name of a user upon whose storage usage information was collected.

**Total Size**

Amount of space consumed by the objects that are owned by the user.

**Empty Used Space**

Amount of empty used space that resides on the objects that are owned by the user.

**Table Count**

Number of tables that are owned by the user.

**Index Count**

Number of indexes that are owned by the user.

**Other Count**

Number of other objects owned by the user.

**Largest Segment**

Size of the largest segment owned by the user.

**2nd Largest Segment**

Size of the second largest segment owned by the user.

**Segment Size < 50KB**

Number and total space usage of objects owned by the user that are under 50KB in size.

**Segment Size 50KB - 500KB**

Number and total space usage of objects owned by the user that are between 50KB and 500KB in size.

**Segment Size 500KB - 1Mb**

Number and total space usage of objects owned by the user that are between 500KB and 1MB in size.

**Segment Size 1Mb - 10Mb**

Number and total space usage of objects owned by the user that are between 1MB and 10MB in size.

**Segment Size 10Mb - 100Mb**

Number and total space usage of objects owned by the user that are between 10MB and 100MB in size.

**Segment Size 100Mb - 500Mb**

Number and total space usage of objects owned by the user that are between 100MB and 500MB in size.

**Segment Size 500Mb - 1GB**

Number and total space usage of objects owned by the user that are between 500MB and 1GB in size.

**Segment Size > 1Gb**

Number and total space usage of objects owned by the user that are over 1GB in size.

**Oracle - Segments With Wasted Space**

This report provides information on the segments containing allocated space that is currently empty/not being used. Use this information to gather information that can help you discover space that can be reclaimed and allocated to other objects.

**Empty Used Space**

The amount of empty used space within a segment (table, index, etc.)

**Segment Creator**

The owner of a segment

**Segment Name**

The name of a segment

**Computer**

The name of the computer on which the Instance of a segment Instance resides

**Instance**

The SID of an Oracle Instance

**Database**

The name of the database to which the segment belongs

**Tablespace**

The name of the tablespace to which the segment belongs

**Partition**

The partition on which the segment is stored

**Segment Type**

Type of the segment, including:

- TABLE
- TABLE PARTITION
- TABLE SUBPARTITION
- NESTED TABLE
- CLUSTER
- INDEX
- INDEX PARTITION
- INDEX SUBPARTITION
- LOBINDEX
- LOBSEGMENT
- LOB PARTITION
- LOB SUBPARTITION

**Parent Type**

Subset of the segment type

**Parent Creator**

The owner of a segment

**Parent Name**

The name of a segment

**Total Size**

The amount of space that is allocated to a segment

**Number of Extents**

The number of extents that is allocated to a segment

**Freelist Blocks**

The number of blocks that are on the freelist chain

**Initial Extent**

The size of the first extent that is allocated to a segment

**Next Extent**

The amount of space that Oracle will retrieve when allocating another extent

**Maximum Extents**

The maximum number of extents that Oracle can allocate to an object

**Percent Increase**

The size that Oracle allocates for the next extent

## **SqlServer - Database Storage By Computer**

This report shows storage information about the databases in your environment sorted by the computers on which they are stored.

The following list describes the columns that are displayed in the SqlServer Database Storage By Computer report.

### **Computer**

Name of the computer on which SQL Server is running.

### **Total Size**

Total amount of storage space allocated to SQL Server on a computer.

### **Data File Capacity**

Amount of allocated storage space for data files that is unused on a computer where SQL Server is running.

### **Data File Free space**

Amount of free space available on the data files associated with SQL Server on a computer.

### **Log File Capacity**

Amount of allocated storage space for log files that is unused on a computer where SQL Server is running.

### **Log File Free space**

Amount of free space available on the log files associated with SQL Server on a computer.

### **Database Count**

Number of databases associated with SQL Server on a computer.

### **Data File Count**

Number of data files associated with SQL Server on a computer.

### **Log File Count**

Number of log files associated with SQL Server on a computer.

## **SqlServer - Total Database Freespace**

This report provides information on the total free space for data files at a network-wide level, as well as the percentage of free space, the total used space, number of free extents, and number of data files on a network. This report is available for Oracle and Microsoft SQL Server.

### **Data Free Space**

Amount of free space on all data files in the network.

### **Percent Free**

Percent of free space available on the data files in the network.

### **Data Used Space**

Amount of used space on the data files in the network.

### **Data Size**

Total size of data files in the network.

### **Log Free Space**

Amount of free space.

### **Log Percent Used**

Percent of used space.

### **Log Used Space**

Amount of space used by the log.

**Log Size**

Size of the log.

**Number Data Files**

Number of data files on the databases in the network.

**SqlServer - User Database Space Usage**

This report shows information about the RDBMS storage space consumed by users across the network.

The following list describes the columns that appear on the SqlServer - User Database Space Usage report:

**User Name**

Name of a user upon whose storage usage information was collected.

**Total Size**

Amount of space consumed by the objects that are owned by the user.

**Empty Used Space**

Amount of empty used space that resides on the objects that are owned by the user.

**Table Count**

Number of tables that are owned by the user.

**Index Count**

Number of indexes that are owned by the user.

**Other Count**

Number of other objects owned by the user.

**Largest Object**

Size of the largest object owned by the user.

**2nd Largest Object**

Size of the second largest object owned by the user.

**Object Size < 50KB**

Number and total space usage of objects owned by the user that are under 50KB in size.

**Object Size 50KB - 500KB**

Number and total space usage of objects owned by the user that are between 50KB and 500KB in size.

**Object Size 500KB - 1Mb**

Number and total space usage of objects owned by the user that are between 500KB and 1MB in size.

**Object Size 1Mb - 10Mb**

Number and total space usage of objects owned by the user that are between 1MB and 10MB in size.

**Object Size 10Mb - 100Mb**

Number and total space usage of objects owned by the user that are between 10MB and 100MB in size.

**Segment Size 100Mb - 500Mb**

Number and total space usage of objects owned by the user that are between 100MB and 500MB in size.

**Object Size 500Mb - 1GB**

Number and total space usage of objects owned by the user that are between 500MB and 1GB in size.

**Object Size > 1Gb**

Number and total space usage of objects owned by the user that are over 1GB in size.

**Sybase - Database Storage By Computer**

This report shows storage information about the databases in your environment sorted by the computers on which they are stored.

The following list describes the columns on the Sybase - Database Storage By Computer report.

**Computer**

Name of the computer on which Sybase is running.

**Total Device Size**

Total amount of storage space that is allocated to Sybase on a computer.

**Mirrored Device Size**

Total storage capacity of the mirrored device for an instance.

**Device Free Space**

Amount of free space available on the data files that are associated with Sybase on a computer.

**Data Fragment Capacity**

Amount of allocated storage space for log files that is unused on a computer where Sybase is running.

**Data Fragment Free space**

Amount of free space available on the data fragments that are associated with Sybase on a computer.

**Log Fragment Capacity**

Amount of allocated storage space for log fragments that is unused on a computer where Sybase is running.

**Log Fragment Free space**

Amount of free space available on the log files that are associated with Sybase on a computer.

**Device Count**

Number of devices associated with Sybase on a computer.

**Database Count**

Number of databases associated with Sybase on a computer.

**Fragment Count**

Number of fragments associated with Sybase on a computer.

**Log File Count**

Number of log files associated with Sybase on a computer.

**Sybase - Total Device Freespace**

This report provides information on the total free space for Sybase devices at a network-wide level, as well as the percentage of free space, the total used space, number of fragments, and number of devices.

**Free Space**

Amount of free space on all the devices in the network

**Percent Free**

Percent of free space available on the devices in the network

**Used Space**

Amount of used space on the devices in the network

**Total Size**

Total size of devices in the network

**Number Fragments**

Number of fragments associated with the devices in the network

**Number Devices**

Number of devices in the network

**Sybase - Total Database Freespace**

This report provides information on the total free space for data files at a network-wide level, as well as the percentage of free space, the total used space, number of free extents, and number of data files on a network. This report is available for Oracle and Microsoft SQL Server.

**Data Free Space**

Amount of free space on all data files in the network.

**Percent Free**

Percent of free space available on the data files in the network.

**Data Used Space**

Amount of used space on the data files in the network.

**Data Size**

Total size of data files in the network.

**Log Free Space**

Amount of free space available to a database log.

**Log Percent Used**

Percentage of allocated space that a database log is consuming.

**Log Used Space**

Amount of storage space consumed by a database log.

**Log Size**

Total amount of space allocated to a database log.

**Number Fragments**

Number of fragments associated with a database.

**Sybase - User Database Space Usage**

This report shows information about the RDBMS storage space consumed by users across the network.

The following list describes the columns that appear on the Sybase- User Database Space Usage report:

**User Name**

Name of a user upon whose storage usage information was collected.

**Total Size**

Amount of space consumed by the objects that are owned by the user.

**Empty Used Space**

Amount of empty used space that resides on the objects that are owned by the user.

**Table Count**

Number of tables that are owned by the user.

**Index Count**

Number of indexes that are owned by the user.

**Other Count**

Number of other objects owned by the user.

**Largest Object**

Size of the largest object owned by the user.

**2nd Largest Object**

Size of the second largest object owned by the user.

**Object Size < 50KB**

Number and total space usage of objects owned by the user that are under 50KB in size.

**Object Size 50KB - 500KB**

Number and total space usage of objects owned by the user that are between 50KB and 500KB in size.

**Object Size 500KB - 1Mb**

Number and total space usage of objects owned by the user that are between 500KB and 1MB in size.

**Object Size 1Mb - 10Mb**

Number and total space usage of objects owned by the user that are between 1MB and 10MB in size.

**Object Size 10Mb - 100Mb**

Number and total space usage of objects owned by the user that are between 10MB and 100MB in size.

**Object Size 100Mb - 500Mb**

Number and total space usage of objects owned by the user that are between 100MB and 500MB in size.

**Object Size 500Mb - 1GB**

Number and total space usage of objects owned by the user that are between 500MB and 1GB in size.

**Object Size > 1Gb**

Number and total space usage of objects owned by the user that are over 1GB in size.

**UDB - Instance Storage By Computer**

This report shows information about the UDB instances in your environment sorted by the computers on which they are stored.

The following list describes the columns that are displayed on the UDB - Instance Storage By Computer report.

**Computer**

Name of the computer on which a UDB Instance(s) resides

**Total Size**

Total amount of storage space allocated to UDB on a computer

**Container Capacity**

Amount of storage space allocated to the containers that reside on a computer

**Container Free Space**

Amount of free space available on the containers that reside on a computer

**Log File Capacity**

Amount of storage space allocated to the log files that reside on a computer

**Tablespace Count**

Number of tablespaces that reside on a computer

**Container Count**

Number of containers that reside on a computer

**Log File Count**

Number of log files that reside on a computer

**UDB - Total DMS Container Freespace**

This report shows the total free space for the containers associated with DMS tablespaces on UDB instances within your environment.

The following columns are displayed on the UDB - Total DMS Container Freespace report:

**Free Space**

Amount of free space available on the DMS containers within a network.

**Percent Space**

Percentage of free space available on the DMS containers within a network.

**Used Space**

Amount of storage space consumed on the DMS containers within a network.

**Total Size**

Total amount of space on the DMS containers within a network.

**Number Containers**

Number of DMS containers within a network.

**UDB - User Database Space Usage**

This report shows information about the RDBMS storage space consumed by users across the network.

The following list describes the columns that appear on the UDB - User Database Space Usage report:

**User Name**

Name of a user upon whose storage usage information was collected.

**Total Size**

Amount of space consumed by the objects that are owned by the user.

**Empty Used Space**

Amount of empty used space that resides on the objects that are owned by the user.

**Table Count**

Number of tables that are owned by the user.

**Index Count**

Number of indexes that are owned by the user.

**Other Count**

Number of other objects owned by the user.

**Largest Object**

Size of the largest object owned by the user.

**2nd Largest Object**

Size of the second largest object owned by the user.

**Object Size < 50KB**

Number and total space usage of objects owned by the user that are under 50KB in size.

**Object Size 50KB - 500KB**

Number and total space usage of objects owned by the user that are between 50KB and 500KB in size.

**Object Size 500KB - 1Mb**

Number and total space usage of objects owned by the user that are between 500KB and 1MB in size.

**Object Size 1Mb - 10Mb**

Number and total space usage of objects owned by the user that are between 1MB and 10MB in size.

**Object Size 10Mb - 100Mb**

Number and total space usage of objects owned by the user that are between 10MB and 100MB in size.

**Object Size 100Mb - 500Mb**

Number and total space usage of objects owned by the user that are between 100MB and 500MB in size.

**Object Size 500Mb - 1GB**

Number and total space usage of objects owned by the user that are between 500MB and 1GB in size.

**Object Size > 1Gb**

Number and total space usage of objects owned by the user that are over 1GB in size.

## System Reports - Disk Manager

Use these predefined reports to view performance information about storage subsystems.

The following system reports are available for Disk Manager .

**Array Performance**

This report shows performance data for arrays. This report supports IBM System Storage DS8000, DS6000, and IBM TotalStorage Enterprise Storage Server systems only.

Column	Description
Subsystem	ID of the storage system
Array	The ID of the specified array.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.

Column	Description
Disk Utilization Percentage	The approximate utilization percentage of a rank over a specified time interval (the average percent of time that the disks associated with the array were busy).
Sequential I/O Percentage	Percentage of all I/O operations performed for an array over a specified time interval that were sequential operations.
Backend Read I/O Rate	Average number of I/O operations per second for read operations.
Backend Write I/O Rate	Average number of I/O operations per second for write operations.
Total Backend I/O Rate	Average number of I/O operations per second for read and write operations.
Backend Read Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) that were transferred for read operations.
Backend Write Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) that were transferred for write operations.
Total Backend Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) that were transferred for read and write operations.
Backend Read Response Time	Average number of milliseconds that it took to respond to each read operation. For SAN Volume Controller models, this is the external response time of the managed disks (MDisks).
Backend Write Response Time	Average number of milliseconds that it took to respond to each write operation. For SAN Volume Controller models, this is the external response time of the managed disks (MDisks).
Overall Backend Response Time	Average number of milliseconds that it took to respond to each I/O operation (read and write). For SAN Volume Controller models, this is the external response time of the managed disks (MDisks).
Write-cache Delay Percentage	Percentage of I/O operations that were delayed due to write-cache space constraints or other conditions. Write-cache Delay Percentage is the ratio of delayed I/O operations to total I/O operations.
Write-cache Delay I/O Rate	Average number of I/O operations per second that were delayed because of write-cache space constraints or other conditions, for a particular component over an interval.

### Controller Cache Performance

This report shows performance data for storage system controller caches. This report supports IBM System Storage DS8000, DS6000, DS5000, DS4000, and IBM TotalStorage Enterprise Storage Server systems only.

Column	Description
Subsystem	ID of the storage system.
Controller	The ID of the controller.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read I/O Rate (normal)	Average number of I/O operations per second for non-sequential read operations for a component over a specified time interval.
Read I/O Rate (sequential)	Average number of I/O operations per second for sequential read operations for a component over a specified time interval.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (normal)	Average number of I/O operations per second for non-sequential write operations for a component over a specified time interval.
Write I/O Rate (sequential)	Average number of I/O operations per second for sequential write operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (normal)	Average number of I/O operations per second for non-sequential read and write operations for a component over a specified time interval.
Total I/O Rate (sequential)	Average number of I/O operations per second for sequential read and write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read and write operations for a component over a specified time interval.
Cache Holding Time	Average cache holding time, in seconds, for I/O data in this subsystem controller (cluster). Shorter time periods indicate adverse performance.
Read Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and non-sequential read operations for a component over a specified time interval.
Write Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and non-sequential write operations for a component over a specified time interval.

Column	Description
Total Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and non-sequential read and write operations for a component over a specified time interval.
Read Cache Hits Percentage (normal)	Percentage of cache hits for non-sequential read operations for a component over a specified time interval.
Write Cache Hits Percentage (normal)	Percentage of cache hits for non-sequential write operations for a component over a specified time interval.
Total Cache Hits Percentage (normal)	Percentage of cache hits for non-sequential read and write operations for a component over a specified time interval.
Read Cache Hits Performance (sequential)	The sequential read cache allocated for the controller.
Write Cache Hits Performance (sequential)	The sequential write cache allocated for the controller.
Total Cache Hits Performance (sequential)	The total sequential cache percentage (read and write) allocated for the controller.
Record Mode Read I/O Rate	Average number of I/O operations per second for record mode read operations for a component over a specified time interval.
Record Mode Read Cache Hits Percentage	Percentage of cache hits for record mode read operations for a component over a specified time interval.
Disk to Cache I/O Rate	Average number of I/O operations (track transfers) per second for disk to cache transfers for a component over a specified time interval.
Cache to Disk I/O Rate	Average number of I/O operations (track transfers) per second for cache to disk transfers for a component over a specified time interval.
Write-cache Delay Percentage	Percentage of I/O operations that were delayed due to write-cache space constraints or other conditions. Write-cache Delay Percentage is the ratio of delayed I/O operations to total I/O operations.
Write-cache Delay I/O Rate	Average number of I/O operations per second that were delayed due to write-cache space constraints or other conditions for a component over a specified time interval.

## Controller Performance

This report shows performance data for storage system controllers. This report supports IBM System Storage DS8000, DS6000, DS5000, DS4000, and IBM TotalStorage Enterprise Storage Server systems only.

Column	Description
Subsystem	ID of the storage system.
Controller	The ID of the controller.

Column	Description
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read I/O Rate (overall)	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read Data Rate	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write Data Rate	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total Data Rate	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.

## I/O Group Performance

This report shows performance data for I/O groups. This report supports IBM System Storage SAN Volume Controller systems only.

Column	Description
Subsystem	ID of the storage system
I/O Group	The ID of the specified input/output (I/O) group.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
CPU Utilization Percentage	Average utilization percentage of the CPUs.

Column	Description
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.
Port to Host Send I/O Rate	Average number of exchanges (I/Os) per second sent to host computers by a component over a specified time interval.
Port to Host Receive I/O Rate	Average number of exchanges (I/Os) per second received from host computers by a component over a specified time interval.
Total Port to Host I/O Rate	Average number of exchanges (I/Os) per second transmitted between host computers and a component over a specified time interval.
Port to Disk Send I/O Rate	Average number of exchanges (I/Os) per second sent to storage subsystems by a component over a specified time interval.
Port to Disk Receive I/O Rate	Average number of exchanges (I/Os) per second received from storage subsystems by a component over a specified time interval.

Column	Description
Total Port to Disk I/O Rate	Average number of exchanges (I/Os) per second transmitted between storage subsystems and a component over a specified time interval.
Port to Host Send Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second sent to host computers by a component over a specified time interval.
Port to Host Receive Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second received from host computers by a component over a specified time interval.
Total Port to Host Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second transmitted between host computers and a component over a specified time interval.
Port to Disk Send Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second sent to storage subsystems by a component over a specified time interval.
Port to Disk Receive Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second received from storage subsystems by a component over a specified time interval.
Total Port to Disk Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second transmitted between storage subsystems and a component over a specified time interval.

## Managed Disk Group Performance

This report shows performance data for managed-disk (MDisk) groups. This report supports IBM System Storage SAN Volume Controller systems only.

Column	Description
Subsystem	ID of the storage system
Managed Disk Group	The ID of the specified managed disk.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read Transfer Size	Average number of KB per input/output (I/O) for read operations, for a particular component over an interval.
Write Transfer Size	Average number of KB per I/O for write operations, for a particular component over an interval.
Overall Transfer Size	Average number of KB per I/O for read and write operations, for a particular component over an interval.
Backend Read I/O Rate	Average number of I/O operations per second for read operations.
Backend Write I/O Rate	Average number of I/O operations per second for write operations.

Column	Description
Total Backend I/O Rate	Average number of I/O operations per second for read and write operations.
Backend Read Data Rate	Average number of Mbps that were transferred for read operations.
Backend Write Data Rate	Average number of Mbps that were transferred for write operations.
Total Backend Data Rate	Average number of Mbps that were transferred for read and write operations.

## Node Cache Performance report

This report lists the most recently gathered performance data for IBM System Storage SAN Volume Controller nodes, which is aggregated to the node level from the per-node VDisk sample data.

Column	Description
Subsystem	ID of the storage system
Node	The ID of the specified node.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and nonsequential read operations, for a particular component over an interval.
Write Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and nonsequential write operations, for a particular component over an interval.
Total Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and nonsequential read and write operations, for a particular component over an interval.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Disk to Cache Transfer Rate	Average number of I/O operations (track transfers) per second for disk to cache transfers, for a particular component over an interval.
Cache to Disk Transfer Rate	Average number of I/O operations (track transfers) per second for cache to disk transfers, for a particular component over an interval.

Column	Description
Write-cache Delay Percentage	Percentage of I/O operations that were delayed because of write-cache space constraints or other conditions, for a particular component over an interval. (The ratio of delayed operations to total I/Os.)
Write-cache Overflow Percentage	Percentage of write operations that were delayed because of lack of write-cache space, for a particular component over an interval.
Write-cache Flush-through Percentage	Percentage of write operations that were processed in flush-through write mode, for a particular component over an interval.
Write Cache Write-through Percentage	Percentage of write operations that were processed in write-through write mode, for a particular component over an interval.
Write-cache Delay I/O Rate	Average number of I/O operations per second that were delayed because of write-cache space constraints or other conditions, for a particular component over an interval.
Write-cache Overflow I/O Rate	Average number of tracks per second that were delayed because of lack of write-cache space, for a particular component over an interval.
Write Cache Flush-through I/O Rate	Average number of tracks per second that were processed in flush-through write mode, for a particular component over an interval.
Write Cache Write-through I/O Rate	Average number of tracks per second that were processed in write-through write mode, for a particular component over an interval.
Readahead Percentage of Cache Hits	Percentage of all read cache hits which occurred on prestaged data.
Dirty Write Percentage of Cache Hits	Percentage of all write cache hits which occurred on already dirty data in the cache.

## Port Performance

This report shows performance data for ports. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system
Port	The ID of the specified port.
WWPN	The World Wide Port Name (WWPN) of the selected port.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Port Send Bandwidth Percentage	The approximate bandwidth utilization percentage for send operations by a port based on its current negotiated speed.

Column	Description
Port Receive Bandwidth Percentage	The approximate bandwidth utilization percentage for receive operations by this port, based on its current negotiated speed.
Overall Port Bandwidth Percentage	The approximate bandwidth utilization percentage for send and receive operations by this port.
Port Send Utilization Percentage	The average amount of time that the port was busy sending data over a time interval.
Port Receive Utilization Percentage	The average amount of time that the port was busy receiving data over a time interval.
Overall Port Utilization Percentage	The average amount of time that the port was busy sending or receiving data over a time interval.
Port Send I/O Rate	The average number of input/output (I/O) operations per second for send operations for a port over a time interval.
Port Receive I/O Rate	Average number of I/O operations per second of receive operations for a port over a time interval.
Total Port I/O Rate	Average number of I/O operations per second for send and receive operations for a port over a time interval.
Port Send Data Rate	The average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for send (read) operations for a port over a time interval.
Port Receive Data Rate	The average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for receive (write) operations for a port over a time interval.
Total Port Data Rate	The average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for send and receive operations for a port over a time interval.
Port to Host Send I/O Rate	The average number of exchanges (I/Os) per second sent to host computers by a component over a time interval.
Port to Host Receive I/O Rate	The average number of exchanges (I/Os) per second received from host computers by a component over a time interval.
Total Port to Host I/O Rate	The average number of exchanges (I/Os) per second transmitted between host computers and a component over a time interval.
Port to Disk Send I/O Rate	The average number of exchanges (I/Os) per second sent to storage subsystems by a component over a time interval.
Port to Disk Receive I/O Rate	The average number of exchanges (I/Os) per second received from storage subsystems by a component over a time interval.

Column	Description
Total Port to Disk I/O Rate	The average number of exchanges (I/Os) per second transmitted between storage subsystems and a component over a time interval.
Port to Host Send Data Rate	The average number of megabytes (2 <sup>20</sup> bytes) per second sent to host computers by a component over a time interval.
Port to Host Receive Data Rate	The average number of megabytes (2 <sup>20</sup> bytes) per second received from host computers by a component over a time interval.
Total Port to Host Data Rate	The average number of megabytes (2 <sup>20</sup> bytes) per second transmitted between host computers and a component over a time interval.
Port to Disk Send Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second sent to storage subsystems by a component over a time interval.
Port to Disk Receive Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second received from storage subsystems by a component over a time interval.
Total Port Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second transmitted between storage subsystems and a component over a time interval.
Port Send Response Time	The average number of milliseconds that it took to service each send (read) operation for a port over a time interval.
Port Receive Response Time	The average number of milliseconds that it took to service each receive (write) operation for a port over a time interval.
Total Port Response Time	The average number of milliseconds that it took to service each operation (send and receive) for a port over a time interval.
Port Send Transfer Size	The average number of KB sent per I/O by a port over a time interval.
Port Receive Transfer Size	The average number of KB received per I/O by a port over a time interval.
Total Port Transfer Size	The average number of KB transferred per I/O by a port over a time interval.

## Subsystem Performance

This report shows performance data for storage systems. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system.
Time	Date and time that the data was collected.

Column	Description
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.

### Top Active Volumes Cache Hit Performance

This report summarizes the primary metrics for active volumes, prioritized by cache hit ratio. Only volumes with an input/output (I/O) rate that is greater than 0 will be included in this report. If all volumes are inactive, this report will be empty. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system.
Volume	The ID of the volume.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.

Column	Description
Read Cache Hits Percentage (overall)	Overall read cache percentage for both sequential and nonsequential read operations.
Write Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and nonsequential write operations.
Total Cache Hits Percentage (overall)	Percentage of cache hits for both sequential and nonsequential read and write operations.
Readahead Percentage of Cache Hits	Percentage of all read cache hits which occurred on prestaged data.
Dirty Write Percentage of Cache Hits	Percentage of all write cache hits which occurred on already dirty data in the cache.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.

## Top Volumes Data Rate Performance

This report summarizes the primary performance metrics for volumes, prioritized by data rate. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system
Volume	The ID of the specified volume.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.

### Top Volumes Disk Performance

This report summarizes the primary performance metrics for volumes, prioritized by disk rate. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system.
Volume	The ID of the volume.
Time	Date and time that the data was collected.

Column	Description
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Disk to Cache Transfer Rate	Average number of I/O operations (track transfers) per second for disk to cache transfers, for a particular component over an interval.
Cache to Disk Transfer Rate	Average number of I/O operations (track transfers) per second for cache to disk transfers, for a particular component over an interval.
Write-cache Delay Percentage	Percentage of I/O operations that were delayed because of write-cache space constraints or other conditions, for a particular component over an interval. (The ratio of delayed operations to total I/Os.)
Write-cache Overflow Percentage	Percentage of write operations that were delayed because of lack of write-cache space, for a particular component over an interval.
Write-cache Flush-through Percentage	Percentage of write operations that were processed in flush-through write mode, for a particular component over an interval.
Write Cache Write-through Percentage	Percentage of write operations that were processed in write-through write mode, for a particular component over an interval.
Write-cache Delay I/O Rate	Average number of I/O operations per second that were delayed because of write-cache space constraints or other conditions, for a particular component over an interval.
Write-cache Overflow I/O Rate	Average number of tracks per second that were delayed because of lack of write-cache space, for a particular component over an interval.
Write Cache Flush-through I/O Rate	Average number of tracks per second that were processed in flush-through write mode, for a particular component over an interval.
Write Cache Write-through I/O Rate	Average number of tracks per second that were processed in write-through write mode, for a particular component over an interval.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.

Column	Description
Read Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.

### Top Volumes I/O Rate Performance

This report summarizes the primary performance metrics for volumes, prioritized by I/O rate. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system.
Volume	The ID of the specified volume.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read operations for a component over a specified time interval.

Column	Description
Write Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.

### Top Volumes Response Performance

This report summarizes the primary performance metrics for volumes, prioritized by response rate. This report supports all storage systems.

Column	Description
Subsystem	ID of the storage system.
Volume	The ID of the volume.
Time	Date and time that the data was collected.
Interval	The actual duration of the sample interval (in seconds) for the performance data that was collected.
Read Response Time	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.
Overall Response Time	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.
Peak Read Response Time	The peak (worst) response time for disk reads for a component over a time interval.
Peak Write Response Time	The peak (worst) response time for disk writes for a component over a time interval.
Read I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential read operations for a component over a specified time interval.

Column	Description
Write I/O Rate (overall)	Average number of I/O operations per second for both sequential and non-sequential write operations for a component over a specified time interval.
Total I/O Rate (overall)	Average number of I/O operations per second for both sequential and nonsequential read and write operations.
Read Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for write operations for a component over a specified time interval.
Total Data Rate	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read and write operations for a component over a specified time interval.

## System reports - Fabric Manager

Use these predefined reports to view performance information about fabrics.

### Port Connections

Use the Port Connections report to view information about the ports on the switches in your storage area network (SAN). This report includes information about the port connections and status, as well as the port and switch IDs.

#### Fabric ID

The ID of the fabric that the switch is in.

#### Switch

The label value of the switch.

#### Switch Port

The ID of the port (*domainID,port\_number*).

**Slot** The number for the blade that the port is on.

**Index** The unique number for the port across the whole switch.

#### Switch Port State

The state of the switch port: Normal, Warning, or Critical.

#### Connection State

The state of the connection between the two ports: Normal, Warning, or Critical.

#### Connected Port

The port that the switch port is connected to. This value is the WWN of the device connected to that port.

#### Connected Port State

The state of the connected port: Normal, Warning, or Critical.

#### Device

The device that the connected port is on.

**Device State**

The state of the device that the connected port is on: Normal, Warning, or Critical.

**SAN Assets (ALL)**

Use the SAN Assets (All) report to generate and view reports that provide information about all the assets discovered by IBM Tivoli Storage Productivity Center.

The following list describes the columns that are on the SAN Assets (ALL) report. All of the columns in the report are for display only.

**Fabric ID**

The ID of the fabric that the asset is in.

**Type** The type of discovered asset.

**Label** The label of the asset.

**Identifier**

The unique identifier of the storage asset. For example, a switch WWN.

**Status** The state of the device, either Normal, Warning, or Critical.

**SAN Assets (Connected Devices)**

Use the SAN Assets (Connected Devices) report to generate and view reports that provide information about all the connected devices discovered by IBM Tivoli Storage Productivity Center.

The following table lists the columns that are on the SAN Assets (Connected Devices) report. All of the columns in the report are for display only.

**Fabric ID**

The ID of the fabric that the asset is in.

**Type** The type of discovered asset.

**Label** The label of the asset.

**Identifier**

The unique identifier of the asset. For example, the device worldwide name.

**Status** The status of the asset: Normal, Warning, or Critical.

**SAN Assets (Switches)**

Use the SAN Assets (Switches) report to generate and view reports that provide information about switches in your SAN. These reports provide information about the switch ID, type, manufacturer, WWN, location, and other details.

The following list describes the columns that are on the SAN Assets (Switches) report. All of the columns in the report are for display only.

**Fabric ID**

The ID of the fabric that the switch is in.

**Type** The type is always "Switch".

**Switch Type**

The type of discovered switch. For example, a physical switch.

**Label** The label of the switch.

**Status** The status of the switch. The possible states are **Normal** and **Missing**.

**IP Address**

The IP address of the switch.

**Vendor ID**

The manufacturer of the switch.

**Model** The model name and number of the switch.

**Version**

The version information of the switch.

**Serial Number**

The serial number of the switch.

**Object ID**

The object ID of the switch.

**Management ID**

The management ID of the switch.

**Management Address**

The URL of the switch element manager.

**Domain**

The ID of the domain that the switch is in.

**Contact**

The contact information for the switch.

**WWN** The world-wide name (WWN) of the switch.

**Location**

The physical location of the switch.

**Physical Switch WWN**

The WWN for the parent or physical switch of a virtual switch. If this is not a virtual switch then this column is empty.

**Switch Performance**

Use the Switch Performance report to generate and view reports that provide information about the free and occupied ports on the switches in your SAN. These reports provide information about the port connections and status, as well as the port and switch IDs, data and packet transfer rates, and other details. This report can be generated only for switches that have had performance monitors run on them.

The following list describes the columns that are on the Switch Performance report. All of the columns in the report are for display only.

**Switch**

The ID of the switch.

**Time** The date and time of the data collection.

**Interval**

The size of the sample interval, in seconds.

**Port Send Packet Rate**

The rate at which packets are sent through this port.

**Port Receive Packet Rate**

The rate at which packets are received through this port.

**Total Port Packet Rate**

The total rate at which packet operations are performed through this port.

**Port Send Data Rate**

The rate at which data is sent through this port.

**Port Receive Data Rate**

The rate at which data is received through this port.

**Total Port Data Rate**

The total rate at which data is processed through this port.

**Port Peak Send Data Rate**

The peak rate at which data is sent through this switch.

**Port Peak Receive Data Rate**

The peak rate at which data is received through this switch.

**Port Send Packet Size**

The size of the data block that is sent out through this switch.

**Port Receive Packet Size**

The size of the data block that is received in through this switch.

**Overall Port Packet Size**

The total size of the data block that is transferred by the switch.

**Error Frame Rate**

The rate at which error frames are generated by the switch.

**Dumped Frame Rate**

The rate at which frames are dumped by the switch.

**Link Failure Rate**

The rate at which failed links are generated by the switch.

**Switch Port Errors**

Use the Switch Port Errors report to generate and view reports that provide information about the errors that are being generated by ports on the switches in your SAN. These reports provide information about the error frames, dumped frames, link failures, port and switch IDs, and other details. This report can be generated only for switches that have had performance monitors run on them.

To view more information for a specific file, click . Detailed information per computer is displayed in a **Network** tab. The **Network** tab displays file summary by computer.

The following list describes the fields on the Switch Port Errors report. All the fields on the report are for display only.

**Switch**

The ID of the switch.

**Port** The ID of the port.

**WWPN**

The World Wide Port Name (WWPN) of the selected port.

**Slot** The number for the blade that the port is on.

**Index** The unique number for the port across the whole switch.

**Time** The date and time of the data collection.

**Interval**

The size of the sample interval, in seconds.

**Port Send Packet Size**

The size of the data block that is sent out through this switch.

**Port Receive Packet Size**

The size of the data block that is received in through this switch.

**Overall Port Packet Size**

The total size of the data block that is transferred by the switch.

**Error Frame Rate**

The rate at which error frames are generated by the switch.

**Dumped Frame Rate**

The rate at which frames are dumped by the switch.

**Link Failure Rate**

The rate at which failed links are generated by the switch.

**Loss of Sync Rate**

The average number of times per second that synchronization was lost after the last reset of the device, for a particular component over a particular time interval.

**Loss of Signal Rate**

The average number of times per second that the signal was lost after the last reset of the device, for a particular component over a particular time interval.

**CRC Error Rate**

The average number of frames received per second in which the CRC in the frame did not match the CRC computed by the receiver, for a particular component over a particular time interval.

**Short Frame Rate**

The average number of frames received per second that were shorter than 28 octets (24 header + 4 CRC), not including any start of frame/end of frame bytes, for a particular component over a particular time interval.

**Long Frame Rate**

The average number of frames received per second that were longer than 2140 octets (24 header + 4 CRC + 2112 data), not including any start of frame/end of frame bytes, for a particular component over a particular time interval.

**Encoding Disparity Error Rate**

The average number of disparity errors received per second, for a particular component over a particular time interval.

The following list describes columns that are not part of the Switch Port Errors system report. However, you can include them, and save the resulting report in the *<user-id> Reports* node.

**Port Send Packet Rate**

The rate at which packets are sent through this port.

**Port Receive Packet Rate**

The rate at which packets are received through this port.

**Total Port Packet Rate**

The total rate at which packet operations are performed through this port.

**Port Send Data Rate**

The rate at which data is sent through this port.

**Port Receive Data Rate**

The rate at which data is received through this port.

**Total Port Data Rate**

The total rate at which data is processed through this port.

**Port Peak Send Data Rate**

The peak rate at which data is sent through this switch.

**Port Peak Receive Data Rate**

The peak rate at which data is received through this switch.

**Top Switch Ports Data Rate Performance**

Use the Top Switch Port Data Rate Performance report to generate and view reports that provide information about the switches in your SAN that have the top data rates. This report can be generated only for switches that have had performance monitors run on them.

This report only displays rows for the 25 highest data rates from the switch ports monitored. It displays those rows in descending order by Total Port Data Rate. You can adjust the number of rows shown on the **Selection** tab.

To view more information for a specific file, click . Detailed information per computer is displayed in a **Network** tab. The **Network** tab displays the file summary by computer.

The following list describes the fields that are on the Top Switch Ports Data Rate Performance report. All of the fields on the report are for display only.

**Switch**

The ID of the switch.

**Port** The ID of the port.

**Time** The date and time of the data collection.

**Interval**

The size of the sample interval, in seconds.

**Total Port Data Rate**

The total rate at which data is processed through this port.

**Total Port Packet Rate**

The total rate at which the packet operations are performed through this port.

The following list describes columns that are not part of the Top Switch Ports Data Rate Performance report. However, you can include them, and save the resulting report in the *<user> Reports* node.

**Port Send Packet Rate**

The rate at which packets are sent through this port.

**Port Receive Packet Rate**

The rate at which packets are received through this port.

**Port Send Data Rate**

The rate at which data is sent through this port.

**Port Receive Data Rate**

The rate at which data is received through this port.

**Port Peak Send Data Rate**

The peak rate at which data is sent through this switch.

**Port Peak Receive Data Rate**

The peak rate at which data is received through this switch.

**Port Send Packet Size**

The size of the data block that is sent out through this switch.

**Port Receive Packet Size**

The size of the data block that is received in through this switch.

**Overall Port Packet Size**

The total size of the data block that is transferred by the switch

**Error Frame Rate**

The rate at which error frames are generated by the switch.

**Dumped Frame Rate**

The rate at which frames are dumped by the switch.

**Link Failure Rate**

The rate at which failed links are generated by the switch.

**WWPN**

The World Wide Name identifier for the FC port.

**Slot** The number for the blade that the port is on.

**Index** The unique number for the port across the whole switch.

**Top Switch Ports Packet Rate Performance**

Use the Top Switch Ports Packet Rate Performance report to generate and view reports that provide information about the switches in your SAN that have the top packet rates. This report can only be generated for switches that have had performance monitors run on them.

This report only displays rows for the 25 highest packet rates from the switch ports monitored. It displays those rows in descending order by Total Port Packet Rate. You can adjust the number of rows shown on the Selection tab.

**To view more information for a specific file:**

- Click . Detailed information per computer will be displayed in a **Network** tab. The **Network** tab displays file summary by computer.

This section describes the fields on the Top Switch Ports Packet Rate Performance report. All the fields on the report are for display only.

**Switch**

The ID of the switch.

**Port** The ID of the port.

**Time** The date and time of the data collection.

**Interval**

The size of the sample interval, in seconds.

**Total Port Packet Rate**

The total rate at which the packet operations are performed through this port.

**Total Port Data Rate**

The total rate at which data is processed through this port.

The following list describes the columns that are not part of the Top Switch Ports Packet Rate Performance report. However, you can include them, and save the resulting report in the <user> *Reports* node.

**Port Send Packet Rate**

The rate at which packets are sent through this port.

**Port Receive Packet Rate**

The rate at which packets are received through this port.

**Port Send Data Rate**

The rate at which data is sent through this port.

**Port Receive Data Rate**

The rate at which data is received through this port.

**Port Peak Send Data Rate**

The peak rate at which data is sent through this switch.

**Port Peak Receive Data Rate**

The peak rate at which data is received through this switch.

**Port Send Packet Size**

The size of the data block that is sent out through this switch.

**Port Receive Packet Size**

The size of the data block that is received in through this switch.

**Overall Port Packet Size**

The total size of the data block that is transferred by the switch.

**Error Frame Rate**

The rate at which error frames are generated by the switch.

**Dumped Frame Rate**

The rate at which frames are dumped by the switch.

**Link Failure Rate**

The rate at which failed links are generated by the switch.

**WWPN**

The World Wide Name identifier for the FC port.

**Slot** The number for the blade that the port is on.

**Index** The unique number for the port across the whole switch.

---

## Batch reports

Use the information in this section to learn how to generate and view batch reports. These reports are available in the IBM Tivoli Storage Productivity Center > **Reporting > My Reports > Batch Reports** node in the navigation tree.

A batch report represents any Tivoli Storage Productivity Center report that you want to run on a regular basis and save its data to a file. Schedule batch reports to run immediately, run once at a specified date and time, or run repeatedly at a specified date, time, cycle, and day. You can also select the time zone to use when running the report.

You can view the information in a generated batch report file directly or import it into an application of your choice. Batch reports provide a convenient and powerful way for you to save report definitions and schedule when to run those reports.

## Creating batch reports

Create a batch report.

To create a batch report follow this procedure:

1. Expand **IBM Tivoli Storage Productivity Center** → **Reporting** → **My Reports**.
2. Right-click the **Batch Reports** node and select **Create Batch Report**.

**Note:** If the batch report you want to create is similar to an existing one, click the name of the existing report, edit it and save it using a different name.

3. Click the **Report** tab and select the type of report you want to create and move it from **Available** to **Current Selections** by clicking . See “Selecting batch report options” on page 1063 for details of the tab contents.
4. Click the **Selection** tab and refine the criteria for selecting and displaying report data. Some options might not be available for all reports. Use the **Selection** page to:
  - Select a profile for controlling which data is collected. This option is not available for all reports. See “Using profiles” on page 354 for information about profiles.
  - Click **Selection** to specify the resources (for example, computers) that will be displayed in the report. This option is not available for all reports. For details about selecting resources, see “Selecting resources to appear on a report” on page 823.
  - Click **Filters** to apply filters the data that you want to display (for example, show only the machines that contain over 80% used space). For details about applying filters, see “Filtering the resources that appear on a report” on page 825.
  - Select the columns you want to include in the report and move them from **Available Columns** to **Included Columns** by clicking .

**Note:**

- The values you set in **Available Columns** and **Included Columns** are not used for the following types of batch reports: History CSV File, PDF Chart, and HTML Chart.
  - The value you set in the **Summation Level** field is not used for the following types of batch reports: History CSV File, PDF Chart, and HTML Chart.
5. Click the **Options** tab of the Batch Report job window, specify the following:
    - The machine on which the report file will be saved
    - The report format (for example, HTML)
    - Whether to run a script when the report process is complete
    - The format for the name of the batch report

See “Selecting batch report options” on page 1063 for details of the tab contents.

6. In the **When to Run** tab of the Batch Report job window, specify when and how often to run the batch report. See “Scheduling a batch report” on page 1067 for details of the tab contents.

7. In the **Alert** tab of the Batch Report job window, define the conditions that will trigger an alert and the method of notification (for example, e-mail). See "Defining alerts for batch reports" on page 1068 for details of the tab contents.
8. Click **File** → **Save** and type a name for the batch report. The batch report will be saved using your user ID as a prefix. For example, if you are logged onto Tivoli Storage Productivity Center as "Smith," the name of the batch report will be `Smith.report_name`.

## Selecting batch report options

Define the agent computer that you want to run the batch report on and specify the format of the file to be saved.

Use the **Options** page to define where the batch report is run and specify information about the output file.

1. Use the following fields to specify the location where a batch report is saved.

### TPC Server

Save the batch report on the computer where the Tivoli Storage Productivity Center server is located. Use the **Report Location** field to specify the directory where the batch report file is saved.

**Agent** Save the batch report on the computer where an agent is located. Use the **Report Location** field to specify the directory where the batch report file is saved.

You can save batch reports to computers on which the following agents are deployed:

- Data agents
- Storage Resource agents that are v4.2 or higher.

The **Select Agent** field becomes active if you select to save a batch report to an agent.

### Select Agent

Select the name of the computer on which an agent is deployed. This menu only displays computers on which the following agents are deployed:

- Data agents
- Storage Resource agents that are v4.2 or higher.

To save a batch report to a computer on which v4.1 of a Storage Resource agent is deployed, you must upgrade that agent to v4.2 or higher.

### Note:

- The type of report that is selected for the batch report determines the agents that are available in this list. Agents that do not support the selected report are not displayed. For example, agents for versions of the product before v4.1 are not available for Data Source reports.
- If the agent you select from this menu is removed from the computer before the batch report is run, an error occurs and the batch report is not generated. If this error occurs, edit the definition of the batch report to specify an existing agent and then run the report again.
- There are differences in the batch reports depending on whether a Storage Resource agent or a Data agent is selected. If you are using a Storage Resource agent to collect data, these additional columns are available in the batch reports using the Selection tab:

- Is Encryptable
- Is Encrypted

### Report Location

Specify the directory where you want to save the batch report. This field is only available for batch reports that are sent to the following locations:

- TPC Server
- Storage Resource agents that are v4.2 or higher.

For Data agents, batch reports are automatically saved to the following default locations:

### Windows

```
C:\Program Files\IBM\TPC\ca\subagents\TPC\Data\log\
  computer_name\reports\
```

**Note:** If you upgraded to Tivoli Storage Productivity Center v4.2 or higher from a version before 3.1, the default location for batch reports is:

```
C:\Program Files\IBM\TPC\ep\subagents\TPC\Data\log\
  computer_name\reports\
```

### UNIX or Linux

```
/opt/IBM/TPC/ca/subagents/TPC/Data/log/computer_name/reports/
```

**Note:** If you upgraded to Tivoli Storage Productivity Center v4.2 or higher from a version before 3.1, the default location for batch reports is:

```
/opt/tivoli/ep/subagents/TPC/Data/log/computer_name/reports/
```

For Storage Resource agent batch reports, when you select a Storage Resource agent from the **Select Agent** drop-down list, you see the location for the batch reports.

### Windows

```
SRA_location\agent\log\computername\reports
```

### UNIX or Linux

```
SRA_location/agent/log/computername/reports
```

### Note:

You can modify the location of the batch reports for Storage Resource agents and the TPC server only. You cannot modify the location of the batch reports for the Data agents.

You also have the option of saving the report on the Tivoli Storage Productivity Center server. The default path for the Tivoli Storage Productivity Center server is:

### Windows

```
C:\Program Files\IBM\TPC\data\log\reports
```

### UNIX or Linux

```
/opt/IBM/TPC/data/log/reports
```

2. In the **Report Type Specification** section, select the type of batch report you want to generate. You are limited to one type of output per batch report job and can select from the following output formats:

### CSV File

Create a CSV (comma delimited) file of the batch report. Select **Include Headers** to include column headers in the batch report output file. Select **Include Totals** to include the Totals column in the report output file.

### Formatted File

Create a formatted text file of the batch report.

### HTML File

Create an HTML file of the batch report.

### History CSV File

For reports with historical trending, you can export the historical data to a CSV file. The CSV file has the following format: *<object name, date, amount, date, amount>* and so on, where *<date, amount>* corresponds to each data point on the history chart.

### PDF Chart

Create a chart for the batch report in PDF format. After you select this option, you can determine the type of chart you want to create. The list of available chart types vary by the report you selected on the **Report** tab:

- Chart space usage
- History chart: File Count
- History chart: Free Space
- History chart: Free Space %
- History chart: Used Space
- History chart: Used Space %
- History chart: Capacity

#### Note:

- You must use Adobe Acrobat Reader to view the resulting PDF. You can download Adobe Acrobat Reader from: <http://get.adobe.com/reader/>.
- This option is available for reports that support charting only.
- For agents that run on Linux and UNIX computers, you must perform additional configuration steps to enable this option. For information about how to configure the agent system, go to the Tivoli Storage Productivity Center Information Center. Search for the topic "Configuring IBM Tivoli Storage Productivity Center for batch reports on UNIX or Linux."
- The batch chart uses any customization settings that are defined for the corresponding "online" chart. "Online" charts are those charts generated using the Reporting facility.

For example, if you choose to generate a **TPC-wide Storage Space > File System Space > By Filesystem > PDF Chart > Chart space usage** batch report chart, any customization settings defined in the Reporting facility for **Data Manager > Reporting > TPC-wide Storage Space > File System Space > By Filesystem > Chart space usage for selected** is applied to the batch report chart.

Any batch chart with an associated online report that provides a choice between "selected" and "all" for its generated charts use the customization settings defined for the "selected" chart.

- If you select **PDF Chart > Pie Chart** from the Chart Customization window and one of the elements represented in the pie chart is much smaller than the other elements, the pie chart displays a graphical error. For example, if the pie chart for a batch report shows disk space, and the disk space used is 4 KB and the free space is 10 GB, a graphical error is displayed.

### HTML Chart

Select this option if you want to create a chart for the batch report in HTML format. When HTML Chart is selected, the drop-down list to the right becomes active. Use this drop-down list to select the type of chart you want to create. The list of available chart types vary by the report you selected on the **Report** tab:

- Chart space usage
- History chart: File Count
- History chart: Free Space
- History chart: Free Space %
- History chart: Used Space
- History chart: Used Space %
- History chart: Capacity

### Note:

- If you generate charts for reports and these charts contain long path names or a large number of segments, the text on the charts might overlap and make them difficult to read.
- For agents that run on Linux and UNIX computers, you must perform additional configuration steps to enable this option. For information about how to configure the agent system, go to the Tivoli Storage Productivity Center Information Center. Search for the topic "Configuring IBM Tivoli Storage Productivity Center for batch reports on UNIX or Linux."
- The batch chart you generate uses any customization settings that are defined for the corresponding "online" chart. "Online" charts are those generated using the Reporting facility.

For example, if you choose to generate a **TPC-wide Storage Space > File System Space > By Filesystem > PDF Chart > Chart space usage** batch report chart, any customization settings defined in the Reporting facility for **Data Manager > Reporting > TPC-wide Storage Space > File System Space > By Filesystem > Chart space usage for selected** is applied to the batch report chart.

Any batch chart with an associated online report that provides a choice between "selected" and "all" for its generated charts use the customization settings defined for the "selected" chart.

### Customize this chart

Click this button to use the Chart Customization window to customize the chart that is generated for the batch report. You will be able to select a chart type and chart orientation. If there is a customized chart for the corresponding online report, the customized chart is used for this batch report. However, you can override that customized chart by using this function.

The button is active only when **PDF Chart** or **HTML Chart** is selected.

3. In the **Classic Column Names Specification** section, check **Use Classic Column Names** to use the original names of report columns in the output for batch reports. If you do not select this option, the new names of columns are used. For your reference, the online help displays the original names of those columns within parentheses ( ) next to their new names.

**Note:** The titles of some reports have been updated. These new titles are always used for batch reports

4. In the **Script** section, check **Run Script** to run a script when the batch report is completed.

Select this option and enter the name of the script you want to run against the results of the batch report. For example, if you create a batch report for the most obsolete files on monitored computers, you can indicate a script that runs a program to archive all the files that appear in that report.

5. In the **Output File Specification** section, define the output file naming format for the batch report file.

#### **Enter Mask that will be used to create the output file name**

Displays the parameters that determine the name of the output file. For example, if you use the default parameters, {Report creator} {Report name} {Report run number}, Tivoli Storage Productivity Center retrieves the values for these parameters and uses them to name the output file. Click any of the following parameters to include them in the mask for the name of an output file:

- Report creator (default)
- Report name (default)
- Report run number (default)
- Report title
- Report run date
- Report run time
- Unique number

**Note:** If you include {Report name} in the mask, Tivoli Storage Productivity Center uses the name of the batch report definition in the name of the output file. If you included NLS characters in the name of the batch report definition, errors might occur if you selected a Storage Resource agent as a destination for the batch report. You can use NLS characters in the name of a batch report definition in the following situations:

- TPC server or Data agent is selected as the destination for a batch report.
- A Storage Resource agent is selected as the destination for a batch report and the {Report name} parameter is not included in the mask for the output file name. If {Report name} is not used in the mask, it is recommended that other parameters are included in the mask to ensure that the output file name is unique. For example, {Report Creator} {Report Run Number} {Report Title} {Unique number}.

## **Scheduling a batch report**

Determine when and how often to run a batch report.

Use the **When to Run** page to specify when and how often to run the batch reporting job.

You have the following options for determining when to generate a report:

- Generate the report immediately
- Generate the report once at a specified time and date
- Generate the report repeatedly according to a schedule you specify

Select the option you want and then edit the time and date information accordingly. You can also use the fields in the How to handle time zones section to indicate the time zone that IBM Tivoli Storage Productivity Center should use when scheduling and running the batch report. For example, if you selected to run the job at 9:00 AM, you can use the fields in this section to run the batch report at:

- 9:00 AM local time of the agent running the batch report
- 9:00 AM of the time zone where the server resides
- 9:00 AM of a specific time zone, such as 9:00 AM CST or 9:00 GMT. For example, if you select 9:00 AM CST, the batch report will run at 7:00 AM on an agent located in the PST time zone.

**Local time in each timezone.** Select this option to use the time zone of the computer where the agent that collects data for the job is deployed. For probes of storage systems, tape libraries, and fabrics, the time zone of the Tivoli Storage Productivity Center server is used.

**Same Global time across all timezones.** Use the options in this section to apply the same global time across all the time zones where the probe is being run.

- **Use the timezone that the server runs in.** Select this option to use the time zone of the location where the Tivoli Storage Productivity Center server resides.
- **Use this timezone.** Select this option to indicate a specific time zone for when to run the job. Select a timezone from the list box.

## Defining alerts for batch reports

Define the alert that will be triggered if the batch report fails to run.

Use the **Alert** tab to define an alert that will be triggered if the report does not run on schedule.

To define alert values for a batch report, complete the following steps:

1. Expand **IBM Tivoli Storage Productivity Center > Reporting -> My Reports** and right-click on **Batch Reports**.
2. Select **Create Batch Reports**. The Create Batch Reports window opens.
3. For information on creating the batch report, see "Batch reports" on page 1061.
4. Click the **Alerts** tab.
5. Define the conditions that will trigger the alert. The default setting is **Report Failed**. No other alerting conditions are currently available.
6. Select alert mechanisms in addition to writing an error to the error log:
  - If you want to use Simple Network Management Protocol (SNMP) traps, IBM Tivoli Enterprise Console events, or e-mail as an alert notification, you must specify disposition values in the Alert Dispositions window. Expand **Administrative Services > Configuration > Alert Disposition**.
  - If you want a script to be run after an event has been triggered, you must create the script before you create the alert.
7. Save the file:
  - a. Click **File > Save**.

- b. The **Save As** window opens. Enter a name for the batch report and click **OK**.

#### **Editing alert values for a batch report**

1. Expand **IBM Tivoli Storage Productivity Center > My Reports > Batch Reports**. The list of existing batch reports is displayed.
2. Click the batch report. The **Edit Batch Report** window opens.
3. In the **Alerts** tab, make any necessary changes.
4. Click **File > Save**.

#### **Related topics:**

"Batch reports" on page 1061

### **Creating batch reports for storage subsystem or switch performance**

This topic describes how to create a batch report for storage subsystem performance or switch performance.

To create a batch report for storage subsystem performance or switch performance, follow these steps:

1. Expand **IBM Tivoli Storage Productivity Center > Reporting > My Reports**.
2. Right-click the **Batch Reports** node and select **Create Batch Report**.
3. Click the **Report** tab and select the type of report you want to create and move it from **Available** to **Current Selections** by clicking the right-arrow button (>>). Select an item from **Storage Subsystem Performance** or **Switch Performance**.
4. Click the **Selection** tab. The Report Filter Specifications window displays.

#### **Selection button**

This determines the resources upon which you want to report, such as the storage subsystems, the fibre-channel ports, and so forth. The Select Resources window displays. The type of resources displayed for selection depends on the type of report you previously selected on the **Report** tab. For example, if you selected a By Storage Subsystem report, all displayed resources will be storage subsystems. If you clear the box for a resource on the Select Resources window, a warning icon displays on the Selection button.

#### **Filter button**

This further defines the data that you want to include in the report. Filters enable you to apply general rules to the report. When you click this button, the Edit Filter window displays.

For example, to select only data associated with subsystems that have a name ending with "123-IBM", select the "Subsystem" column, the "LIKE" operator, and type "\*123-IBM" (without the quotation marks) in the Value 1 field. To select only data which has a Read I/O Rate greater than 0, select the "Read I/O Rate (overall)" column, the ">" operator, and type "0" (without the quotation marks) in the Value 1 field.

If a filter is defined for this report, a warning icon displays on the **Filter** button.

#### **Time range selectors**

All performance reports display historical performance data. Use the time range selectors to specify the exact time range that you want the report to cover. Click one of the following radio buttons to select the type of historical report you want:

### Display latest performance data

This report contains only the latest available performance data for the selected resources. Note that even the latest data available might still be somewhat old, depending on whether data was recently collected for the resources. Including the time column in the report will help you determine how old the latest available data actually is. Regardless of the age of the data, clicking this button ensures that only a single row (representing a single point in time) for each selected resource is included in the report. If no data has ever been collected for a particular resource, then that resource is not included in the report. If no data has ever been collected for any resource, then the resulting report will be empty.

### Display historic performance data using absolute time

This report contains only data that falls within a specific time range. Select the time range using the **From** and **To** selectors. The specified from and to values are interpreted as inclusive. The resulting report contains all the performance data that is available within the specified time range, for each selected resource. This means that the data can consist of potentially many rows per resource, each with a unique timestamp. If no data has been collected for a particular resource during the specified time range, that resource is not included in the report. If no data has been collected for any resource during the specified time range, then the resulting report will be empty.

To determine which historical performance records fall within the specified time range, the **beginning timestamp** of the collection intervals is used for comparison. If an historical record contains performance data for an interval of time from 1:00 PM to 1:05 PM, that record would be included in the report for a time range of 1:00 PM to 8:00 PM. However, that same record would not be included if a time range of 1:02 PM to 8:02 PM was specified, because it is the beginning of the time period (for example, 1:00 PM in this example) that is used to determine inclusion in the specified time interval.

Specifying an absolute time range is not suitable for batch reports that are run on a repeating schedule, because the specified time range is fixed and will not automatically be updated based on the most current date and time. The result will be that the same report is generated every time that the batch report is run. Instead, use a relative time range for this type of report.

### Display historic performance data using relative time

This report contains only data that falls within a specific time range extending backward from the current date and time. Specify the number of days in the desired time range, using the **days ago until now** field. The report will be exactly the same as a report using absolute time, with the **To** selector set to the current date and time, and the **From** selector set to the current date and time minus the number of **days ago until now**. However, when regenerating this report periodically, as the current date and time advances, the data included in the report

will advance as well. As a result, this is the suitable option to select when defining batch reports that are run on a repeated schedule.

Note that the same criteria applies as if determining which historical performance records fall within the specified time range. Only the beginning timestamp of the collection intervals is used for comparison. This means that data for the current hour or the current day is not included in the report when selecting hourly or daily summation data, because data for the current hour or current day is only saved in the database when the hour or day is complete. As an alternative, consider using the first radio button, **Display latest performance data**, to see a report showing the most recent daily summation data.

### Summation Level

Use this selector to select which type of performance data records to include in the report. The Tivoli Storage Productivity Center Performance Manager collects and stores three different types of performance data:

#### By sample

Represents the most detailed data. There is usually one sample record per resource for every **n** minutes, where **n** is the performance monitor interval length that was specified when the monitor was defined. Each sample represents the average performance of the resource over those **n** minutes. A sample record with a timestamp of **t** will be saved at time **t+n**. In other words, the beginning of each **n** minute time interval is used for display and for time range matching.

#### Hourly

Represents an hourly average of the performance of the specified resources. There will be one hourly record written every hour, per resource. Each such record will be written at or shortly after each hour mark on the (device) clock. For example, a record with a timestamp of 12:00 PM and interval length of 1 hour will be written at 1:00 PM.

#### Daily

Represents a daily average of the performance of the resources. There will be one daily record written every day, per resource. Each daily record will be written at or shortly after midnight, according to the device clock. For example, a record with a timestamp of April 21, 12:00 AM and interval length of 24 hours will be written on April 22, 12:00 AM.

Note that hourly and daily records are usually retained in the database for longer periods of time, compared to By Sample records. As a result, if a generated report indicates that sample data is no longer available for a particular time range in the past, it is possible that the sample data has already been purged, in which case you can try generating the report using hourly or daily summation levels.

Be aware that when selecting a time range using the **Display historic performance data using relative time** radio button, it is necessary to select the length of the range in days. This can lead to unexpected results when also selecting the daily summation level. Remember that a daily record is not written until the day is complete, which means that at any given time during the day, the current day's data does not yet

exist in the database. Therefore, selecting the daily summation level as well as a relative time range of **n days ago until now**, will usually result in n-1 records being returned per resource, assuming that at least n-1 days worth of data has been previously collected for those resources. Specifying a relative time range of **1 days ago until now** will result in an empty report.

### **Available Columns, Included Columns**

Use these items to specify which columns to include and which columns to exclude from the generated report.

#### **Available Columns**

Displays the columns that you can include in the generated report that are not already included. If a column appears in the **Included Columns** list box, it will not appear in the **Available Columns** list box.

#### **Included Columns**

Displays the columns that will appear in the generated report. By default, all columns for a report are listed in this list box and will be displayed in the generated report. You can highlight the columns and use the up and down arrows to rearrange the order of the columns in the report. The order of the items in this list box determines the order in which the columns will appear in the generated report. The columns with grayed-out names are the frozen columns, which cannot be selected, removed, or reordered for this type of report.

If a column appears in the **Available Columns** list box, it will not appear in the **Included Columns** list box.

To exclude a column from a report, click the name of the column in the **Included Columns** list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the left-arrow button (<<). The selected columns are removed from the **Included Columns** list box, and will appear in the **Available Columns** list box.

To include a column in a report, click the name of the column in the **Available Columns** list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the right-arrow button (>>). The selected columns will be removed from the **Available Columns** list box, and will appear in the **Included Columns** list box.

To rearrange the order of columns that will appear in the generated report, click the name of a column in the **Available Columns** list box. Click **Shift+click** and **Ctrl+click** to select multiple columns, if so desired. Then click the up-arrow button (^) or the down-arrow button (v) to move the selected columns up or down in the list, relative to the other columns.

5. Click the **Options** tab of the Batch Report job window, specify the following:
  - The machine on which the report file will be saved
  - The report format (for example, HTML)
  - Whether to run a script when the report process is complete
  - The format for the name of the batch report
6. In the **When to Run** tab of the Batch Report job window, specify when and how often to run the batch report.

7. In the **Alert** tab of the Batch Report job window, define the conditions that will trigger an alert and the method of notification.
8. Click **File > Save** and type a name for the batch report. The batch report will be saved using your user ID as a prefix. For example, if you are logged onto Tivoli Storage Productivity Center as "Smith," the name of the batch report will be `Smith.report_name`.

## Editing batch reports

Edit existing batch report definitions.

To edit a batch-report definition, follow this procedure:

1. Expand **IBM Tivoli Storage Productivity Center > Reporting > My Reports > Batch Reports**.
2. Click the report name, make your changes and then click **File > Save**.

## Viewing job information for a batch report

View job information for batch reports on the Job Management panel. Use this panel to check the status of a batch report schedule and view the runs, jobs, and log files associated with it.

To display a list of the runs and jobs for a batch report, complete the following steps:

1. Expand **IBM Tivoli Storage Productivity Center > Reporting > My Reports > Batch Reports**.
2. Click the name of a batch report. The content pane displays information about the batch report schedule.
3. Click **View Job History**. The Job Management panel is displayed and the batch report schedule is highlighted in the **Schedules** section.
4. View the runs and jobs for the highlighted batch report schedule in the **Jobs for Selected Schedule** section. See "Managing schedules, jobs, and runs" on page 297 for more information about how to use the Job Management panel.

## Displaying log files for a batch report

Display the log files batch reports.

To display the log files for a batch report schedule, complete these steps:

1. Expand **IBM Tivoli Storage Productivity Center > Reporting > My Reports > Batch Reports**.
2. Click the name of a batch report. The content pane displays information about the batch report schedule.
3. Click **View Job History**. The Job Management panel is displayed and the batch report schedule is highlighted in the **Schedules** section.
4. In the **Jobs for Selected Schedule**, expand the run whose log files you want to view. Click + or - to expand or collapse the job listing under a run.
5. Select the job whose log file you want to view and click **View Log File(s)**. See "Managing schedules, jobs, and runs" on page 297 for more information about how to use the Job Management panel.

## Displaying batch reports from the saved directory

Access the report file that is generated from a batch report schedule. This file contains the data for the report that you generated as a batch report.

After you run a batch report, batch report files are saved in the directory that you specified on the **Options** page of the Create Batch Report panel. Batch reports are automatically saved to the following default locations:

- Storage Resource agents:
  - Windows: C:\Program Files\IBM\TPC\agent\log\computername\reports
  - UNIX/Linux: /opt/IBM/TPC/agent/log/computername/reports
- Data agents:
  - Windows: C:\Program Files\IBM\TPC\ca\subagents\TPC\Data\log\computer\_name\reports\
  - UNIX/Linux: /opt/IBM/TPC/ca/subagents/TPC/Data/log/computer\_name/reports/

## Viewing CSV batch reports with spreadsheet applications

View CSV-formatted batch reports in third-party spreadsheet applications.

If you are using a spreadsheet program (such as Excel) to view a CSV-type batch report file, that program might display data in the wrong columns either because the data was exported from Data Manager, the data contains commas, or the file was opened or formatted in the spreadsheet program by double-clicking it.

If data is displaying in the wrong columns, open the CSV file using the spreadsheet program's open command.

## Exporting and importing settings that you define

This topic describes how to export batch report definitions, constraints, groups, and profiles.

You can export settings that you define from one instance of IBM Tivoli Storage Productivity Center and import the settings into another instance. To export and import your definitions, complete the following steps:

1. On the system running the server component, change to the following directory:

**On Linux and UNIX operating systems**

/opt/IBM/TPC/data/server/tools/

**On Windows operating systems**

C:\Program files\IBM\TPC\data\server\tools\

2. To export the definitions from a command prompt, type the following command and press **Enter**:

```
export -e <file>
```

where <file> is the fully qualified name of the file where the definition information is written.

3. On the system to which you want to migrate the definitions, change to the **tools** directory.

4. To import the definitions, type the following command and press **Enter**:

```
export -i <file>
```

where <file> is the fully qualified name of the file that you created when exporting.

---

## User ID (saved) reports

Use the information in this section to learn how to generate, save, and view user ID reports. You can create a user ID reports based on a system report or any of the online reports available in Data Manager, Data Manager for Databases, Disk Manager, or Fabric Manager. Once saved, user ID reports are available in the **IBM Tivoli Storage Productivity Center > Reporting > My Reports > user ID name** node in the navigation tree.

### Creating a user-defined report

Create a custom report based on a system report or any of the online reports available in Data Manager, Data Manager for Databases, Disk Manager, or Fabric Manager.

To create a custom report, follow this procedure:

1. Specify new report criteria by doing one of the following:
  - Access a system report and change its format according to your organization's needs.
  - Create a new report using the reporting component in any of the IBM Tivoli Storage Productivity Center managers. For example, **Data Manager → Reporting → Usage → Access Load → Access Time → By Filesystem**.
2. Click **File → Save** and type a name for the report. The report is saved in the **Tivoli Storage Productivity Center > Reporting > My Reports > user name's** node, where *user name's* is your login name. For example, if you are logged in as "Smith", your custom reports appear under the **Smith's Reports** node.

### Displaying user-defined reports

Display a custom report saved under your user ID.

To display a list of custom reports, expand the **IBM Tivoli Storage Productivity Center > Reporting > My Reports > <your user ID>** node. Click the name of the report you want to view.

### Editing user-defined reports

Change the settings for an existing user ID report and save those changes.

To edit a custom report definition, follow this procedure:

1. Expand **My Reports → user name's Reports**.
2. Click the report name, make your changes and then click **File → Save**.

---

## Rollup reports

Use rollup reports to view the storage information collected by the master IBM Tivoli Storage Productivity Center server from its associated subordinate servers. Rollup reports enable you to have a network-wide perspective of storage usage in an environment where multiple Tivoli Storage Productivity Center servers are deployed and collecting storage metrics.

Before you can generate rollup reports, you must perform the following:

- Associate subordinate servers with the master server on the **Administrative Services > Data Sources > Tivoli Storage Productivity Center Servers** window.

- Run discoveries, probes, and scans from the subordinate servers to gather information about their locally-monitored storage entities.
- Run discoveries, probes, and scans from the master server to gather information about its locally-monitored storage entities. Note that information about the storage entities monitored by a master server are automatically shown in rollup reports.
- Run TPC Server probes from the master against the subordinate servers to collect their storage information for the rollup reports. Use the Tivoli Storage Productivity Center **Monitoring > TPC Server Probes** node to define and schedule probe jobs.

**Note:**

- If the same storage entity is managed by multiple subordinate servers, rollup reports reflect the storage information from the subordinate server that most recently probed that entity.
- After upgrading to Tivoli Storage Productivity Center 5.1, you must run probes against the monitored storage assets for the master server to have information about those assets displayed in **Tivoli Storage Productivity Center > Reporting > Rollup Reports**.

Tivoli Storage Productivity Center includes different rollup reporting categories that provide you with the flexibility to view data about your storage resources according to the needs of your environment. The following rollup reporting categories are available:

## Generating rollup reports

Learn how to generate and view rollup reports.

1. Expand the navigation tree to display the type of report you want to generate. For example, if you want to generate a database capacity report, expand **IBM Tivoli Storage Productivity Center > Reporting > Rollup Reports > Database Capacity**.
2. Highlight a By Clause to determine how you want to view a report. For example, to view rollup capacity information according to computer group, click **Tivoli Storage Productivity Center > Reporting > Rollup Reports > All DBMSs > By Computer Group**. The **Selection** page displays.
3. Use the **Selection** page to determine what columns appear within a report, what storage assets to report upon (Capacity and Database Capacity reports only), and how to filter that values that appear report columns.
4. (Capacity and Database Capacity reports only) Click **Selection...** to select the objects that you want to report upon from the Select Resources window. See “Selecting resources to appear on a report” on page 823 for information.
5. Click **Filter...** to further filter the objects that appear in a report. Filters enable you to apply general rules to the report based on the rows in that report. See “Filtering the resources that appear on a report” on page 825 for more information on filtering.
6. Use the **Available Columns** and **Included Columns** list boxes to determine what columns are displayed in a generated report.
7. Click **Generate Report**. A new tab will be added to the tab dialog representing the report that you generated.
8. Click the new tab to view the report. Reports are tabular in format and composed of rows and columns. You can scroll the report to view the entire report. Use the **View** menu to hide/show the navigation tree to increase the

viewable area of the report or drag the divider bar in the middle of the screen back and forth to reallocate the amount of space that is given each pane.

## Rollup reports - fragmentation

Fragmentation occurs when related storage entities are being monitored by different subordinate IBM Tivoli Storage Productivity Center servers.

The following example shows when fragmentation can occur using subordinate servers and rollup reports:

- **Example:** Host A is assigned a volume from storage subsystem 1. Host A is being monitored only by one Tivoli Storage Productivity Center subordinate server (Server 1) and storage subsystem 1 is being monitored by another subordinate server (Server 2). Server 1 and Server 2 are subordinate servers to the master server (Server 3).

**Reason for fragmentation:** In this example, the host and subsystem are fragmented because they are not being monitored by the same Tivoli Storage Productivity Center server. This will cause the **Correlated Volume Space** value in the rollup reports for storage subsystems and volumes to be incorrect.

To prevent fragmentation when using master and subordinate server relationships to generate rollup reports, we recommend the following:

- Do not monitor a storage subsystem and the hosts to which its volumes are assigned with different subordinate servers that are associated with the same master server.
- Do not monitor a fabric and its related switches with different subordinate servers that are associated with the same master server.
- If an agent machine is using storage from a subsystem, then both the agent and subsystem should be monitored by the same subordinate server.
- Configure all the subordinate servers to discover all the storage subsystems within your environment. Note that if a subordinate server is monitoring a subsystem with an agent other than the agent that is using storage on that subsystem, the value for the **Correlated Volume Space** column in rollup reports will be incorrect. For example:
  - Host A has storage from Subsystem 1
  - Subordinate server B is Monitoring Host A and Subsystem 1
  - Subordinate server C is Monitoring Subsystem 1 and probed the subsystem more recently than server B.
  - The master server is monitoring subordinate servers B and server C.

The master server will report the storage subsystem data from server C. Because the master server does not know about Host A, the value for the **Correlated Volume Space** column will be incorrect.

## Rollup Reports - Asset

Use these reports to view detailed statistics about agents (IBM Tivoli Storage Productivity Center), computers, storage subsystems, disk and volume groups, disks, filesystems, logical volumes, volumes, and fabrics that are monitored by subordinate servers.

The information shown in these reports is gathered by the master server when it runs Tivoli Storage Productivity Center server probes against associated subordinate servers. If the same storage entity is managed by multiple subordinate servers, rollup reports reflect the storage information from the subordinate server that most recently probed that entity.

## Rollup Reports - Asset - Agents

Use this report to view information about Data agents, Fabric agents, and Storage Resource agents that are associated with subordinate servers in your environment.

You can generate and sort the data within this report using the following By clauses:

- **By Agent:** Shows agents sorted according to the name of the computer on which they are installed.
- **By OS Type:** Shows agents sorted according to the operating system under which they run. Click the magnifying glass icon next to an operating system type to view more detailed information about each of the agents running under that operating system.
- **By TPC Server:** Shows agents sorted according to the subordinate server that manages them. Click the magnifying glass icon next to subordinate server to view more detailed information about each of the agents associated with that server.

**Note:** The first column in each report remains displayed when scrolling through the other columns on the report.

### By Agent

#### Agent Name

Name of the computer on which an agent is installed.

#### Data/SR Agent Version

Tivoli Storage Productivity Center version number of a Data agent or Storage Resource agent (for example, 4.2.0).

#### Fabric Agent Version

Tivoli Storage Productivity Center version number of a Fabric agent (for example, 4.1.1).

#### OS Type

Operating system on the computer where an agent is installed.

#### Data/SR Agent Status

Status of a Data agent or Storage Resource agent. Possible statuses include Up and Down. A down agent represents an agent that is still running but with which the server is not communicating.

#### Fabric Agent Status

Status of a Fabric agent. Possible statuses include Up and Down. A down agent represents an agent that is still running but with which the server is not communicating.

#### Data/SR Agent Port

Port number on which a Data agent or Storage Resource agent listens for requests. Port 9549 is registered for use by IBM.

#### Fabric Agent Port

Port number on which a Fabric agent listens for requests. Port 9550 is registered for use by IBM.

#### Host Address

Network name or IP address of an agent as seen by subordinate server.

#### Time Zone

Time zone where the agent is installed (for example, CDT).

**CPU Architecture**

Instruction set architecture on the computer where an agent is running.

**By OS Type****OS Type**

Operating system on the computer where an agent is installed.

**Number of Data Agents/SR Agents**

Total number of Data agents and Storage Resource agents that are running on the operating system.

**Number of Data Agents/SR Agents (Status: Up)**

Number of Data agents and Storage Resource agents that are running on the operating system that have a status of Up.

**Number of Data Agents/SR Agents (Status: Down)**

Number of Data agents and Storage Resource agents that are running on the operating system that have a status of Down. A down agent represents an agent that is still running but with which the server is not communicating.

**Number of Data Agents/SR Agents (Status: Defected)**

Number of Data agents and Storage Resource agents that are running on the operating system that have been reassigned to another server.

**Number of Data Agents/SR Agents (Status: Upgrading)**

Number of Data agents and Storage Resource agents that are running on the operating system and are currently in the process of upgrading to the same version as the subordinate server.

**Number of Data Agents/SR Agents (Status: Unreachable)**

Number of Data agents and Storage Resource agents that are running on the operating system that are unreachable. This status indicates that an agent that is unreachable and not responding to the server. This status might occur when the agent is not running but did not inform the server that it was shutting down, or when a network problem has occurred.

**Number of Data Agents/SR Agents (Status: Upgrade Required)**

Number of Data agents and Storage Resource agents that are running on the operating system that require an upgrade to the same version as the subordinate server.

**Number of Data Agents/SR Agents (Status: Deleted)**

Number of Data agents and Storage Resource agents that are running on the operating system that have a status of Deleted.

**Number of Fabric Agents**

Total number of Fabric agents that are running on the operating system.

**Number of Fabric Agents (Status: Up)**

Number of Fabric agents that are running on the operating system that have a status of Up.

**Number of Fabric Agents (Status: Down)**

Number of Fabric agents that are running on the operating system that have a status of Down. A down agent represents an agent that is still running but with which the server is not communicating.

## **By TPC Server**

### **TPC Server**

Name of the TPC server on which an agent is associated.

### **Number of Data/SR Agents**

Total number of Data agents and Storage Resource agents that are associated with the TPC server.

### **Number of Data Agents/SR Agents (Status: Up)**

Number of Data agents and Storage Resource agents that are associated with the TPC server that have a status of Up.

### **Number of Data Agents/SR Agents (Status: Down)**

Number of Data agents and Storage Resource agents that are associated with the TPC server that have a status of Down. A down agent represents an agent that is still running but with which the server is not communicating.

### **Number of Data Agents/SR Agents (Status: Defected)**

Number of Data agents and Storage Resource agents that are associated with the TPC server that have been reassigned to another server.

### **Number of Data Agents/SR Agents (Status: Upgrading)**

Number of Data agents and Storage Resource agents that are associated with the TPC server and are currently in the process of upgrading to the same version as the subordinate server.

### **Number of Data Agents/SR Agents (Status: Unreachable)**

Number of Data agents and Storage Resource agents that are associated with the TPC server that are unreachable. This status indicates that an agent that is unreachable and not responding to the server. This status might occur when the agent is not running but did not inform the server that it was shutting down, or when a network problem has occurred.

### **Number of Data Agents/SR Agents (Status: Upgrade Required)**

Number of Data agents and Storage Resource agents that are associated with the TPC server that require an upgrade to the same version as the subordinate server.

### **Number of Data Agents/SR Agents (Status: Deleted)**

Number of Data agents and Storage Resource agents that are associated with the TPC server that have a status of Deleted.

### **Number of Fabric Agents**

Total number of Fabric agents associated with the TPC server.

### **Number of Fabric Agents (Status: Up)**

Number of Fabric agents associated with the TPC server that have a status of Up.

### **Number of Fabric Agents (Status: Down)**

Number of Fabric agents associated with the TPC server that have a status of Down.

## **Rollup Reports - Asset - Computers**

Use this report to view information about the hosts and computers (including NetApp) that are monitored by subordinate servers in your environment. This includes VMWare-related entities such as hypervisors and virtual machines.

**Note:** The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

You can generate and sort the data within this report using the following by clauses:

- **By Computer:** Shows computers monitored by subordinate servers. Sorted by computer name.
- **By TPC Server:** Shows subordinate servers that are monitoring computers. Sorted by subordinate server name. Click the magnifying glass icon next to subordinate server to view more detailed information about each of the computers associated with that server.

**Note:** The first column in each report remains displayed when scrolling through the other columns on the report.

### **By Computer**

**Note:** Two entries for the same host might appear in this report and the values for that host are counted twice in the **TOTAL** column. This scenario occurs under the following circumstances:

- You install two Storage Resource agents on the same host (using the long and short names of the host) that point to different Tivoli Storage Productivity Center servers. For example, you install an agent from serverA using the short name of a host (for example, hostC). You install another agent from serverB using the long name of the same host (for example, hostC.storage.chicago.com). You then set up the servers in a master and subordinate relationship. For example, serverA is the master and serverB is the subordinate. In this example, there are two entries in the report for the host: hostC and hostC.storage.chicago.com. The values for hostC are counted twice in the **TOTAL** column.
- A Storage Resource agent on a host (hostC) points to two different Tivoli Storage Productivity Center servers (serverA and serverB). The host has a dynamic IP address. You set up serverA as the master and serverB as the subordinate. Server serverA probes hostC, but then the IP address of hostC changes before serverB probes the host. In this example, the report might display two entries for hostC: one entry with the IP address that was probed by serverA; the other entry with the changed IP address that was probed by serverB. The values for hostC are counted twice in the **TOTAL** column.
- A Storage Resource agent on a host (hostC) points to two different Tivoli Storage Productivity Center servers (serverA and serverB). The host has a name that resolves to hostC.storage.chicago.com on serverA and hostC.srm.storage.chicago.com on serverB. You then set up the servers in a master and subordinate relationship. For example, serverA is the master and serverB is the subordinate. In this example, there are two entries in the report for the host: hostC.storage.chicago.com and hostC.srm.storage.chicago.com. The values for hostC are counted twice in the **TOTAL** column.

#### **Computer**

Name of a computer monitored by a subordinate server.

#### **OS Type**

Operating system running on a computer.

#### **OS Version**

Version of the operating system running on a computer.

**RAM** Amount of RAM installed on a computer.

**Disk Space (Capacity)**

Total storage capacity for a computer. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Note:** If the computer is an IBM Tivoli Storage SAN File Systems client, then this value will also include the capacity of any storage subsystem volumes visible to this computers that are owned by the SAN File System.

**Number of Disks**

Total number of disks for a computer. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value in this column:

- Computer disks on a computer that has not been probed by a Storage Resource agent or Data agent.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Processor Count**

Number of CPUs running on a computer.

**IP Address**

IP address of a computer.

**Serial Number**

Serial number of a computer.

**Model** Model number or name of a computer.

**Manufacturer**

Manufacturer of a computer (for example, IBM).

**Time Zone**

Time zone where the computer is located.

**Available File System Space (Filesystem Free Space)**

Total amount unique file system storage space that is not used or available to the computer. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Network Address**

Network name of a computer.

**Processor Type**

Type of processor running on a computer (for example, GenuineIntel: x86 Family 15).

**Processor Speed**

Speed at which a computer's processor is running (in MHz).

**CPU Arch**

Architecture of the processor (for example, IA32).

**Swap Space**

Amount of swap space (virtual memory) defined on a computer.

**By TPC Server****TPC Server**

Name of a subordinate server that is monitoring computers in your environment.

**# of Computers**

Number of computers monitored by the subordinate server.

**Disk Space (Capacity)**

Total storage capacity of the computers monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value for this column:

- Computer disks on a computer that has not been probed.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Note:** If a computer is an IBM Tivoli Storage SAN File Systems client, then this value will also include the capacity of any storage subsystem volumes visible to this computers that are owned by the SAN File System.

**Available File System Space (Filesystem Free Space)**

Total amount unique file system storage space that is not used or available to the computers that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**Number of Disks**

Number of disks associated with the computers monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value in this column:

- Computer disks on a computer that has not been probed by the Storage Resource agent or Data agent.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Rollup Reports - Asset - Storage Subsystems**

Use this report to view information about the storage subsystems that are monitored by subordinate servers in your environment.

**Note:** The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

You can generate and sort the data within this report using the following By clauses:

- **By Storage Subsystem:** Sorted according to storage systems name. The names of storage systems monitored by subordinate servers appear in the first column and remain displayed when scrolling through the other columns on the report.
- **By Disk Space:** Sorted according to the storage capacity of storage systems. The names of storage systems monitored by subordinate servers and their disk capacity appear in the first two columns and remain displayed when scrolling through the other columns on the report.
- **By TPC Server:** Shows storage systems aggregated at subordinate server level. The names of subordinate servers that are monitoring storage systems appear in the first column and remain displayed when scrolling through the other columns on the report. Click the magnifying glass icon next to subordinate server to view more detailed information about each of the storage systems monitored by that server.

**Note:**

- Storage systems that have been discovered but not probed are not displayed in these reports.
- This report includes information about storage system volumes. For IBM System Storage SAN Volume Controller systems, IBM Tivoli Storage Productivity Center uses the term "Volume" to represent "virtual disks" for those systems.

### **By Storage Subsystem, and By Disk Space**

**Name** Name or alias of a storage system that is monitored by a subordinate server or the master server.

**Disk Space (Capacity)**

Total raw (unformatted) disk capacity of a storage system. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Capacity of spare disks identified on IBM TotalStorage Enterprise Storage Server, IBM System Storage DS8000, and IBM System Storage DS6000 storage systems.
- Capacity of storage system disks that become missing after a storage system probe.

**Note:** For Hitachi Data Systems storage systems, this value is the capacity of all the volumes in the storage system.

**Available Disk Space (Unallocated Space)**

Total unformatted disk free space of the storage system. Tivoli Storage Productivity Center does not include the following storage space in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- RAID overhead on storage systems that are identified by Tivoli Storage Productivity Center.
- External back-end storage for TagmaStore systems.
- Storage space that is consumed by volumes that reside on external disks when Hitachi Data Systems (HDS) storage systems are configured as storage virtualizers.

**Note:** For Hitachi Data Systems storage systems, internal disk information is not available. This field is set to 0.

**Number of Disks**

Total number of disks in the storage system. Tivoli Storage Productivity Center does not include disks that become missing after a successful storage system probe in its calculation of the value for this column. For Hitachi Data Systems storage systems, internal disk information is not available. This field is to 1.

**Number of Volumes (LUNs)**

Number of storage volumes and virtual storage volumes discovered by a probe. Tivoli Storage Productivity Center does not include storage volumes or virtual storage volumes that become missing after a successful probe in its calculation of the value for this column.

**Volume Space (LUN Capacity)**

Total amount of unique storage system volume space or virtual storage volume space discovered on monitored storage system arrays. Tivoli Storage Productivity Center does not include storage volumes or virtual storage volumes that become missing after a successful probe in its calculation of the value for this column.

**Note:** For space-efficient volumes, this value is the amount of storage space requested for these volumes, not the actual allocated amount. This can result in discrepancies in the overall storage space reported for a storage system using space-efficient volumes. This also applies to other space calculations, such as the calculations for the storage system's Consumable (Available) Volume Space and FlashCopy Target Volume Space.

**Consumable Volume Space (Usable LUN Capacity)**

Total amount of unique storage system volume space or virtual storage volume space discovered on monitored storage system arrays. Tivoli Storage Productivity Center does not include the following storage entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe
- Storage system volumes or virtual storage volumes that are used as flash copy targets.
- Storage system volumes or virtual storage volumes that are identified as a Business Continuance Volume extended (BCVx) (EMC only).
- Storage system volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database (EMC only).

**FlashCopy Target Volume Space (Capacity)**

Total amount of unique storage system volume space and virtual storage volume space discovered on monitored storage system arrays and has been identified as flash copy target space. Tivoli Storage Productivity Center does not include the following storage entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes or virtual storage volumes that are not used as flash copy targets.

**Note:** TotalStorage Enterprise Storage Server systems must have at least the following microcode levels: `ess800mincodelevel = 2.4.3.56`, `essf20mincodelevel = 2.3.3.89`. Tivoli Storage Productivity Center does not

report FlashCopy information if the TotalStorage Enterprise Storage Server systems do not meet this requirement.

#### **Correlated Volume Space (LUN Capacity Visible to Data Manager)**

Total amount of storage system volume space or virtual storage volume space on systems where the systems disks are identified by Tivoli Storage Productivity Center as residing within the monitored storage systems in a group. This includes storage system volumes or virtual storage volumes identified as back-end storage volumes on monitored storage system virtualizers. Tivoli Storage Productivity Center does not include the following entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that are assigned to a monitored storage system but are not identified by Tivoli Storage Productivity Center as a disk residing within the storage system. Reasons why these disks are not identified as residing within the storage system include:
  - Tivoli Storage Productivity Center does not support the identification of disks for some storage system types.
  - The connection of the disk to the storage system is lost and is no longer detectable during a probe.
- Storage system volumes or virtual storage volumes that are identified as Business Continuance Volume extended (BCVx).
- Storage system volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database.

#### **Volume Space Not Correlated (LUN Capacity Not Visible to Data Manager)**

Total amount of unique storage system volume space and virtual storage volume space discovered on monitored storage system arrays in a group that can be assigned or are assigned to systems within the network. Tivoli Storage Productivity Center does not include the following entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that reside within a monitored storage system.
- Storage system volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage system virtualizers.

#### **Unavailable Disk Space (Overhead)**

Amount of storage system volume or virtual storage volume space that is dedicated to redundancy. This value is dependent on the storage system SMI-S provider returning a valid RAID value that can be used to determine the overhead. If the value is zero for a storage system, the overhead cannot be calculated. Tivoli Storage Productivity Center does not include the storage system volumes or virtual storage volumes that become missing after a probe in its calculation of the value for this column.

#### **Formatted Space (Capacity)**

Total amount of formatted storage space associated with the storage system that is used or can be used for system storage volumes or virtual storage volumes. This value is dependent on the storage system SMI-S provider returning a formatted value.

For some storage systems, this value is the total managed space which includes space that cannot be used for storage volumes or virtual storage

volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the total size of the managed disk groups created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

**Formatted Space with No Volumes (Formatted Space with No Volumes)**

Total amount of formatted storage space associated with the storage system that can be used for system storage volumes or virtual storage volumes. This value is dependent on the storage system SMI-S provider returning a formatted value.

For some systems, this value represents the remaining managed space that includes space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the space within the managed disk groups that does not include the size of the virtual disks created and the corresponding virtual disk extent overhead.

**Overall Unavailable Disk Space (Total Overhead)**

(TotalStorage Enterprise Storage Server, DS6000, DS8000, and SAN Volume Controller storage systems only.) Total amount of unformatted space within disk groups or array sites.

**Unformatted Disk Space (Undefined Disk Group or Array Site Capacity)**

This value does not apply to all storage systems. For TotalStorage Enterprise Storage Server, DS6000, DS8000 storage systems, this value is the total raw disk space of any unformatted disk groups or array sites. For IBM XIV Storage System, this value is the total available physical (hard) space that remains for pool creation. For other storage systems, this value is the total disk space that is not within a storage pool or N/A if the value is not applicable for the storage system.

**Cache** Amount of RAM or other cache for a storage system.

**Note:** This column is blank for SAN Volume Controllers.

**Manufacturer**

Manufacturer of a storage system.

**Model** Model number/name of a storage system.

**Serial Number**

Serial number of a storage system.

**Firmware Revision**

Microcode level of a storage system.

**Assigned Volume Space (Subsystem Assigned LUN Capacity)**

Total storage system volume space within the storage system that is mapped or assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes that are not mapped or are not assigned to host systems.

**Unassigned Volume Space (Subsystem Unassigned LUN Capacity)**

Total storage system volume space within a storage system that is not mapped or not assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes that are mapped or assigned to host systems.

**Unassigned and Available Formatted Space (Subsystem Total Formatted Free Space)**

Total storage system space that is not mapped or not assigned to host systems and the total amount of formatted storage space associated with the storage system that can be used for system storage volumes.

This total amount of formatted storage space is dependent on the storage system SMI-S provider returning a formatted value. For some systems, this value represents the remaining managed space that might include space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a probe.
- Storage system volumes that are mapped or assigned to host systems.

**zOS Volume Space (LUN Capacity)**

Total storage system space that is reserved for use on mainframe storage such as used by zOS. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on open system server or non-mainframe storage.

**Open System Volume Space (LUN Capacity)**

Total storage system space that is reserved for use on open system storage such as used by operating systems like Linux, AIX, HP/UX, Solaris, and Windows. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on mainframe storage.

**Last Probed Timestamp**

Date and time when a storage system was last probed by the subordinate or master server.

**Physical Disk Space (Capacity)**

Total amount of physical disk space discovered on the monitored storage system arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

### **Backend Volume Space (LUN Capacity)**

Total amount of storage system volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on a monitored storage system virtualizer (for example, SAN Volume Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are back-end disks on a storage system virtualizer that is not monitored.

### **By TPC Server**

#### **TPC Server**

Name of a subordinate server that is monitoring storage systems in your environment.

#### **Number of Subsystems (Total)**

Number of storage systems monitored by the subordinate server.

#### **Disk Space (Total Disk Capacity)**

Total raw (unformatted) disk capacity of the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Capacity of spare disks identified on TotalStorage Enterprise Storage Server, DS8000, and DS6000 storage systems.
- Capacity of storage system disks that become missing after a storage system probe.

**Note:** For Hitachi Data Systems storage systems, this value is the capacity of all the Volumes in the storage system.

#### **Available Disk Space (Total Disk Unallocated Space)**

Total unformatted disk free space of the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following storage space in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- RAID overhead on storage systems that are identified by Tivoli Storage Productivity Center.
- External back-end storage for TagmaStore systems.
- Storage space that is consumed by volumes that reside on external disks when Hitachi Data Systems (HDS) storage systems are configured as storage virtualizers.

**Note:** For Hitachi Data Systems storage systems, internal disk information is not available. This field is set to 0.

#### **Number of Disks (Total)**

Total number of disks in the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include disks that become missing after a successful storage system probe in its calculation of the value for this column. For Hitachi Data Systems storage systems, internal disk information is not available. This field is set to 1.

**Number of Volumes (Total Number of LUNs)**

Total number of storage volumes and virtual storage volumes discovered by the subordinate server. Tivoli Storage Productivity Center does not include storage volumes or virtual storage volumes that become missing after a successful probe in its calculation of the value for this column.

**Volume Space (Total LUN Capacity)**

Total amount of unique storage system volume space or virtual storage volume space discovered on storage system arrays that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include storage volumes or virtual storage volumes that become missing after a successful probe in its calculation of the value for this column.

**Note:** For space-efficient volumes, this value is the amount of storage space requested for these volumes, not the actual allocated amount. This can result in discrepancies in the overall storage space reported for a storage system using space-efficient volumes. This also applies to other space calculations, such as the calculations for the storage system's Consumable (Available) Volume Space and FlashCopy Target Volume Space.

**Consumable Volume Space (Total Usable LUN Capacity)**

Total amount of unique storage system volume space or virtual storage volume space discovered on storage system arrays that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following storage entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe
- Storage system volumes or virtual storage volumes that are used as flash copy targets.
- Storage system volumes or virtual storage volumes that are identified as a Business Continuance Volume extended (BCVx) (EMC only).
- Storage system volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database (EMC only).

**FlashCopy Target Volume Space (Total FlashCopy Target Capacity)**

Total amount of unique storage system volume space and virtual storage volume space discovered on storage system arrays that are monitored by the subordinate server and have been identified as flash copy target space. Tivoli Storage Productivity Center does not include the following storage entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes or virtual storage volumes that are not used as flash copy targets.

**Note:** TotalStorage Enterprise Storage Server systems must have at least the following microcode levels: `ess800mincodelevel = 2.4.3.56`, `essf20mincodelevel = 2.3.3.89`. Tivoli Storage Productivity Center does not report FlashCopy information if the TotalStorage Enterprise Storage Server systems do not meet this requirement.

**Unavailable Disk Space (Overhead)**

Amount of storage system volume or virtual storage volume space that is dedicated to redundancy and is monitored by the subordinate server. This value is dependent on the storage system SMI-S provider returning a valid

RAID value that can be used to determine the overhead. If the value is zero for a storage system, the overhead cannot be calculated. Tivoli Storage Productivity Center does not include the storage system volumes or virtual storage volumes that become missing after a probe in its calculation of the value for this column.

#### **Correlated Volume Space (Total LUN Capacity Visible to Data Manager)**

Total amount of storage system volume space or virtual storage volume space on systems where the systems disks are identified by Tivoli Storage Productivity Center as residing within the storage systems that are monitored by the subordinate server. This includes storage system volumes or virtual storage volumes identified as back-end storage volumes on monitored storage system virtualizers.

The value in this column reflects the systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that are assigned to a monitored storage system but are not identified by Tivoli Storage Productivity Center as a disk residing within the storage system. Reasons why these disks are not identified as residing within the storage system include:
  - Tivoli Storage Productivity Center does not support the identification of disks for some storage system types.
  - The connection of the disk to the storage system is lost and is no longer detectable during a probe.
- Storage system volumes or virtual storage volumes that are identified as Business Continuance Volume extended (BCVx).
- Storage system volumes or virtual storage volumes used as a Volume Configuration Management (VCM) database.

#### **Volume Space Not Correlated (Total LUN Capacity Not Visible to Data Manager)**

Total amount of unique storage system volume space and virtual storage volume space discovered on monitored storage system arrays that can be assigned or are assigned to servers within the network. The value in this column reflects the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following entities in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Disks that reside within a monitored storage system.
- Storage system volumes or virtual storage volumes that Tivoli Storage Productivity Center identifies as back-end storage volumes on monitored storage system virtualizers.

#### **Overall Unavailable Disk Space (Total Formatted Capacity)**

Total amount of formatted storage space that is used or can be used for system storage volumes or virtual storage volumes. The value in this column reflects the storage systems that are monitored by the subordinate server. This value is dependent on the storage system SMI-S provider returning a formatted value.

For some storage systems, this value is the total managed space which includes space that cannot be used for storage volumes or virtual storage

volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

**Note:** This value does not apply to SAN Volume Controller.

**Formatted Space (Total Formatted Space with No Volumes)**

Total amount of formatted storage space that can be used for system storage volumes or virtual storage volumes. The value in this column reflects the storage systems that are monitored by the subordinate server. This value is dependent on the storage system SMI-S provider returning a formatted value.

For some systems, this value represents the remaining managed space that includes space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the total size of the managed disk groups created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

**Formatted Space with No Volumes (Total Subsystem Total Formatted Free Space)**

Total storage system space that is not mapped or not assigned to host systems and the total amount of formatted storage space associated with the storage system that can be used for system storage volumes. The value in this column reflects the storage systems that are monitored by the subordinate server.

This total amount of formatted storage space is dependent on the storage system SMI-S provider returning a formatted value. For some systems, this value represents the remaining managed space that might include space that cannot be used for storage volumes or virtual storage volumes. This can occur due to a number of reasons, such as space not being formatted until storage volumes are created.

For SAN Volume Controller, this value represents the space within the managed disk groups that does not include the size of the virtual disks created and the corresponding virtual disk extent overhead.

Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a probe.
- Storage system volumes that are mapped or assigned to host systems.

**Capacity Overhead (Total)**

(TotalStorage Enterprise Storage Server and SAN Volume Controller only.)  
Sum of all the space in a disk group minus the formatted capacity of the storage systems monitored by a subordinate server.

**Unformatted Disk Space (Total Undefined Disk Group or Array Site Capacity)**

This value does not apply to all storage systems. For TotalStorage Enterprise Storage Server, DS6000, DS8000 storage systems, this value is the total raw disk space of any unformatted disk groups or array sites that are monitored by the subordinate server. For the XIV system, this value is the total available physical (hard) space that remains for pool creation. For other storage systems, this value is the total disk space that is not within a storage pool or **N/A** if the value is not applicable for the storage system.

**Cache (Total)**

Amount of RAM or other cache for the storage systems that are monitored by the subordinate server.

**Assigned Volume Space**

Total storage system volume space within the storage system that is mapped or assigned to host systems. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes that are not mapped or are not assigned to host systems.

**Unassigned Volume Space (Total Subsystem Assigned LUN Capacity)**

Total storage system volume space within storage systems that is mapped or assigned to host systems. The value in this column reflects the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes that are not mapped or are not assigned to host systems.

**Unassigned and Available Formatted Disk Space (Total Subsystem Unassigned LUN Capacity)**

Total storage system volume space within storage systems that is not mapped or not assigned to host systems. The value in this column reflects the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a probe.
- Storage system volumes that are mapped or assigned to host systems.

**zOS Volume Space (Total zOS LUN Capacity)**

Total storage system space that is reserved for use on mainframe storage such as used by zOS. The value in this column reflects the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a storage system probe.
- Storage system volumes that are reserved for use on open system server or non-mainframe storage.

**Open System Volume Space (Total Open System LUN Capacity)**

Total storage system space that is reserved for use on open system storage such as used by operating systems like Linux, AIX, HP/UX, Solaris, and Windows. The value in this column reflects the storage systems that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes that become missing after a storage system probe.

- Storage system volumes that are reserved for use on mainframe storage.

### **Physical Disk Space (Capacity)**

Total amount of physical disk space discovered on the storage system arrays that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

### **Backend Volume Space (LUN Capacity)**

Total amount of storage system volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on a monitored storage system virtualizer (for example, SAN Volume Controller). The value in this column reflects the volumes that are monitored by the subordinate server. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are back-end disks on a storage system virtualizer that is not monitored.

## **Rollup Reports - Asset - Disk/Volume Groups**

Use this report to view information about the disk and volume groups that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- **By Computer:** Shows disk and volume groups aggregated at the computer level and sorted by computer name.
- **By Disk/Volume Group Space:** Shows disk and volume groups aggregated at the computer level and sorted by storage capacity.
- **By Available Disk/Volume Group Space:** Shows disk and volume groups aggregated at the computer level and sorted by storage free space.
- **By TPC Server:** Shows disk and volume groups aggregated at the subordinate server level and sorted by subordinate server name. Click the magnifying glass icon next to the name of a subordinate server to view information about the computers it monitors.

**Note:** The first column in each report remains displayed when scrolling through the other columns on the report.

### **By Computer**

**Note:** The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

#### **Computer Name**

Name of a computer with disk and volume groups that is monitored by a subordinate server.

**Number of Disk/Volume Groups (Volume Groups)**

Number of volume groups on a computer.

**Disk/Volume Group Space (Total Capacity)**

Total storage capacity of the disks and volume groups on a computer.

**Available Disk/Volume Group Space (Total Free Space)**

Amount of storage space available on the disk and volume groups that are monitored by a subordinate server.

**OS Type**

Operating system running on a computer.

**Number of Disks**

Number of disks on a computer.

**Last Probe Time**

Date and time when a computer was last probed.

**By Disk/Volume Group Space (Freespace)****Computer Name**

Name of a computer with disk and volume groups that are monitored by a subordinate server.

**Disk/Volume Group Space (Total Free Space)**

Amount of storage space available on the disks and volume groups associated with a computer.

**Number of Disk/Volume Groups (Number of Volume Groups)**

Number of volume groups on a computer.

**Available Disk/Volume Group Space (Total Capacity)**

Total storage capacity of the disks and volume groups on a computer.

**OS Type**

Operating system running on a computer.

**Number of Disks**

Number of disks on a computer.

**Last Probe Time**

Date and time when a computer was last probed.

**By Available Disk/Volume Group Space (Capacity)****Computer Name**

Name of a computer with disk and volume groups that is monitored by a subordinate server.

**Available Disk/Volume Group Space (Total Capacity)**

Total storage capacity of the disks and volume groups on a computer.

**Number of Disk/Volume Groups (Volume Groups)**

Number of volume groups on a computer.

**Disk/Volume Group Space (Total Free Space)**

Amount of storage space available on the disks and volume groups associated with a computer.

**OS Type**

Operating system running on a computer.

**Number of Disks**

Number of disks on a computer.

**Last Probe Time**

Date and time when a computer was last probed.

**By TPC Server****TPC Server**

Name of a subordinate server that is monitoring computers with disk and volume groups.

**Number of Disk/Volume Groups**

Number of disk and volume groups that are monitored by a subordinate server.

**Disk/Volume Group Space (Total Free Space)**

Amount of storage space available on the disks and volume groups that are monitored by a subordinate server.

**Available Disk/Volume Group Space (Total Capacity)**

Total storage capacity of the disks and volume groups that are monitored by a subordinate server.

**Rollup Reports - Asset - Disks**

Use this report to view information about the disks that are monitored by subordinate servers in your environment.

You can generate and sort the data within Disk reports using the following by clauses:

- **By Available Disk Space (Computers):** Shows disks aggregated at the computer level and sorted by unallocated space. The names of computers and their system type appear in the first two columns and remain displayed when scrolling through the other columns on the report.
- **By Available Disk Space (Subsystems):** Shows disks aggregated at the storage subsystem level and sorted by unallocated space. The names of storage subsystems and their system type appear in the first two columns and remain displayed when scrolling through the other columns on the report.
- **By TPC Server (computers):** Shows computer disks aggregated at the subordinate server level. The names of subordinate servers appear in the first column and remain displayed when scrolling through the other columns on the report. Click the magnifying glass icon next to a subordinate server name to view more information about the computers monitored by that subordinate server.
- **By TPC Server (subsystems):** Shows storage subsystem disks aggregated at the subordinate server level. The names of subordinate servers appear in the first column and remain displayed when scrolling through the other columns on the report. Click the magnifying glass icon next to a subordinate server name to view more information about the storage subsystems monitored by that subordinate server.

**Note:** The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

**By Available Disk Space (Computers)****TOTAL**

Shows the system-wide totals for each of the columns in the report.

**System Name**

Name of a computer with disks that are monitored by a subordinate server.

**OS Type**

Operating system running on a computer.

**Available Disk Space (Total Unallocated Space)**

Amount of storage space on disks that is not allocated to any logical volume. Note: the value that appears in the TOTAL row for this column includes the unallocated capacity of all disks within the computers monitored by subordinate servers.

**Disk Space (Total Capacity)**

Amount of storage space available on the disks associated with a computer.

**Number of Disks**

Number of disks on a computer.

**By Available Disk Space (Subsystems)****System Name**

Name of a storage subsystem with disks that are monitored by a subordinate server.

**Subsystem Type**

Operating system running on a storage subsystem.

**Available Disk Space (Total Unallocated Space)**

Amount of space on the disk that is not allocated to any volumes for disks within storage subsystems). Note: the value that appears in the TOTAL row for this column includes the unallocated capacity of all disks within the storage subsystem, including the capacity of spare disks.

**Disk Space (Total Capacity)**

Amount of storage space available on the disks associated with a storage subsystem.

**Note:** For space-efficient volumes, this value is the amount of storage space requested for these volumes, not the actual allocated amount. This can result in discrepancies in the overall storage space reported for a storage system using space-efficient volumes. This also applies to other space calculations, such as the calculations for the storage system's Consumable (Available) Volume Space and FlashCopy Target Volume Space.

**Number of Disks**

Total number of disks in a storage subsystem.

**Physical Disk Space**

Total amount of physical disk space discovered on the monitored storage subsystem arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage subsystem disks that become missing after a storage subsystem probe.
- Back-end storage volumes on monitored storage subsystem virtualizers (for example, IBM SAN Volume Controller) that are attached from a storage subsystem.

## By TPC Server (Computers)

### TOTAL

Shows the system-wide totals for each of the columns in the report.

### TPC Server

Name of a subordinate server that is monitoring disks on computers.

### Available Disk Space (Total Unallocated Space)

Amount of storage space on computer disks that is not allocated to any logical volume and are monitored by a subordinate server.

### Disk Space (Total Capacity)

Amount of storage space available on all the computer disks that are monitored by a subordinate server.

**Note:** For space-efficient volumes, this value is the amount of storage space requested for these volumes, not the actual allocated amount. This can result in discrepancies in the overall storage space reported for a storage system using space-efficient volumes. This also applies to other space calculations, such as the calculations for the storage system's Consumable (Available) Volume Space and FlashCopy Target Volume Space.

### Number of Disks

Number of computer disks monitored by a subordinate server.

## By TPC Server (Subsystems)

### TPC Server

Name of a subordinate server that is monitoring disks on storage subsystems.

### Available Disk Space (Total Unallocated Space)

Amount of storage space on storage subsystem disks that is not allocated to any volume and are monitored by a subordinate server.

### Disk Space (Total Capacity)

Amount of storage space available on all the storage subsystem disks that are monitored by a subordinate server.

### Number of Disks

Number of storage subsystem disks monitored by a subordinate server.

### Physical Disk Space

Total amount of physical disk space discovered on the monitored storage subsystem arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage subsystem disks that become missing after a storage subsystem probe.
- Back-end storage volumes on monitored storage subsystem virtualizers (for example, IBM SAN Volume Controller) that are attached from a storage subsystem.

## Rollup Reports - Asset - File Systems or Logical Volumes

Use this report to view information about the filesystems or logical volumes that are monitored by subordinate servers in your environment.

You can generate and sort the data within File Systems or Logical Volumes reports using the following by clauses:

- By Available File System or Logical Volume Space: Shows filesystems aggregated at the computer level and sorted by free space and computer name.
- By TPC Server: Shows filesystems aggregated at the subordinate server level and sorted by subordinate server name. Click the magnifying glass icon next to a subordinate server name to view more information about the filesystems or logical volumes monitored by that subordinate server.

**Note:** The first column in each report remains displayed when scrolling through the other columns on the report.

**Note:** The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

## **By Available File System or Logical Volume Space**

### **Computer Name**

Name of a computer with filesystems or logical volumes that are monitored by a subordinate server.

### **Available File System/Logical Volume Space (Free Space)**

Amount of storage space available in the filesystems or logical volumes on a computer.

### **Consumed File System/Logical Volume Space (Used Space)**

Amount of storage space consumed by the filesystems or logical volumes on a computer.

### **File System/Logical Volume Space (Capacity)**

Total storage capacity of the filesystems or logical volumes on a computer.

### **OS Type**

Operating system running on a computer.

### **Number of File Systems/Logical Volumes (Number of FSs/LVs)**

Number of filesystems or logical volumes on a computer.

## **By TPC Server**

### **TPC Server**

Name of a subordinate server that is monitoring the filesystems and logical volumes in your environment.

### **Available File System/Logical Volume Space (Total Free Space)**

Amount of storage space available in all the filesystems or logical volumes on the computers monitored by the subordinate server.

### **Consumed File System/Logical Volume Space (Total Used Space)**

Amount of storage space consumed by all the filesystems or logical volumes on the computers monitored by the subordinate server.

### **File System/Logical Volume Space (Total Capacity)**

Total storage capacity of all the filesystems or logical volumes on the computers monitored by the subordinate server.

### **Number of File Systems/Logical Volumes (Number of FSs/LVs)**

Number of filesystems or logical volumes on the computers monitored by the subordinate server.

## Rollup Reports - Asset - Storage Subsystem Volumes

Use this report to view information about the Storage Subsystem Volumes that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Storage Subsystem: Shows Storage Subsystem Volume capacity and count aggregated at the storage subsystem level.
- By Storage Subsystem Volume Space: Shows Storage Subsystem Volume capacity and count aggregated at the subsystem level. Sorted according to the storage capacity of Storage Subsystem Volumes.
- By TPC Server: Shows Storage Subsystem Volume capacity and count aggregated at the subordinate server level. Sorted by subordinate server name. Click the magnifying glass icon next to a subordinate server to view information about the storage subsystems it monitors.

**Note:** The first column in each report remains displayed when scrolling through the other columns on the report.

**Note:** The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

### By Storage Subsystem

#### Storage Subsystem Name

Name of a storage subsystem containing Storage Subsystem Volumes that is monitored by a subordinate server.

#### Storage Subsystem Type

Type of storage subsystem, such as the IBM SAN Volume Controller.

#### Volume Space (LUN Capacity)

Total storage capacity of the Storage Subsystem Volumes in a storage subsystem.

#### Consumable Volume Space (Usable LUN Capacity)

Storage capacity of Storage Subsystem Volumes in the created disk array (not including BCVs, VCM database, and Replication targets).

#### Correlated Volume Space (LUN Capacity Visible to Data Manager)

Sum of the capacity of all monitored Storage Subsystem Volumes visible to a monitored host computer and the capacity of all monitored Storage Subsystem Volumes that are back-end disks on a monitored Storage Subsystem Virtualizer.

#### Formatted Space (Formatted Capacity)

(IBM TotalStorage Enterprise Storage Server, IBM FAStT, HP StorageWorks, and Hitachi Data Systems only) Total amount of formatted storage space in the storage pools associated with a storage subsystem. For example, a RAID volume space has more capacity than a stripe-mirror volume space.

For SAN Volume Controller, this value represents the total size of the managed disk groups created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

**Assigned Volume Space (Subsystem Assigned LUN Capacity)**

Total storage capacity of all Storage Subsystem Volumes that the storage subsystem knows are assigned to a host computer.

**zOS Volume Space (zOS LUN Capacity)**

Total storage capacity for all the Storage Subsystem Volumes allocated to zOS. Data for this column is calculated for TotalStorage Enterprise Storage Server only. The value for this column is set to N/A for other storage subsystems.

**Number of Volumes (Number of LUNs)**

Number of Storage Subsystem Volumes associated with a storage subsystem.

**Backend Volume Space**

Total amount of storage subsystem volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on a monitored storage subsystem virtualizer (for example, SAN Volume Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage subsystem volumes or virtual storage volumes that become missing after a storage subsystem probe.
- Storage subsystem volumes or virtual storage volumes that are back-end disks on a storage subsystem virtualizer that is not monitored.

**By Storage Subsystem Volume Space****Volume Space (LUN Capacity)**

Total storage capacity of the Storage Subsystem Volumes in a storage subsystem.

**Consumable Volume Space (Usable LUN Capacity)**

Storage capacity of Storage Subsystem Volumes in the created disk array (not including BCVs, VCM database, and Replication targets).

**Correlated Volume Space (LUN Capacity Visible to Data Manager)**

Sum of the capacity of all monitored Storage Subsystem Volumes visible to a monitored host computer and the capacity of all monitored Storage Subsystem Volumes that are back-end disks on a monitored Storage Subsystem Virtualizer.

**Formatted Space (Formatted Capacity)**

(IBM TotalStorage Enterprise Storage Server, IBM FAStT, HP StorageWorks, and Hitachi Data Systems only) Total amount of formatted storage space in the storage pools associated with a storage subsystem. For example, a RAID volume space has more capacity than a stripe-mirror volume space.

For SAN Volume Controller, this value represents the total size of the managed disk groups created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

**Assigned Volume Space (Subsystem Assigned LUN Capacity)**

Total storage capacity of all Storage Subsystem Volumes that the storage subsystem knows are assigned to a host computer.

**zOS Volume Space (zOS LUN Capacity)**

Total storage capacity for all the storage subsystem volumes allocated to zOS. Data for this column is calculated for TotalStorage Enterprise Storage

Server and SAN Volume Controller and SAN Volume Controller only. The value for this column is set to N/A for other storage subsystems.

**Number of Volumes (Number of LUNs)**

Number of storage subsystem volumes associated with a storage subsystem.

**Storage Subsystem Name**

Name of a storage subsystem containing storage subsystem volumes that is monitored by a subordinate server.

**Storage Subsystem Type**

Type of storage subsystem, such as the IBM SAN Volume Controller.

**Backend Volume Space**

Total amount of storage subsystem volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the backend disk space on a monitored storage subsystem virtualizer (for example, SAN Volume Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage subsystem volumes or virtual storage volumes that become missing after a storage subsystem probe.
- Storage subsystem volumes or virtual storage volumes that are backend disks on a storage subsystem virtualizer that is not monitored.

**By TPC Server**

**TPC Server**

Name of a subordinate server that is monitoring storage subsystems.

**Storage Subsystem Count**

Number of storage subsystems that are monitored by a subordinate server.

**Volume Space (LUN Capacity)**

Total storage capacity of the Storage Subsystem Volumes that are monitored by a subordinate server.

**Consumable Volume Space (Usable LUN Capacity)**

Storage capacity of Storage Subsystem Volumes in the created disk array (not including BCVs, VCM database, and Replication targets) that are monitored by a subordinate server.

**Correlated Volume Space (LUN Capacity Visible to Data Manager)**

Sum of the capacity of all monitored Storage Subsystem Volumes visible to a monitored host computer and the capacity of all monitored Storage Subsystem Volumes that are back-end disks on a monitored Storage Subsystem Virtualizer associated with a subordinate server.

**Formatted Space (Formatted Capacity)**

(IBM TotalStorage Enterprise Storage Server, IBM FAStT, HP StorageWorks, and Hitachi Data Systems only) Total amount of formatted storage space in the storage pools associated with the storage subsystems that are monitored by a subordinate server. For example, a RAID volume space has more capacity than a stripe-mirror volume space.

For SAN Volume Controller, this value represents the total size of the managed disk groups created on the SAN Volume Controller. This value does not include managed disk space that is not defined to a managed disk group.

**Assigned Volume Space (Subsystem Assigned LUN Capacity)**

Total storage capacity of all Storage Subsystem Volumes that the monitored storage subsystems know are assigned to a host computer.

**zOS Volume Space (zOS LUN Capacity)**

Total storage capacity for all the Storage Subsystem Volumes allocated to zOS that are monitored by a subordinate server. Data for this column is calculated for TotalStorage Enterprise Storage Server and SAN Volume Controller only. The value for this column is set to N/A for other storage subsystems.

**Number of Volumes (Number of LUNs)**

Number of Storage Subsystem Volumes associated with the storage subsystems monitored by a subordinate server.

**Backend Volume Space**

Total amount of storage subsystem volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the backend disk space on a monitored storage subsystem virtualizer (for example, SAN Volume Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage subsystem volumes or virtual storage volumes that become missing after a storage subsystem probe.
- Storage subsystem volumes or virtual storage volumes that are backend disks on a storage subsystem virtualizer that is not monitored.

**Rollup Reports - Asset - Fabrics**

Use this report to view information about the fabrics that are monitored by subordinate servers in your environment.

You can view the following reports about fabrics:

- SAN Assets (ALL): Use this report to view information about all the SAN assets for each subordinate server.
- SAN Assets (Connected Dev): Use this report to view information about all the connected devices for each subordinate server.
- SAN Assets (Switches): Use this report to view information about switches in your SAN for each subordinate server.

**SAN Assets (ALL)****TPC Server**

Name of a subordinate server that is monitoring fabrics.

**Fabric ID**

The ID of the fabric that the asset is in.

**Type** The type of asset discovered. For example: switch, host, host bus adapter, storage subsystem.

**Label** The label of the asset. For example: the host name, switch name, storage subsystem name, node name of the port.

**Identifier**

The unique identifier of the switch. For example, the switch WWN.

**Status** The status of the asset: Normal, Warning, or Critical.

## **SAN Assets (Connected Dev)**

### **TPC Server**

Name of a subordinate server that is monitoring a connected device.

### **Fabric ID**

The ID of the fabric that the asset is in.

**Type** The type of asset discovered. For example: switch, host, host bus adapter, storage subsystem.

**Label** The label of the asset. For example: the host name, switch name, storage subsystem name, node name of the port.

### **Identifier**

The unique identifier of the switch. For example, the switch WWN.

**Status** The status of the asset: Normal, Warning, or Critical.

## **SAN Assets (Switches)**

### **TPC Server**

Name of a subordinate server that is monitoring a switch.

### **Fabric ID**

The ID of the fabric that a switch is in.

**Type** The type of switch discovered.

### **Switch Type**

The switch type, such as physical.

**Label** The label of a switch.

**Status** The status of a switch: Normal, Warning, or Critical.

### **IP Address**

The IP address of a switch.

### **Vendor ID**

The manufacturer of the switch.

**Model** The model name and number of a switch.

### **Version**

The version information of the switch.

### **Serial Number**

The serial number of the switch.

### **Object ID**

The object ID of the switch.

### **Management ID**

The management ID of the switch.

### **Management Address**

The URL of the switch element manager.

### **Domain**

The name of the domain that the switch is in.

### **Contact**

The contact information for the switch.

**WWN** The world-wide name (WWN) of the switch.

**Location**

The physical location of the switch.

**Physical Switch WWN**

The WWN for the parent or physical switch of a virtual switch. If this is not a virtual switch then this column is empty.

**Rollup Reports - Asset - Hypervisors**

Use this report to view information about the hypervisors that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clause:

- By Hypervisor: Sorted according to hypervisor name. The names of hypervisors monitored by subordinate servers appear in the first column and remain displayed when scrolling through the other columns on the report.

**By Hypervisors****Hypervisor Name**

Name of a hypervisor monitored by a subordinate server.

**OS Version**

Version of the operating system running on a computer.

**RAM** The amount of RAM installed on a computer.

**Disk Space**

Total raw (unformatted) disk capacity of a storage subsystem. Tivoli Storage Productivity Center does not include the following capacity information in its calculation of the value for this column:

- Capacity of spare disks identified on IBM TotalStorage Enterprise Storage Server, IBM DS8000, and IBM DS6000 storage subsystems.
- Capacity of storage subsystem disks that become missing after a storage subsystem probe.

**Note:** For Hitachi Data Systems storage subsystems, this is the capacity of all the Volumes in the storage subsystem.

**Number of Disks**

Total number of disks for a computer. Tivoli Storage Productivity Center does not include the following disks in its calculation of the value in this column:

- Computer disks on a computer that has not been probed by a Storage Resource agent or Data agent.
- Computer disks that become missing after a probe. Disks can become undetectable for a number of reasons, including a physical removal of the disks from a computer.

**Processor Count**

Number of CPUs running on a computer.

**IP Address**

IP address of a computer.

**Serial Number**

Serial number of a computer.

**Model** Model number or name of a computer.

**Manufacturer**

Manufacturer of a computer (for example, IBM).

**Time Zone**

Time zone where the computer is located.

**Available File System Space**

Total amount unique file system storage space that is not used or available to the computer. Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

**OS Type**

Operating system running on a computer.

**Network**

Network name of a computer.

**Processor Type**

Type of processor running on a computer (for example, GenuineIntel: x86 Family 15).

**Processor Speed**

Speed at which a computer's processor is running (in MHz).

**CPU Architecture**

Architecture of the processor (for example, IA32).

**Swap Space**

Amount of swap space (virtual memory) defined on a computer.

## Rollup Reports - Database Asset

Use these reports to view detailed statistics that have been collected by subordinate servers about the RDBMSs in your environment, including Oracle, SQL Server, Sybase, and UDB/DB2.

The information shown in these reports is gathered by the master server when it runs Tivoli Storage Productivity Center server probes against associated subordinate servers. If the same storage entity is managed by multiple subordinate servers, rollup reports reflect the storage information from the subordinate server that most recently probed that entity.

### Rollup Reports - Database Asset - All DBMSs

Use this report to view information about the RDBMSs (including Oracle, Sybase, SQL Server, and UDB/DB2) that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Instance: Shows databases for each computer sorted by computer name.
- By Version: Shows databases for each computer sorted by RDBMS version.
- By DBMS Type: Shows databases for each computer sorted by RDBMS type.
- By TPC Server: Shows databases aggregated at the subordinate server level and sorted by subordinate server name.

**Note:** The first column in each report remains displayed when scrolling through the other columns on the report.

**Note:** The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

## **By Instance**

### **Computer Name**

Name of the computer on which an Instance resides.

### **Instance**

Name of an instance.

### **RDBMS Type**

RDBMS to which an instance belongs (e.g., Oracle, SQL Server, Sybase, UDB, etc.).

### **RDBMS Version**

Version of the RDBMS under which an instance is running.

**Port** Port on which an instance listens for requests.

### **Home Directory**

Path of the home directory for an instance.

### **Logonid**

ID used by Tivoli Storage Productivity Center to log in to an instance.

### **Probe Status**

Status of the last probe run against an instance.

### **Last Start Time**

Date and time when an instance was last started.

### **Last Probe Time**

Date and time when an instance was last probed.

### **Tablespace count**

Number of tablespaces associated with an instance.

### **File Count**

Number of data files associated with an instance.

### **Log File Count**

Number of log files associated with an instance.

### **File Free Space**

Amount of storage free space available on the data files associated with an instance.

### **Total Size**

Amount of storage space allocated to an instance.

### **File Capacity**

Amount of storage space allocated to the data files associated with an instance.

## **By Version**

### **RDBMS Version**

Version of the RDBMS under which an instance is running.

**Computer Name**

Name of the computer on which an instance resides.

**Instance**

Name of an instance.

**RDBMS Type**

RDBMS to which an instance belongs (e.g., Oracle, SQL Server, Sybase, UDB, etc.).

**Port** Port on which an instance listens for requests.

**Home Directory**

Path of the home directory for an instance.

**Logonid**

ID used by Tivoli Storage Productivity Center to log in to an instance.

**Probe Status**

Status of the last probe run against an instance.

**Last Start Time**

Date and time when an instance was last started.

**Last Probe Time**

Date and time when an instance was last probed.

**Tablespace Count**

Number of tablespaces associated with an instance.

**File Count**

Number of data files associated with an instance.

**Log File Count**

Number of log files associated with an instance.

**File Free Space**

Amount of storage free space available on the data files associated with an instance.

**Total Size**

Amount of storage space allocated to an instance.

**File Capacity**

Amount of storage space allocated to the data files associated with an instance.

**By DBMS Type****RDBMS Type**

RDBMS to which an instance belongs (e.g., Oracle, SQL Server, Sybase, UDB, etc.).

**Computer Name**

Name of the computer on which an instance resides.

**Instance**

Name of an instance.

**RDBMS Version**

Version of the RDBMS under which an instance is running.

**Port** Port on which an instance listens for requests.

**Home Directory**

Path of the home directory for an instance.

**Logonid**

ID used by Tivoli Storage Productivity Center to log in to an instance.

**Probe Status**

Status of the last probe run against an instance.

**Last Start Time**

Date and time when an instance was last started.

**Last Probe Time**

Date and time when an instance was last probed.

**Tablespace count**

Number of tablespaces associated with an instance.

**File Count**

Number of data files associated with an instance.

**Log File Count**

Number of log files associated with an instance.

**File Free Space**

Amount of storage free space available on the data files associated with an instance.

**Total Size**

Amount of storage space allocated to an instance.

**File Capacity**

Amount of storage space allocated to the data files associated with an instance.

**By TPC Server****TPC Server**

Name of a subordinate server that is monitoring DBMSs in your environment.

**Total Number of DBMSs**

Number of DBMSs monitored by a subordinate server.

**Number of UDB Instances**

Number of UDB instances monitored by a subordinate server.

**Number of Oracle Instances**

Number of Oracle instances monitored by a subordinate server.

**Number of SQL/Server Instances**

Number of SQL/Server instances monitored by a subordinate server.

**Number of Sybase Instances**

Number of Sybase instances monitored by a subordinate server.

**Tablespace Count**

Number of tablespaces associated with the instances monitored by a subordinate server.

**File Count**

Number of data files associated with the instances monitored by a subordinate server.

**Log File Count**

Number of log files associated with the instances monitored by a subordinate server.

**File Free Space**

Amount of storage free space available on the data files associated with the instances monitored by a subordinate server.

**Total Size**

Amount of storage space allocated to the instances monitored by a subordinate server.

**Total File Capacity (File Capacity)**

Amount of storage space allocated to the data files associated with the instances monitored by a subordinate server.

**Rollup Reports - Database Asset - Oracle, SQL/Server, Sybase, UDB**

Use this report to view information about Oracle, Sybase, SQL Server, and UDB/DB2 instances that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Instance: Shows databases for each computer sorted by computer name.
- By Version: Shows databases for each computer sorted by the version of the RDBMS under which a database is running.
- By TPC Server: Shows databases aggregated at the subordinate server level and sorted by subordinate server name.

**Note:** The first column in each report remains displayed when scrolling through the other columns on the report.

**By Instance****Computer Name**

Name of the computer on which an Instance resides.

**Instance**

Name of an instance.

**RDBMS Type**

RDBMS to which an instance belongs (e.g., Oracle, SQL Server, Sybase, UDB, etc.).

**RDBMS Version**

Version of the RDBMS under which an instance is running.

**Port** Port on which an instance listens for requests.

**Home Directory**

Path of the home directory for an instance.

**Logonid**

ID used by Tivoli Storage Productivity Center to log in to an instance.

**Probe Status**

Status of the last probe run against an instance.

**Last Start Time**

Date and time when an instance was last started.

**Last Probe Time**

Date and time when an instance was last probed.

**Tablespace count**

Number of tablespaces associated with an instance.

**File Count**

Number of data files associated with an instance.

**Log File Count**

Number of log files associated with an instance.

**File Free Space**

Amount of storage free space available on the data files associated with an instance.

**Total Size**

Amount of storage space allocated to an instance.

**File Capacity**

Amount of storage space allocated to the data files associated with an instance.

**By Version****RDBMS Version**

Version of the RDBMS under which an instance is running.

**Computer Name**

Name of the computer on which an instance resides.

**Instance**

Name of an instance.

**RDBMS Type**

RDBMS to which an instance belongs (e.g., Oracle, SQL Server, Sybase, UDB, etc.).

**Port** Port on which an instance listens for requests.

**Home Directory**

Path of the home directory for an instance.

**Logonid**

ID used by Tivoli Storage Productivity Center to log in to an instance.

**Probe Status**

Status of the last probe run against an instance.

**Last Start Time**

Date and time when an instance was last started.

**Last Probe Time**

Date and time when an instance was last probed.

**Tablespace Count**

Number of tablespaces associated with an instance.

**File Count**

Number of data files associated with an instance.

**Log File Count**

Number of log files associated with an instance.

**File Free Space**

Amount of storage free space available on the data files associated with an instance.

**Total Size**

Amount of storage space allocated to an instance.

**File Capacity**

Amount of storage space allocated to the data files associated with an instance.

**By TPC Server****TPC Server**

Name of a subordinate server that is monitoring DBMSs in your environment.

**Number of Oracle Instances**

Number of Oracle instances monitored by a subordinate server.

**Number of SQL/Server Instances**

Number of SQL/Server instances monitored by a subordinate server.

**Number of Sybase Instances**

Number of Sybase instances monitored by a subordinate server.

**Number of UDB Instances**

Number of UDB instances monitored by a subordinate server.

**Tablespace count**

Number of tablespaces associated with the instances monitored by a subordinate server.

**File Count**

Number of data files associated with the instances monitored by a subordinate server.

**Log File Count**

Number of log files associated with the instances monitored by a subordinate server.

**File Free Space**

Amount of storage free space available on the data files associated with the instances monitored by a subordinate server.

**Total Size**

Amount of storage space allocated to the instances monitored by a subordinate server.

**Total File Capacity**

Amount of storage space allocated to the data files associated with the instances monitored by a subordinate server.

## Rollup Reports - TPC Server Storage Space

Use these reports to view storage metrics related to the disk space, filesystem space, consumed filesystem space, and available filesystem space gathered by the subordinate servers in your environment.

The information shown in these reports is gathered by the master server when it runs "Collecting storage statistics from Tivoli Storage Productivity Center servers" on page 342 against associated subordinate servers. If the same storage entity is managed by multiple subordinate servers, rollup reports reflect the storage information from the subordinate server that most recently probed that entity.

## Rollup Reports - TPC Server Storage Space - Disk Space

Use this report to view disk capacity information about the computers and storage systems that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Storage Subsystem: Shows disk capacity aggregated at the storage system level and sorted by storage system name. Storage systems that have been discovered but not probed are not displayed in this report.
- By Storage Subsystem Group: Shows disks capacity aggregated at the storage system monitoring group and storage system reporting group levels and sorted by group name. Storage systems that have been discovered but not probed are not included in the values shown in this report.
- By Computer: Shows disks capacity aggregated at the computer level and sorted by computer name.
- By Computer Group: Shows disks capacity aggregated at the computer monitoring group and computer reporting group levels and sorted by group name.
- By Cluster: Shows disks capacity aggregated at the cluster level and sorted by cluster name.
- By TPC Server (Computers): Shows computer disk capacity aggregated at the subordinate server level and sorted by subordinate server name.
- By TPC Server (Storage Subsystems): Shows storage system disk capacity aggregated at the subordinate server level and sorted by subordinate server name. Storage systems that have been discovered but not probed are not included in the values shown in this report.

**Note:** The first column in each report remains displayed when scrolling through the other columns on the report.

**Note:** The names of some columns have been changed. For your reference, the original names of those columns appear within parentheses ( ) next to their new names.

### By Storage Subsystem

#### Subsystem Name

Name of a storage system that is monitored by a subordinate server.

#### Subsystem Type

Type of storage system, such as the IBM System Storage SAN Volume Controller.

#### Disk Space (Disk Capacity)

Total raw (unformatted) disk capacity of a storage system.

#### Available Disk Space (Available Capacity)

Amount of storage space available on the disks associated with a storage system. For Hitachi Data Systems storage systems, internal disk information is not available. This field will be 0.

#### Number of Disks

Number of disks associated with a storage system. For Hitachi Data Systems storage systems, internal disk information is not available. This field will be set to 1.

**Number of Volumes (Number of LUNs)**

Number of volumes associated with a storage system.

**Storage Subsystem Volume Space (LUN capacity)**

Amount of storage space allocated to the volumes associated with the storage system.

**Consumable Storage Subsystem Volume Space (Usable LUN Capacity)**

Storage capacity of volumes in the created disk array (not including BCVs, VCM database, and Replication targets).

**Correlated Volume Space (Visible LUN Capacity)**

Capacity of all volumes visible to a Storage Resource agent or Data agent associated with a storage system.

**FlashCopy Target Storage Subsystem Volume Space (FlashCopy Target Capacity)**

The total capacity of all FlashCopy target volumes in the system. Note: TotalStorage Enterprise Storage Server systems must have at least the following microcode levels: `ess800mincodelevel = 2.4.3.56`, `essf20mincodelevel = 2.3.3.89`. Tivoli Storage Productivity Center does not report FlashCopy information if the TotalStorage Enterprise Storage Server systems do not meet this requirement.

**Volume Space Not Correlated (Not Visible LUN Capacity)**

Usable volume capacity minus assigned volume capacity.

**Unavailable Disk Space (Overhead)**

Amount of capacity that is dedicated to redundancy.

**Formatted Disk Space (Formatted Capacity)**

(IBM TotalStorage Enterprise Storage Server, FASTT, HP StorageWorks, and Hitachi Data Systems only.) Total amount of formatted storage space in the storage pools associated with the storage system. For example, a RAID volume space has more capacity than a stripe-mirror volume space.

**Formatted Disk Space with No Volumes (Total Formatted Space with No Volumes)**

(TotalStorage Enterprise Storage Server, FASTT, HP StorageWorks, and Hitachi Data Systems only.) Amount of storage space available to allocate to volumes in the storage pools associated with the storage system.

**Unformatted Disk Space (Undefined Disk Group or Array Site Capacity)**

Raw disk space in ranks on which no volume space has been defined. For TotalStorage Enterprise Storage Server systems, this value is the total raw capacity of any unformatted disk groups. For IBM XIV Storage System, this value is the total available physical (hard) space that remains for pool creation. For FASTT, HP StorageWorks, and Hitachi Data Systems storage systems, this value is the total capacity of the disks that are not in a storage pool.

**Cache** Amount of RAM or other cache for a storage system.

**Note:** This column is blank for SAN Volume Controllers.

**Assigned Volume Space (Subsystem Assigned LUN Capacity)**

Total storage capacity of all volumes that the storage system knows are assigned to a host computer. Note: The column is blank for SAN Volume Controller.

**Unassigned Volume Space (Subsystem Unassigned LUN Capacity)**

Total storage capacity of all volumes that the storage system knows are not assigned to a host computer. Note: The column is blank for SAN Volume Controller.

**zOS Volume Space (zOS LUN Capacity)**

Total storage capacity for all the volumes allocated to zOS. Data for this column is calculated for TotalStorage Enterprise Storage Server only. The value for this column is set to N/A for other storage systems.

**Open System Volume Space (Open System LUN Capacity)**

Total volume storage capacity (excluding the zOS volume space).

**Physical Disk Space**

Total amount of physical disk space discovered on the monitored storage system arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

**Backend Volume Space**

Total amount of storage system volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on a monitored storage system virtualizer (for example, SAN Volume Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are back-end disks on a storage system virtualizer that is not monitored.

**By Storage Subsystem Group****Subsystem Group Name**

Name of a storage system monitoring group or storage system reporting group.

**TPC Server**

Name of a subordinate server to which the group is associated.

**Disk Space (Disk Capacity)**

Total raw (unformatted) disk capacity of the storage systems in a group.

**Available Disk Space (Available Capacity)**

Amount of storage space available on the disks associated with the storage systems in a group.

**Number of Disks**

Number of disks associated with the storage systems in a group.

**Number of Volumes (Number of LUNs)**

Number of volumes associated with the storage systems in a group.

**Storage Subsystem Volume Space (LUN capacity)**

Amount of storage space allocated to the volumes associated with the storage systems in a group.

**Consumable Storage Subsystem Volume Space (Usable LUN Capacity)**

Storage capacity of volumes in the created disk array (not including BCVs, VCM database, and Replication targets).

**FlashCopy Target Storage Subsystem Volume Space (FlashCopy Target Capacity)**

The total capacity of all FlashCopy target volumes in the storage systems in a group.

**Correlated Volume Space (LUN Capacity Visible to Data Manager)**

Capacity of all volumes visible to a Storage Resource agent or Data agent associated with the storage systems in a group.

**Volume Space Not Correlated (LUN Capacity Not Visible to Data Manager)**

Usable volume capacity minus assigned volume capacity on the storage systems in a group.

**Unavailable Volume Space (Overhead)**

Amount of capacity that is dedicated to redundancy in the storage systems in a group.

**Formatted Space (Formatted Capacity)**

(TotalStorage Enterprise Storage Server, FAStT, HP StorageWorks, and Hitachi Data Systems only.) Total amount of formatted storage space in the storage pools associated with the storage systems in a group.

**Total Formatted Space with no Volumes (Total Formatted Space with No Volumes)**

(TotalStorage Enterprise Storage Server, FAStT, HP StorageWorks, and Hitachi Data Systems only.) Amount of storage space available to allocate to volumes in the storage pools associated with the storage systems in a group.

**Unformatted Disk Space (Total Overhead)**

(TotalStorage Enterprise Storage Server only.) Sum of all the space in a disk group minus the formatted capacity on the storage systems in a group.

**Cache** Amount of RAM or other cache for the storage systems in a group.

**Note:** This column does not include values for SAN Volume Controllers.

**Assigned Volume Space (Subsystem Assigned LUN Capacity)**

Total storage capacity of all volumes that the storage systems in a group know are assigned to a host computer.

**Unassigned Volume Space (Subsystem Unassigned LUN Capacity)**

Total storage capacity of all volumes that the storage systems in a group know are not assigned to a host computer.

**zOS Volume Space (zOS LUN Capacity)**

Total storage capacity for all the volumes on the storage systems in a group allocated to zOS.

**Open System Volume Space (Open System LUN Capacity)**

Total volume storage capacity (excluding the zOS volume capacity) of the storage systems in a group.

**Physical Disk Space**

Total amount of physical disk space discovered on the monitored storage system arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.

- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

### Backend Volume Space

Total amount of storage system volume space or virtual storage space that Tivoli Storage Productivity Center identifies as the back-end disk space on a monitored storage system virtualizer (for example, SAN Volume Controller). Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system volumes or virtual storage volumes that become missing after a storage system probe.
- Storage system volumes or virtual storage volumes that are back-end disks on a storage system virtualizer that is not monitored.

### By Computer

**Note:** Two entries for the same host might appear in this report and the values for that host are counted twice in the **TOTAL** column. This scenario occurs under the following circumstances:

- You install two Storage Resource agents on the same host (using the long and short names of the host) that point to different Tivoli Storage Productivity Center servers. For example, you install an agent from serverA using the short name of a host (for example, hostC). You install another agent from serverB using the long name of the same host (for example, hostC.storage.chicago.com). You then set up the servers in a master and subordinate relationship. For example, serverA is the master and serverB is the subordinate. In this example, there are two entries in the report for the host: hostC and hostC.storage.chicago.com. The values for hostC are counted twice in the **TOTAL** column.
- A Storage Resource agent on a host (hostC) points to two different Tivoli Storage Productivity Center servers (serverA and serverB). The host has a dynamic IP address. You set up serverA as the master and serverB as the subordinate. Server serverA probes hostC, but then the IP address of hostC changes before serverB probes the host. In this example, the report might display two entries for hostC: one entry with the IP address that was probed by serverA; the other entry with the changed IP address that was probed by serverB. The values for hostC are counted twice in the **TOTAL** column.
- A Storage Resource agent on a host (hostC) points to two different Tivoli Storage Productivity Center servers (serverA and serverB). The host has a name that resolves to hostC.storage.chicago.com on serverA and hostC.srm.storage.chicago.com on serverB. You then set up the servers in a master and subordinate relationship. For example, serverA is the master and serverB is the subordinate. In this example, there are two entries in the report for the host: hostC.storage.chicago.com and hostC.srm.storage.chicago.com. The values for hostC are counted twice in the **TOTAL** column.

### Computer Name

Name of a computer.

### Disk Space (Total Capacity)

Total storage capacity for a computer. If the computer is an IBM Tivoli Storage SAN File Systems client, then this value also includes the capacity of any volumes visible to this computer that are owned by the SAN File System.

**Available Disk Space (Total Unallocated Space)**

Amount of unused storage space on a computer (not in file systems seen by this operating system). If the computer is an IBM Tivoli Storage SAN File Systems client, then this value excludes the unallocated space on any volumes visible to it that are owned by the SAN File System.

**Number of Disks**

Number of disks on a computer.

**Owned Disk Space (Owned Capacity)**

Total storage capacity for a computer that is owned by that computer. If Data Manager can determine that a disk was configured for a different host, the capacity for that disk is counted in the "Owned Capacity".

If the computer is an IBM Tivoli Storage SAN File Systems client, then this value does not include the capacity of any volumes visible to it that are owned by the SAN File System. If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads the host-ID. If this host-ID does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

**Other Available Disk Space (Other Unallocated Space)**

Total unallocated space on disks owned by the computer. This column does not display the total unallocated disk space on disks not owned by the computer. If the computer is an IBM Tivoli Storage SAN File Systems client, then this value excludes the unallocated space on any volumes visible to it that are owned by the SAN File System.

**Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)**

Total disk capacity of all non-Fibre attached disks for a computer.

**Fibre Channel Attached Disk Space (Total Other Attached Unallocated Space)**

Total unallocated space of all non-Fibre attached disks for a computer.

**Non-Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Capacity)**

Total disk capacity of all fibre channel attached disks for a computer.

**Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Unallocated Space)**

Total unallocated space of all fibre channel attached disks for a computer.

**By Computer Group****Computer Group Name**

Name of a computer monitoring group or computer reporting group.

**Disk Space (Total Capacity)**

Total storage capacity for the computers in a group. If the computer is an IBM Tivoli Storage SAN File Systems client, then this value also includes the capacity of any volumes visible to this computer that are owned by the SAN File System.

**Available Disk Space (Total Unallocated Space)**

Amount of unused storage space on the computers in a group.

**Number of Disks**

Number of disks on the computers in a group.

**Owned Disk Space (Owned Capacity)**

Total storage capacity for the computers in a group that is owned by those

computers. If Data Manager can determine that a disk was configured for a different host, the capacity for that disk is counted in the "Owned Capacity".

If any computers in the group are IBM Tivoli Storage SAN File Systems clients, then this value does not include the capacity of any volumes visible to it that are owned by the SAN File System. If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads the host-ID. If this host-ID does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

**Other Available Disk Space (Other Unallocated Space)**

Total unallocated space on disks owned by the computers in a group. This column does not display the total unallocated disk space on disks not owned by computers. If any of the computers in the group are IBM Tivoli Storage SAN File Systems clients, then this value excludes the unallocated space on any volumes visible to it that are owned by the SAN File System.

**Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)**

Total disk capacity of all non-Fibre attached disks on the computers in a group.

**Fibre Channel Attached Disk Space (Total Other Attached Unallocated Space)**

Total unallocated space of all non-Fibre attached disks on the computers in a group.

**Non-Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Capacity)**

Total disk capacity of all fibre channel attached disks on the computers in a group.

**Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Unallocated Space)**

Total unallocated space of all fibre channel attached disks on the computers in a group.

**By Cluster**

**Cluster Name**

Name of a cluster.

For Storwize V7000 Unified or IBM SONAS clusters, the storage system name is included with the cluster name in the Computer or Device column. The format of the column is `storagesystem_name: cluster_name`, where `storagesystem_name` is the name of the Storwize V7000 Unified or IBM SONAS device that the cluster belongs to. For example, `subsystem-03.lab.austin.us.com: kq98n5d.acct` displays storage system `subsystem-03.lab.austin.us.com` that cluster `kq98n5d.acct` belongs to.

**Disk Space (Total Capacity)**

Total storage capacity for a cluster.

**Available Disk Space (Total Unallocated Space)**

Amount of unused storage space on a cluster (not in file systems seen by this operating system).

**Owned Disk Space (Owned Capacity)**

Total storage capacity for a cluster that is owned by that cluster. If Data Manager can determine that a disk was configured for a different host, the capacity for that disk is counted in the "Owned Capacity".

If the computer is an IBM Tivoli Storage SAN File Systems client, then this value does not include the capacity of any volumes visible to it that are owned by the SAN File System. If the host is Solaris and Veritas Volume Manager (VxVM) is in use, the product examines the Veritas disk-label and reads the host-ID. If this host-ID does not agree with the local host-ID, the disk is classified as belonging to a different (Solaris) host.

**Other Available Disk Space (Other Unallocated Space)**

Total unallocated space on disks owned by the cluster. This column does not display the total unallocated disk space on disks not owned by the cluster. If a computer in a cluster is an IBM Tivoli Storage SAN File Systems client, then this value excludes the unallocated space on any volumes visible to it that are owned by the SAN File System.

**Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)**

Total disk capacity of all non-Fibre attached disks in a cluster.

**Fibre Channel Attached Disk Space (Total Other Attached Unallocated Space)**

Total unallocated space of all non-Fibre attached disks in a cluster.

**Non-Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Capacity)**

Total disk capacity of all fibre channel attached disks in a cluster.

**Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Unallocated Space)**

Total unallocated space of all fibre channel attached disks in a cluster.

**By TPC Server (Computers)**

**TPC Server**

Name of a subordinate server that is monitoring computer disks in your environment.

**Disk Space (Total Capacity)**

Total storage capacity of all the computer disks monitored by a subordinate server.

**Available Disk Space (Total Unallocated Space)**

Amount of unused storage space on all the computer disks monitored by a subordinate server.

**Number of Disks**

Number of computer disks monitored by a subordinate server.

**Non-Fibre Channel Attached Disk Space (Total Other Attached Capacity)**

Total disk capacity of all non-Fibre attached disks monitored by a subordinate server.

**Fibre Channel Attached Disk Space (Total Other Attached Unallocated Space)**

Total unallocated space of all non-Fibre attached disks monitored by a subordinate server.

**Non-Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Capacity)**

Total disk capacity of all fibre channel attached disks monitored by a subordinate server.

**Fibre Channel Attached Available Disk Space (Total Fibre Channel Attached Unallocated Space)**

Total unallocated space of all fibre channel attached disks monitored by a subordinate server.

## By TPC Server (Storage Subsystems)

### TPC Server

Name of a subordinate server that is monitoring storage system disks in your environment.

### Disk Space (Total Capacity)

Total raw (unformatted) disk capacity of the storage systems monitored by a subordinate server.

### Available Disk Space (Total Unallocated Space)

Amount of storage space available on the disks associated with the storage systems monitored by a subordinate server.

### Number of Disks

Number of storage system disks monitored by a subordinate server.

### Physical Disk Space

Total amount of physical disk space discovered on the monitored storage system arrays. Tivoli Storage Productivity Center does not include the following volumes in its calculation of the value for this column:

- Storage system disks that become missing after a storage system probe.
- Back-end storage volumes on monitored storage system virtualizers (for example, SAN Volume Controller) that are attached from a storage system.

## Rollup Reports - TPC Server Storage Space - File System Space

Use this report to view file system space information about the file systems that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Computer: Shows file system capacity aggregated at the computer level and sorted by computer name.
- By Computer Group: Shows file system capacity aggregated at the computer monitoring group and computer reporting group levels and sorted by group name.
- By Cluster: Shows file system capacity aggregated at the cluster level and sorted by cluster name.
- By TPC Server: Shows file system capacity aggregated at the subordinate server level and sorted by subordinate server name.

**Note:** The first column in each report remains displayed when scrolling through the other columns on the report.

## By Computer

### Computer Name

Name of the computer on which a file system resides.

### Total Capacity

Total amount (capacity) of storage space in the file systems on a computer. Note that the value in this field might be greater than **Total Used Space** + **Total Free Space** for some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the **df** command) does not include some space reserved by the operating system (overhead). Therefore, the value in

the **Total Capacity** field is greater than or equal to the value of **Total Used Space** + **Total Free Space**, the difference representing the space wasted due to the system overhead.

### **Total Used Space**

Total amount of used storage space in the file systems on a computer. On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead). Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

The value that appears in the **TOTAL** row for this column represents the difference between the **TOTAL** values in the **Total Capacity** and **Total Free Space** columns. If the calculated value for the **TOTAL** row is negative, the column displays 0.

The **TOTAL** row does not add the used space coming from VMWare computers. See the *VMWare capacity reports* topic in the *Planning* chapter of the *Tivoli Storage Productivity Center Installation and Configuration Guide* for information about how file system and disk capacity are calculated in this report for VMWare computers. This topic is also available in the *Planning* section of the *Tivoli Storage Productivity Center Information Center*.

The value that appears in the **TOTAL** row for this column does not include the following file systems:

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent or Data agent has been installed.
- File systems on discovered virtual machine servers where the Storage Resource agent or Data agent is installed, but the hypervisor for the virtual machine servers has not been discovered and the total used space exceeds the capacity of the total file system capacity.

### **Total Free Space**

Total amount of unused storage space in the file systems on a computer.

### **Number of FS's/LV's**

Number of file systems or logical volumes on a computer.

## **By Computer Group**

### **Computer Group**

Name of a computer monitoring group or computer reporting group.

### **Total Capacity**

Total amount (capacity) of storage space on the file systems in a group. Note that the value in this field might be greater than **Total Used Space** + **Total Free Space** for some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the **df** command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space** + **Total Free Space**, the difference representing the space wasted due to the system overhead.

**Total Used Space**

Total amount of used storage space on the file systems in a group. On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

**Total Free Space**

Total amount of unused storage space on the file systems in a group.

**Number of FS's/LV's**

Number of file systems or logical volumes in a group.

**By Cluster****Cluster**

Name of a cluster.

**Total Capacity**

Total storage capacity of the file systems in a cluster. Note that the value in this field might be greater than **Total Used Space** + **Total Free Space** for some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the **df** command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space** + **Total Free Space**, the difference representing the space wasted due to the system overhead.

**Total Used Space**

Total amount of used storage space on the file systems in a cluster. On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

**Total Free Space**

Total amount of unused storage space on the file systems in a cluster.

**By TPC Server****TPC Server**

Name of a subordinate server that is monitoring file systems in your environment.

**Total Capacity**

Total storage capacity of all the file systems monitored by a subordinate server.

**Total Used Space**

Total amount of used storage space on the file systems monitored by a subordinate server. On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead).

**Total Free Space**

Total amount of unused storage space on the file systems monitored by a subordinate server.

**Total Number of FS's/LV's**

Total number of file systems or logical volumes monitored by a subordinate server.

**Rollup Reports - TPC Server Storage Space - Consumed File System Space**

Use this report to view information about the used storage space on filesystems that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Computer: Shows filesystem used space aggregated at the computer level and sorted by computer name.
- By Computer Group: Shows filesystem used space aggregated at the computer monitoring group and computer reporting group levels and sorted by group name.
- By Cluster: Shows filesystem used space aggregated at the cluster level and sorted by cluster name.
- By TPC Server: Shows filesystem used space aggregated at the subordinate server level and sorted by subordinate server name.

**Note:** The first column in each report remains displayed when scrolling through the other columns on the report.

## By Computer

### Computer Name

Name of the computer on which a filesystem resides.

### Total Used Space

Total amount of used storage space in the file systems on a computer. On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead). Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

The value that appears in the **TOTAL** row for this column represents the difference between the **TOTAL** values in the **Total Capacity** and **Total Free Space** columns. If the calculated value for the **TOTAL** row is negative, the column displays 0.

The **TOTAL** row does not add the used space coming from VMWare computers. See the *VMWare capacity reports* topic in the *Planning* chapter of the *Tivoli Storage Productivity Center Installation and Configuration Guide* for information about how file system and disk capacity are calculated in this report for VMWare computers. This topic is also available in the *Planning* section of the *Tivoli Storage Productivity Center Information Center*.

The value that appears in the **TOTAL** row for this column does not include the following file systems:

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent or Data agent has been installed.
- File systems on discovered virtual machine servers where the Storage Resource agent or Data agent is installed, but the hypervisor for the virtual machine servers has not been discovered and the total used space exceeds the capacity of the total file system capacity.

### Total Free Space

Total amount of unused storage space in the filesystems on a computer.

**Total Capacity**

Total amount (capacity) of storage space in the filesystems on a computer. Note that the value in this field might be greater than **Total Used Space + Total Free Space** for some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the **df** command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space + Total Free Space**, the difference representing the space wasted due to the system overhead.

**Number of FS's/LV's**

Number of filesystems or logical volumes on a computer.

**By Computer Group****Computer Group**

Name of a computer monitoring group or computer reporting group.

**Total Capacity**

Total amount (capacity) of storage space on the filesystems in a group. Note that the value in this field might be greater than **Total Used Space + Total Free Space** for some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the **df** command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space + Total Free Space**, the difference representing the space wasted due to the system overhead.

**Total Used Space**

Total amount of used storage space on the filesystems in a group. On some UNIX filesystems, this value does not include storage space reserved by the operating system (overhead).

**Total Free Space**

Total amount of unused storage space on the filesystems in a group.

**Number of FS's/LV's**

Number of filesystems or logical volumes in a computer group.

**By Cluster****Cluster**

Name of a cluster.

**Total Used Space**

Total amount of used storage space on the filesystems in a cluster. On some UNIX filesystems, this value does not include storage space reserved by the operating system (overhead).

**Total Free Space**

Total amount of unused storage space on the filesystems in a cluster.

**Total Capacity**

Total storage capacity of the filesystems in a cluster. Note that the value in this field might be greater than **Total Used Space + Total Free Space** for some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the **df** command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Total Capacity**

field is greater than or equal to the value of **Total Used Space + Total Free Space**, the difference representing the space wasted due to the system overhead.

**Number of FS's/LV's**

Number of filesystems or logical volumes in a cluster.

**By TPC Server**

**TPC Server**

Name of a subordinate server that is monitoring filesystems in your environment.

**Total Used Space**

Total amount of used storage space on the filesystems monitored by a subordinate server. On some UNIX filesystems, this value does not include storage space reserved by the operating system (overhead).

**Total Free Space**

Total amount of unused storage space on the filesystems monitored by a subordinate server.

**Total Capacity**

Total storage capacity of all the filesystems monitored by a subordinate server.

**Total Number of FS's/LV's**

Number of filesystems or logical volumes monitored by a subordinate server.

**Rollup Reports - TPC Server Storage Space - Available File System Space**

Use this report to view information about the available storage space on file systems that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Computer: Shows filesystem free space aggregated at the computer level and sorted by computer name.
- By Computer Group: Shows filesystem free space aggregated at the computer monitoring group and computer reporting group levels and sorted by group name.
- By Cluster: Shows filesystem free space aggregated at the cluster level and sorted by cluster name.
- By IBM Tivoli Storage Productivity Center Server: Shows filesystem free space aggregated at the subordinate server level and sorted by subordinate server name.

**Note:** The first column in each report remains displayed when scrolling through the other columns on the report.

**By Computer**

**Computer Name**

Name of the computer on which a filesystem resides.

**Total Free Space**

Total amount of unused storage space in the filesystems on a computer.

### Total Used Space

Total amount of used storage space in the file systems on a computer. On some UNIX file systems, this value does not include storage space reserved by the operating system (overhead). Tivoli Storage Productivity Center does not include the following file systems in its calculation of the value for this column:

- File systems that become missing after a probe.
- File systems that are mounted remotely and are not identified to a network attached storage server.
- File systems that are not mounted.

The value that appears in the **TOTAL** row for this column represents the difference between the **TOTAL** values in the **Total Capacity** and **Total Free Space** columns. If the calculated value for the **TOTAL** row is negative, the column displays 0.

The **TOTAL** row does not add the used space coming from VMWare computers. See the *VMWare capacity reports* topic in the *Planning* chapter of the *Tivoli Storage Productivity Center Installation and Configuration Guide* for information about how file system and disk capacity are calculated in this report for VMWare computers. This topic is also available in the *Planning* section of the *Tivoli Storage Productivity Center Information Center*.

The value that appears in the **TOTAL** row for this column does not include the following file systems:

- File systems on discovered hypervisors that are assigned to virtual machine servers where the Storage Resource agent or Data agent has been installed.
- File systems on discovered virtual machine servers where the Storage Resource agent or Data agent is installed, but the hypervisor for the virtual machine servers has not been discovered and the total used space exceeds the capacity of the total file system capacity.

### Total Capacity

Total amount (capacity) of storage space in the filesystems on a computer. Note that the value in this field might be greater than **Total Used Space** + **Total Free Space** for some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the **df** command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space** + **Total Free Space**, the difference representing the space wasted due to the system overhead.

### Number of FS's/LV's

Number of filesystems or logical volumes on a computer.

### By Computer Group

#### Computer Group

Name of a computer monitoring group or computer reporting group.

#### Total Free Space

Total amount of unused storage space on the filesystems in a group.

#### Total Used Space

Total amount of used storage space on the filesystems in a group. On some UNIX filesystems, this value does not include storage space reserved by the operating system (overhead).

**Total Capacity**

Total amount (capacity) of storage space on the filesystems in a group. Note that the value in this field might be greater than **Total Used Space + Total Free Space** for some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the **df** command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space + Total Free Space**, the difference representing the space wasted due to the system overhead.

**Number of FS's/LV's**

Number of filesystems or logical volumes in a computer group.

**By Cluster****Cluster**

Name of a cluster.

**Total Free Space**

Total amount of unused storage space on the filesystems in a cluster.

**Total Used Space**

Total amount of used storage space on the filesystems in a cluster. On some UNIX filesystems, this value does not include storage space reserved by the operating system (overhead).

**Total Capacity**

Total storage capacity of the filesystems in a cluster. Note that the value in this field might be greater than **Total Used Space + Total Free Space** for some UNIX systems. This occurs because the used space reported on UNIX (both by the APIs used by the Storage Resource agents or Data agents and by the **df** command) does not include some space reserved by the operating system (overhead). Therefore, the value in the **Total Capacity** field is greater than or equal to the value of **Total Used Space + Total Free Space**, the difference representing the space wasted due to the system overhead.

**By TPC Server****TPC Server**

Name of a subordinate server that is monitoring filesystems in your environment.

**Total Free Space**

Total amount of unused storage space on the filesystems monitored by a subordinate server.

**Total Used Space**

Total amount of used storage space on the filesystems monitored by a subordinate server. On some UNIX filesystems, this value does not include storage space reserved by the operating system (overhead).

**Total Capacity**

Total storage capacity of all the filesystems monitored by a subordinate server.

**Number of FS's/LV's**

Number of filesystems or logical volumes monitored by a subordinate server.

## Rollup Reports - Database Capacity

Use these reports to view storage capacity, used space, and free space at the computer, computer group, database, instance, and IBM Tivoli Storage Productivity Center server level for RDBMSs that are monitored by subordinate servers.

For a specific instance, computer, group of computers, or database that is monitored by a subordinate server, you can use these rollup reports to view:

- how much storage you have for an RDBMS and the objects it contains
- how much storage is being used for an RDBMS and the objects it contains
- what percentage of RDBMS storage is free for expansion

The information shown in these reports is gathered by the master server when it runs Tivoli Storage Productivity Center server probes against associated subordinate servers. If the same storage entity is managed by multiple subordinate servers, rollup reports reflect the storage information from the subordinate server that most recently probed that entity.

### Rollup Reports - Database Capacity - All DBMSs

Use this report to view storage capacity information for the DBMSs (including Oracle, Sybase, SQL Server, and UDB/DB2) that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Instance: Shows database capacity aggregated at the computer level and sorted by instance name.
- By Computer: Shows database capacity aggregated at the computer level and sorted by computer name.
- By Computer Group: Shows database capacity aggregated at the computer monitoring group and computer reporting group levels and sorted by group name.
- By TPC Server: Shows database capacity aggregated at the subordinate server level and sorted by subordinate server name.

**Note:** The first column in each report remains displayed when scrolling through the other columns on the report.

### By Instance

#### Instance

Name of an instance.

#### RDBMS Type

RDBMS to which an instance belongs (e.g., Oracle, SQL Server, Sybase, UDB, etc.).

#### Computer Name

Name of the computer on which an Instance resides.

#### Total Size

Amount of storage space allocated to an instance.

#### File Capacity

Amount of storage space allocated to the data files associated with an instance.

**File Free Space**

Amount of storage free space available on the data files associated with an instance.

**Tablespace Count**

Number of tablespaces associated with an instance.

**File Count**

Number of data files associated with an instance.

**Log File Count**

Number of log files associated with an instance.

**By Computer****Computer Name**

Name of the computer on which an Instance resides.

**Total Size**

Amount of storage space allocated to an instance.

**File Capacity**

Amount of storage space allocated to the data files associated with an instance.

**File Free Space**

Amount of storage free space available on the data files associated with an instance.

**Tablespace Count**

Number of Tablespaces associated with an instance.

**File Count**

Number of data files associated with an instance.

**Log File Count**

Number of log files associated with an instance.

**By Computer Group****Computer Group**

Name of a computer monitoring group or reporting group.

**Total Size**

Amount of storage space allocated to instances in a group.

**File Capacity**

Amount of storage space allocated to the data files associated with instances in a group.

**File Free Space**

Amount of storage free space available on the data files associated with instances in a group.

**Tablespace Count**

Number of databases or tablespaces associated with instances in a group.

**File Count**

Number of data files associated with instances in a group.

**Log File Count**

Number of log files associated with instances in a group.

**TPC Server**

Name of a subordinate server that is monitoring the computer group.

## By TPC Server

### TPC Server

Name of a subordinate server that is monitoring DBMSs in your environment.

### Total Size

Amount of storage space allocated to instances monitored by a subordinate server.

### Total File Capacity

Amount of storage space allocated to the data files associated with instances monitored by a subordinate server.

### File Free Space

Amount of storage free space available on the data files associated with instances monitored by a subordinate server.

### Tablespace Count

Number of tablespaces associated with instances monitored by a subordinate server.

### File Count

Number of data files associated with instances monitored by a subordinate server.

### Log File Count

Number of log files associated with instances monitored by a subordinate server.

## Rollup Reports - Database Capacity - Oracle, Sybase, SQL Server, and UDB

Use this report to view storage capacity information for the Oracle, Sybase, SQL Server, and UDB/DB2 databases that are monitored by subordinate servers in your environment.

You can generate and sort the data within this report using the following by clauses:

- By Database: Shows database capacity aggregated at the computer level and sorted by instance name.
- By Computer: Shows database capacity aggregated at the computer level and sorted by computer name.
- By Computer Group: Shows database capacity aggregated at the computer monitoring group and computer reporting group levels and sorted by group name.
- By TPC Server: Shows database capacity aggregated at the subordinate server level and sorted by subordinate server name.

**Note:** The first column in each report remains displayed when scrolling through the other columns on the report.

## By Database

### Database Instance

Name of a database instance.

### Computer Name

Name of the computer on which an instance resides.

**Total Size**

Amount of storage space allocated to an instance.

**File Capacity**

Amount of storage space allocated to the data files associated with an instance.

**File Free Space**

Amount of storage free space available on the data files associated with an instance.

**Tablespace Count**

Number of tablespaces associated with an instance.

**File Count**

Number of data files associated with an instance.

**Log File Count**

Number of log files associated with an instance.

**By Computer****Computer Name**

Name of the computer on which an instance resides.

**Total Size**

Amount of storage space allocated to an instance.

**File Capacity**

Amount of storage space allocated to the data files associated with an instance.

**File Free Space**

Amount of storage free space available on the data files associated with an instance.

**Tablespace Count**

Number of tablespaces associated with an instance.

**File Count**

Number of data files associated with an instance.

**Log File Count**

Number of log files associated with an instance.

**By Computer Group****Computer Group**

Name of a computer monitoring group or reporting group.

**Total Size**

Amount of storage space allocated to instances in a group.

**File Capacity**

Amount of storage space allocated to the data files associated with instances in a group.

**File Free Space**

Amount of storage free space available on the data files associated with instances in a group.

**Tablespace Count**

Number of tablespaces associated with instances in a group.

**File Count**

Number of data files associated with instances in a group.

**Log File Count**

Number of log files associated with instances in a group.

**TPC Server**

Name of a subordinate server that is monitoring the group.

**By TPC Server****TPC Server**

Name of a subordinate server that is monitoring DBMSs in your environment.

**Tablespace Count**

Number of tablespaces associated with instances monitored by a subordinate server.

**File Count**

Number of data files associated with instances monitored by a subordinate server.

**Log File Count**

Number of log files associated with instances monitored by a subordinate server.

---

## Data source reports - overview

Use data source reports to view detailed information about the agents from which IBM Tivoli Storage Productivity Center collects information about storage resources. Data sources include CIMOM agents, Storage Resource agents, Data agents, Fabric agents, VMWare, and subordinate Tivoli Storage Productivity Center servers.

---

## Data source reports - CIMOM agents

Use these reports to view detailed information about the CIMOM agents that have been associated with IBM Tivoli Storage Productivity Center.

**Related Topics**

- Selecting resources upon which to report
- Filtering the resources that appear in a report
- Generating a report
- Drilling down a report row (By Managed Device report only)
- Navigating tabs

## Data source report - By CIMOM Agent

Use this report to view detailed information about the CIMOM agents that are used as data sources for IBM Tivoli Storage Productivity Center.

Each CIMOM that has been associated with IBM Tivoli Storage Productivity Center appears as its own row in this report.

### Service URL

The service URL of the CIMOM containing the IP address of the CIMOM, the port on which the CIMOM is listening, and the protocol used for communication. This URL has a protocol [http|https], an IP address (IPv4 or IPv6), and a port number. For example:

- **IPv4:** https://127.0.0.1:5989
- **IPv6:** https://[2001:DB8::1234:0000:0000:5678:ABCD]:5989

### Display Name

The name of the CIMOM as specified by the CIMOM provider that will appear in the Tivoli Storage Productivity Center user interface.

### Description

The optional description that was entered on the Add CIMOM panel.

### Managed Device Category

The type of device that is managed by a CIMOM (for example, storage subsystem, switch, or tape library). The value **NA** appears in this column if you have not run a CIMOM discovery against a CIMOM or a CIMOM does not manage any devices.

### Connection Status

The status of this CIMOM with respect to Tivoli Storage Productivity Center. Possible values are: **SUCCESS**, **UNCONFIGURED**, **UNKNOWN**, **INVALID\_NAMESPACE**, **TIMEOUT**, **REFUSED**, **LOGIN\_FAILED**, **SSL\_HANDSHAKE\_ERROR**, **SSL\_REGISTRATION\_INVALID**, **CIMCLIENT\_ERROR**

### Status Timestamp

The date and time when the **Connection Status** information was last collected.

### Number of Managed Devices

The number of devices managed by a CIMOM.

### Interoperability Namespace

The interoperability namespace of a CIMOM. This namespace within the CIMOM allows for accessing the CIM Interop Schema (including the class instances of the Server Profile) and determines how Tivoli Storage Productivity Center interacts with the CIMOM when retrieving information. For a NetApp CIMOM, enter /interop.

### Username

The CIMOM user name used for authentication.

### Truststore Location

The location (path on this computer) of a certificate file for certificate based authentication in the https protocol.

### User Interface Description

The name of the Human Interface Service (if any) supported by this CIMOM.

**Software Level**

The software version level of the CIMOM agent.

**Protocol Version**

The version of the cim-xml protocol.

**Authentication Mechanism**

The authentication mechanism supported by the CIMOM. This column can contain the following values: **Unknown, None, Other, Basic, Digest**.

**Alias** The alias of the CIMOM.

**Protocol**

The protocol used to communicate with the CIMOM. Possible values are **http** and **https**.

**SLP Attributes**

The standard set of attributes for this CIMOM. The attributes are retrieved via SLP.

## Data source report - By Managed Device

Use this report to view information about the devices managed by CIMOMs in your environment. Only devices that are managed by the CIMOMs used as data sources for IBM Tivoli Storage Productivity Center are displayed.

You must run a CIMOM discovery job before you can view the devices managed by CIMOMs in this report. If a device is managed by multiple CIMOMs, the report displays a separate row for each of those CIMOMs. Therefore, the number of rows for a device in the report is equal to the number of CIMOMs managing that device.

**Magnifying glass icon** 

Click this button to view a more detailed report about a device.

**Device Name**

The display name (label) of the managed storage subsystem, switch, or tape library.

**Device Category**

Indicates whether a device that is managed by a CIMOM is a storage subsystem, switch, or tape library.

**Device Type**

Indicates the type of a managed device based on its category. For example, a device that is a storage subsystem might have a value of **DS8000** in this column.

**Device Status**

The consolidated status of the managed device.

**Device Operational Status**

The operational status of a storage subsystem.

**Device Last Probe Time**

The date and time when a probe was last run on a managed device.

**Device Vendor**

The manufacturer of the managed device.

**Device Model**

The model number of the managed device.

**Device Serial Number**

The serial number of the managed device.

**Device Microcode Level**

The microcode or firmware level of the managed device.

**Device IP Address**

The IP address of the managed device.

**Device Element Manager**

The URL or the fully-qualified name of the executable file that launches the element manager.

**CIMOM Service URL**

The service URL of the CIMOM. This URL includes the IP address or host name of the CIMOM, the port on which the CIMOM is listening, and the protocol used for communication (http|https). For example:  
https://127.0.0.1:9551.

**CIMOM Display Name**

The name of the CIMOM as specified by the CIMOM provider that will appear in the Tivoli Storage Productivity Center user interface.

**CIMOM Description**

The optional description that was entered on the Add CIMOM panel.

**CIMOM Connection Status**

The status of this CIMOM with respect to Tivoli Storage Productivity Center. Possible values are: SUCCESS, UNCONFIGURED, UNKNOWN, INVALID\_NAMESPACE, TIMEOUT, REFUSED, LOGIN\_FAILED, SSL\_HANDSHAKE\_ERROR, SSL\_REGISTRATION\_INVALID, CIMCLIENT\_ERROR

**CIMOM Status Timestamp**

The date and time when the **Connection Status** information was last collected.

**CIMOM Interoperability Namespace**

The interoperability namespace of a CIMOM. This namespace within the CIMOM allows for accessing the CIM Interop Schema (including the class instances of the Server Profile) and determines how Tivoli Storage Productivity Center interacts with the CIMOM when retrieving information. For a NetApp CIMOM, enter /interop.

**CIMOM Username**

The CIMOM user name used for authentication.

**CIMOM Trustore Location**

The location (path on this computer) of a certificate file for certificate based authentication in the https protocol.

**CIMOM User Interface Description**

The name of the Human Interface Service (if any) supported by this CIMOM.

**CIMOM Software Level**

The software version level of the CIMOM agent.

**CIMOM Protocol Version**

The version of the cim-xml protocol.

**CIMOM Authentication Mechanism**

The authentication mechanism supported by the CIMOM. This column can contain the following values: **Unknown, None, Other, Basic, Digest**.

**CIMOM Alias**

The alias of the CIMOM.

**CIMOM Protocol**

The protocol used to communicate with the CIMOM. Possible values are **http** and **https**.

**CIMOM SLP Attributes**

The standard set of attributes for this CIMOM. The attributes are retrieved via SLP.

---

## Tivoli Storage Productivity Center Monitoring Agent reports

After you have installed and configured the Tivoli Storage Productivity Center Monitoring Agent, you can view reports and information from Tivoli Storage Productivity Center.

There are four predefined workspaces which are shipped with Tivoli Storage Productivity Center:

**TPC Server Overview**

Provides an over view of the key parameters and infrastructure metrics about the Data server and Device server managed entities.

**Managed SAN Overview**

Provides an overview about several metrics concerning the managed SAN environment.

**Managed SAN Health**

Monitors the health and availability of the SAN attached devices managed by Tivoli Storage Productivity Center.

**TPC Data Collection Overview**

Displays the status of the latest probe jobs and performance monitors.

**Managed SAN Overview workspace**

The Managed SAN Overview workspace provides an overview about several metrics about the managed SAN environment. You can access this workspace by clicking **Managed SAN Overview** in the navigation tree of the Navigator window.

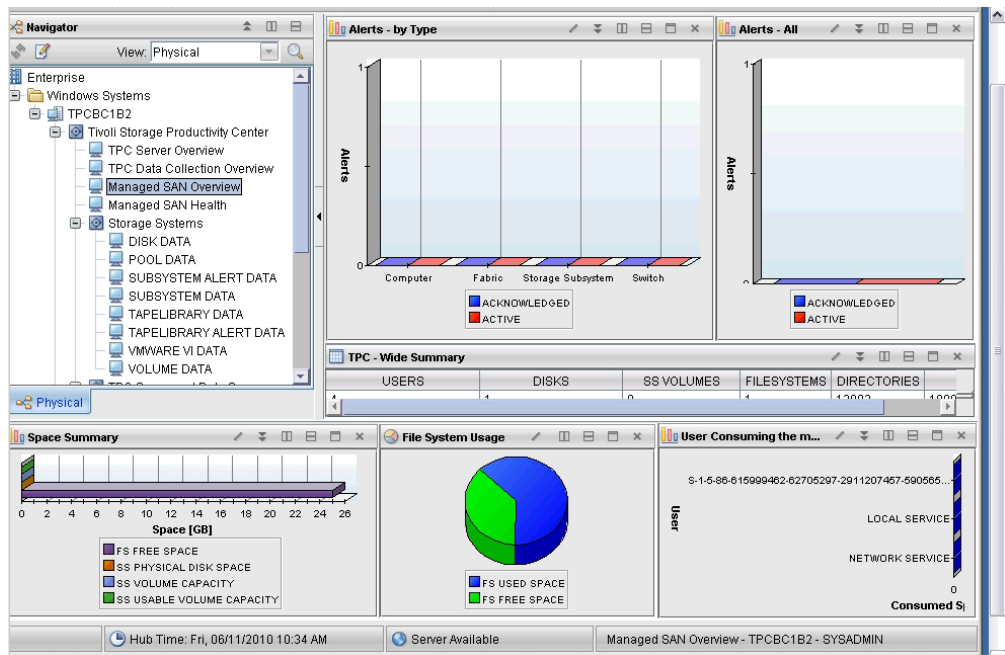

Figure 62. Managed SAN overview report

You can see the following views:

#### Alerts - by Type

Displays a bar chart showing the number of all computers, switches, storage systems, and fabric alerts including their current state (acknowledged or active).

#### Alerts - All

Displays a bar chart showing the number of all alerts of all devices including their current state (acknowledged or active).

#### TPC-Wide Summary

Displays a table showing the total amount of users, disks, storage system volumes, file systems, files, and folders.

#### Space Summary

Displays a bar chart showing the total amount of file system capacity, physical disk space of all storage systems, total amount of the available volume capacity, and total amount of usable volume capacity in the managed storage environment.

#### User Consuming the most Space

Displays a chart with the total amount of space allocated by single users. Only the ten users using the most space is shown.

#### File System Usage

Displays a pie chart showing the total amount of free and used file system space in the managed storage environment.

### Managed SAN Health workspace

The Managed SAN Health workspace provides an overview about the objects in the managed SAN environment. You can access this workspace by clicking **Managed SAN Health** in the navigation tree of the Navigator window.

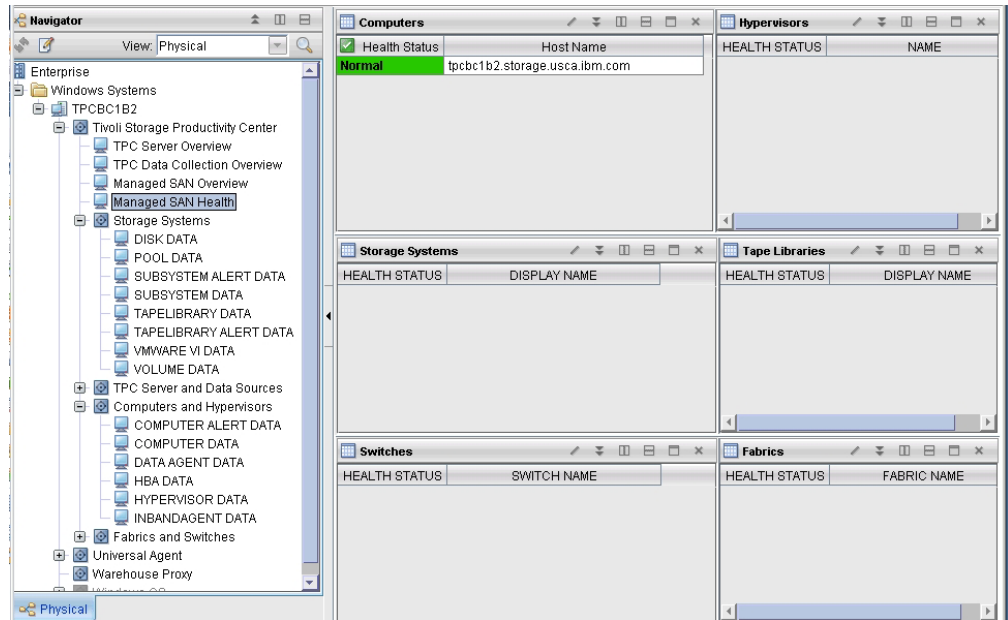

Figure 63. Managed SAN Health report

This workspace shows the following information:

**Computers**

Displays a list of all managed computers including their health status.

**Hypervisors**

Displays a list of all managed VMware hypervisors including their health status.

**Storage Systems**

Displays a list of all managed storage systems including their health status.

**Fabrics**

Displays a list of all managed fabrics including their health status.

**Switches**

Displays a list of all managed switches including their health status.

**Tape libraries**

Displays a list of all managed tape libraries including their health status.

**TPC Server Overview workspace**

The TPC Server Overview workspace provides an overview of several metrics about the Tivoli Storage Productivity Center server. You can access this workspace by clicking **TPC Server Overview** in the navigation tree of the Navigator window.

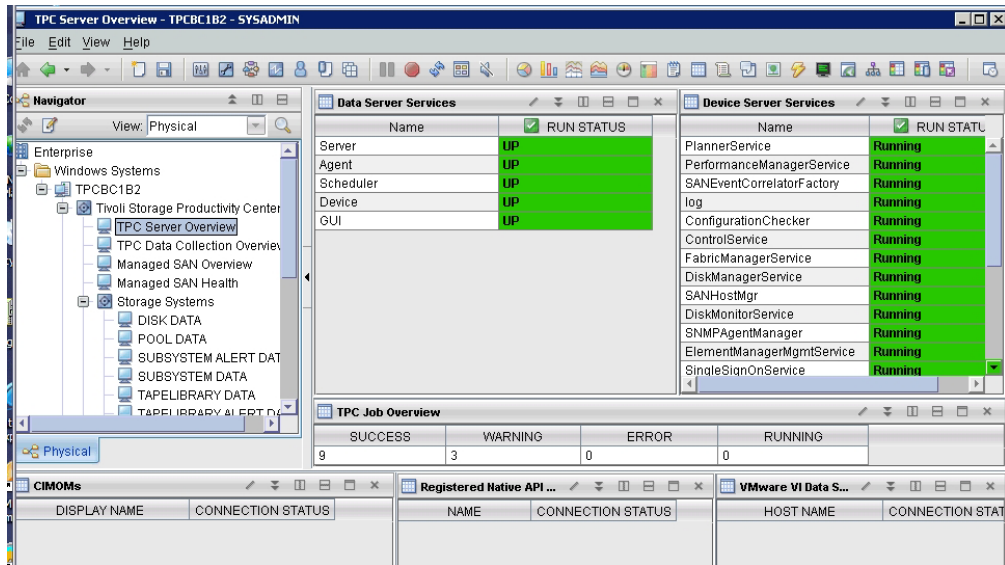

Figure 64. TPC Server overview report

This workspace provides the following views:

#### Data Server Services

Displays a table showing all the Data server services (Server, Agent, Scheduler, Device, and GUI) including their run status.

#### Device Server Services

Displays a table showing all Device server services including their run status.

#### TPC Job Overview

Displays a table showing statistics about the total amount of jobs and their corresponding status.

#### CIMOMs

Displays a table showing all the managed CIMOMs including their connection status.

#### Registered Native API Devices

Displays a table showing all managed native interface devices including their corresponding connection status.

#### VMware VI Data Sources

Displays a report showing all attached VMware VI Data Sources and their corresponding connection status.

### TPC Data Collection Overview workspace

The TPC Data Collection Overview workspace provides the status of the latest probe jobs and performance monitor jobs. You can access this workspace by clicking **TPC Data Collection Overview** in the navigation tree of the Navigator window.

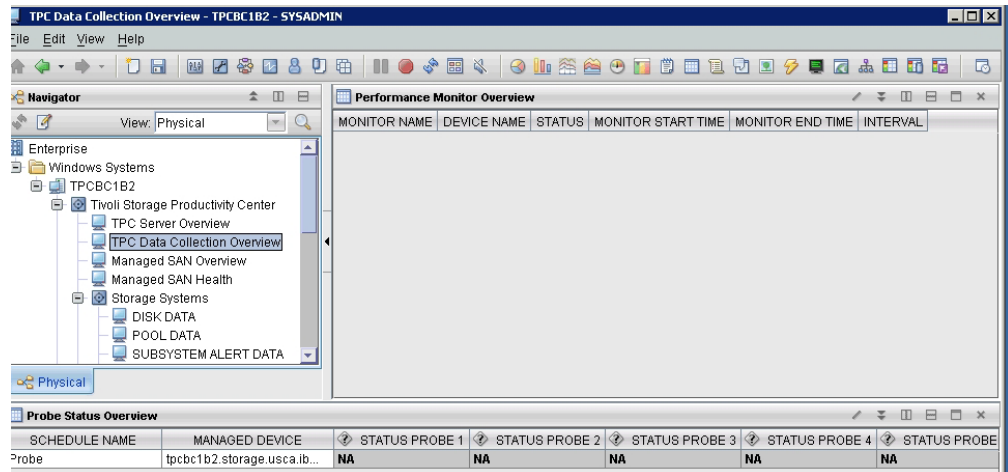

Figure 65. TPC Server overview report

This workspace provides the following information:

#### Probe status overview

Displays a table showing all probe jobs and their status with the last five runs.

#### Performance monitor overview

Displays a table showing all performance monitor jobs and their corresponding status.

### Detailed Tivoli Storage Productivity Center reports

There are several reports which provide detailed information about the monitored entities. You can access these reports by clicking the appropriate entity in the navigation tree of the Navigator window. These entities are:

#### Storage Systems

Under **Storage Systems**, you can view these detailed reports:

- DISK DATA
- POOL DATA
- SUBSYSTEM ALERT DATA
- SUBSYSTEM DATA
- TAPELIBRARY DATA
- TAPELIBRARY ALERT DATA
- VMWARE VI DATA
- VOLUME DATA

#### TPC Server and Data Sources

Under TPC Server and Data Sources, you can view these detailed reports:

- CIMOM DATA
- DATASERVER API
- DEVICESERVER API
- JOB STATUS DATA
- REGISTERED NATIVE API DATA
- OTHER DEVICE DATA
- PERFORMANCE MONITOR DATA

- PROBE STATUS DATA
- SCHEDULED JOB DATA
- TPC SERVER DATA

#### **Computers and Hypervisors**

Under **Computers and Hypervisors**, you can view these detailed reports:

- COMPUTER ALERT DATA
- COMPUTER DATA
- DATA AGENT DATA
- HBA DATA
- HYPERVISOR DATA
- INBANDAGENT DATA

#### **Fabrics and Switches**

Under **Fabrics and Switches**, you can view these detailed reports:

- FABRIC DATA
- FABRIC ALERT DATA
- OUTBANDAGENT DATA
- SWITCH DATA
- SWITCH ALERT DATA

See the Tivoli Storage Productivity Center online help for information about these entities.

---

## Chapter 9. Reporting in the web-based GUI

Use the web-based GUI reports to show information about the storage resources in your environment.

---

### Viewing predefined and custom reports

You can use IBM Tivoli Common Reporting to view predefined reports and create custom reports.

#### Predefined reports

You view the predefined reports that are provided by Tivoli Storage Productivity Center in Tivoli Common Reporting.

You can view one of the following types of predefined report:

- Resources
- Performance
- Historical space
- Storage tiering

#### Reports about resources

Run reports about resources to show the relationships between resources. For example, to show the pools that are related to a storage system, run the Storage Resource Relationships Summary Report. Resources reports also provide the current capacity, the available space, and the used space for resources. For example, to show the current space statistics for a pool on a storage system, run the Storage System - Pools Space Report.

#### Reports about performance

Run reports about performance to show the most active resources on switches, on storage virtualizers, or on storage systems over a specified period. For example, to find out which are the most active volumes on a storage system over a specified period, run the Storage Systems - Most Active Volumes Report. To find out more about the performance of a specific resource over a specified period, run a details report such as the Storage System - Volume Details Report.

#### Reports about historical space

Run reports about historical space to determine whether additional storage resources are required. For example, to show how space is used over a specified period on volumes on storage systems, or on volumes in a storage resource group, run the Storage System - Volumes Historical Space Report. The space statistics are analyzed to determine the future storage requirements for your environment.

#### Reports about storage tiering

Run reports about storage tiering to show the workload activity of managed disk groups and virtual disks. You can also run the Volume Migration Recommendation Report to identify volumes that might require migration based on the conditions that are set in tiering policies.

Charts are automatically generated for most of the predefined reports. Depending on the type of resource, the charts show statistics for space usage, workload activity, bandwidth percentage, and so on.

**Tip:** When you view a predefined report, click **Help** to find out more about predefined and custom reports.

## Custom reports

Unlike predefined reports, you can select the information that you want to include in custom reports. Custom reports can contain detailed information about the relationships between monitored resources, the properties of monitored resources, and detailed information about the performance of monitored resources.

You can create reports with basic formatting, or you can design more complex reports with advanced formatting features. The advanced formatting features include inserting charts in reports, and inserting links that open related reports.

To create a report, browse the list of monitored resources in your storage environment, and drag items that are associated with the resources into a report. For example, you can drag items that show capacity data for storage virtualizers into a report.

---

## Creating and viewing reports from the web-based GUI

Use the web-based GUI to create custom reports and view predefined reports.

### Restriction:

You cannot create custom reports from the following packages:

- IBM Tivoli Storage Productivity Center Historical Information
  - IBM Tivoli Storage Productivity Center Storage Tiering
1. Start the web-based GUI for Tivoli Common Reporting.
  2. Depending on the type of report that you want to see, open the appropriate report tool:
    - To run a predefined report and view the report, select **Reporting > View predefined reports**.
    - To create a basic report with limited formatting, select **Reporting > Create a basic report**.
    - To create a report and apply advanced formatting features to the report, select **Reporting > Design a report**.
  3. Select the package you require from the list of available packages that is displayed in Tivoli Common Reporting.

---

## Accessing report features in Tivoli Common Reporting

You can view predefined reports and create custom reports from Tivoli Common Reporting. You do not have to return to the Tivoli Storage Productivity Center web-based GUI to do these tasks.

1. From the Tivoli Common Reporting user interface, click the **Home** icon () , if you are not on the Tivoli Common Reporting home page.

2. Depending on the type of report that you want to see, open the appropriate report tool:
  - To create a basic report with limited formatting, select **Launch > Query Studio**.
  - To create a report and apply advanced formatting features to the report, select **Launch > Report Studio**.
3. Click a package from the list of available packages that is displayed in Tivoli Common Reporting.
4. Depending on the type of report that you want to see, open the appropriate report tool:
  - To view a predefined report, navigate to the report and click the report.
  - To create a basic report with limited formatting, use the Query Studio features to create the report.
  - To create a report and apply advanced formatting features to the report, use the Report Studio features to create the report.

---

## Setting options for reports

When you schedule or run a report, you can specify the output format and how the report is delivered.

You can select output formats for the report. For example, you can select PDF, HTML, and other formats. If you choose PDF as the format for your report, you can set options such as the orientation and paper size for reports.

You can also specify to print the report, to send the report by email, and other delivery options.

1. Navigate to a report in Tivoli Common Reporting.
2. Depending on whether you want to schedule a report or run a report, do one of the following steps:
  - To schedule a report, and select format and delivery options, click the **Schedule** icon ().
  - To run a report, and select format and delivery options, click the **Run with options** icon (). To set advanced options, click **advanced options**, and then select **Run in the background**.

For more information about report options, go to the IBM Cognos 8 v4 Business Intelligence Information Center at <http://publib.boulder.ibm.com/infocenter/c8bi/v8r4m0/index.jsp>. To schedule a report, search for *schedule entry frequency*. To select formats for reports, search for *reports formats*. To select delivery options for reports, search for *distributing reports*. To set advanced report options, search for *advanced report options*.

---

## Predefined reports about resources

You can run predefined reports about resources that show the relationships between resources, and the current space statistics for servers, storage virtualizers, and storage systems.

Before you run the predefined reports about resources, you must ensure that data is collected from the resources. The following table shows the data that must be collected.

Resource	Prerequisite
Server	Data must be collected from the server by the Storage Resource agent.
Hypervisor	Data must be collected from the VMware ESX server.
NAS	Data must be collected from any NetApp or IBM Scale Out Network Attached Storage resources that are in your storage environment.
Storage virtualizer	Data must be collected from any of the following storage virtualizers that are in your storage environment: <ul style="list-style-type: none"> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> <li>• SAN Volume Controller</li> </ul>
Storage system	Data must be collected from the storage system.

You can run the following predefined reports that contain information about resources:

- Predefined reports that show the relationships between resources
- Predefined reports that show the current capacity and space statistics for servers, disks on servers, and file systems on servers
- Predefined reports that show the current capacity and space statistics for storage virtualizers and related resources such as local disks, managed disks, pools, and volumes
- Predefined reports that show the current capacity and space statistics for storage systems and related resources such as disks, pools, and volumes

**Tip:** To learn more about reports, see frequently asked questions about reports in the IBM Tivoli Storage Productivity Center Information Center (<http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp>).

## Relationship reports

Storage relationship reports show the relationships between the resources in your environment.

### Running the Storage Resource Relationships Summary Report

To show the relationships between storage resources, run the Storage Resource Relationships Summary Report.

To run the report with the default settings, click **Finish**.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Resources**.
2. Click **Storage Resource Relationships Summary Report**.
3. Optional: Select one or more of the following:
  - a. Servers
  - b. Hypervisors

- c. NAS resources
  - d. Storage virtualizers
  - e. Storage systems
4. Click **Finish**.

If the resources that you selected are related, a report is created. If a report is not created, a message is displayed in the report.

**Restriction:** To create a report when you select a single resource, the selected resource must be connected to other resources.

**Related reference:**

“Storage Resource Relationships Summary Report”

The Storage Resource Relationships Summary Report shows the relationships between storage resources.

## **Storage Resource Relationships Summary Report**

The Storage Resource Relationships Summary Report shows the relationships between storage resources.

### **Report output**

Information is provided about related resources and the devices, such as managed disks (MDisks), that are related to resources.

#### **Server Name**

The fully qualified domain name of the server. For example, the name of a server might be `server.example.com`.

#### **Hypervisor Name**

The fully qualified domain name of the hypervisor. For example, the name of a hypervisor might be `hypervisor.example.com`.

#### **NAS Name**

The fully qualified domain name of the NAS device. For example, the name of a NAS device might be `nas.example.com`.

#### **Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

#### **Storage Virtualizer Volume Name**

The name that was assigned to the storage virtualizer volume when it was added to the system.

#### **Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

#### **Storage Virtualizer MDisk Name**

The name that was assigned to the managed disk on a storage virtualizer when it was added to the system.

#### **Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

#### **Storage Volume Name**

The name that was assigned to the storage volume when it was added to the system.

## Related links

To open related reports, click the name of the resource or storage device, click **Go To**, and then click the name of the report.

Resource or storage device	Related reports
Storage virtualizer	Storage Virtualizer - Details Report
Storage virtualizer volume	Storage Virtualizer - Volume Details Report
Storage virtualizer pool	Storage Virtualizers - Most Active Pools Report, and Storage Virtualizer - Pool Details Report
Storage virtualizer managed disk (MDisk)	Storage Virtualizer - MDisk Details Report
Storage system	Storage System - Details Report
Storage volume	Storage System - Volume Details Report
Storage pool	Storage Systems - Most Active Pools Report

### Related tasks:

“Running the Storage Resource Relationships Summary Report” on page 1146  
To show the relationships between storage resources, run the Storage Resource Relationships Summary Report.

## Running the Storage Relationships Summary Report (Configurable)

To show the relationships between resources, run the Storage Relationships Summary Report (Configurable). You can show or hide resources, and you can hide resources that are not related to other resources or storage devices.

To run the report with the default settings, click **Finish**. Servers, storage systems, storage virtualizers, and their related resources are shown in the report.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Resources**.
2. Click the **Storage Resource Relationships Summary Report (Configurable)** link.
3. Optional: Select the storage resources that you want to show in the report.
4. Optional: Specify whether you want to show or hide a resource that is related to other storage devices such as a file system, but not to other resources. For example, a server has a related file system. You can show the server and its related storage devices in the report, or you can hide the resource and its related storage devices in the report.
5. Optional: Click **Finish** to run the report.
6. Optional: Click **Next**. In the Select storage resources page, select one or more of the following:
  - a. Servers
  - b. Hypervisors
  - c. NAS resources
  - d. Storage virtualizers
  - e. Storage systems
7. Click **Finish**.

If information is available for the resources that you selected, a report is created that shows the selected resource and its related resources. If a report is not created, a message is displayed in the report.

**Restriction:** To create a report when you select a single resource, the selected resource must be connected to other storage devices or resources. To create a report about two or more selected resources, the resources that you selected must be related.

**Related reference:**

“Storage Relationships Summary Report (Configurable)”

The Storage Relationships Summary Report (Configurable) shows the relationships between storage resources.

## **Storage Relationships Summary Report (Configurable)**

The Storage Relationships Summary Report (Configurable) shows the relationships between storage resources.

### **Report output**

Information is provided about related resources and the devices, such as managed disks (MDisks), that are related to resources.

**Server Name**

The fully qualified domain name of the server. For example, the name of a server might be `server.example.com`.

**Server Disk Path**

The identifier that specifies a path to a server disk, for example `/dev/hdisk0`.

A server disk might have one or more disk paths. To identify unique server disks, add the Server Disk Serial Number column to the report, and group the server disks by the serial number.

**Logical Volume Path**

The path to a logical volume on a resource, for example `/dev/hd1`.

**File System Mount Point**

The name or mount point of the file system for the resource. For example, on Microsoft Windows systems, the value in this column header might be `c:\` or `d:\`. On operating systems such as AIX, Linux, Solaris, or HP-UX, the mount point might be `/opt` or `/export/home`.

**Hypervisor Name**

The fully qualified domain name of the hypervisor. For example, the name of a hypervisor might be `hypervisor.example.com`.

**Hypervisor Disk Path**

The identifier that specifies a path to a hypervisor server disk, for example `vmhba1:0:0`.

**NAS Name**

The fully qualified domain name of the NAS device. For example, the name of a NAS device might be `nas.example.com`.

**NAS Export Name**

The name of the exported file system.

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Storage Virtualizer Volume Name**

The name that was assigned to the storage virtualizer volume when it was added to the system.

**Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

**Storage Virtualizer MDisk Name**

The name that was assigned to the managed disk on a storage virtualizer when it was added to the system.

**Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

**Storage Volume Name**

The name that was assigned to the storage volume when it was added to the system.

**Storage Pool Name**

The name that was assigned to the pool when it was added to the system.

**Related links**

To open related reports, click the name of the resource or storage device, click **Go To**, and then click the name of the report.

Resource or storage device	Related reports

**Related tasks:**

“Running the Storage Relationships Summary Report (Configurable)” on page 1148  
 To show the relationships between resources, run the Storage Relationships Summary Report (Configurable). You can show or hide resources, and you can hide resources that are not related to other resources or storage devices.

**Server reports**

Server reports show the space statistics for servers, file systems, and disks.

**Running the Server Storage Summary Report**

To see information about the capacity and space of server disks and file systems, run the Server Storage Summary Report.

To run the report with the default settings, click **Finish**.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Resources**.
2. Open the Server folder.
3. Click **Server Storage Summary Report**.
4. Optional: Select one or more servers.
5. Optional: Select a sort option. You can order the metrics represented in the chart by disk or by file system.

**Tip:** When the report is created, you can change the sort option.

6. Optional: Select a sort order.
7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

**Related reference:**

“Server Storage Summary Report”

The Server Storage Summary Report, shows the space statistics for disks and file systems on servers.

## Server Storage Summary Report

The Server Storage Summary Report, shows the space statistics for disks and file systems on servers.

### Charts

The bar chart shows the capacity, used space, available space, and percentage of used space for disks on servers. Dots are used to represent the total space that is used by the file system, and the total space that is available to the file system on the server. You can position the cursor over the dot to show the amount of used space or the amount of available space for the file system. The position of the dot that is used to represent the total space that is available to the file system is also used to show the total capacity of the file system.

**Tip:** To change the sort order, select a value from the **Sort Order** list.

### Report output

For each server, the following information is provided:

**Server Total Disk Capacity (GiB)**

The amount of storage space that is on a server.

**Server Total Disk Available Space (GiB)**

The amount of unused storage space on all disks on a server.

**Server Total Disk Used Space (GiB)**

The amount of storage space that is used on all disks on a server.

**Server Total Disk Used Space (%)**

The percentage of used storage space on all disks on the server.

**Server Total File System Capacity (GiB)**

The amount of storage space on the file system of the resource.

**Server Total File System Used Space (GiB)**

The amount of used storage space in the file system of the resource.

**Server Total File System Available Space (GiB)**

The amount of unused storage space in the file system of the resource.

**Server Total File System Used Space (%)**

The amount of used storage space in the file system of the resource.

**Related reports**

To open related reports, click the name of the server, click **Go To**, and then click the name of the report. You can open the following related reports:

- The File System Details Report
- The Server Disk Details Report

**Related tasks:**

The bar chart shows the capacity, used space, available space, and percentage of used space for disks on servers.

**Tip:** To change the sort order, select a value from the **Sort Order** list.

## Report output

For each server, the following information is provided:

### Server Disk Path

The identifier that specifies a path to a server disk, for example /dev/hdisk0.

A server disk might have one or more disk paths. To identify unique server disks, add the Server Disk Serial Number column to the report, and group the server disks by the serial number.

### Server Disk Capacity (GiB)

The amount of storage space that is on a server disk.

### Server Disk Available Space (GiB)

The amount of unused storage space that is on a server disk.

### Server Disk Used Space

The amount of storage space that is used on a server disk.

### Server Disk Used Space (%)

The percentage of used storage space on the disk.

### Server Disk Status

The condition of the resource, for example normal, warning, or error.

### Server Disk Firmware Version

The version number of the firmware that is running on the disk.

### Server Disk Model

The model name or model number of the resource.

### Server Disk Vendor

The vendor who supplied the resource.

### Related tasks:

**Tip:** To change the sort order, select a value from the **Sort Order** list.

**Report output**

For each server, the following information is provided:

**File System Mount Point**

The name or mount point of the file system for the resource. For example, on Microsoft Windows systems, the value in this column header might be c:\ or d:\. On operating systems such as AIX, Linux, Solaris, or HP-UX, the mount point might be /opt or /export/home.

**File System Type**

The type of file system that the resource uses.

**File System Capacity (GiB)**

The amount of storage space on the file system of the resource.

**File System Used Space (GiB)**

The amount of used storage space in the file system of the resource.

**File System Available Space (GiB)**

The amount of unused storage space in the file system of the resource.

**File System Used Space (%)**

The percentage of used space in the file system on the server.

**File System Available Inodes**

The number of unused inodes in file systems on the operating system.

**Tip:** For Microsoft Windows systems, this column is blank.

**File System Used Inodes**

The number of used inodes in file systems on the operating system.

**Tip:** For Microsoft Windows systems, this column is blank.

**Related tasks:**

“Running the File System Details Report” on page 1153

To see information about the capacity of file systems on servers, run the File System Details Report.

**Storage virtualizer reports**

Storage virtualizer reports show the space statistics for storage virtualizers. The reports also show the space statistics for local disks, managed disks, pools, and volumes on storage virtualizers.

## Running the Storage Virtualizers - Space Report

To see information about the capacity of pools, managed disks (MDisks), and volumes on storage virtualizers, run the Storage Virtualizers - Space Report.

To run the report with the default settings, click **Finish**. By default all of the storage virtualizers in the list are selected.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Resources**.
2. Open the Storage Virtualizer folder.
3. Click **Storage Virtualizers - Space Report**.
4. Optional: Select one or more storage virtualizers.
5. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

## Storage Virtualizers - Space Report

The Storage Virtualizers - Space Report shows the space statistics for pools, managed disks (MDisks), disks, volumes, and virtual volumes on storage virtualizers.

### Charts

The bar chart shows the used space and available space for pools on storage virtualizers.

### Report output

For each storage virtualizer, the following information is provided:

#### **Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

#### **Storage Virtualizer Total Pool Capacity (GiB)**

The amount of storage space in pools on the storage virtualizer.

#### **Storage Virtualizer Pool Used Space (GiB)**

The total amount of used storage space in the pools in a storage virtualizer pool.

#### **Storage Virtualizer Pool Available Space (GiB)**

The amount of unused storage space in a storage virtualizer pool.

#### **Storage Virtualizer Volume Allocated Space (GiB)**

The amount of storage space that is allocated to volumes.

**Storage Virtualizer MDisk Capacity (GiB)**

The amount of storage space on the managed disk.

**Storage Virtualizer MDisk Available Space (GiB)**

The amount of space on managed disks that is available to be added to a pool.

**Storage Virtualizer Total Volume Capacity (GiB)**

The amount of virtual volume space on all volumes on the storage virtualizer.

**Storage Virtualizer Volume Assigned Space (GiB)**

The amount of virtual volume space that is assigned to the server or storage virtualizer.

**Storage Virtualizer Disk Capacity (GiB)**

The amount of local disk storage on the storage virtualizer.

**Storage Virtualizer Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Storage Virtualizer Number of Volumes**

The number of volumes on a resource.

**Storage Virtualizer Number of MDisks**

The number of managed disks on a resource.

**Report links**

To open related reports, click the name of the storage virtualizer, click **Go To**, and then click the name of the report. You can open the following related reports:

- The Storage Virtualizer - Pools Space Report
- The Storage Virtualizer - Volumes Space Report
- The Storage Virtualizer - MDisks Space Report
- The Storage Virtualizer - Local Disks Space Report

## **Storage Virtualizer - Local Disks Space Report**

The Storage Virtualizer - Local Disks Space Report shows the space statistics for local disks on storage virtualizers.

### **Charts**

The bar chart shows the capacity of local disks, grouped by the storage class of the disk, for storage virtualizers.

### **Report output**

For each type of storage class of disk on a storage virtualizer, the following information is provided:

**Storage Virtualizer Local Disk Storage Class**

The storage technology of the storage virtualizer local disk. For example, the storage class can be serial-attached SCSI (SAS) or solid-state drive (SSD).

**Storage Virtualizer Local Disk Name**

The name that was assigned to the local disk on the storage virtualizer when it was added to the system.

**Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Storage Virtualizer Local Disk Vendor**

The vendor who supplied the resource.

**Storage Virtualizer Local Disk Model**

The model name or model number of the resource.

**Storage Virtualizer Local Disk Firmware Version**

The version number of the firmware that is running on the disk.

**Storage Virtualizer Local Disk Capacity (GiB)**

The amount of storage space on the local disk.

**Storage Virtualizer Local Disk Speed (RPM)**

The speed of the storage virtualizer local disk.

**Related tasks:**

“Running the Storage Virtualizer - Local Disks Space Report” on page 1156  
To see information about the capacity of local disks on storage virtualizers, run the Storage Virtualizer - Local Disks Space Report.

**Running the Storage Virtualizer - MDisks Space Report**

To see information about used space and available space on managed disks (MDisks) on storage virtualizers, run the Storage Virtualizer - MDisks Space Report.

To run the report with the default settings, click **Finish**. By default all of the storage virtualizers in the list are selected.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Resources**.
2. Open the Storage Virtualizer folder.
3. Click **Storage Virtualizer - MDisks Space Report**.
4. Optional: Select one or more storage virtualizers.
5. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

**Related reference:**

“Storage Virtualizer - MDisks Space Report”

**Storage Virtualizer - MDisks Space Report**

The Storage Virtualizer - MDisks Space Report shows the space statistics for managed disks (MDisks) on storage virtualizers.

**Charts**

The bar chart shows the used space and the available space for MDisks on storage virtualizers.

**Report output**

For each MDisk on a storage virtualizer, the following information is provided:

**Storage Virtualizer MDisk Name**

The name that was assigned to the managed disk on a storage virtualizer when it was added to the system.

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Storage Virtualizer MDisk Capacity (GiB)**

The amount of storage space on the managed disk.

**Storage Virtualizer MDisk Used Space (GiB)**

The amount of used space on the managed disk.

**Storage Virtualizer MDisk Available Space (GiB)**

The amount of space on managed disks that is available to be added to a pool.

**Storage Virtualizer MDisk Strip Size (KiB)**

The number of blocks in a strip on a storage virtualizer managed disk.

**Storage Virtualizer MDisk Mode**

The access mode of a managed disk on a storage virtualizer. The access mode describes how extents are provided for virtual disks. Extents can be provided to virtual disks in the following ways:

**Array** Extents are provided from local disks.

**Managed**

Extents are provided from a back-end storage volume.

**Unmanaged**

The managed disk is not used in the system.

**Storage Virtualizer MDisk RAID Level**

The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

**Storage Virtualizer MDisk Type**

The type of managed disk on a storage virtualizer. For example, the storage virtualizer can be a local or virtual managed disk.

**Storage Virtualizer MDisk Is Balanced**

Shows whether logical unit numbers (LUNs) are properly balanced across storage controllers on the managed disk. If this value is Yes, the LUNs are properly balanced.

**Storage Virtualizer MDisk Fast Write State**

Shows whether the cache for a volume on a disk that is managed by a storage virtualizer is empty, contains data, or is corrupted.

**Storage Virtualizer MDisk Write Verify**

Shows whether all write operations on the storage virtualizer managed disk are verified by an immediate follow-up read operation. The follow-up read operation verifies that the write operation was successful. If this value is Yes, all write operations are verified by a follow-up read operation.

**Related tasks:**

“Running the Storage Virtualizer - MDisks Space Report” on page 1158

To see information about used space and available space on managed disks (MDisks) on storage virtualizers, run the Storage Virtualizer - MDisks Space Report.

**Running the Storage Virtualizer - Pools Space Report**

To see information about the used space and available space in pools on storage virtualizers, run the Storage Virtualizer - Pools Space Report.

To run the report with the default settings, click **Finish**. By default all of the storage virtualizers in the list are selected.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Resources**.

2. Open the Storage Virtualizer folder.
3. Click **Storage Virtualizer - Pools Space Report**.
4. Optional: Select one or more storage virtualizers.
5. Click **Finish**.

## **Storage Virtualizer - Pools Space Report**

The Storage Virtualizer - Pools Space Report shows the space statistics for pools on storage virtualizers.

### **Charts**

The bar chart shows the used space and available space for pools on storage virtualizers.

### **Report output**

**Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Storage Virtualizer Pool Capacity (GiB)**

The amount of storage space in the pool on the storage virtualizer. For SAN Volume Controller, this value represents the amount of managed disk space that is assigned to the managed disk group.

**Storage Virtualizer Pool Used Space (GiB)**

The amount of storage space that is used in the pool on the storage virtualizer.

**Storage Virtualizer Pool Available Space (GiB)**

The amount of unused storage space in a storage virtualizer pool.

**Storage Virtualizer Pool Real Volume Capacity (GiB)**

The amount of space on all allocated extents in a pool. The allocated extents include the used extents and extents that were assigned to volumes when they were allocated.

**Storage Virtualizer Pool Used Volume Space (GiB)**

The amount of used space on all the volumes and volume copies in the pool.

**Storage Virtualizer Pool Virtual Volume Capacity (GiB)**

The amount of virtual volume space on all volumes in the pool.

**Storage Virtualizer Pool Extent Size (MiB)**

The size of the extents that were specified when a pool was created.

**Storage Virtualizer Pool Number of Storage Volumes**

The number of volumes in the storage virtualizer pool.

**Storage Virtualizer Pool Number of MDisks**

The number of managed disks on a resource.

**Storage Virtualizer Pool Assigned Volume Space (GiB)**

The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

**Storage Virtualizer Pool Unassigned Volume Space (GiB)**

The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

**Storage Virtualizer Pool RAID Level**

The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

**Storage Virtualizer Pool Is Thin Provisioned**

Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is Yes, the resource is thin-provisioned.

**Storage Virtualizer Pool Is Solid State**

Shows whether there are solid-state drives in the pool. This property can contain the following values:

**Mixed** The pool contains both hard disk drives and solid-state drives.

**Non solid state**

The pool contains no solid-state drives.

**Solid state**

The pool contains a least one solid-state drive.

**Storage Virtualizer Pool Overallocation Percentage**

The percentage of space that is allocated to virtual capacity on volumes in the pool.

**Storage Virtualizer Pool Warning Level**

The percentage of used capacity of the resource at which a warning is generated.

**Report links**

To open related reports, click the name of the storage pool, click **Go To**, and then click the name of the report. You can open the following related reports:

- The Storage Virtualizer - Volumes Space Report
- The Storage Virtualizer - MDisks Space Report
- The Storage Virtualizer - Pools Historical Space Report

**Related tasks:**

“Running the Storage Virtualizer - Pools Space Report” on page 1159

To see information about the used space and available space in pools on storage virtualizers, run the Storage Virtualizer - Pools Space Report.

**Running the Storage Virtualizer - Volumes Space Report**

To see information about the capacity of volumes on storage virtualizers, run the Storage Virtualizer - Volumes Space Report.

To run the report with the default settings, click **Finish**. By default all of the storage virtualizers in the list are selected.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Resources**.
2. Open the Storage Virtualizer folder.
3. Click the **Storage Virtualizer - Volumes Space Report** link.
4. Optional: Select one or more storage virtualizers.
5. Optional: Select the type of volume.

Option	Description
<b>All</b>	Select <b>All</b> , the default, to view information about all of the volumes on the selected storage virtualizers.
<b>Primary</b>	Select <b>Primary</b> to view information about primary volumes on the selected storage virtualizers.
<b>Secondary</b>	Select <b>Secondary</b> to view information about secondary volumes on the selected storage virtualizers.

6. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

**Related reference:**

“Storage Virtualizer - Volumes Space Report”

### Storage Virtualizer - Volumes Space Report

The Storage Virtualizer - Volumes Space Report shows the space statistics for volumes on storage virtualizers.

### Charts

The bar chart shows the used space for volumes on storage virtualizers.

### Report output

For each volume on a storage virtualizer, the following information is provided:

**Storage Virtualizer Volume Name**

The name that was assigned to the storage virtualizer volume when it was added to the system.

**Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Storage Virtualizer Volume Copy ID**

The identifier of the storage virtualizer volume copy.

**Storage Virtualizer Volume Copy Is Primary**

Shows whether the storage virtualizer volume copy is the primary volume copy.

**Storage Virtualizer Volume Used Space (GiB)**

The amount of virtual space that is used on a thin-provisioned volume. For volumes that are not thin provisioned, this value is same as the **Storage Virtualizer Volume Capacity** value.

**Storage Virtualizer Volume Capacity (GiB)**

The amount of storage space on the volume.

**Storage Virtualizer Volume Real Space (GiB)**

The physical space for a thin-provisioned volume that was allocated when the volume was created.

**Storage Virtualizer Volume Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Storage Virtualizer Volume Is Assigned**

Shows whether the volume is assigned to a server. If this value is Yes, the volume is assigned to a server.

**Storage Virtualizer Volume Is Thin Provisioned**

Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is Yes, the resource is thin-provisioned.

**Storage Virtualizer Volume Warning Level**

The percentage of used capacity of the resource at which a warning is generated.

**Storage Virtualizer Volume Type**

The type of storage virtualizer volume. For example, the storage virtualizer volume can be striped, sequential, or another type of storage virtualizer volume.

**Storage Virtualizer Volume Grain Size (KiB)**

The unit in which space is allocated from a volume. Larger grain sizes maximize performance. Smaller grain sizes maximize space efficiency.

**Related links**

To open the related report, click the name of the volume, click **Go To**, and then click **Storage Virtualizer - Volumes Historical Space Report**.

## Storage system reports

Storage system reports show the space statistics for storage systems. The reports also show the space statistics for disks, pools, and volumes on storage systems.

**Running the Storage Systems - Space Report**

To see information about the capacity of disks, pools, and volumes on storage systems, run the Storage Systems - Space Report.

To run the report with the default settings, click **Finish**. By default all of the storage systems in the list are selected.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Resources**.
2. Open the Storage System folder.
3. Click **Storage Systems - Space Report**.
4. Optional: Select one or more storage systems.
5. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

**Related reference:**

“Storage Systems - Space Report”

The Storage Systems - Space Report shows the space statistics for pools, disks, and volumes on storage systems.

## **Storage Systems - Space Report**

The Storage Systems - Space Report shows the space statistics for pools, disks, and volumes on storage systems.

### **Charts**

The bar chart shows the used space and available space for pools on storage systems.

### **Report output**

For each storage system, the following information is provided:

**Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

**Storage System Type**

The type of storage system. For example, the storage system can be a DS8000, or an XIV system, or another type of storage system.

**Storage System Pool Capacity (GiB)**

The amount of storage space in pools that are on the storage system. For an XIV system, this value represents the physical capacity of the pool, not the virtual capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

**Storage System Used Pool Space (GiB)**

The amount of space that is in use in all pools on a storage system.

**Storage System Available Pool Space (GiB)**

The amount of unused space in pools that are on the storage system.

**Storage System Volume Capacity (GiB)**

The amount of space on all volumes on the storage system.

**Storage System Number of Volumes**

The number of volumes on a resource.

**Storage System Number of Disks**

The number of disks on the storage system.

**Storage System Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Storage System Unallocated Disk Space (GiB)**

The amount of disk space that can be added to a pool.

**Storage System Volume Capacity Assigned to MDisks (GiB)**

The amount of space that is on volumes that are assigned to a storage virtualizer to use as managed disks.

**Storage System Disk Capacity (GiB)**

The total amount of space that is on a physical disk on the storage system.

**Storage System Total Disk Capacity (GiB)**

The amount of space on physical disks on a storage system, including spare disks.

**Storage System Cache (GiB)**

The size of the cache on the storage system.

**Storage System Assigned Volume Space (GiB)**

The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

**Storage System Volume Capacity for z/OS**

The amount of space on all volumes on the storage system that the z/OS operating system can use.

**Storage System Real Available Pool Space (GiB)**

The amount of unused space in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

**Storage System Real Configured Pool Space (GiB)**

The amount of storage space that is in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

**Report links**

To open related reports, click the name of the storage system, click **Go To**, and then click the name of the report. You can open the following related reports:

- The Storage Systems - Historical Space Report
- The Storage System - Disks Space Report
- The Storage System - Volumes Space Report
- The Storage System - Pools Space Report

**Related tasks:**

“Running the Storage Systems - Space Report” on page 1163

To see information about the capacity of disks, pools, and volumes on storage systems, run the Storage Systems - Space Report.

**Running the Storage System - Disks Space Report**

To see information about the capacity of disks on DS4000, DS5000, and DS8000 storage systems, run the Storage System - Disks Space Report.

To run the report with the default settings, click **Finish**. By default all of the storage systems in the list are selected.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Resources**.
2. Open the Storage System folder.
3. Click **Storage System - Disks Space Report**.
4. Optional: Select one or more storage systems.
5. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

### **Storage System - Disks Space Report**

The Storage System - Disks Space Report shows the space statistics for disks on DS4000, DS5000, and DS8000 storage systems.

### **Charts**

The bar chart shows the capacity of disks, grouped by storage class, on storage systems.

### **Report output**

For each disk on a storage system, the following information is provided:

**Storage Disk Class**

The storage technology of the disk. This property applies only to DS8000, DS5000, and DS4000 storage systems. This property can contain the following values:

**FC** The disk is a Fibre Channel disk.

**Nearline ATA**

The disk is a nearline Advanced Technology Attachment disk.

**Nearline SAS**

The disk is a nearline serial-attached SCSI disk.

**SAS** The disk is a serial-attached SCSI disk.

**SATA** The disk is a Serial Advanced Technology Attachment disk.

**SSD** The disk is a solid-state drive.

**Unavailable**

The disk is on a DS5000 or DS4000 series system, and is not a solid-state drive.

**Storage Disk Name**

The name that was assigned to the storage disk when it was added to the system.

**Storage Disk Name**

The name of the resource.

**Storage System Type**

The type of storage system. For example, the storage system can be a DS8000, or an XIV system, or another type of storage system.

**Storage Pool Name**

The name of the resource.

**Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

**Storage Disk Vendor**

The vendor who supplied the resource.

**Storage Disk Model**

The model name or model number of the resource.

**Storage Disk Serial Number**

The serial number of the resource.

**Storage Disk Firmware Version**

The version number of the firmware that is running on the disk.

**Storage Disk Capacity (GiB)**

The amount of storage space that is on a physical disk on the storage system.

**Storage Disk Speed (RPM)**

The speed of the disk.

**Related tasks:**

“Running the Storage System - Disks Space Report” on page 1165

To see information about the capacity of disks on DS4000, DS5000, and DS8000 storage systems, run the Storage System - Disks Space Report.

**Running the Storage System - Pools Space Report**

To see information about the used and available space of pools on storage systems, run the Storage System - Pools Space Report.

To run the report with the default settings, click **Finish**. By default all of the storage systems in the list are selected.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Resources**.
2. Open the Storage System folder.
3. Click **Storage System - Pools Space Report**.
4. Optional: Select one or more storage systems.
5. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

“Storage System - Pools Space Report”

The Storage System - Pools Space Report shows the space statistics for pools on storage systems.

**Storage System - Pools Space Report**

The Storage System - Pools Space Report shows the space statistics for pools on storage systems.

**Charts**

The bar chart shows the used space and available space for pools on storage systems.

**Report output**

For each pool on a storage system, the following information is provided:

**Storage Pool Name**

The name that was assigned to the pool when it was added to the system.

**Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

**Storage Pool Capacity (GiB)**

The amount of storage space in the storage pool.

**Storage Pool Used Space (GiB)**

The amount of storage space that is used in the pool.

**Storage Pool Available Space (GiB)**

The amount of unused storage space in the pool.

**Storage Pool Assigned Volume Space (GiB)**

The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

**Storage Pool Unassigned Volume Space (GiB)**

The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

**Storage Pool Virtual Volume Capacity (GiB)**

The amount of virtual volume space on all volumes in the pool.

**Storage Pool Used Volume Space (GiB)**

The amount of used space on all the volumes in the pool.

**Storage Pool Real Configured Space (GiB)**

The amount of storage space that is in an XIV system pool that has an associated soft size. The soft size of a pool is the virtual size of a thin-provisioned pool.

**Storage Pool Real Available Space (GiB)**

The amount of unused space that is in an XIV system pool that has an associated soft size. The soft size of a pool is the virtual size of a thin-provisioned pool.

**Storage Pool Repository Capacity (GiB)**

The amount of space on all extents in the repository of a pool. This space can be used to allocate track space-efficient volumes. This attribute applies only to DS8000 storage systems.

**Storage Pool Used Repository Space (GiB)**

The amount of space on all extents in the repository of a pool that are allocated. This space can be used to allocate track space-efficient volumes. This attribute applies only to the DS8000 storage systems.

**Storage Pool Is Thin Provisioned**

Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is Yes, the resource is thin-provisioned.

**Storage Pool Is Solid State**

Shows whether there are solid-state drives in the pool. This property can contain the following values:

**Mixed** The pool contains both hard disk drives and solid-state drives.

**Non solid state**

The pool contains no solid-state drives.

**Solid state**

The pool contains a least one solid-state drive.

**Storage Pool RAID Level**

The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

**Report links**

To open related reports, click the name of the storage pool, click **Go To**, and then click the name of the report. You can open the following related reports:

**Storage System - Volumes Space Report**

The Storage System - Volumes Space Report shows the space statistics for volumes on storage systems.

**Charts**

The bar chart shows the used space for volumes on storage systems.

**Report output**

For each volume on a storage system, the following information is provided:

**Storage Volume Name**

The name that was assigned to the storage volume when it was added to the system.

**Storage Pool Name**

The name that was assigned to the pool when it was added to the system.

**Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

**Storage Volume WWN**

The worldwide name of the volume.

**Storage Volume Capacity (GiB)**

The amount of storage space on the volume.

**Storage Volume Used Space (GiB)**

The amount of virtual space that is used on a thin-provisioned volume. For volumes that are not thin provisioned, this value is same as the **Storage Volume Capacity** value. This property applies only to DS8000 storage systems.

**Storage Volume Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Storage Volume Is Assigned**

Shows whether the volume is assigned to a server. If this value is Yes, the volume is assigned to a server.

**Storage Volume Is Thin Provisioned**

Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is Yes, the resource is thin-provisioned.

**Storage Volume Logical Subsystem**

The logical subsystem (LSS) to which a volume or pool belongs.

**Storage Volume RAID Level**

The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

## Predefined reports about performance

You can run predefined reports to monitor the performance of switches, storage virtualizers, and storage systems over a specified period.

You can run the following predefined reports to monitor the performance of resources:

- Most active reports that show which are the most active resources on switches, storage virtualizers, and storage systems
- Detailed reports that show the performance statistics for resources such as switches, storage virtualizers, and storage systems
- Detailed reports that show the performance statistics for resources such as pools on storage virtualizers, or on storage systems

**Tip:** To learn more about reports, see frequently asked questions about reports in the IBM Tivoli Storage Productivity Center Information Center (<http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp>).

## Switch reports

Switch reports show the most active ports on switches. The reports also show information about the performance of switches and ports on switches.

### Running the Most Active Switch Ports Report

To see which ports are most active on switches, run the Most Active Switch Ports Report.

To run the report with the default settings, click **Finish**. By default all of the switches are selected.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Performance**.
2. Open the Fabric and Switch folder.
3. Click **Most Active Switch Ports Report**.
4. Select a switch, and then select a sort order.
5. Optional: Select an interval.
6. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

## 7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

### **Related reference:**

“Most Active Switch Ports Report”

## **Most Active Switch Ports Report**

The Most Active Switch Ports Report shows the performance statistics for the most active ports on a switch. Use the report to monitor the performance of ports over a specified period.

### **Charts**

The bar chart shows the most active ports on the switch. By default, ports are sorted by the total frame rate.

**Tip:** To change the sort order, select a value from the **Sort Order** list.

### **Report output**

The information that is provided about the most active ports on switches is as follows:

#### **Switch Name**

The user-defined name for the switch, or the name that was assigned to the switch by the vendor.

#### **Switch Port WWPN**

The worldwide port name of the port on the switch.

#### **Total Port Frame Rate (frames/s)**

The average number of frames per second that are transferred. This value includes frames that are sent and frames that are received by the port.

#### **Total Port Data Rate (MiB/s)**

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

#### **Overall Port Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

### **Related reports**

To open related reports, click the name of the resource or device, click **Go To**, and then click the name of the report. You can open the following related reports:

- Switch Performance Details Report
- Switch Port Performance Details Report

**Related tasks:**

**Switch Performance Details Report**

The Switch Performance Details Report shows the performance statistics for a switch. Use the report to monitor the performance of a switch over a specified period.

**Charts**

The charts show the following performance statistics for the ports on the switch:

- The send frame rates, the receive frame rates, and the total frame rates
- The send data rates, the receive data rates, and the total data rates
- The send bandwidth percentages, the receive bandwidth percentages, and the overall bandwidth percentages

**Report output**

The information that is provided about the switch is as follows:

**Switch Name**

The user-defined name for the switch, or the name that was assigned to the switch by the vendor.

**Day or Hour or Sample**

Depending on the interval that is selected to run the report, a row of information about the specified resource or device is provided at hourly, daily, or at a user-defined (sample) interval.

**Port Send Frame Rate (frames/s)**

The average number of frames per second that are sent through the port.

**Port Receive Frame Rate (frames/s)**

The average number of frames per second that are received by the port.

**Total Port Frame Rate (frames/s)**

The average number of frames per second that are transferred. This value includes frames that are sent and frames that are received by the port.

**Port Send Data Rate (MiB/s)**

The average rate at which data is sent through the port. The rate is measured in MiB per second.

**Port Receive Data Rate (MiB/s)**

The average rate at which data is received by the port. The rate is measured in MiB per second.

**Total Port Data Rate (MiB/s)**

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

**Port Send Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Port Receive Bandwidth Percentage**

The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Overall Port Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

## Switch Port Performance Details Report

The Switch Port Performance Details Report shows the performance statistics for a port on a switch. Use the report to monitor the performance of a port over a specified period.

### Charts

The charts show the following performance statistics for the port:

- The send frame rate, the receive frame rate, and the total frame rate
- The send data rate, the receive data rate, and the total data rate
- The send bandwidth percentage, the receive bandwidth percentage, and the overall bandwidth percentage
- The error rates

### Report output

The information that is provided about the port on the switch is as follows:

**Switch Name**

The user-defined name for the switch, or the name that was assigned to the switch by the vendor.

**Switch Port WWPN**

The worldwide port name of the port on the switch.

**Day or Hour or Sample**

Depending on the interval that is selected to run the report, a row of information about the specified resource or device is provided at hourly, daily, or at a user-defined (sample) interval.

**Port Send Frame Rate (frames/s)**

The average number of frames per second that are sent through the port.

**Port Receive Frame Rate (frames/s)**

The average number of frames per second that are received by the port.

**Total Port Frame Rate (frames/s)**

The average number of frames per second that are transferred. This value includes frames that are sent and frames that are received by the port.

**Port Send Data Rate (MiB/s)**

The average rate at which data is sent through the port. The rate is measured in MiB per second.

**Port Receive Data Rate (MiB/s)**

The average rate at which data is received by the port. The rate is measured in MiB per second.

**Total Port Data Rate (MiB/s)**

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

**Port Send Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Port Receive Bandwidth Percentage**

The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Overall Port Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Error Frame Rate (count/s)**

The average number of error frames per second that are received. An error frame is a frame that violates the Fibre Channel Protocol.

**Discarded Frame Rate (count/s)**

The average number of frames per second that are discarded because host buffers are unavailable for the port.

**Link Failure Rate (count/s)**

The average number of link errors per second.

**CRC Error Rate (count/s)**

The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

**Discarded Class 3 Frame Rate (count/s)**

The average number of class 3 frames per second that are discarded.

**Invalid Transmission Word Rate (count/s)**

The average number of bit errors per second that are detected.

**Related reports**

## Storage virtualizer reports

Storage virtualizer reports show the most active storage virtualizers, and the most active storage resources on storage virtualizers.

### Running the Storage Virtualizers - Most Active IO Groups Report

To see which I/O groups are most active on your storage virtualizers, run the Storage Virtualizers - Most Active IO Groups Report.

To run the report with the default settings, click **Finish**. By default all of the storage virtualizers are selected.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Performance**.
2. Open the Storage Virtualizer folder.
3. Click **Storage Virtualizers - Most Active IO Groups Report**.
4. Optional: Select a storage virtualizer, and then select a sort order.
5. Optional: Select an interval.
6. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

**Related reference:**

“Storage Virtualizers - Most Active IO Groups Report”

The Storage Virtualizers - Most Active IO Groups Report shows the performance statistics for the most active I/O groups on storage virtualizers. Use the report to monitor the performance of I/O groups over a specified period.

### Storage Virtualizers - Most Active IO Groups Report

The Storage Virtualizers - Most Active IO Groups Report shows the performance statistics for the most active I/O groups on storage virtualizers. Use the report to monitor the performance of I/O groups over a specified period.

### Charts

The chart shows the most active I/O groups on storage virtualizers. By default, I/O groups are sorted by the total overall I/O rate.

**Tip:** To change the sort order, select a value from the **Sort Order** list.

## Report output

The information that is provided for I/O groups is as follows:

### Storage Virtualizer Name

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

### Storage Virtualizer I/O Group Name

The name that was assigned to the I/O group on a storage virtualizer when it was added to the system.

### Total Response Time (ms/op)

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

### Total Normal I/O Rate (ops/s)

The average number of nonsequential I/O operations per second. This value includes both read and write operations.

### Total Data Rate (MiB/s)

The average number of MiB per second that are transferred for read operations and write operations.

### Processor Utilization Percentage

The average percentage of time that the processors are busy.

## Related reports

To open related reports, click the name of the resource or storage device, click **Go To**, and then click the name of the report. You can open the following related reports:

## Running the Storage Virtualizers - Most Active MDisks Report

To see which managed disks (MDisks) are most active on your storage virtualizers, run the Storage Virtualizers - Most Active MDisks Report.

To run the report with the default settings, click **Finish**. By default all of the storage virtualizers are selected.

**Tip:** To select a resource, click the resource. To select multiple resources, press **Ctrl** and click the resources. To select a series of resources, select the first resource, and then press **Shift** and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Performance**.
2. Open the Storage Virtualizer folder.
3. Click **Storage Virtualizers - Most Active MDisks Report**.
4. Optional: Select a storage virtualizer, and then select a sort order.
5. Optional: Select an interval.

- Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

- Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

**Related reference:**

“Storage Virtualizers - Most Active MDisks Report”

The Storage Virtualizers - Most Active MDisks Report shows the performance statistics for the most active managed disks (MDisks) on storage virtualizers. Use the report to monitor the performance of MDisks over a specified period.

### **Storage Virtualizers - Most Active MDisks Report**

The Storage Virtualizers - Most Active MDisks Report shows the performance statistics for the most active managed disks (MDisks) on storage virtualizers. Use the report to monitor the performance of MDisks over a specified period.

### **Charts**

The chart shows the most active MDisks on storage virtualizers. By default, MDisks are sorted by the total back-end I/O rate.

**Tip:** To change the sort order, select a value from the **Sort Order** list.

### **Report output**

The information that is provided for MDisks is as follows:

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

**Storage Virtualizer MDisk Name**

The name that was assigned to the managed disk on a storage virtualizer when it was added to the system.

**Overall Back-End Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Total Back-End I/O Rate (ops/s)**

The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

**Total Back-End Data Rate (MiB/s)**

The average rate at which data is transmitted between the back-end

storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

“Storage Virtualizers - Most Active Nodes Report”

The Storage Virtualizers - Most Active Nodes Report shows the performance statistics for the most active nodes on storage virtualizers. Use the report to monitor the performance of nodes over a specified period.

### Storage Virtualizers - Most Active Nodes Report

The Storage Virtualizers - Most Active Nodes Report shows the performance statistics for the most active nodes on storage virtualizers. Use the report to monitor the performance of nodes over a specified period.

### Charts

The chart shows the most active nodes on storage virtualizers. By default, nodes are sorted by the total overall I/O rate.

**Tip:** To change the sort order, select a value from the **Sort Order** list.

### Report output

The information that is provided for nodes is as follows:

#### Storage Virtualizer Name

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

#### Storage Virtualizer I/O Group Name

The name that was assigned to the I/O group on a storage virtualizer when it was added to the system.

#### Storage Virtualizer Node Name

The name that was assigned to the storage virtualizer node when it was added to the system.

#### Total Response Time (ms/op)

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

#### Total Overall I/O Rate (ops/s)

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

#### Total Data Rate (MiB/s)

The average number of MiB per second that are transferred for read operations and write operations.

#### Processor Utilization Percentage

The average percentage of time that the processors are busy.

### Related reports

To open related reports, click the name of the resource or device, click **Go To**, and then click the name of the report. You can open the following related reports:

- Storage Virtualizer - Details Report
- Storage Virtualizer - IO Group Details Report
- Storage Virtualizer - Node Details Report

**Related tasks:**

“Running the Storage Virtualizers - Most Active Nodes Report” on page 1180  
To see which nodes are most active on your storage virtualizers, run the Storage Virtualizers - Most Active Nodes Report.

**Running the Storage Virtualizers - Most Active Pools Report**

To see which pools are most active on your storage virtualizers, run the Storage Virtualizers - Most Active Pools Report.

To run the report with the default settings, click **Finish**. By default all of the storage virtualizers are selected.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Performance**.
2. Open the Storage Virtualizer folder.
3. Click **Storage Virtualizers - Most Active Pools Report**.
4. Optional: Select a storage virtualizer, and then select a sort order.
5. Optional: Select an interval.
6. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

## **Storage Virtualizers - Most Active Volumes Report**

The Storage Virtualizers - Most Active Volumes Report shows the performance statistics for the most active volumes on storage virtualizers. Use the report to monitor the performance of volumes over a specified period.

### **Charts**

The chart shows the most active volumes on storage virtualizers. By default, volumes are sorted by the total overall I/O rate.

**Tip:** To change the sort order, select a value from the **Sort Order** list.

### **Report output**

The information that is provided for volumes is as follows:

#### **Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

#### **Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

#### **Storage Virtualizer I/O Group Name**

The name that was assigned to the I/O group on a storage virtualizer when it was added to the system.

#### **Storage Virtualizer Volume Name**

The name that was assigned to the storage virtualizer volume when it was added to the system.

#### **Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

#### **Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

#### **Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

#### **Volume Utilization**

The average percentage of time that the volume is busy.

## Charts

The chart shows the most active ports on storage virtualizers. By default, ports are sorted by the total port I/O rate.

**Tip:** To change the sort order, select a value from the **Sort Order** list.

## Report output

The information that is provided for ports is as follows:

### Storage Virtualizer Name

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

### Storage Virtualizer Port Name

An alphanumeric string that identifies a storage virtualizer port.

### Total Port I/O Rate (ops/s)

The average number of send operations and receive operations per second.

### Total Port Data Rate (MiB/s)

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

### Overall Port Bandwidth Percentage

The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

## Related reports

## Storage virtualizer performance details reports

Storage virtualizer reports about performance details show information about the performance of storage virtualizers, and information about the performance of the resources related to storage virtualizers.

### Running the Storage Virtualizer - Details Report

To see information about the performance of storage virtualizers, run the Storage Virtualizer - Details Report.

To run the report, you must select a storage virtualizer.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Performance**.
2. Open the Storage Virtualizer folder.
3. Click **Storage Virtualizer Performance Details Report**.
4. Select a storage virtualizer.

5. Optional: Select an interval.
6. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

**Related reference:**

“Storage Virtualizer - Details Report”

The Storage Virtualizer - Details Report shows the performance statistics for a storage virtualizer. Use the report to monitor the performance of a storage virtualizer over a specified period.

### **Storage Virtualizer - Details Report**

The Storage Virtualizer - Details Report shows the performance statistics for a storage virtualizer. Use the report to monitor the performance of a storage virtualizer over a specified period.

### **Charts**

The charts show the following performance statistics for the storage virtualizer:

- Total overall rates for I/O operations, and the total overall response times
- The overall I/O rates for read and write operations, and the response times for read and write operations
- The data rates for read and write operations, and the total data rates
- The overall cache hit percentage for read operations, the cache delay percentage for write operations, and the utilization percentage for processors

### **Report output**

The information that is provided for a storage virtualizer is as follows:

#### **Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

#### **Day or Hour or Sample**

Depending on the interval that is selected to run the report, a row of information about the specified resource or device is provided at hourly, daily, or at a user-defined (sample) interval.

#### **Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

#### **Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

**Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

**Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

**Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Write Cache Delay Percentage**

The percentage of I/O operations that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as a percentage of all I/O operations.

**Processor Utilization Percentage**

The average percentage of time that the processors are busy.

**Related reports**

To open related reports, click the name of the storage virtualizer, click **Go To**, and then click the name of the report. You can open the following related reports:

## Storage Virtualizer - MDisk Details Report

The Storage Virtualizer - MDisk Details Report shows the performance statistics for a managed disk (MDisk) on a storage virtualizer. Use the report to monitor the performance of an MDisk over a specified period.

## Charts

The charts show the following performance statistics for an MDisk on a storage virtualizer:

- The total I/O rates for back-end operations, and the total response times for back-end operations
- The I/O rates for read and write back-end operations, and the response times for read and write back-end operations
- The total data rates for back-end operations, and the data rates for read and write back-end operations

- The overall queue times for back-end operations, and the queue times for read and write back-end operations

## Report output

The information that is provided for an MDisk is as follows:

### Storage Virtualizer Name

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

### Storage Virtualizer Pool Name

The name that was assigned to the pool when it was added to the system.

### Storage Virtualizer MDisk Name

The name that was assigned to the managed disk on a storage virtualizer when it was added to the system.

### Day or Hour or Sample

Depending on the interval that is selected to run the report, a row of information about the specified resource or device is provided at hourly, daily, or at a user-defined (sample) interval.

### Back-End Read I/O Rate (ops/s)

The average number of read operations per second that are issued to the back-end storage resources.

### Back-End Write I/O Rate (ops/s)

The average number of write operations per second that are issued to the back-end storage resources.

### Total Back-End I/O Rate (ops/s)

The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

### Back-End Read Response Time (ms/op)

The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

### Back-End Write Response Time (ms/op)

The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

### Overall Back-End Response Time (ms/op)

The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

### Back-End Read Data Rate (MiB/s)

The average number of MiB per second that are read from the back-end storage resources.

**Back-End Write Data Rate (MiB/s)**

The average number of MiB per second that are written to the back-end storage resources.

**Total Back-End Data Rate (MiB/s)**

The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

**Back-End Read Queue Time (ms/op)**

The average number of milliseconds that a read operation spends in the queue before being sent to the back-end storage resources.

**Back-End Write Queue Time (ms/op)**

The average number of milliseconds that write operations spend in the queue before being sent to the back-end storage resources.

**Overall Back-End Queue Time (ms/op)**

The average number of milliseconds that a read or a write operation spends in the queue before being sent to the back-end storage resources.

“Storage Virtualizer - Pool Details Report”

The Storage Virtualizer - Pool Details Report shows the performance statistics for a pool on a storage virtualizer. Use the report to monitor the performance of a pool over a specified period.

### **Storage Virtualizer - Pool Details Report**

The Storage Virtualizer - Pool Details Report shows the performance statistics for a pool on a storage virtualizer. Use the report to monitor the performance of a pool over a specified period.

### **Charts**

The charts show the following performance statistics for a pool on a storage virtualizer:

- The total overall rates for I/O operations, and the total response times
- The overall I/O rates for read and write operations, and the response times for read and write operations
- The total I/O rates for back-end operations, and overall response times for back-end operations
- The I/O rates for back-end read operations and back-end write operations, and the response rates for back-end read and back-end write operations

### **Report output**

The information that is provided for a pool is as follows:

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

**Day or Hour or Sample**

Depending on the interval that is selected to run the report, a row of information about the specified resource or device is provided at hourly, daily, or at a user-defined (sample) interval.

**Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

**Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

**Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

**Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

**Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Back-End Read I/O Rate (ops/s)**

The average number of read operations per second that are issued to the back-end storage resources.

**Back-End Write I/O Rate (ops/s)**

The average number of write operations per second that are issued to the back-end storage resources.

**Total Back-End I/O Rate (ops/s)**

The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

**Back-End Read Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Write Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Overall Back-End Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Related reports**

To open related reports, click the name of the storage virtualizer, click **Go To**, and then click **Storage Virtualizers - Most Active Pools Report**.

### Related tasks:

To see information about the performance of a pool on a storage virtualizer, run the Storage Virtualizer - Pool Details Report.

## Running the Storage Virtualizer - Volume Details Report

To see information about the performance of a volume on a storage virtualizer, run the Storage Virtualizer - Volume Details Report.

To run the report, you must select a storage virtualizer and a volume.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Performance**.
2. Open the Storage Virtualizer folder.
3. Click **Storage Virtualizer - Volume Details Report**.
4. Select a storage virtualizer.
5. Select a volume.
  - a. Type a keyword. For example, type lun, to find the names of volumes that start with lun. To change the default search option, click **Options**.

**Tip:** Use the percent symbol (%) as a wildcard. For example, type a% to find volume names that begin with 'a' or 'A'. Type %a to find volume names that begin with or contain the letter 'a' or 'A'. You can type % to retrieve all of the volumes on a resource.

- b. Click **Search**. If the search is successful, the names of the volumes are displayed in the **Choice** list.
  - c. From the list, select a volume.
6. Optional: Select an interval.
  7. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

### Related reference:

“Storage Virtualizer - Volume Details Report”

The Storage Virtualizer - Volume Details Report shows the performance statistics of a volume on a storage virtualizer. Use the report to monitor the performance of a volume over a specified period.

## Storage Virtualizer - Volume Details Report

The Storage Virtualizer - Volume Details Report shows the performance statistics of a volume on a storage virtualizer. Use the report to monitor the performance of a volume over a specified period.

### Charts

The charts show the following performance statistics for a volume on a storage virtualizer:

- The total overall rates for I/O operations, and the total response times
- The overall rates for I/O read operations, the overall rates for I/O write operations, the response times for read operations, and the response times for write operations
- The data rates for read operations, the data rates for write operations, and the total data rates
- The overall cache hit percentage for read operations, the cache delay percentage for write operations, and the utilization percentage for volumes

## Report output

The information that is provided for a volume is as follows:

### Storage Virtualizer Name

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

### Day or Hour or Sample

Depending on the interval that is selected to run the report, a row of information about the specified resource or device is provided at hourly, daily, or at a user-defined (sample) interval.

### Storage Virtualizer Pool Name

The name that was assigned to the pool when it was added to the system.

### Storage Virtualizer Volume Name

The name that was assigned to the storage virtualizer volume when it was added to the system.

### Overall Read I/O Rate (ops/s)

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

### Overall Write I/O Rate (ops/s)

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

### Total Overall I/O Rate (ops/s)

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

### Read Response Time (ms/op)

The average number of milliseconds to complete a read operation.

### Write Response Time (ms/op)

The average number of milliseconds to complete a write operation.

### Total Response Time (ms/op)

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

### Read Data Rate (MiB/s)

The average number of MiB per second that are transferred for read operations.

### Write Data Rate (MiB/s)

The average number of MiB per second that are transferred for write operations.

### Total Data Rate (MiB/s)

The average number of MiB per second that are transferred for read operations and write operations.

### **Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

### **Write Cache Delay Percentage**

The percentage of I/O operations that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as a percentage of all I/O operations.

### **Volume Utilization**

The average percentage of time that the volume is busy.

**Charts**

The charts show the following performance statistics for a port on a storage virtualizer:

- The total I/O rates
- The send I/O rates for ports, and the receive I/O rates for ports
- The send data rates for ports, the receive data rates for ports, and the total data rates for ports
- The overall bandwidth percentage for ports

**Report output**

The information that is provided for ports is as follows:

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Storage Virtualizer Port Name**

An alphanumeric string that identifies a storage virtualizer port.

**Day or Hour or Sample**

Depending on the interval that is selected to run the report, a row of information about the specified resource or device is provided at hourly, daily, or at a user-defined (sample) interval.

**Port Send I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which data is sent from a port.

**Port Receive I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which the port receives data.

**Total Port I/O Rate (ops/s)**

The average number of send operations and receive operations per second.

**Port Send Data Rate (MiB/s)**

The average rate at which data is sent through the port. The rate is measured in MiB per second.

**Port Receive Data Rate (MiB/s)**

The average rate at which data is received by the port. The rate is measured in MiB per second.

**Total Port Data Rate (MiB/s)**

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

**Overall Port Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Storage Systems - Most Active Arrays Report**

The Storage Systems - Most Active Arrays Report shows the performance statistics for the most active arrays on DS6000 series, DS8000 series, and IBM Enterprise Storage Server storage systems. Use the report to monitor the performance of arrays over a specified period.

**Charts**

The bar chart shows the most active arrays on DS6000 series, DS8000 series, and IBM Enterprise Storage Server storage systems. By default, arrays are sorted by the I/O rate.

**Tip:** To change the sort order, select a value from the **Sort Order** list.

## Report output

The information that is provided about the most active arrays is as follows:

### Storage System Name

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

### Storage System Controller Name

The name that was assigned to the controller when it was added to the system.

### Storage Pool Name

The name that was assigned to the pool when it was added to the system.

### Storage System Array Name

The name that was assigned to the array when it was added to the system.

### Total Response Time (ms/op)

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

### Total Overall I/O Rate (ops/s)

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

### Total Data Rate (MiB/s)

The average number of MiB per second that are transferred for read operations and write operations.

### Overall Back-End Response Time (ms/op)

The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

### Total Back-End I/O Rate (ops/s)

The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

### Total Back-End Data Rate (MiB/s)

The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

### Disk Utilization Percentage

The average percentage of time that the disks that are associated with an array are busy.

No value is calculated for this column if there are multiple ranks in the extent pool where the thin-provisioned volumes are allocated. In this case, N/A appears in this column. This limitation applies only to DS8000 storage systems.

If there is only a single rank in the extent pool, the value for this column is calculated regardless of the thin-provisioned volumes.

4. Select a storage system, and then select a sort order.
5. Optional: Select an interval.
6. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

The Storage Systems - Most Active Ports Report shows the performance statistics for the most active ports on storage systems. Use the report to monitor the performance of ports over a specified period.

### Storage Systems - Most Active Ports Report

The Storage Systems - Most Active Ports Report shows the performance statistics for the most active ports on storage systems. Use the report to monitor the performance of ports over a specified period.

### Charts

The bar chart shows the most active ports on storage systems. By default, ports are sorted by the I/O rate.

**Tip:** To change the sort order, select a value from the **Sort Order** list.

### Report output

The information that is provided about the most active ports is as follows:

**Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

**Storage System FC Port**

The number of the fibre channel (FC) port on the storage system.

**Overall Port Response Time (ms/op)**

The average number of milliseconds to complete a send or receive operation.

**Total Port I/O Rate (ops/s)**

The average number of send operations and receive operations per second.

**Total Port Data Rate (MiB/s)**

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

**Overall Port Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Related reports**

To open related reports, click the name of the resource or device, click **Go To**, and then click the name of the report. You can open the following related reports:

To see which ports are most active on storage systems, run the Storage Systems - Most Active Ports Report.

## Storage system performance details reports

Storage system reports about performance details show information about the performance of storage systems, and information about the performance of the resources related to storage systems.

**Running the Storage System - Details Report**

To see performance statistics for a storage system, run the Storage System - Details Report.

To run the report, you must select a storage system.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Performance**.
2. Open the Storage System folder.
3. Click **Storage System - Details Report**.
4. Select a storage system.
5. Optional: Select an interval.
6. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

**Related reference:**

“Storage System - Details Report”

The Storage System - Details Report shows the performance statistics for a storage system. Use the report to monitor the performance of a storage system over a specified period.

### **Storage System - Details Report**

The Storage System - Details Report shows the performance statistics for a storage system. Use the report to monitor the performance of a storage system over a specified period.

### **Charts**

The charts show the following performance statistics for a storage system:

- The total I/O rates, and the total response times
- The read I/O rates, write I/O rates, and response times
- The read data rates, and the write data rates
- The read cache hit percentages, and the write cache hit percentages

### **Report output**

The information that is provided about the storage system is as follows:

#### **Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

#### **Day or Hour or Sample**

Depending on the interval that is selected to run the report, a row of information about the specified resource or device is provided at hourly, daily, or at a user-defined (sample) interval.

#### **Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

#### **Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

#### **Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

#### **Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

#### **Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Related reports**

To open related reports, click the name of the storage system, click **Go To**, and then click the name of the report. You can open the following related reports:

To see performance statistics for a storage system, run the Storage System - Details Report.

**Running the Storage System - Array Details Report**

To see performance statistics for an array on DS6000 series, DS8000 series, and IBM Enterprise Storage Server storage systems, run the Storage System - Array Details Report.

To run the report, you must select a storage system and an array.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Performance**.
2. Open the Storage System folder.
3. Click **Storage System - Array Details Report**.
4. Select a storage system, and then select an array.
5. Optional: Select an interval.
6. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

**Related reference:**

“Storage System - Array Details Report”

The Storage System - Array Details Report shows the performance statistics for arrays on DS6000 series, DS8000 series, and IBM Enterprise Storage Server storage systems. Use the report to monitor the performance of an array over a specified period.

### **Storage System - Array Details Report**

The Storage System - Array Details Report shows the performance statistics for arrays on DS6000 series, DS8000 series, and IBM Enterprise Storage Server storage systems. Use the report to monitor the performance of an array over a specified period.

### **Charts**

The charts show the following performance statistics for arrays on storage systems:

- The total I/O rates, and the total response times
- The read I/O rates, the write I/O rates, the read response times, and the write response times
- The back-end I/O rates, and the back-end I/O response times
- The back-end read I/O rates, the back-end write I/O rates, the read response times, and the write response times

### **Report output**

The information that is provided about the array is as follows:

**Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

**Storage System Controller Name**

The name that was assigned to the controller when it was added to the system.

**Storage System Array Name**

The name that was assigned to the array when it was added to the system.

**Day or Hour or Sample**

Depending on the interval that is selected to run the report, a row of information about the specified resource or device is provided at hourly, daily, or at a user-defined (sample) interval.

**Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

**Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

**Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

**Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

**Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Back-End Read I/O Rate (ops/s)**

The average number of read operations per second that are issued to the back-end storage resources.

**Back-End Write I/O Rate (ops/s)**

The average number of write operations per second that are issued to the back-end storage resources.

**Total Back-End I/O Rate (ops/s)**

The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

**Back-End Read Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Write Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Overall Back-End Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Disk Utilization Percentage**

The average percentage of time that the disks that are associated with an array are busy.

No value is calculated for this column if there are multiple ranks in the extent pool where the thin-provisioned volumes are allocated. In this case, N/A appears in this column. This limitation applies only to DS8000 storage systems.

If there is only a single rank in the extent pool, the value for this column is calculated regardless of the thin-provisioned volumes.

## Storage System - Controller or Module Details Report

The Storage System - Controller or Module Details Report shows the performance statistics for controllers or modules on a storage system. Use the report to monitor the performance of a controller or an array over a specified period.

## Charts

The charts show the following performance statistics for each controller or module on a storage system:

- The total I/O rates, and the total response times
- The read I/O rates, the write I/O rates, and the response times
- The read data rates, and the write data rates
- The read cache hit percentages, and the write cache hit percentages

## Report output

The information that is provided about the controller or module is as follows:

### **Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

### **Storage System Controller Name or Module Name**

The name that was assigned to the controller or module when it was added to the system.

### **Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

### **Day or Hour or Sample**

Depending on the interval that is selected to run the report, a row of information about the specified resource or device is provided at hourly, daily, or at a user-defined (sample) interval.

### **Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

### **Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

### **Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

### **Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

### **Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

### **Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

### **Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

### **Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

### **Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

### **Overall Write Cache Hit Percentage**

To see performance statistics for controllers or modules on a storage system, run the Storage System - Controller or Module Details Report.

## Running the Storage System - Volume Details Report

To see performance statistics for volumes on a storage system, run the Storage System - Volume Details Report.

To run the report, you must select a storage system and a volume.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Performance**.
2. Open the Storage System folder.
3. Click **Storage System - Volume Details Report**.

4. Select a storage system.

5. Select a volume.

- a. Type a keyword. For example, type lun, to find the names of volumes that start with lun. To change the default search option, click **Options**.

**Tip:** Use the percent symbol (%) as a wildcard. For example, type a% to find volume names that begin with 'a' or 'A'. Type %a to find volume names that begin with or contain the letter 'a' or 'A'. You can type % to retrieve all of the volumes on a resource.

- b. Click **Search**. If the search is successful, the names of the volumes are displayed in the **Choice** list.

c. From the list, select a volume.

6. Optional: Select an interval.

7. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

## Predefined reports about historical information

You can run predefined reports about historical information to monitor how space is used on storage systems and storage virtualizers over a specified period.

You can run the following types of predefined report about historical information:

- Predefined reports that show how space is used on storage virtualizers and related resources such as:
  - Pools
  - Volumes
- Predefined reports that show how space is used on storage systems such as:
  - Pools
  - Volumes

**Tip:** To learn more about reports, see frequently asked questions about reports in the IBM Tivoli Storage Productivity Center Information Center (<http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp>).

## Running the Storage Virtualizers - Historical Space Report

To see how space on storage virtualizers is used, run the Storage Virtualizers - Historical Space Report.

To run the report with the default settings, click **Finish**. By default all of the storage virtualizers are selected.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Historical Information**.
2. Open the Storage Virtualizer folder.
3. Click **Storage Virtualizers - Historical Space Report**.
4. Optional: Select one or more storage virtualizers.
5. Optional: Select an interval.
6. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

### Related reference:

"Storage Virtualizers - Historical Space Report"

The Storage Virtualizers - Historical Space Report shows the usage of space on storage virtualizers over a specified period. Use the report to determine whether additional storage resources are required.

## Storage Virtualizers - Historical Space Report

The Storage Virtualizers - Historical Space Report shows the usage of space on storage virtualizers over a specified period. Use the report to determine whether additional storage resources are required.

### Charts

The chart shows the following space statistics for the storage virtualizers:

- The capacity of the pools on the storage virtualizers
- The used space in the pools on the storage virtualizers
- The available space in the pools on the storage virtualizers
- The capacity of the virtual volumes on the storage virtualizers
- The capacity of the managed disks (MDisks) on the storage virtualizers

### Report output

The following information is included in reports for storage virtualizers:

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Date** The date that the data was collected for the report.

**Storage Virtualizer Total Pool Capacity (GiB)**

The amount of storage space in pools on the storage virtualizer.

**Storage Virtualizer Pool Used Space (GiB)**

The amount of storage space that is used in the pool on the storage virtualizer.

**Storage Virtualizer Pool Available Space (GiB)**

The amount of unused storage space in a storage virtualizer pool.

**Storage Virtualizer Volume Allocated Space**

The amount of storage space that is allocated to volumes.

**Storage Virtualizer MDisk Capacity (GiB)**

The amount of storage space on the managed disk.

**Storage Virtualizer MDisk Available Space (GiB)**

The amount of space on managed disks that is available to be added to a pool.

**Storage Virtualizer Total Volume Capacity (GiB)**

The amount of virtual volume space on all volumes on the storage virtualizer.

**Storage Virtualizer Volume Assigned Space (GiB)**

The amount of virtual volume space that is assigned to the server or storage virtualizer.

**Storage Virtualizer Disk Capacity (GiB)**

The amount of local disk storage on the storage virtualizer.

**Storage Virtualizer Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Storage Virtualizer Number of Volumes**

The number of volumes in the storage virtualizer pool.

**Storage Virtualizer Number of MDisks**

The number of managed disks on a resource.

**Related tasks:**

“Running the Storage Virtualizers - Historical Space Report” on page 1224  
To see how space on storage virtualizers is used, run the Storage Virtualizers - Historical Space Report.

## Running the Storage Virtualizer - Pools Historical Space Report

To see how space in pools on a storage virtualizer is used, run the Storage Virtualizer - Pools Historical Space Report.

You can see how space in a pool on a storage virtualizer, or in pools in a storage resource group, are used.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Historical Information**.
2. Open the Storage Virtualizer folder.

3. Click **Storage Virtualizer - Pools Historical Space Report**.
4. Required: Select the type of historical space report that you want to create.
5. Optional: You can filter the type of data that you want to see in a report. You can select either of the following options:
  - **Of a Pool in a Storage Virtualizer**
    - a. Click **Next**.
    - b. Select a storage virtualizer, and then select a pool.
  - **Of Pools in a Storage Resource Group**
    - a. Click **Next**.
    - b. Select a storage resource group.
6. Optional: Select an interval.
7. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

**Related reference:**

“Storage Virtualizer - Pools Historical Space Report”

The Storage Virtualizer - Pools Historical Space Report shows the usage of space in a pool on a storage virtualizer, or of pools in a storage resource group over a specified period. Use the report to determine whether additional storage resources are required.

## Storage Virtualizer - Pools Historical Space Report

The Storage Virtualizer - Pools Historical Space Report shows the usage of space in a pool on a storage virtualizer, or of pools in a storage resource group over a specified period. Use the report to determine whether additional storage resources are required.

### Charts

The chart shows the following space statistics for the pool on the storage virtualizer:

- The capacity of the pool
- The used space in the pool
- The available space in the pool
- The virtual volume capacity of the pool
- The real volume capacity of the pool

The chart shows the following space statistics for the pools in the storage resource group:

- The capacity of the pools
- The used space in the pools

- The available space in the pools
- The virtual volume capacity of the pools
- The real volume capacity of the pools

## Report output

The following information is included in reports for a pool on a storage virtualizer, or for pools in a storage resource group:

### **Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

### **Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

**Date** The date that the data was collected for the report.

### **Storage Virtualizer Pool Capacity (GiB)**

The amount of storage space in the pool on the storage virtualizer. For SAN Volume Controller, this value represents the amount of managed disk space that is assigned to the managed disk group.

### **Storage Virtualizer Pool Available Space (GiB)**

The amount of unused storage space in a storage virtualizer pool.

### **Storage Virtualizer Pool Used Space (GiB)**

The amount of storage space that is used in the pool on the storage virtualizer.

### **Storage Virtualizer Pool Used Volume Space (GiB)**

The amount of used space on all the volumes and volume copies in the pool.

### **Storage Virtualizer Pool Real Volume Capacity (GiB)**

The amount of space on all allocated extents in a pool. The allocated extents include the used extents and extents that were assigned to volumes when they were allocated.

### **Storage Virtualizer Pool Virtual Volume Capacity (GiB)**

The amount of virtual volume space on all volumes in the pool.

### **Storage Virtualizer Pool Assigned Volume Space (GiB)**

The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

### **Storage Virtualizer Pool Unassigned Volume Space (GiB)**

The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

### **Storage Virtualizer Pool Number of Storage Volumes**

The number of volumes in the storage virtualizer pool.

### **Storage Virtualizer Pool Number of MDisks**

The number of managed disks on a resource.

**Related tasks:**

“Running the Storage Virtualizer - Pools Historical Space Report” on page 1225  
To see how space in pools on a storage virtualizer is used, run the Storage Virtualizer - Pools Historical Space Report.

## Running the Storage Virtualizer - Volumes Historical Space Report

To see how space on volumes on a storage virtualizer is used, run the Storage Virtualizer - Volumes Historical Space Report

You can see how space on a volume on a storage virtualizer, or on volumes in a storage resource group, are used.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Historical Information**.
2. Open the Storage Virtualizer folder.
3. Click **Storage Virtualizer - Volumes Historical Space Report**.
4. Required: Select the type of historical space report that you want to create.
5. Optional: You can filter the type of data that you want to see in a report. You can select either of the following options:
  - **Of a Volume in a Storage Virtualizer**
    - a. Click **Next**.
    - b. Select a storage virtualizer.
    - c. Type a keyword and click **Search**. For example, type lun, to find the names of volumes that start with lun. To change the default search option, click **Options**.

**Tip:** Use the percent symbol (%) as a wildcard. For example, type a% to find volume names that begin with 'a' or 'A'. Type %a to find volume names that begin with or contain the letter 'a' or 'A'. You can type % to retrieve all of the volumes on a resource.
    - d. Select a volume.
  - **Of Volumes in a Storage Resource Group**
    - a. Click **Next**.
    - b. Select a storage resource group.
6. Optional: Select an interval.
7. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.
8. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

**Related reference:**

The Storage Virtualizer - Volumes Historical Space Report shows the usage of space on a volume on a storage virtualizer, or on volumes in a storage resource group over a specified period. Use the report to determine whether additional storage resources are required.

## Storage Virtualizer - Volumes Historical Space Report

The Storage Virtualizer - Volumes Historical Space Report shows the usage of space on a volume on a storage virtualizer, or on volumes in a storage resource group over a specified period. Use the report to determine whether additional storage resources are required.

### Charts

The chart shows the following space statistics for the volume on the storage virtualizer:

- The capacity of the volume
- The used space on the volume
- The real space on the volume

The chart shows the following space statistics for the volumes in the storage resource group:

- The capacity of the volumes
- The used space on the volumes
- The real space on the volumes

If the volume is thin provisioned, the chart shows the total amount of virtual space that is allocated to the volume, and the total amount of real space that is used by the volume.

### Report output

The following information is included in reports for a volume on a storage virtualizer, or for volumes in a storage resource group:

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

**Storage Virtualizer Volume Name**

The name that was assigned to the storage virtualizer volume when it was added to the system.

**Date** The date that the data was collected for the report.

**Storage Virtualizer Volume Capacity (GiB)**

The amount of storage space on the volume.

**Storage Virtualizer Volume Overhead**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Storage Virtualizer Volume Used Space (GiB)**

The amount of virtual space that is used on a thin-provisioned volume. For volumes that are not thin provisioned, this value is same as the **Storage Virtualizer Volume Capacity** value.

**Storage Virtualizer Volume Real Space (GiB)**

The physical space for a thin-provisioned volume that was allocated when the volume was created.

**Related tasks:**

## Running the Storage Systems - Historical Space Report

To see how space on storage systems is used, run the Storage Systems - Historical Space Report.

To run the report with the default settings, click **Finish**. By default all of the storage systems are selected.

**Tip:** To select a resource, click the resource. To select multiple resources, press Ctrl and click the resources. To select a series of resources, select the first resource, and then press Shift and click the last resource.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Historical Information**.
2. Open the Storage System folder.
3. Click **Storage Systems - Historical Space Report**.
4. Optional: Select one or more storage systems.
5. Optional: Select an interval.
6. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

7. Click **Finish**.

If information is available for the resources that you selected, a report is created. If no information is available for the selected resources, or data collection is unsuccessful, a message is displayed in the report.

**Related reference:**

## Report output

The following information is included in reports for storage systems:

### **Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

**Date** The date that the data was collected for the report.

### **Storage System Pool Capacity (GiB)**

The amount of storage space in pools that are on the storage system. For an XIV system, this value represents the physical capacity of the pool, not the virtual capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

### **Storage System Used Pool Space (GiB)**

The amount of space that is in use in all pools on a storage system.

### **Storage System Available Pool Space (GiB)**

The amount of unused space in pools that are on the storage system.

### **Storage System Volume Capacity (GiB)**

The amount of space on all volumes on the storage system.

### **Storage System Number of Volumes**

The number of volumes on a resource.

### **Storage System Number of Disks**

The number of disks on the storage system.

### **Storage System Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

### **Storage System Unallocated Disk Space (GiB)**

The amount of disk space that can be added to a pool.

### **Storage System Volume Capacity Assigned to MDisks (GiB)**

The amount of space that is on volumes that are assigned to a storage virtualizer to use as managed disks.

### **Storage System Disk Capacity (GiB)**

The amount of storage space on physical disks on the storage system, excluding spare disks.

### **Storage System Total Disk Capacity (GiB)**

The amount of space on physical disks on a storage system, including spare disks.

### **Storage System Assigned Volume Space (GiB)**

The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

**Storage System Volume Capacity for z/OS (GiB)**

The amount of space on all volumes on the storage system that the z/OS operating system can use.

**Storage System Real Available Pool Space (GiB)**

The amount of unused space in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

**Storage System Real Configured Pool Space (GiB)**

The amount of storage space that is in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

**Related tasks:**

- The used space in the pools
- The available space in the pools
- The virtual volume capacity of the pools
- The used volume space in the pools

### Report output

The following information is included in reports for a pool on a storage system or for pools in a storage resource group:

**Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

**Storage Pool Name**

The name that was assigned to the pool when it was added to the system.

**Date** The date that the data was collected for the report.

**Storage System Pool Capacity (GiB)**

The amount of storage space in pools that are on the storage system. For an XIV system, this value represents the physical capacity of the pool, not the virtual capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

**Storage Pool Available Space (GiB)**

The amount of unused storage space in the pool.

**Storage Pool Used Space (GiB)**

The amount of storage space that is used in the pool.

**Storage Pool Virtual Volume Capacity (GiB)**

The amount of virtual volume space on all volumes in the pool.

**Storage Pool Used Volume Space (GiB)**

The amount of used space on all the volumes in the pool.

**Storage Pool Assigned Volume Space (GiB)**

The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

**Storage Pool Unassigned Volume Space (GiB)**

The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

**Storage Pool Real Configured Space (GiB)**

The amount of storage space that is in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

**Related tasks:**

## Storage System - Volumes Historical Space Report

The Storage System - Volumes Historical Space Report shows the usage of space on a volume on a storage system, or on volumes in a storage resource group over a specified period. Use the report to determine whether additional storage resources are required.

### Charts

The chart shows the following space statistics for the volume on a storage system:

- The capacity of the volume
- The used space on the volume
- The space on the volume that is used for system management

The chart shows the following space statistics for the volumes in a storage resource group:

- The capacity of the volumes
- The used space on the volumes
- The space on the volumes that is used for system management

If the volume is thin provisioned, the chart shows the total amount of virtual space that is allocated to the volume, and the total amount of real space that is used by the volume.

### Report output

The following information is included in reports for a volume on a storage system, or for volumes in a storage resource group:

**Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

**Storage Pool Name**

The name that was assigned to the pool when it was added to the system.

**Storage Volume Name**

The name that was assigned to the storage volume when it was added to the system.

**Date** The date that the data was collected for the report.

**Storage Volume Capacity (GiB)**

The amount of storage space on the volume.

**Storage Volume Used Space (GiB)**

The amount of virtual space that is used on a thin-provisioned volume. For volumes that are not thin provisioned, this value is same as the **Storage Volume Capacity** value. This property applies only to DS8000 storage systems.

**Storage Volume Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Related tasks:**

To see how space on volumes on storage systems is used, run the Storage System - Volumes Historical Space Report.

---

## Predefined reports about storage tiering

Use storage tier reports to help you determine the best storage-tier configuration for your environment.

### Information collection

IBM Tivoli Storage Productivity Center collects information from:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

Tivoli Storage Productivity Center provides Tivoli Common Reporting reports that show performance and usage data for the SAN Volume Controller, Storwize V7000, and Storwize V7000 Unified systems in your environment.

### Workload activity reports

Before you run workload activity reports, you must set the back-end properties of the managed disk (MDisk) groups in your environment.

You can use the Tivoli Storage Productivity Center CLI called `tcptool` to set the back-end properties of MDisk groups. Alternatively, you can set the properties in the MDisk Group Details page in the Tivoli Storage Productivity Center stand-alone GUI.

**Learn more:** For more information, see the topics about the `setarray` command, the `autosetarray` command, and the `lsarray` command in the IBM Tivoli Storage Productivity Center Information Center (<http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp>).

With the information that is collected from Tivoli Storage Productivity Center, you can run workload activity reports. The reports provide information about the workload activity of these resources:

- Managed disk (MDisk) groups
- Virtual disks (VDisks) in MDisk groups
- VDisks in storage resource groups
- VDisks in storage virtualizers

By analyzing workload activity reports, you can determine:

- Whether the workload activity of an MDisk group is too low or too high
- Whether a VDisk should be migrated in one of the following ways:
  - To an MDisk group with a faster read I/O capability rate
  - To an MDisk group with a slower read I/O capability rate

**Explanation:** In the predefined reports about performance, resources, and historical information, MDisk groups are called pools, and VDisks are called volumes.

### Volume migration recommendation report

Before you run the Volume Migration Recommendation Report report, complete the following tasks:

- Create a storage tiering policy
- Analyze the storage tiering policy

Tiering policies specify the conditions for migrating volumes from one storage resource group to another storage resource group. The Volume Migration Recommendation Report shows the volumes that might require migration based on the conditions that are set in the tiering policies.

## Running the MDisk Groups - Workload Activity Report

To see which managed disk (MDisk) groups are most active, run the MDisk Groups - Workload Activity Report.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Storage Tiering**.
2. Click **MDisk Groups - Workload Activity Report**.
3. Select a storage virtualizer.
4. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

5. Click **Finish**.

**Related reference:**

“MDisk Groups - Workload Activity Report”

Use the MDisk Groups - Workload Activity Report to monitor the workload activity of managed disk (MDisk) groups.

“Read I/O capability formula” on page 1272

The read I/O capability formula is used by IBM Tivoli Storage Productivity Center to estimate the workload capacity of managed disk (MDisk) groups.

## MDisk Groups - Workload Activity Report

Use the MDisk Groups - Workload Activity Report to monitor the workload activity of managed disk (MDisk) groups.

You can use the information that the report provides to investigate which MDisk groups are being under used or overused. To assess whether a virtual disk in an MDisk group should be migrated to a lower-capability or higher-capability MDisk group, you view the related MDisk Group - VDisk Workload Activity Details Report.

### Reporting periods

The name of the storage virtualizer, the date filter such as Last 7 days, and the reporting period are displayed on the report.

If you select **All** as the search filter when you run a report, the system date is displayed as the start date for the report. Depending on the time zone, 1969 or 1970 is displayed in the year field of the start date.

### Retention of report data

If you remove an MDisk group or a VDisk, the daily data that is collected for reports is retained for a configurable period. The default is 90 days. If you run a report after the data retention period expired, the daily data for the MDisk group or the VDisk is unavailable.

### Read I/O rate capability

To estimate the read I/O rate capability of an MDisk group, you must set the back-end pool properties of MDisk groups.

If you do not set the back-end pool properties of an MDisk group:

- Not Set is displayed in the MDisk Group Read I/O Rate Capability column
- Not Available is displayed in the MDisk Group Read I/O Rate Availability column

If the read I/O rate capability of an MDisk group is less than the maximum read I/O rate of the MDisk group, negative values are displayed in the report.

### Charts

The maximum length of an MDisk group, VDisk, or storage resource group name in charts is 25 characters. Names that are longer than 25 characters are truncated. To indicate that a name is truncated, an ellipsis (...) is appended to the name. For example, if the name of an MDisk group is myverylongmanageddiskgroupname123 in a chart, it is truncated and displayed as myverylongmanageddiskgroupname...

Two charts are displayed:

- Most Active MDisk Groups
- Most Available MDisk Groups

### Most Active MDisk Groups

For each MDisk group two bars are used:

- A yellow bar that shows the average activity value
- A red bar that shows the maximum activity value

To calculate the average activity value of an MDisk group, the following formula is used:

$\text{average}(\text{maximum\_read\_I/O\_rate} \div \text{read\_I/O\_rate\_capability})$

To calculate the maximum activity value, the following formula is used:

$\text{maximum}(\text{maximum\_read\_I/O\_rate} \div \text{read\_I/O\_rate\_capability})$

In this sample excerpt of report output for `mdiskgroup1`, the values that are required to calculate average and maximum activity values are provided.

MDisk Group Report Date	MDisk Group Read I/O Rate Capability (ops/s)	MDisk Group Max Read I/O Rate (ops/s)
Dec 6 2011	331	216.77
Dec 7 2011	331	256.40
Dec 8 2011	331	270.87

The average activity value of an MDisk group is calculated as follows:

1. For each report in the MDisk group, the value in the MDisk Group Max Read I/O Rate column is divided by the value in the MDisk Group Read I/O Rate Capability column:

$$216.77 \div 331 = 0.65$$

$$256.40 \div 331 = 0.77$$

$$270.87 \div 331 = 0.81$$

2. The result of the operation for each report is added:

$$0.65 + 0.77 + 0.81 = 2.23$$

3. To get the average value, the total is divided by the number of days that are specified in the date range. For example, if the reporting period spans 3 days, the total is divided by 3.

$$2.23 \div 3 = 0.74$$

The maximum value of an MDisk group is calculated as follows. For each report in an MDisk group, the value in the MDisk Group Max Read I/O Rate column is divided by the value in the MDisk Group Read I/O Rate Capability column:

$$216.77 \div 331 = 0.65$$

$$256.40 \div 331 = 0.77$$

$$270.87 \div 331 = 0.81$$

In this sample, the maximum value is 0.81.

### Most Available MDisk Groups

For each MDisk group two bars are used:

- A blue bar to represent minimum values
- A red bar to represent average values

In this sample excerpt of report output for mdiskgroup2, the values that are required to calculate minimum and average availability values for MDisk Groups are provided.

MDisk Group Report Date	MDisk Group Read I/O Rate Availability (ops/s)
Dec 6 2011	435.41
Dec 7 2011	560.92
Dec 8 2011	480.95

The minimum value of an MDisk group is calculated as follows:

- For all of the reports for an MDisk group, the lowest value in the MDisk Group Read I/O Rate Availability column is used. In this sample, the lowest value for mdiskgroup2 is 435.41.

The average value of an MDisk group is calculated as follows:

1. For each report in an MDisk group, the values in the MDisk Group Read I/O Rate Availability column are added:

$$435.41 + 560.92 + 480.95 = 1477.28$$

2. To get the average value, the total is divided by the number of days that are specified in the date range. (For example, if the reporting period spans 3 days, the total is divided by 3.)

$$1477.28 \div 3 = 492.42$$

In this sample, the average value is 492.42.

The number of MDisk groups in a storage virtualizer determines how many MDisk groups are displayed in each chart, as shown in the following table.

Number of MDisk groups in the storage virtualizer	Number of MDisk groups in the Most Active MDisk Groups chart	Number of MDisk groups in the Least Active MDisk Groups chart
≥ 10	5	5
9	5	4
8	4	4
7	4	3
6	3	3
5	3	2
4	2	2
3	2	1
2	1	1
1	1	0

**Tip:** Click the bar that represents an MDisk group in a chart to open the MDisk Group - VDisk Workload Activity Details Report. Alternatively, you can click the name of the MDisk group in the report.

### Threshold values

The names of the threshold values in the report that are used to monitor workload activity for MDisk groups are:

- Actual Size Threshold
- Read I/O Rate Threshold
- Max Read Response Time Threshold
- Max Write Response Time Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the value of the actual size threshold is changed during a reporting period from 50% to 60%, the name of the column is changed to MDisk Group Available Size < Actual Size Threshold of {50 - 60%}. The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: {%}. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used:

$$(\text{maximum\_response\_time\_value} \times \text{maximum\_response\_time\_threshold\_value}) \div 100.$$

The result is converted from seconds to hours and minutes, and displayed in the report. Read and write response times are sampled at 5-minute intervals over a 24-hour period.

## Report output

For each MDisk group, the following information is provided:

### **MDisk Group**

The name of the MDisk group.

### **MDisk Group Report Date**

The date that the data was collected for the report.

### **MDisk Group Capacity Status**

If the storage capacity that is allocated is less than the actual storage capacity, a status value of OK is displayed. If the storage capacity that is allocated is more than the actual storage capacity, a status value of Warning is displayed. The actual capacity of the MDisk group is calculated as follows:

$$(\text{mdisk\_group\_real\_capacity\_value} \div \text{mdisk\_group\_capacity\_value}) \times 100$$

### **MDisk Group Capacity (GB)**

The total storage capacity in GB of all of the disks in the MDisk group.

### **MDisk Group Real Capacity (GB)**

The total amount in GB of real storage capacity in the MDisk group.

### **MDisk Group Free Space (GB)**

The total amount of remaining capacity in GB that can be allocated to increase the size of an existing VDisk, or allocated to an additional VDisk.

### **MDisk Group Available Size < Actual Size Threshold of {%}**

If the amount of storage space that is available for allocation to VDIsks is less than the actual size threshold, Yes is displayed in the column. If the amount of storage space that is available for allocation to VDIsks is more than the actual size threshold, No is displayed in the column.

### **MDisk Group Read I/O Rate (ops/s)**

The read I/O rate of the MDisk group in operations per second.

### **MDisk Group Read I/O Rate Capability (ops/s)**

The read I/O capability rate of the MDisk group in operations per second.

**Tip:** To find out how the read I/O capability rate is calculated, see “Read I/O capability formula” on page 1272

**MDisk Group Max Read I/O Rate (ops/s)**

The maximum read I/O rate of the MDisk group in operations per second.

**MDisk Group Read I/O Rate Availability (ops/s)**

The difference between the read I/O capability rate and the maximum read I/O rate in operations per second.

**MDisk Group Read I/O Rate Availability < Read I/O Rate Capability Threshold of {%}** The availability rate for read I/O operations is compared with the read I/O rate capability threshold. If the availability rate for read I/O operations is less than the read I/O rate capability threshold, Yes is displayed in the column. If the availability rate for read I/O operations is more than the read I/O rate capability threshold, No is displayed in the column.

**MDisk Group Max Read Response Time (ms/op)**

The maximum read response time in milliseconds per operation.

**MDisk Group Max Read Response Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read response time threshold is exceeded over a 24 hour period.

**MDisk Group Average Read Response Time (ms/op)**

The average read response time in milliseconds per operation.

**MDisk Group Max Write I/O Rate (ops/s)**

The maximum write I/O rate in operations per second.

**MDisk Group Max Write Response Time (ms/op)**

The maximum write response time in milliseconds per operation.

**MDisk Group Max Write Response Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum write response time threshold is exceeded over a 24 hour period.

**MDisk Group Average Write Response Time (ms/op)**

The average write response time in milliseconds per operation.

**MDisk Group Average Write I/O Size (KB)**

The average size of write I/O operations in KB.

“Running the MDisk Groups - Workload Activity Report” on page 1237  
To see which managed disk (MDisk) groups are most active, run the MDisk Groups - Workload Activity Report.

## Running the MDisk Groups - VDisk Workload Activity Report

To see which virtual disks (VDisks) are most active in managed disk (MDisk) groups, run the MDisk Groups - VDisk Workload Activity Report.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Storage Tiering**.
2. Click **VDisk Workload Activity Reports**.
3. Select **MDisk Groups - VDisk Workload Activity Report**.
4. Select a storage virtualizer.

- Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

- Click **Finish**.

**Related reference:**

“MDisk Groups - VDisk Workload Activity Report”

Use the MDisk Groups - VDisk Workload Activity Report to monitor the performance of virtual disks (VDisks) in managed disk (MDisk) groups. The workload activity of each MDisk group is determined by calculating the average and the maximum peak utilization of the VDIs in the MDisk group.

## MDisk Groups - VDisk Workload Activity Report

Use the MDisk Groups - VDisk Workload Activity Report to monitor the performance of virtual disks (VDisks) in managed disk (MDisk) groups. The workload activity of each MDisk group is determined by calculating the average and the maximum peak utilization of the VDIs in the MDisk group.

### Reporting period

The name of the storage virtualizer, the date filter such as Last 7 days, and the reporting period are displayed on the report.

If you select **All** as the search filter when you run a report, the system date is displayed as the start date for the report. Depending on the time zone, 1969 or 1970 is displayed in the year field of the start date.

### Retention of report data

If you remove an MDisk group or a VDisk, the daily data that is collected for reports is retained for a configurable period. The default is 90 days. If you run a report after the data retention period expired, the daily data for the MDisk group or the VDisk is unavailable.

### VDisk migration

If a VDisk is migrated to another MDisk group during a reporting period, daily VDisk reports are produced only for the target MDisk group. For the target MDisk group, VDisk reports are produced from the day that the VDisk is migrated from the source MDisk group until the last day of the reporting period.

### Charts

The maximum length of an MDisk group, VDisk, or storage resource group name in charts is 25 characters. Names that are longer than 25 characters are truncated. To indicate that a name is truncated, an ellipsis (...) is appended to the name. For example, if the name of an MDisk group is myverylongmanageddiskgroupname123 in a chart, it is truncated and displayed as myverylongmanageddiskgroupname...

Two charts are shown:

### Most Active MDisk Groups chart

For each MDisk group two bars are shown:

- A yellow bar that shows average VDisk utilization
- A red bar that shows maximum VDisk utilization

To calculate average VDisk utilization, the following formula is used:

`average(vdisk_peak_utilization)`

To calculate maximum VDisk utilization, the following formula is used:

`maximum(vdisk_peak_utilization)`

In this sample excerpt of report output for VDisk1, the values that are required to calculate average and maximum VDisk utilization are provided.

VDisk Report Date	VDisk Peak Utilization (%)
Dec 6 2011	86.30
Dec 7 2011	50.01
Dec 8 2011	79.41

To calculate the average value of a VDisk:

1. The values for VDisk1 in the VDisk Utilization (%) column are added:  
 $86.30 + 50.01 + 79.41 = 215.72$
2. The total is divided by the number of days that are specified in the date range. For example, if the reporting period spans 3 days, the total is divided by 3.  
 $215.72 \div 3 = 71.91$

In the sample, the average peak VDisk utilization is 71.91.

For each MDisk group, the maximum VDisk utilization is also shown in the chart. The maximum VDisk utilization is the highest value for a VDisk in the VDisk Utilization (%) column. In the sample, the highest value for VDisk1 is 86.30.

### Least Active MDisk Groups chart

For each MDisk group two bars are shown:

- A yellow bar that shows average VDisk utilization
- A red bar that shows maximum VDisk utilization

The same formulas that are used in the most active MDisk group chart are also used in the least active MDisk group chart.

The number of MDisk groups in the storage virtualizer determines how many MDisk groups are shown in each chart, as shown in the following table.

Number of MDisk groups in the storage virtualizer	Number of MDisk groups in the Most Active MDisk Groups chart	Number of MDisk groups in the Least Active MDisk Groups chart
$\geq 10$	5	5
9	5	4
8	4	4
7	4	3
6	3	3

Number of MDisk groups in the storage virtualizer	Number of MDisk groups in the Most Active MDisk Groups chart	Number of MDisk groups in the Least Active MDisk Groups chart
5	3	2
4	2	2
3	2	1
2	1	1
1	1	0

**Tip:** Click the bar that represents an MDisk group in a chart to open the MDisk Group - VDisk Workload Activity Details Report. Alternatively, click the name of the MDisk group in the report. Click the name of the VDisk in the report to open the VDisk Details Report.

## Threshold values

The names of the threshold values that are used in the report to monitor workload activity for VDIs are as follows:

- VDisk Max Read Response Time Threshold
- VDisk Max Write Response Time Threshold
- Max Read Cache Hits Time Threshold
- Max Read I/O Rate Threshold
- Max Write I/O Rate Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the VDisk maximum read response time threshold value is changed during a reporting period from 70% to 80%, the name of the column is changed to VDisk Max Read Response Time Threshold of {70 - 80%} Exceeded By (hr.:min.). The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: {%}. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used:  $(\text{maximum\_response\_time\_value} \times \text{maximum\_response\_time\_threshold\_value}) / 100$ . The result is converted from seconds to hours and minutes, and displayed in the report. Read and write response times are sampled at 5-minute intervals over a 24-hour period.

## Report output

For each VDisk in an MDisk group, the following information is provided:

### **MDisk Group**

The name of the MDisk group.

**VDisk** The name of the VDisk.

### **VDisk Report Date**

The date that the data was collected for the report.

### **VDisk Capacity (GB)**

The total storage capacity of the VDisk in GB.

### **VDisk Thin Provisioning Status**

The warning level threshold is set in the thin provisioning profile for the

VDisk. The threshold is exceeded when the capacity of the VDisk that is used exceeds or is equal to the warning level threshold. If the used capacity of the VDisk in GB is  $\geq$  the specified warning threshold value, a status value of Warning is displayed. If the used capacity of the VDisk in GB is  $<$  the specified warning threshold value, a status value of OK is displayed. If thin provisioning is not used, a status value of Not Applicable is displayed.

**VDisk Peak Utilization (%)**

The highest value of VDisk utilization over a 24-hour period.

**VDisk Read I/O rate (ops/s)**

The read I/O rate of the VDisk in operations per second.

**VDisk Max Read I/O rate (ops/s)**

The maximum read I/O rate of the VDisk in operations per second.

**VDisk Average Read Response Time (ms/op)**

The average read response time in milliseconds per operation.

**VDisk Max Read Response Time (ms/op)**

The maximum read response time in milliseconds per operation.

**VDisk Max Read Response Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read response time threshold for the VDisk is exceeded over a 24 hour period.

**VDisk Write I/O Rate (ops/s)**

The write I/O rate in operations per second.

**VDisk Average Write Response Time (ms/op)**

The average write response time in milliseconds per operation.

**VDisk Max Write Response Time (ms/op)**

The maximum write response time in milliseconds per operation.

**VDisk Max Write Response Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum write response time threshold for the VDisk is exceeded over a 24 hour period.

**VDisk Max Read Density Rate (ops/s per GB)**

The maximum read density rate in operations per second per GB. This value is calculated by dividing the maximum read I/O rate in operations per second by the number of GB that the VDisk was allocated.

**VDisk I/O Rate Share of Total VDisk Read I/O Rate (%)**

The maximum read I/O rate of the VDisk as a percentage of the total maximum read I/O rate of all the VDIs in the MDisk group.

**VDisk Capacity Share of Total VDisk Capacity (%)**

The real capacity of the VDisk as a percentage of the real capacity of all the VDIs in the MDisk group.

**VDisk Average Read Cache Hits (%)**

The average read cache hits in percent.

**VDisk Max Read Cache Hits (%)**

The maximum read cache hits in percent.

**VDisk Max Read Cache Hits Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read cache hits time threshold is exceeded over a 24 hour period.

**VDisk Max Read I/O Rate Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read I/O rate threshold is exceeded over a 24 hour period.

**VDisk Max Write I/O Rate Threshold {%} Exceeded of By (hr.:min.)**

The number of hours and minutes that the maximum write I/O rate threshold is exceeded over a 24 hour period.

**VDisk Max Write Cache Delay I/O Rate (ops/s)**

The maximum write cache delay I/O rate of the VDisk in operations per second.

- VDisk Max Read Response Time Threshold
- VDisk Max Write Response Time Threshold
- Max Read Cache Hits Time Threshold
- Max Read I/O Rate Threshold
- Max Write I/O Rate Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the VDisk maximum read

response time threshold value is changed during a reporting period from 70% to 80%, the name of the column is changed to VDisk Max Read Response Time Threshold of {70 - 80%} Exceeded By (hr.:min.). The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: {%}. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used:  $(\text{maximum\_response\_time\_value} \times \text{maximum\_response\_time\_threshold\_value})/100$ . The result is converted from seconds to hours and minutes, and displayed in the report. Read and write response times are sampled at 5-minute intervals over a 24-hour period.

## Report output

For each VDisk in an MDisk group, the following information is provided:

### **MDisk Group**

The name of the MDisk group.

**VDisk** The name of the VDisk.

### **VDisk Report Date**

The date that the data was collected for the report.

### **VDisk Capacity (GB)**

The total storage capacity of the VDisk in GB.

### **VDisk Thin Provisioning Status**

The warning level threshold is set in the thin provisioning profile for the VDisk. The threshold is exceeded when the capacity of the VDisk that is used exceeds or is equal to the warning level threshold. If the used capacity of the VDisk in GB is  $\geq$  the specified warning threshold value, a status value of Warning is displayed. If the used capacity of the VDisk in GB is  $<$  the specified warning threshold value, a status value of OK is displayed. If thin provisioning is not used, a status value of Not Applicable is displayed.

### **VDisk Peak Utilization (%)**

The highest value of VDisk utilization over a 24-hour period.

### **VDisk Read I/O rate (ops/s)**

The read I/O rate of the VDisk in operations per second.

### **VDisk Max Read I/O rate (ops/s)**

The maximum read I/O rate of the VDisk in operations per second.

### **VDisk Average Read Response Time (ms/op)**

The average read response time in milliseconds per operation.

### **VDisk Max Read Response Time (ms/op)**

The maximum read response time in milliseconds per operation.

### **VDisk Max Read Response Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read response time threshold for the VDisk is exceeded over a 24 hour period.

### **VDisk Write I/O Rate (ops/s)**

The write I/O rate in operations per second.

### **VDisk Average Write Response Time (ms/op)**

The average write response time in milliseconds per operation.

### **VDisk Max Write Response Time (ms/op)**

The maximum write response time in milliseconds per operation.

**VDisk Max Write Response Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum write response time threshold for the VDisk is exceeded over a 24 hour period.

**VDisk Max Read Density Rate (ops/s per GB)**

The maximum read density rate in operations per second per GB. This value is calculated by dividing the maximum read I/O rate in operations per second by the number of GB that the VDisk was allocated.

**VDisk I/O Rate Share of Total VDisk Read I/O Rate (%)**

The maximum read I/O rate of the VDisk as a percentage of the total maximum read I/O rate of all the VDIs in the MDisk group.

**VDisk Capacity Share of Total VDisk Capacity (%)**

The real capacity of the VDisk as a percentage of the real capacity of all the VDIs in the MDisk group.

**VDisk Average Read Cache Hits (%)**

The average read cache hits in percent.

**VDisk Max Read Cache Hits (%)**

The maximum read cache hits in percent.

**VDisk Max Read Cache Hits Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read cache hits time threshold is exceeded over a 24 hour period.

### Charts

The maximum length of an MDisk group, VDisk, or storage resource group name in charts is 25 characters. Names that are longer than 25 characters are truncated. To indicate that a name is truncated, an ellipsis (...) is appended to the name. For example, if the name of an MDisk group is myverylongmanageddiskgroupname123 in a chart, it is truncated and displayed as myverylongmanageddiskgroupname...

Two charts are shown:

#### Most Active VDisks chart

For each storage virtualizer, two bars are shown:

- A yellow bar that shows average VDisk utilization
- A red bar that shows maximum VDisk utilization

To calculate average VDisk utilization, the following formula is used:

average(vdisk\_peak\_utilization)

To calculate maximum VDisk utilization, the following formula is used:

maximum(vdisk\_peak\_utilization)

In this sample excerpt of report output for VDisk1, the values that are required to calculate average and maximum VDisk utilization are provided.

VDisk Report Date	VDisk Peak Utilization (%)
Dec 6 2011	86.30
Dec 7 2011	50.01
Dec 8 2011	79.41

To calculate the average value of a VDisk:

1. The values for VDisk1 in the VDisk Utilization (%) column are added:

$$86.30 + 50.01 + 79.41 = 215.72$$

2. The total is divided by the number of days that are specified in the date range. For example, if the reporting period spans 3 days, the total is divided by 3.

$$215.72 \div 3 = 71.91$$

In the sample, the average peak VDisk utilization is 71.91.

In this sample excerpt of report output for VDisk1, the values that are required to calculate average and maximum VDisk utilization are provided.

VDisk Report Date	VDisk Peak Utilization (%)
Dec 6 2011	86.30
Dec 7 2011	50.01
Dec 8 2011	79.41

#### Least Active VDIsks chart

For each storage virtualizer, two bars are shown:

- A yellow bar that shows average VDisk utilization
- A red bar that shows maximum VDisk utilization

The same formulas that are used in the most active VDIsks chart are also used in the least active VDIsks chart.

The number of VDIsks in a storage virtualizer determines how many VDIsks are shown in each chart, as shown in the following table.

Number of VDIsks in the storage virtualizer	Number of VDIsks in the Most Active VDIsks chart	Number of VDIsks in the Least Active VDIsks chart
≥ 10	5	5
9	5	4
8	4	4
7	4	3
6	3	3
5	3	2

Number of VDIs in the storage virtualizer	Number of VDIs in the Most Active VDIs chart	Number of VDIs in the Least Active VDIs chart
4	2	2
3	2	1
2	1	1
1	1	0

**Tip:** Click the bar that represents a VDisk in a chart to open the VDisk Details Report. Alternatively, click the name of the VDisk in the report. Click the name of the MDisk group in the report to open the MDisk Group Details Report.

## Threshold values

The names of the threshold values that are used in the report to monitor workload activity for VDIs are as follows:

- VDisk Max Read Response Time Threshold
- VDisk Max Write Response Time Threshold
- Max Read Cache Hits Time Threshold
- Max Read I/O Rate Threshold
- Max Write I/O Rate Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the VDisk maximum read response time threshold value is changed during a reporting period from 70% to 80%, the name of the column is changed to VDisk Max Read Response Time Threshold of {70 - 80%} Exceeded By (hr.:min.). The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: {%}. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used:  $(\text{maximum\_response\_time\_value} \times \text{maximum\_response\_time\_threshold\_value}) / 100$ . The result is converted from seconds to hours and minutes, and displayed in the report. Read and write response times are sampled at 5-minute intervals over a 24-hour period.

## Report output

For each VDisk in a storage virtualizer, the following information is shown:

### **MDisk Group**

The name of the MDisk group.

**VDisk** The name of the VDisk.

### **VDisk Report Date**

The date that the data was collected for the report.

### **VDisk Capacity (GB)**

The total storage capacity of the VDisk in GB.

### **VDisk Thin Provisioning Status**

The warning level threshold is set in the thin provisioning profile for the VDisk. The threshold is exceeded when the capacity of the VDisk that is used exceeds or is equal to the warning level threshold. If the used capacity of the VDisk in GB is  $\geq$  the specified warning threshold value, a

status value of Warning is displayed. If the used capacity of the VDisk in GB is < the specified warning threshold value, a status value of OK is displayed. If thin provisioning is not used, a status value of Not Applicable is displayed.

**VDisk Peak Utilization (%)**

The highest value of VDisk utilization over a 24-hour period.

**VDisk Read I/O rate (ops/s)**

The read I/O rate of the VDisk in operations per second.

**VDisk Max Read I/O rate (ops/s)**

The maximum read I/O rate of the VDisk in operations per second.

**VDisk Average Read Response Time (ms/op)**

The average read response time in milliseconds per operation.

**VDisk Max Read Response Time (ms/op)**

The maximum read response time in milliseconds per operation.

**VDisk Max Read Response Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read response time threshold for the VDisk is exceeded over a 24 hour period.

**VDisk Write I/O Rate (ops/s)**

The write I/O rate in operations per second.

**VDisk Average Write Response Time (ms/op)**

The average write response time in milliseconds per operation.

**VDisk Max Write Response Time (ms/op)**

The maximum write response time in milliseconds per operation.

**VDisk Max Write Response Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum write response time threshold for the VDisk is exceeded over a 24 hour period.

**VDisk Max Read Density Rate (ops/s per GB)**

The maximum read density rate in operations per second per GB. This value is calculated by dividing the maximum read I/O rate in operations per second by the number of GB that the VDisk was allocated.

**VDisk I/O Rate Share of Total VDisk Read I/O Rate (%)**

The maximum read I/O rate of the VDisk as a percentage of the total maximum read I/O rate of all the VDIs in the MDisk group.

**VDisk Capacity Share of Total VDisk Capacity (%)**

The real capacity of the VDisk as a percentage of the real capacity of all the VDIs in the MDisk group.

**VDisk Average Read Cache Hits (%)**

The average read cache hits in percent.

**VDisk Max Read Cache Hits (%)**

The maximum read cache hits in percent.

**VDisk Max Read Cache Hits Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read cache hits time threshold is exceeded over a 24 hour period.

**VDisk Max Read I/O Rate Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read I/O rate threshold is exceeded over a 24 hour period.

**VDisk Max Write I/O Rate Threshold {%} Exceeded of By (hr.:min.)**

The number of hours and minutes that the maximum write I/O rate threshold is exceeded over a 24 hour period.

**VDisk Max Write Cache Delay I/O Rate (ops/s)**

The maximum write cache delay I/O rate of the VDisk in operations per second.

**Related tasks:**

“Running the Storage Virtualizer - VDisk Workload Activity Report” on page 1251  
To see which virtual disks (VDisks) are most active on a storage virtualizer, run the Storage Virtualizer - VDisk Workload Activity Report.

## Running the Storage Resource Group - VDisk Workload Activity Report

To see which virtual disks (VDisks) are most active in storage resource groups, run the Storage Resource Group - VDisk Workload Activity Report.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Storage Tiering**.
2. Click **VDisk Workload Activity Reports**.
3. Select **Storage Resource Group - VDisk Workload Activity Report**.
4. Select a storage virtualizer.
5. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

6. Click **Finish**.

**Related reference:**

“Storage Resource Group - VDisk Workload Activity Report”

Use the Storage Resource Group - VDisk Workload Activity Report to monitor the workload activity of virtual disks (VDisks) in storage resource groups. The workload activity of each storage resource group is determined by calculating the average and maximum peak utilization of the VDisks in the storage resource group.

## Storage Resource Group - VDisk Workload Activity Report

Use the Storage Resource Group - VDisk Workload Activity Report to monitor the workload activity of virtual disks (VDisks) in storage resource groups. The workload activity of each storage resource group is determined by calculating the average and maximum peak utilization of the VDisks in the storage resource group.

### Reporting period

The name of the storage virtualizer, the date filter such as Last 7 days, and the reporting period are shown on the report.

If you select **All** as the search filter when you run a report, the system date is displayed as the start date for the report. Depending on the time zone, 1969 or 1970 is displayed in the year field of the start date.

## Retention of report data

If you remove an MDisk group or a VDisk, the daily data that is collected for reports is retained for a configurable period. The default is 90 days. If you run a report after the data retention period expired, the daily data for the MDisk group or the VDisk is unavailable.

## VDisk migration

If a VDisk is migrated to another MDisk group during a reporting period, daily VDisk reports are produced only for the target MDisk group. For the target MDisk group, VDisk reports are produced from the day that the VDisk is migrated from the source MDisk group until the last day of the reporting period.

## Charts

The maximum length of an MDisk group, VDisk, or storage resource group name in charts is 25 characters. Names that are longer than 25 characters are truncated. To indicate that a name is truncated, an ellipsis (...) is appended to the name. For example, if the name of an MDisk group is myverylongmanageddiskgroupname123 in a chart, it is truncated and displayed as myverylongmanageddiskgroupname...

Two charts are shown:

### Most Active Storage Resource Groups chart

For each storage resource group, two bars are shown:

- A yellow bar that shows average VDisk utilization
- A red bar that shows maximum VDisk utilization

To calculate average VDisk utilization, the following formula is used:

`average(vdisk_peak_utilization)`

To calculate maximum VDisk utilization, the following formula is used:

`maximum(vdisk_peak_utilization)`

In this sample excerpt of report output for VDisk1, the values that are required to calculate average and maximum VDisk utilization are provided.

VDisk Report Date	VDisk Peak Utilization (%)
Dec 6 2011	86.30
Dec 7 2011	50.01
Dec 8 2011	79.41

To calculate the average value of a VDisk:

1. The values for VDisk1 in the VDisk Utilization (%) column are added:  
 $86.30 + 50.01 + 79.41 = 215.72$
2. The total is divided by the number of days that are specified in the date range. For example, if the reporting period spans 3 days, the total is divided by 3.  
 $215.72 \div 3 = 71.91$

In the sample, the average peak VDisk utilization is 71.91.

In this sample excerpt of report output for VDisk1, the values that are required to calculate average and maximum VDisk utilization are provided.

VDisk Report Date	VDisk Peak Utilization (%)
Dec 6 2011	86.30
Dec 7 2011	50.01
Dec 8 2011	79.41

### Least Active Storage Resource Groups chart

For each storage resource group, two bars are shown:

- A yellow bar that shows average VDisk utilization
- A red bar that shows maximum VDisk utilization

The same formulas that are used in the most active storage resource groups chart are also used in the least active storage resource groups chart.

The number of storage resource groups in a storage virtualizer determines how many storage resource groups are shown in each chart, as shown in the table.

Number of storage resource groups in the storage virtualizer	Number of storage resource groups in the Most Active Storage Resource Groups chart	Number of storage resource groups in the Least Active Storage Resource Groups chart
≥ 10	5	5
9	5	4
8	4	4
7	4	3
6	3	3
5	3	2
4	2	2
3	2	1
2	1	1
1	1	0

**Tip:** Click the bar that represents a storage resource group to open the Storage Resource Group: VDisk Workload Activity Details Report. Alternatively, click the name of the storage resource group in the report. Click the name of the VDisk in the report to open the VDisk Details Report. Click the name of the MDisk group in the report to open the MDisk Group Details Report.

### Threshold values

The names of the threshold values that are used in the report to monitor workload activity for VDIs are as follows:

- VDisk Max Read Response Time Threshold
- VDisk Max Write Response Time Threshold
- Max Read Cache Hits Time Threshold
- Max Read I/O Rate Threshold
- Max Write I/O Rate Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the VDisk maximum read response time threshold value is changed during a reporting period from 70% to 80%, the name of the column is changed to VDisk Max Read Response Time Threshold of {70 - 80%} Exceeded By (hr.:min.). The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: {%}. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used:  $(\text{maximum\_response\_time\_value} \times \text{maximum\_response\_time\_threshold\_value})/100$ . The result is converted from seconds to hours and minutes, and displayed in the report. Read and write response times are sampled at 5-minute intervals over a 24-hour period.

## Report output

For each storage resource group in a storage virtualizer, the following information is provided about VDIs:

### Storage Resource Group

The name of the storage resource group.

### MDisk Group

The name of the MDisk group.

**VDisk** The name of the VDisk.

### VDisk Report Date

The date that the data was collected for the report.

### VDisk Capacity (GB)

The total storage capacity of the VDisk in GB.

### VDisk Thin Provisioning Status

The warning level threshold is set in the thin provisioning profile for the VDisk. The threshold is exceeded when the capacity of the VDisk that is used exceeds or is equal to the warning level threshold. If the used capacity of the VDisk in GB is  $\geq$  the specified warning threshold value, a status value of Warning is displayed. If the used capacity of the VDisk in GB is  $<$  the specified warning threshold value, a status value of OK is displayed. If thin provisioning is not used, a status value of Not Applicable is displayed.

### VDisk Peak Utilization (%)

The highest value of VDisk utilization over a 24-hour period.

### VDisk Read I/O rate (ops/s)

The read I/O rate of the VDisk in operations per second.

### VDisk Max Read I/O rate (ops/s)

The maximum read I/O rate of the VDisk in operations per second.

### VDisk Average Read Response Time (ms/op)

The average read response time in milliseconds per operation.

### VDisk Max Read Response Time (ms/op)

The maximum read response time in milliseconds per operation.

### VDisk Max Read Response Time Threshold of {%} Exceeded By (hr.:min.)

The number of hours and minutes that the maximum read response time threshold for the VDisk is exceeded over a 24 hour period.

**VDisk Write I/O Rate (ops/s)**

The write I/O rate in operations per second.

**VDisk Average Write Response Time (ms/op)**

The average write response time in milliseconds per operation.

**VDisk Max Write Response Time (ms/op)**

The maximum write response time in milliseconds per operation.

**VDisk Max Write Response Time Threshold of { % } Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum write response time threshold for the VDisk is exceeded over a 24 hour period.

**VDisk Max Read Density Rate (ops/s per GB)**

The maximum read density rate in operations per second per GB. This value is calculated by dividing the maximum read I/O rate in operations per second by the number of GB that the VDisk was allocated.

**VDisk I/O Rate Share of Total VDisk Read I/O Rate (%)**

The maximum read I/O rate of the VDisk as a percentage of the total maximum read I/O rate of all the VDIs in the MDisk group.

**VDisk Capacity Share of Total VDisk Capacity (%)**

The real capacity of the VDisk as a percentage of the real capacity of all the VDIs in the MDisk group.

**VDisk Average Read Cache Hits (%)**

The average read cache hits in percent.

**VDisk Max Read Cache Hits (%)**

The maximum read cache hits in percent.

**VDisk Max Read Cache Hits Time Threshold of { % } Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read cache hits time threshold is exceeded over a 24 hour period.

**VDisk Max Read I/O Rate Threshold of { % } Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read I/O rate threshold is exceeded over a 24 hour period.

**VDisk Max Write I/O Rate Threshold { % } Exceeded of By (hr.:min.)**

The number of hours and minutes that the maximum write I/O rate threshold is exceeded over a 24 hour period.

**VDisk Max Write Cache Delay I/O Rate (ops/s)**

The maximum write cache delay I/O rate of the VDisk in operations per second.

## Threshold values

The names of the threshold values that are used in the report to monitor workload activity for VDIs are as follows:

- VDisk Max Read Response Time Threshold
- VDisk Max Write Response Time Threshold
- Max Read Cache Hits Time Threshold
- Max Read I/O Rate Threshold
- Max Write I/O Rate Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the VDisk maximum read response time threshold value is changed during a reporting period from 70% to 80%, the name of the column is changed to VDisk Max Read Response Time Threshold of {70 - 80%} Exceeded By (hr.:min.). The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: {%}. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used:  $(\text{maximum\_response\_time\_value} \times \text{maximum\_response\_time\_threshold\_value})/100$ . The result is converted from seconds to hours and minutes, and displayed in the report. Read and write response times are sampled at 5-minute intervals over a 24-hour period.

## Report output

The following information is provided about VDIs in the storage resource group:

### MDisk Group

The name of the MDisk group.

**VDisk** The name of the VDisk.

**VDisk Report Date**

The date that the data was collected for the report.

**VDisk Capacity (GB)**

The total storage capacity of the VDisk in GB.

**VDisk Thin Provisioning Status**

The warning level threshold is set in the thin provisioning profile for the VDisk. The threshold is exceeded when the capacity of the VDisk that is used exceeds or is equal to the warning level threshold. If the used capacity of the VDisk in GB is  $\geq$  the specified warning threshold value, a status value of `Warning` is displayed. If the used capacity of the VDisk in GB is  $<$  the specified warning threshold value, a status value of `OK` is displayed. If thin provisioning is not used, a status value of `Not Applicable` is displayed.

**VDisk Peak Utilization (%)**

The highest value of VDisk utilization over a 24-hour period.

**VDisk Read I/O rate (ops/s)**

The read I/O rate of the VDisk in operations per second.

**VDisk Max Read I/O rate (ops/s)**

The maximum read I/O rate of the VDisk in operations per second.

**VDisk Average Read Response Time (ms/op)**

The average read response time in milliseconds per operation.

**VDisk Max Read Response Time (ms/op)**

The maximum read response time in milliseconds per operation.

**VDisk Max Read Response Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read response time threshold for the VDisk is exceeded over a 24 hour period.

**VDisk Write I/O Rate (ops/s)**

The write I/O rate in operations per second.

**VDisk Average Write Response Time (ms/op)**

The average write response time in milliseconds per operation.

**VDisk Max Write Response Time (ms/op)**

The maximum write response time in milliseconds per operation.

**VDisk Max Write Response Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum write response time threshold for the VDisk is exceeded over a 24 hour period.

**VDisk Max Read Density Rate (ops/s per GB)**

The maximum read density rate in operations per second per GB. This value is calculated by dividing the maximum read I/O rate in operations per second by the number of GB that the VDisk was allocated.

**VDisk I/O Rate Share of Total VDisk Read I/O Rate (%)**

The maximum read I/O rate of the VDisk as a percentage of the total maximum read I/O rate of all the VDIs in the MDisk group.

**VDisk Capacity Share of Total VDisk Capacity (%)**

The real capacity of the VDisk as a percentage of the real capacity of all the VDIs in the MDisk group.

**VDisk Average Read Cache Hits (%)**

The average read cache hits in percent.

**VDisk Max Read Cache Hits (%)**

The maximum read cache hits in percent.

**VDisk Max Read Cache Hits Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read cache hits time threshold is exceeded over a 24 hour period.

**VDisk Max Read I/O Rate Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read I/O rate threshold is exceeded over a 24 hour period.

**VDisk Max Write I/O Rate Threshold {%} Exceeded of By (hr.:min.)**

The number of hours and minutes that the maximum write I/O rate threshold is exceeded over a 24 hour period.

**VDisk Max Write Cache Delay I/O Rate (ops/s)**

The maximum write cache delay I/O rate of the VDisk in operations per second.

**Related tasks:**

“Running the Storage Resource Group - VDisk Workload Activity Details Report” on page 1260

To see which virtual disks (VDisks) are most active in a storage resource group, run the Storage Resource Group - VDisk Workload Activity Details Report.

## Running the MDisk Group Details Report

To see statistics about the performance of a managed disk (MDisk) group, run the MDisk Group Details Report.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Storage Tiering**.
2. Click **MDisk Group Details Report**.
3. Select a storage virtualizer, and then select an MDisk group.
4. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

5. Click **Finish**.

**Related reference:**

“MDisk Group Details Report”

Use the MDisk Group Details Report to monitor the workload activity of a managed disk (MDisk) group.

## MDisk Group Details Report

Use the MDisk Group Details Report to monitor the workload activity of a managed disk (MDisk) group.

The report provides information about the workload activity and capacity of a selected MDisk group. Based on the information that is provided in the report, you can analyze storage services for an MDisk group.

## Reporting period

The name of the storage virtualizer, the name of the MDisk group, the date filter such as Last 7 days, and the reporting period are displayed on the report.

If you select **All** as the search filter when you run a report, the system date is displayed as the start date for the report. Depending on the time zone, 1969 or 1970 is displayed in the year field of the start date.

## Retention of report data

If you remove an MDisk group or a VDisk, the daily data that is collected for reports is retained for a configurable period. The default is 90 days. If you run a report after the data retention period expired, the daily data for the MDisk group or the VDisk is unavailable.

## Read I/O rate capability

If you do not set the back-end pool properties of an MDisk group:

- Not Set is displayed in the MDisk Group Read I/O Rate Capability column
- Not Available is displayed in the MDisk Group Read I/O Rate Availability column

If the read I/O rate capability of an MDisk group is less than the maximum read I/O rate of the MDisk group, negative values are displayed in the report.

## Threshold values

The names of the threshold values in the report that are used to monitor workload activity for MDisk groups are:

- Actual Size Threshold
- Read I/O Rate Threshold
- Max Read Response Time Threshold
- Max Write Response Time Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the value of the actual size threshold is changed during a reporting period from 50% to 60%, the name of the column is changed to MDisk Group Available Size < Actual Size Threshold of {50 - 60%}. The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: {%}. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used:

$(\text{maximum\_response\_time\_value} \times \text{maximum\_response\_time\_threshold\_value}) \div 100$ .

**Tip:** To monitor the workload activity of all MDisk groups in a storage virtualizer, run the MDisk Groups - Workload Activity report.

## Report output

The following information is provided about the MDisk group:

### MDisk Group

The name of the MDisk group.

**MDisk Group Report Date**

The date that the data was collected for the report.

**MDisk Group Capacity Status**

If the storage capacity that is allocated is less than the actual storage capacity, a status value of OK is displayed. If the storage capacity that is allocated is more than the actual storage capacity, a status value of Warning is displayed. The actual capacity of the MDisk group is calculated as follows:

$$(\text{mdisk\_group\_real\_capacity\_value} \div \text{mdisk\_group\_capacity\_value}) \times 100$$

**MDisk Group Capacity (GB)**

The total storage capacity in GB of all of the disks in the MDisk group.

**MDisk Group Real Capacity (GB)**

The total amount in GB of real storage capacity in the MDisk group.

**MDisk Group Free Space (GB)**

The total amount of remaining capacity in GB that can be allocated to increase the size of an existing VDisk, or allocated to an additional VDisk.

**MDisk Group Available Size < Actual Size Threshold of {%**

If the amount of storage space that is available for allocation to VDIsks is less than the actual size threshold, Yes is displayed in the column. If the amount of storage space that is available for allocation to VDIsks is more than the actual size threshold, No is displayed in the column.

**MDisk Group Read I/O Rate (ops/s)**

The read I/O rate of the MDisk group in operations per second.

**MDisk Group Read I/O Rate Capability (ops/s)**

The read I/O capability rate of the MDisk group in operations per second.

**Tip:** To find out how the read I/O capability rate is calculated, see “Read I/O capability formula” on page 1272

**MDisk Group Max Read I/O Rate (ops/s)**

The maximum read I/O rate of the MDisk group in operations per second.

**MDisk Group Read I/O Rate Availability (ops/s)**

The difference between the read I/O capability rate and the maximum read I/O rate in operations per second.

**MDisk Group Read I/O Rate Availability < Read I/O Rate Capability Threshold of {%**

The availability rate for read I/O operations is compared with the read I/O rate capability threshold. If the availability rate for read I/O operations is less than the read I/O rate capability threshold, Yes is displayed in the column. If the availability rate for read I/O operations is more than the read I/O rate capability threshold, No is displayed in the column.

**MDisk Group Max Read Response Time (ms/op)**

The maximum read response time in milliseconds per operation.

**MDisk Group Max Read Response Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum read response time threshold is exceeded over a 24 hour period.

**MDisk Group Average Read Response Time (ms/op)**

The average read response time in milliseconds per operation.

**MDisk Group Max Write I/O Rate (ops/s)**

The maximum write I/O rate in operations per second.

**MDisk Group Max Write Response Time (ms/op)**

The maximum write response time in milliseconds per operation.

**MDisk Group Max Write Response Time Threshold of {%} Exceeded By (hr.:min.)**

The number of hours and minutes that the maximum write response time threshold is exceeded over a 24 hour period.

**MDisk Group Average Write Response Time (ms/op)**

The average write response time in milliseconds per operation.

**MDisk Group Average Write I/O Size (KB)**

The average size of write I/O operations in KB.

**Related tasks:**

“Running the MDisk Group Details Report” on page 1265

To see statistics about the performance of a managed disk (MDisk) group, run the MDisk Group Details Report.

## Running the VDisk Details Report

To see information about a virtual disk (VDisk), run the VDisk Details Report.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Storage Tiering**.
2. Click **VDisk Details Report**.
3. Select a storage virtualizer, and then select a VDisk.
4. Optional: To limit the time frame of the report, specify a date filter or a date range. To reduce the amount of information that is retrieved, change the default date filter. It is easier to analyze small amounts of information over shorter periods.

**Tip:** Before you specify a start date and an end date, you must select **Date Range (below)** from the list of filters.

5. Click **Finish**.

**Related reference:**

“VDisk Details Report”

Use the VDisk Details Report to monitor the workload activity of a virtual disk (VDisk) in a managed disk group.

## VDisk Details Report

Use the VDisk Details Report to monitor the workload activity of a virtual disk (VDisk) in a managed disk group.

Based on the information that the report provides, you can analyze the performance of a VDisk in a managed disk (MDisk) group.

### Reporting period

If you select **All** as the search filter when you run a report, the system date is displayed as the start date for the report. Depending on the time zone, 1969 or 1970 is displayed in the year field of the start date.

## Retention of report data

If you remove an MDisk group or a VDisk, the daily data that is collected for reports is retained for a configurable period. The default is 90 days. If you run a report after the data retention period expired, the daily data for the MDisk group or the VDisk is unavailable.

## Threshold values

The names of the threshold values that are used in the report to monitor workload activity for VDIs are as follows:

- VDisk Max Read Response Time Threshold
- VDisk Max Write Response Time Threshold
- Max Read Cache Hits Time Threshold
- Max Read I/O Rate Threshold
- Max Write I/O Rate Threshold

Threshold values are set during installation. If a threshold value is changed during a reporting period, the original value and the new threshold value are displayed as minimum and maximum values. If, for example, the VDisk maximum read response time threshold value is changed during a reporting period from 70% to 80%, the name of the column is changed to VDisk Max Read Response Time Threshold of {70 - 80%} Exceeded By (hr.:min.). The convention that is used to represent a threshold value is a number followed by the percent sign and enclosed in brackets: {%}. When the report is run, the variable value is replaced with the threshold value. To calculate whether read or write response time thresholds are exceeded, the following formula is used:  $(\text{maximum\_response\_time\_value} \times \text{maximum\_response\_time\_threshold\_value})/100$ . The result is converted from seconds to hours and minutes, and displayed in the report. Read and write response times are sampled at 5-minute intervals over a 24-hour period.

## Report output

The following information is displayed about the VDisk:

### **MDisk Group**

The name of the MDisk group.

**VDisk** The name of the VDisk.

### **VDisk Report Date**

The date that the data was collected for the report.

### **VDisk Capacity (GB)**

The total storage capacity of the VDisk in GB.

### **VDisk Thin Provisioning Status**

The warning level threshold is set in the thin provisioning profile for the VDisk. The threshold is exceeded when the capacity of the VDisk that is used exceeds or is equal to the warning level threshold. If the used capacity of the VDisk in GB is  $\geq$  the specified warning threshold value, a status value of `Warning` is displayed. If the used capacity of the VDisk in GB is  $<$  the specified warning threshold value, a status value of `OK` is displayed. If thin provisioning is not used, a status value of `Not Applicable` is displayed.

### **VDisk Peak Utilization (%)**

The highest value of VDisk utilization over a 24-hour period.

- VDisk Read I/O rate (ops/s)**  
The read I/O rate of the VDisk in operations per second.
- VDisk Max Read I/O rate (ops/s)**  
The maximum read I/O rate of the VDisk in operations per second.
- VDisk Average Read Response Time (ms/op)**  
The average read response time in milliseconds per operation.
- VDisk Max Read Response Time (ms/op)**  
The maximum read response time in milliseconds per operation.
- VDisk Max Read Response Time Threshold of {%} Exceeded By (hr.:min.)**  
The number of hours and minutes that the maximum read response time threshold for the VDisk is exceeded over a 24 hour period.
- VDisk Write I/O Rate (ops/s)**  
The write I/O rate in operations per second.
- VDisk Average Write Response Time (ms/op)**  
The average write response time in milliseconds per operation.
- VDisk Max Write Response Time (ms/op)**  
The maximum write response time in milliseconds per operation.
- VDisk Max Write Response Time Threshold of {%} Exceeded By (hr.:min.)**  
The number of hours and minutes that the maximum write response time threshold for the VDisk is exceeded over a 24 hour period.
- VDisk Max Read Density Rate (ops/s per GB)**  
The maximum read density rate in operations per second per GB. This value is calculated by dividing the maximum read I/O rate in operations per second by the number of GB that the VDisk was allocated.
- VDisk I/O Rate Share of Total VDisk Read I/O Rate (%)**  
The maximum read I/O rate of the VDisk as a percentage of the total maximum read I/O rate of all the VDIs in the MDisk group.
- VDisk Capacity Share of Total VDisk Capacity (%)**  
The real capacity of the VDisk as a percentage of the real capacity of all the VDIs in the MDisk group.
- VDisk Average Read Cache Hits (%)**  
The average read cache hits in percent.
- VDisk Max Read Cache Hits (%)**  
The maximum read cache hits in percent.
- VDisk Max Read Cache Hits Time Threshold of {%} Exceeded By (hr.:min.)**  
The number of hours and minutes that the maximum read cache hits time threshold is exceeded over a 24 hour period.
- VDisk Max Read I/O Rate Threshold of {%} Exceeded By (hr.:min.)**  
The number of hours and minutes that the maximum read I/O rate threshold is exceeded over a 24 hour period.
- VDisk Max Write I/O Rate Threshold {%} Exceeded of By (hr.:min.)**  
The number of hours and minutes that the maximum write I/O rate threshold is exceeded over a 24 hour period.
- VDisk Max Write Cache Delay I/O Rate (ops/s)**  
The maximum write cache delay I/O rate of the VDisk in operations per second.

**Related tasks:**

“Running the VDisk Details Report” on page 1268

To see information about a virtual disk (VDisk), run the VDisk Details Report.

## Running the Volume Migration Recommendation Report

To see volumes that might require migration to other pools, run the Volume Migration Recommendation Report.

You must create policies that specify the performance conditions for volumes.

To run the report with the default settings, click **Finish**. By default all of the policies in the list are selected.

**Tip:** To select a policy, click the policy. To select multiple policies, press Ctrl and click the policies. To select a series of policies, select the first policy, and then press Shift and click the last policy.

1. In the **Public Folders** tab, click **IBM Tivoli Productivity Center Storage Tiering**.
2. Click **Volume Migration Recommendation Report**.
3. Select one or more policies.
4. Click **Finish**.

If information is available for the policies that you selected, a report is created. If no information is available for the selected policies, or data collection is unsuccessful, a message is displayed in the report.

**Related reference:**

“Volume Migration Recommendation Report”

The Volume Migration Recommendation Report, shows the volumes that comply with the criteria for migrating volumes to a pool in another storage resource group. Use the report to identify volumes that might require migration based on the conditions that are set in tiering policies.

## Volume Migration Recommendation Report

The Volume Migration Recommendation Report, shows the volumes that comply with the criteria for migrating volumes to a pool in another storage resource group. Use the report to identify volumes that might require migration based on the conditions that are set in tiering policies.

### Report output

The following information is included in reports that recommend actions for a volume:

**Restriction:** The recommendations for the migration of a volume for the tiering policy that you select might not be shown in the report. For example, if the destination pool that is set in the tiering policy is not available, recommendations for migrating the volume are not provided in the report. To learn more, see the section about troubleshooting reports in the IBM Tivoli Storage Productivity Center Information Center (<http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp>).

**Policy Name**

The user-defined name of the tiering policy.

**Storage Virtualizer Current Name**

The name of the storage virtualizer where the volume is located.

**Storage Pool Current Name**

The name of the pool where the volume is located.

**Storage Volume Name**

The name of the volume that satisfied the conditions for migrating the volume to a pool in another storage resource group.

**Storage Volume WWN**

The worldwide name of the volume.

**Storage Volume Capacity (GB)**

The total amount of storage space on the volume.

**Storage Virtualizer Recommended Name**

The name of the storage virtualizer where the volume can be relocated.

**Storage Pool Recommended Name**

The name of the pool in another storage resource group where the volume can be relocated.

**Storage Volume Current Response Time (ms/op)**

In the current location for the volume, the longest period for read and write response times.

**Storage Volume Predicted Response Time (ms/op)**

In the recommended location for the volume, the longest period for read and write response times.

**Storage Volume Response Time Change (ms/op)**

The change in response times is calculated by subtracting the current response time from the predicted response time.

**Related tasks:**

“Running the Volume Migration Recommendation Report” on page 1271

To see volumes that might require migration to other pools, run the Volume Migration Recommendation Report.

## Read I/O capability formula

The read I/O capability formula is used by IBM Tivoli Storage Productivity Center to estimate the workload capacity of managed disk (MDisk) groups.

The estimated workload capacity is compared with the actual workload capacity to assess the most active and least active MDisk groups in a storage subsystem. To monitor the workload activity of MDisk groups, you can run customized reports such as the MDisk Groups - Workload Activity Report. This formula is used for MDisk groups in the following storage systems:

- SAN Volume Controller
- Storwize V7000
- Storwize V7000 Unified

The formula that is used by IBM Tivoli Storage Productivity Center to estimate the read I/O capability rate is:

$$\frac{[\text{Estimated Read I/O Workload} * \text{Type of Disk I/O Capability} * \text{Number of Disks}]}{[\text{Estimated Read I/O Workload} * (1 - \text{Cache Hit Ratio}) + \text{Estimated Write I/O Workload} * \text{RAID Type Weighted I/O Ratio}]}$$

There are two types of value that are used by the formula:

- Fixed values provided by IBM Tivoli Storage Productivity Center
- Variable values that you must specify for each MDisk group

The following fixed values are used by the formula:

#### **Estimated Read I/O Workload**

The estimated read I/O workload of an MDisk group. The estimate is set to a fixed value of 0.7 (70%).

#### **Estimated Write I/O Workload**

The estimated write I/O workload of an MDisk group. The estimate is set to a fixed value of 0.3 (30%).

You specify the following variable values for each MDisk group:

#### **Type of Disk I/O Capability**

When you specify the type of disk that the back-end pool uses:

- You can accept the default I/O capability per second of the disk
- You can enter a new value for the I/O capability per second of the disk

For example, the default value for the I/O capability rate per second of fiber types of disk with 15,000 revolutions per minute (rpm) is 150 I/O operations per second. To change the I/O capability for a type of disk, you issue the **setbackdisktype** command and you enter a new value for the **-iops** parameter.

#### **Number of Disks**

You specify the number of physical disks that the back-end pool uses.

#### **Cache Hit Ratio**

When you specify the type of storage system that the back-end pool uses:

- You can accept the default cache hit ratio for the storage system
- You can enter a new value for the cache hit ratio of the storage system

For example, the default cache hit ratio of the XIV system is 0.7 (70%). To change the cache hit ratio for a type of storage system, you issue the **setbacktype** command and you enter a new value for the **-cachehit** parameter.

#### **RAID Type Weighted I/O Ratio**

When you specify the type of RAID that the back-end pool uses:

- You can accept the default value for the weighted I/O ratio of the type of RAID
- You can enter a new value for the weighted I/O ratio of the type of RAID

For example the weighted I/O ratio for RAID5 types of RAID is 4:1. To change the weighted I/O ratio for a type of RAID, you issue the **setbackraidtype** command and you enter a new value for the **-weightedio** parameter.

**Tip:** To set the values of back-end pools for an MDisk group, access the MDisk Group Details page through the **Disk Manager > MDisk Groups** node of the navigation tree. You can also use the Tivoli Storage Productivity Center CLI called **tcptool** to set the values for back-end pools. See the **setarray** command. To change the variable values that are used by the Read I/O capability formula, you must use the Tivoli Storage Productivity Center CLI.

## Example

The following values have been set for a back-end pool. The type of storage system is the XIV system. The type of disk is F15 (Fiber - 15 000 rpm), and the type of RAID is X.

Name of variable	Value
Cache Hit Ratio	0.5 (50%)
Type of Disk I/O Capability	150
RAID Type Weighted I/O Ratio	4
Number of Disks	10

Based on the values that are provided, the read I/O capability per second is:

$$[0.7 * 150 * 10] / [0.7 * (1 - 0.5) + 0.3 * 4]$$

The read I/O capability per second rate is 677. (The result of the calculation is rounded to the nearest whole number.)

## Changing threshold values in storage tier reports

Use the `setdscfg` command to change the threshold values in workload activity reports for managed disk groups and virtual disks.

To change threshold values, you must know the value of the property key that is associated with the name of the threshold in the report.

1. To start the Tivoli Storage Productivity Center CLI, issue the `tpctool` command.
2. Issue the `setdscfg` command, and then set the following values by using the `-property` parameter:
  - a. Specify the name of the threshold with the `property_key` variable.
  - b. Specify the new threshold value with the `value` variable.

The following sample code sets the read I/O rate for MDisk groups to 80%:

```
tpctool setdscfg -url localhost:9550 -user ***** -pwd ***** -property  
ManagedDiskGroupAvailIORate 80
```

3. Press Enter.

The value of the threshold is changed.

### Related reference:

“Threshold values in storage tier reports”

Threshold values are used to assess the workload activity of managed disk (MDisk) groups and virtual disks (VDisks) in storage tier reports. To change a threshold value, you must know the value of the property key that corresponds with the threshold value that is used in the report.

## Threshold values in storage tier reports

Threshold values are used to assess the workload activity of managed disk (MDisk) groups and virtual disks (VDisks) in storage tier reports. To change a threshold value, you must know the value of the property key that corresponds with the threshold value that is used in the report.

The following table contains the name of the threshold value and the corresponding value of the property key for the following reports:

- The MDisk Groups - Workload Activity Report
- The MDisk Group Details Report

Threshold name in report	Property key value
Actual Size Threshold	<i>ManagedDiskGroupAvailSize</i>
Read I/O Rate Threshold	<i>ManagedDiskGroupAvailIORate</i>
Max Read Response Time Threshold	<i>ManagedDiskGroupBERResponseExceeds</i>
Max Write Response Time Threshold	<i>ManagedDiskGroupBEWResponseExceeds</i>

The following table contains the name of the threshold value and the corresponding value of the property key for the following reports:

- MDisk Groups - VDisk Workload Activity Report
- MDisk Groups - VDisk Workload Activity Details Report
- VDisk Details Report
- Storage Resource Group - VDisk Workload Activity Report

Threshold name in report	Property key value
VDisk Max Read Response Time Threshold	VDiskFERResponseExceeds
VDisk Max Write Response Time Threshold	VDiskFEWResponseExceeds
Max Read Cache Hits Time Threshold	VDiskFERHitExceeds
Max Read I/O Rate Threshold	VDiskFEIORExceeds
Max Write I/O Rate Threshold	VDiskFEIOWExceeds

**Related tasks:**

“Changing threshold values in storage tier reports” on page 1274

Use the `setdscfg` command to change the threshold values in workload activity reports for managed disk groups and virtual disks.

## Custom reports about performance

You can use Tivoli Common Reporting to create custom performance reports. Performance reports can contain detailed information about the performance of monitored resources, and some of the properties of those resources.

The resources for which you can create performance reports are storage systems and their components, storage virtualizers and their components, and switches and switch ports. You can add statistics for volumes, back-end arrays, caches, ports, port errors, and other statistics to performance reports. For example, you can add key statistics to a report to create and generate a performance chart for a specific volume of a storage system.

All the performance statistics from the stand-alone GUI are available in the new reporting interface.

## Creating custom performance reports in Tivoli Common Reporting

You can create reports that show performance statistics in IBM Tivoli Common Reporting.

When you create a performance report, include properties and statistics for only one type of device in the report.

The list that you use to create performance reports does not include information about the relationships between storage resources. If you include different types of resources in the report, the report might return incorrect results. For example, if you include storage virtualizers and storage systems in a report, the report might return incorrect results.

**Tip:** Before you run a report, you can preview the report with no data. For more information about how to preview and run reports, see the *IBM Cognos 8 v4 Business Intelligence Information Center* at <http://publib.boulder.ibm.com/infocenter/c8bi/v8r4m0/index.jsp>, and search for run report query studio.

You must specify the time interval for which you want to view performance information. You can specify the time interval in two ways:

- Select a time unit, for example, day, day of week, or week of month.
- Select performance statistics from sample data, hourly data, or daily data in the resource for which you want performance information.

**Restriction:**

You cannot create custom reports from the following packages:

- IBM Tivoli Storage Productivity Center Historical Information
  - IBM Tivoli Storage Productivity Center Storage Tiering
1. Select the **IBM Tivoli Storage Productivity Center Performance** package.
  2. Expand **Tivoli Storage Productivity Center** in the list.
  3. Expand **Performance**.
  4. Optional: Select a time unit from the **Time** item.
  5. Explore the folders in the list to locate the resources, properties, and statistics that you want to include in the report.
  6. Depending on your browser, add properties and statistics to the report:
    - Internet Explorer: Drag the items that you want to see information about to the right pane.
    - Firefox: Select the items that you want to see information about, and then click **Insert**.
  7. Use filters with your performance reports to ensure that your reports do not include too much data. To use filters with your performance reports, do the following steps:
    - a. Add a resource or resource type to the report.
    - b. Select the column heading for the resource or resource type in the right pane, then filter the name of the resource or resource type if necessary.
    - c. Locate the Sample Data, Hourly Data, or Daily Data folder for the resource or resource type in the list. Then add a time stamp from the list to the right pane. For example, you can add a Day time stamp to the report.
    - d. Select the column heading for the time stamp in the right pane, and then filter the time. If you do not enter a time stamp, the report is run on all the records for this resource or resource type in Tivoli Storage Productivity Center.
  8. Click **Save**.

## Data and properties in performance reports

You can include capacity data, properties, and other information about storage systems, storage virtualizers, and switches in performance reports.

### Data for storage systems in performance reports

You can include general information, capacity data, properties, and other information about storage systems in performance reports.

### Information about storage systems

You can create performance reports that include the following information:

#### Storage System Name

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

### Capacity and usage data

You can create performance reports that include the following information:

#### Storage System Pool Capacity (GiB)

The amount of storage space in pools that are on the storage system. For an XIV system, this value represents the physical capacity of the pool, not the virtual capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

#### Storage System Used Pool Space (GiB)

The amount of space that is in use in all pools on a storage system.

#### Storage System Available Pool Space (GiB)

The amount of unused space in pools that are on the storage system.

#### Storage System Volume Capacity (GiB)

The amount of space on all volumes on the storage system.

#### Storage System Overhead (GiB)

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

#### Storage System Assigned Volume Space (GiB)

The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

#### Storage System Unallocated Disk Space (GiB)

The amount of disk space that can be added to a pool.

#### Storage System Number of Disks

The number of disks on the storage system.

#### Storage System Number of Volumes

The number of volumes on a resource.

#### Storage System Cache (GiB)

The size of the cache on the storage system.

#### Storage System Real Available Pool Space (GiB)

The amount of unused space in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

**Storage System Real Configured Pool Space (GiB)**

The amount of storage space that is in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

**Storage System Volume Capacity for z/OS (GiB)**

The amount of space on all volumes on the storage system that the z/OS operating system can use.

**Storage System Volume Capacity Assigned to MDisks (GiB)**

The amount of space that is on volumes that are assigned to a storage virtualizer to use as managed disks.

**Storage System Disk Capacity (GiB)**

The amount of storage space on physical disks on the storage system, excluding spare disks.

**Storage System Total Disk Capacity (GiB)**

The amount of space on physical disks on a storage system, including spare disks.

**Component properties**

You can create performance reports that include the following information:

**Storage System Access Information**

The URL from which you can access the storage system or storage virtualizer.

**Storage System Code Level**

The Shared Ethernet Adapter level of a DS8000 storage system. For other storage systems, this value is the firmware version.

**Storage System Custom Tag 1**

User-defined text that is associated with the resource.

**Storage System Custom Tag 2**

User-defined text that is associated with the resource.

**Storage System Custom Tag 3**

User-defined text that is associated with the resource.

**Storage System User Provided Name**

The name that was specified for the storage system in the storage environment.

**Status information**

You can create performance reports that include the following information:

**Storage System Status**

The condition of the resource, for example normal, warning, or error.

**Storage System Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Storage System Last Data Collection**

The date and time when storage statistics were last collected from the resource.

**Storage System Last Data Collection Status**

The condition of the last data collection. The status can show if the collection was a success, a failure, or if data was collected from the resource.

**Vendor, model, and device information**

You can create performance reports that include the following information:

**Storage System Type**

The type of storage system. For example, the storage system can be a DS8000, or an XIV system, or another type of storage system.

**Storage System IP Address**

The IP address of the resource.

**Storage System Model**

The model name or model number of the resource.

**Storage System Vendor**

The vendor who supplied the resource.

**Storage System Serial Number**

The serial number of the resource.

**Statistics for DS6000 and DS8000 storage systems in performance reports:**

You can include performance data for ports, port errors, volumes, caches, back-end arrays, and other data for DS6000 and DS8000 storage systems in performance reports.

**Port data**

You can create performance reports that include the following information:

**Port Send I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which data is sent from a port.

**Port Receive I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which the port receives data.

**Total Port I/O Rate (ops/s)**

The average number of send operations and receive operations per second.

**Port Send Data Rate (MiB/s)**

The average rate at which data is sent through the port. The rate is measured in MiB per second.

**Port Receive Data Rate (MiB/s)**

The average rate at which data is received by the port. The rate is measured in MiB per second.

**Total Port Data Rate (MiB/s)**

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

**Port Send Response Time (ms/op)**

The average number of milliseconds to complete a send operation.

**Port Receive Response Time (ms/op)**

The average number of milliseconds to complete a receive operation.

**Total Port Response Time (ms/op)**

The average number of milliseconds to complete a send or receive operation.

**Port Send Transfer Size (KiB/op)**

The average number of KiB that are transferred per send operation.

**Port Receive Transfer Size (KiB/op)**

The average number of KiB that are transferred per receive operation.

**Total Port Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both send and receive operations.

**Port PPRC Send I/O Rate (ops/s)**

The average number of operations per second that are sent using the Peer-to-Peer Remote Copy protocol.

**Port PPRC Receive I/O Rate (ops/s)**

The average number of operations per second that are received using the Peer-to-Peer Remote Copy protocol.

**Total Port PPRC I/O Rate (ops/s)**

The average number of send operations and receive operations per second using the Peer-to-Peer Remote Copy protocol.

**Port PPRC Send Data Rate (MiB/s)**

The average number of MiB per second that are sent using the Peer-to-Peer Remote Copy protocol.

**Port PPRC Receive Data Rate (MiB/s)**

The average number of MiB per second that are received using the Peer-to-Peer Remote Copy protocol.

**Total Port PPRC Data Rate (MiB/s)**

The average number of MiB per second that are transferred using the Peer-to-Peer Remote Copy (PPRC) protocol. This value includes both send and receive PPRC operations.

**Port PPRC Send Response Time (ms/op)**

The average number of milliseconds to complete a send operation using the Peer-to-Peer Remote Copy protocol.

**Port PPRC Receive Response Time (ms/op)**

The average number of milliseconds to complete a receive operation using the Peer-to-Peer Remote Copy protocol.

**Total Port PPRC Response Time (ms/op)**

The average number of milliseconds to complete a send or receive operation using the Peer-to-Peer Remote Copy (PPRC) protocol.

**Port error data**

You can create performance reports that include the following information:

**Link Failure Rate (count/s)**

The average number of link errors per second.

**Loss of Sync Rate (count/s)**

The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

**Loss of Signal Rate (count/s)**

The average number of times per second that the signal is lost.

**CRC Error Rate (count/s)**

The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

**Primitive Sequence Protocol Error Rate (count/s)**

The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

**Invalid Transmission Word Rate (count/s)**

The average number of bit errors per second that are detected.

**Error Frame Rate (count/s)**

The average number of error frames per second that are received. An error frame is a frame that violates the Fibre Channel Protocol.

**Link Reset Transmitted Rate (count/s)**

The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR1) state.

**Link Reset Received Rate (count/s)**

The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR2) state.

**Out of Order Data Rate (count/s)**

The average number of times per second that an out-of-order frame is detected.

**Out of Order ACK Rate (count/s)**

The average number of times per second that an out-of-order acknowledge (ACK) frame is detected.

An ACK frame is used for end-to-end flow control and is sent to verify receipt of a frame.

**Duplicate Frame Rate (count/s)**

The average number of duplicate frames per second that are received. A duplicate frame is one that was previously processed for the port.

**Invalid Relative Offset Rate (count/s)**

The average number of times per second that frames are received with an invalid relative offset in the frame header.

**Sequence Timeout Rate (count/s)**

The average number of times per second that the port detects a timeout condition after receiving a sequence initiative for a Fibre Channel exchange.

**Volume data**

You can create performance reports that include the following information:

**Normal Read I/O Rate (ops/s)**

The average number of nonsequential read operations per second.

**Sequential Read I/O Rate (ops/s)**

The average number of sequential read operations per second.

**Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

**Normal Write I/O Rate (ops/s)**

The average number of nonsequential write operations per second.

**Sequential Write I/O Rate (ops/s)**

The average number of sequential write operations per second.

**Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

**Total Normal I/O Rate (ops/s)**

The average number of nonsequential I/O operations per second. This value includes both read and write operations.

**Total Sequential I/O Rate (ops/s)**

The average number of sequential I/O operations per second. This value includes both read and write operations.

**Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

**Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

**Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

**Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

**Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Record Mode Read I/O Rate (ops/s)**

The average number of I/O operations per second for record-mode read operations.

For record-mode read operations, only the requested data is managed in the cache rather than a full track of data.

### **Back-end array data**

You can create performance reports that include the following information:

#### **Back-End Read I/O Rate (ops/s)**

The average number of read operations per second that are issued to the back-end storage resources.

#### **Back-End Write I/O Rate (ops/s)**

The average number of write operations per second that are issued to the back-end storage resources.

#### **Total Back-End I/O Rate (ops/s)**

The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

#### **Back-End Read Data Rate (MiB/s)**

The average number of MiB per second that are read from the back-end storage resources.

#### **Back-End Write Data Rate (MiB/s)**

The average number of MiB per second that are written to the back-end storage resources.

#### **Total Back-End Data Rate (MiB/s)**

The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

#### **Back-End Read Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

#### **Back-End Write Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

#### **Overall Back-End Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

#### **Back-End Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation from the back-end storage resources.

#### **Back-End Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation to the back-end storage resources.

**Overall Back-End Transfer Size (KiB/op)**

The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

**Cache data**

You can create performance reports that include the following information:

**Normal Read Cache Hit Percentage**

The percentage of nonsequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Sequential Read Cache Hit Percentage**

The percentage of sequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Normal Write Cache Hit Percentage**

The percentage of nonsequential write operations that are handled in the cache.

**Sequential Write Cache Hit Percentage**

The percentage of sequential write operations that are handled in the cache.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Total Normal Cache Hit Percentage**

The percentage of nonsequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Total Sequential Cache Hit Percentage**

The percentage of sequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Total Overall Cache Hit Percentage**

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Disk to Cache Transfer Rate (ops/s)**

The average number of tracks that are transferred per second from the disks to the cache.

**Cache to Disk Transfer Rate (ops/s)**

The average number of tracks per second that are transferred from the cache to the disks.

**Write Cache Delay Percentage**

The percentage of I/O operations that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as a percentage of all I/O operations.

**Write Cache Delay I/O Rate (ops/s)**

The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as an average of all I/O operations.

**Record Mode Read Cache Hit Percentage**

The percentage of cache hits for record-mode read operations.

For record-mode read operations, only the requested data, rather than a full track of data, is managed in the cache.

**Other data**

You can create performance reports that include the following information:

**Cache Holding Time (s)**

The average number of seconds that I/O data for a storage system controller is held in the cache. A short cache holding time indicates adverse performance.

**PPRC Transfer Rate (ops/s)**

The average number of tracks per second that are transferred to the secondary device of a Peer-to-Peer Remote Copy (PPRC) pair. This value shows the activity for the source of the PPRC relationship, but shows no activity for the target.

**HPF Read I/O Rate (ops/s)**

The average number of read operations per second that are issued by the High Performance FICON® feature of the storage system.

**HPF Write I/O Rate (ops/s)**

The average number of write operations per second that are issued by the High Performance FICON feature of the storage system.

**Total HPF I/O Rate (ops/s)**

The average number of I/O operations per second that are issued by the High Performance FICON feature of the storage system. This value includes both read and write operations.

**HPF I/O Percentage**

The percentage of all I/O operations that are issued by the High Performance FICON feature of the storage system.

## Statistics for block server systems in performance reports:

You can include performance data for volumes, and cache data for block server storage systems in performance reports.

### Volume data

You can create performance reports that include the following information:

#### **Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

#### **Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

#### **Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

#### **Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

#### **Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

#### **Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

#### **Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

#### **Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

#### **Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

#### **Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

#### **Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

#### **Overall Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

### Cache data

You can create performance reports that include the following information:

#### **Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Total Overall Cache Hit Percentage**

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Statistics for an XIV system in performance reports:**

You can include performance data for volumes, caches, and other data for an XIV system in performance reports.

**Volume data**

You can create performance reports that include the following information:

**Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

**Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

**Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

**Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

**Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

**Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

**Cache data**

You can create performance reports that include the following information:

**Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Total Overall Cache Hit Percentage**

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Read Data Cache Hit Percentage**

The percentage of all read data that is read from the cache.

**Write Data Cache Hit Percentage**

The percentage of all write data that is written to cache slots that are marked as modified.

**Total Data Cache Hit Percentage**

The percentage of all data that is handled in the cache. This value includes read data that is read from the cache and write data that is written to cache slots that are marked as modified.

**Read Cache Miss Response Time (ms/op)**

The average number of milliseconds to complete a read-cache miss operation.

**Write Cache Miss Response Time (ms/op)**

The average number of milliseconds to complete a write-cache miss operation.

**Overall Cache Miss Response Time (ms/op)**

The average number of milliseconds to complete a cache miss operation. This value includes both read-cache miss and write-cache miss operations.

**Read Cache Hit Response Time (ms/op)**

The average number of milliseconds to complete a read-cache hit operation.

**Write Cache Hit Response Time (ms/op)**

The average number of milliseconds to complete a write-cache hit operation.

**Overall Cache Hit Response Time (ms/op)**

The average number of milliseconds to complete a cache hit operation. This value includes both read-cache hit and write-cache hit operations.

**Other data**

You can create performance reports that include the following information:

**Small Transfers I/O Percentage**

The percentage of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

**Medium Transfers I/O Percentage**

The percentage of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

**Large Transfers I/O Percentage**

The percentage of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

**Very Large Transfers I/O Percentage**

The percentage of I/O operations with a very large data transfer size. A very large data transfer has a size that is greater than 512 KiB.

**Small Transfers Data Percentage**

The percentage of data that is transferred as a result of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

**Medium Transfers Data Percentage**

The percentage of data that is transferred as a result of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

**Large Transfers Data Percentage**

The percentage of data that is transferred as a result of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

**Very Large Transfers Data Percentage**

The percentage of data that is transferred as a result of I/O operations with a very large data transfer size. A very large data transfer has a size that is greater than 512 KiB.

**Small Transfers Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation that has a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

**Medium Transfers Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation that has a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

**Large Transfers Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation that has a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

### **Very Large Transfers Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation that has a very large data transfer size. A very large data transfer has a size that is greater than 512 KiB.

## **Data for storage system volumes in performance reports**

You can include general information, capacity data, properties, and other information about storage system volumes in performance reports.

### **Information about storage system volumes**

You can create performance reports that include the following information:

#### **Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

#### **Storage System Controller Name**

The name that was assigned to the controller when it was added to the system.

#### **Storage Pool Name**

The name that was assigned to the pool when it was added to the system.

#### **Storage System Array Name**

The name that was assigned to the array when it was added to the system.

#### **Storage Volume Name**

The name that was assigned to the storage volume when it was added to the system.

### **Capacity and usage data**

You can create performance reports that include the following information:

#### **Storage Volume Capacity (GiB)**

The amount of storage space on the volume.

#### **Storage Volume Used Space (GiB)**

The amount of virtual space that is used on a thin-provisioned volume. For volumes that are not thin provisioned, this value is same as the **Storage Volume Capacity** value. This property applies only to DS8000 storage systems.

#### **Storage Volume Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

### **Component properties**

You can create performance reports that include the following information:

#### **Storage Volume RAID Level**

The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

#### **Storage Volume Is Thin Provisioned**

Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is Yes, the resource is thin-provisioned.

**Storage Volume Is Assigned**

Shows whether the volume is assigned to a server. If this value is Yes, the volume is assigned to a server.

**Storage Volume Is Encrypted**

Shows whether the resource is encrypted. If this value is Yes, the resource is encrypted.

**Storage Volume Is Encryptable**

Shows whether the resource can be encrypted. If this value is Yes, the resource can be encrypted.

**Storage Volume Is Volume Control Manager Database**

Shows whether a volume is used as the Volume Control Manager Database. If this value is Yes, the volume is used as the Volume Control Manager Database. This property applies only to EMC storage systems.

**Storage Volume Format**

Shows the format of the volume or pool. The format can be a Count Key Data (CKD) format, or a fixed block format.

**Storage Volume Serial Number**

The serial number of the resource.

**Storage Volume Number**

The number of the volume that is assigned by the system.

**Storage Volume WWN**

The worldwide name of the volume.

**Storage Volume Logical Subsystem**

The logical subsystem (LSS) to which a volume or pool belongs.

**Status information**

You can create performance reports that include the following information:

**Storage Volume Status**

The condition of the resource, for example normal, warning, or error.

**Storage Volume Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Statistics for volumes on DS6000 and DS8000 storage systems in performance reports:**

You can include performance data for volumes, caches, and other data for storage system volumes on DS6000 and DS8000 storage systems in performance reports.

**Volume data**

You can create performance reports that include the following information:

**Normal Read I/O Rate (ops/s)**

The average number of nonsequential read operations per second.

**Sequential Read I/O Rate (ops/s)**

The average number of sequential read operations per second.

**Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

**Normal Write I/O Rate (ops/s)**

The average number of nonsequential write operations per second.

**Sequential Write I/O Rate (ops/s)**

The average number of sequential write operations per second.

**Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

**Total Normal I/O Rate (ops/s)**

The average number of nonsequential I/O operations per second. This value includes both read and write operations.

**Total Sequential I/O Rate (ops/s)**

The average number of sequential I/O operations per second. This value includes both read and write operations.

**Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

**Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

**Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

**Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

**Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Record Mode Read I/O Rate (ops/s)**

The average number of I/O operations per second for record-mode read operations.

For record-mode read operations, only the requested data is managed in the cache rather than a full track of data.

**Volume Utilization**

The average percentage of time that the volume is busy.

## Cache data

You can create performance reports that include the following information:

### Normal Read Cache Hit Percentage

The percentage of nonsequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

### Sequential Read Cache Hit Percentage

The percentage of sequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

### Overall Read Cache Hit Percentage

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

### Normal Write Cache Hit Percentage

The percentage of nonsequential write operations that are handled in the cache.

### Sequential Write Cache Hit Percentage

The percentage of sequential write operations that are handled in the cache.

### Overall Write Cache Hit Percentage

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

### Total Normal Cache Hit Percentage

The percentage of nonsequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

### Total Sequential Cache Hit Percentage

The percentage of sequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

### Total Overall Cache Hit Percentage

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Disk to Cache Transfer Rate (ops/s)**

The average number of tracks that are transferred per second from the disks to the cache.

**Cache to Disk Transfer Rate (ops/s)**

The average number of tracks per second that are transferred from the cache to the disks.

**Write Cache Delay Percentage**

The percentage of I/O operations that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as a percentage of all I/O operations.

**Write Cache Delay I/O Rate (ops/s)**

The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as an average of all I/O operations.

**Record Mode Read Cache Hit Percentage**

The percentage of cache hits for record-mode read operations.

For record-mode read operations, only the requested data, rather than a full track of data, is managed in the cache.

**Other data**

You can create performance reports that include the following information:

**PPRC Transfer Rate (ops/s)**

The average number of tracks per second that are transferred to the secondary device of a Peer-to-Peer Remote Copy (PPRC) pair. This value shows the activity for the source of the PPRC relationship, but shows no activity for the target.

**HPF Read I/O Rate (ops/s)**

The average number of read operations per second that are issued by the High Performance FICON feature of the storage system.

**HPF Write I/O Rate (ops/s)**

The average number of write operations per second that are issued by the High Performance FICON feature of the storage system.

**Total HPF I/O Rate (ops/s)**

The average number of I/O operations per second that are issued by the High Performance FICON feature of the storage system. This value includes both read and write operations.

**HPF I/O Percentage**

The percentage of all I/O operations that are issued by the High Performance FICON feature of the storage system.

**Statistics for storage system volumes on block servers in performance reports:**

You can include performance data for volumes and caches for storage system volumes on block servers in performance reports.

## Volume data

You can create performance reports that include the following information:

### **Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

### **Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

### **Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

### **Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

### **Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

### **Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

### **Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

### **Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

### **Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

### **Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

### **Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

### **Overall Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

## Volume Utilization

The average percentage of time that the volume is busy.

## Cache data

You can create performance reports that include the following information:

### **Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Total Overall Cache Hit Percentage**

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Statistics for storage system volumes on an XIV system in performance reports:**

You can include performance data for volumes, caches, and other data for storage system volumes on an XIV system in performance reports.

**Volume data**

You can create performance reports that include the following information:

**Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

**Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

**Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

**Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

**Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

**Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

**Volume Utilization**

The average percentage of time that the volume is busy.

**Cache data**

You can create performance reports that include the following information:

**Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Total Overall Cache Hit Percentage**

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Read Data Cache Hit Percentage**

The percentage of all read data that is read from the cache.

**Write Data Cache Hit Percentage**

The percentage of all write data that is written to cache slots that are marked as modified.

**Total Data Cache Hit Percentage**

The percentage of all data that is handled in the cache. This value includes read data that is read from the cache and write data that is written to cache slots that are marked as modified.

**Read Cache Miss Response Time (ms/op)**

The average number of milliseconds to complete a read-cache miss operation.

**Write Cache Miss Response Time (ms/op)**

The average number of milliseconds to complete a write-cache miss operation.

**Overall Cache Miss Response Time (ms/op)**

The average number of milliseconds to complete a cache miss operation. This value includes both read-cache miss and write-cache miss operations.

**Read Cache Hit Response Time (ms/op)**

The average number of milliseconds to complete a read-cache hit operation.

**Write Cache Hit Response Time (ms/op)**

The average number of milliseconds to complete a write-cache hit operation.

**Overall Cache Hit Response Time (ms/op)**

The average number of milliseconds to complete a cache hit operation. This value includes both read-cache hit and write-cache hit operations.

**Other data**

You can create performance reports that include the following information:

**Small Transfers I/O Percentage**

The percentage of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

**Medium Transfers I/O Percentage**

The percentage of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

**Large Transfers I/O Percentage**

The percentage of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

**Very Large Transfers I/O Percentage**

The percentage of I/O operations with a very large data transfer size. A very large data transfer has a size that is greater than 512 KiB.

**Small Transfers Data Percentage**

The percentage of data that is transferred as a result of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

**Medium Transfers Data Percentage**

The percentage of data that is transferred as a result of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

**Large Transfers Data Percentage**

The percentage of data that is transferred as a result of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

**Very Large Transfers Data Percentage**

The percentage of data that is transferred as a result of I/O operations with a very large data transfer size. A very large data transfer has a size that is greater than 512 KiB.

**Small Transfers Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation that has a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

**Medium Transfers Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation that has a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

**Large Transfers Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation that has a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

### **Very Large Transfers Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation that has a very large data transfer size. A very large data transfer has a size that is greater than 512 KiB.

## **Data for storage system ports in performance reports**

You can include general information, properties, and other information about storage system ports in performance reports.

### **Information about storage system ports**

You can create performance reports that include the following information:

#### **Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

#### **Module Name**

The name that was assigned to the module when it was added to the system.

#### **Storage System Port Name**

The name that was assigned to the storage port when the storage system was added to the system.

### **Component properties**

You can create performance reports that include the following information:

#### **Storage System Port Number**

The port number on the resource.

#### **Storage System Port Type**

The type of port on the storage system, storage virtualizer, or switch. For example, the port type can be N\_Port, F\_Port, or another type of port.

#### **Storage System Port Speed (GiB/s)**

The speed of a port, measured in GiB per second.

### **Status information**

You can create performance reports that include the following information:

#### **Storage System Port Status**

The condition of the resource, for example normal, warning, or error.

#### **Storage System Port Enabled State**

Shows whether a port is enabled, disabled, or is enabled but offline.

#### **Storage System Port Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

### **Statistics for ports on DS6000 and DS8000 storage systems in performance reports:**

You can include performance data for storage system port and port errors on DS6000 and DS8000 storage systems in performance reports.

## Port data

You can create performance reports that include the following information:

### Port Send I/O Rate (ops/s)

The average number of I/O operations per second for operations in which data is sent from a port.

### Port Receive I/O Rate (ops/s)

The average number of I/O operations per second for operations in which the port receives data.

### Total Port I/O Rate (ops/s)

The average number of send operations and receive operations per second.

### Port Send Data Rate (MiB/s)

The average rate at which data is sent through the port. The rate is measured in MiB per second.

### Port Receive Data Rate (MiB/s)

The average rate at which data is received by the port. The rate is measured in MiB per second.

### Total Port Data Rate (MiB/s)

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

### Port Send Response Time (ms/op)

The average number of milliseconds to complete a send operation.

### Port Receive Response Time (ms/op)

The average number of milliseconds to complete a receive operation.

### Overall Port Response Time (ms/op)

The average number of milliseconds to complete a send or receive operation.

### Port Send Transfer Size (KiB/op)

The average number of KiB that are transferred per send operation.

### Port Receive Transfer Size (KiB/op)

The average number of KiB that are transferred per receive operation.

### Total Port Transfer Size (KiB/op)

The average number of KiB that are transferred per I/O operation. This value includes both send and receive operations.

### Port FICON Send I/O Rate (ops/s)

The average number of send operations per second for Fibre Channel connection (FICON) usage.

### Port FICON Receive I/O Rate (ops/s)

The average number of receive operations per second for FICON usage.

### Total Port FICON I/O Rate (ops/s)

The average number of send and receive operations per second for FICON usage.

### Port FICON Send Data Rate (MiB/s)

The average number of MiB per second that is sent for FICON usage.

### Port FICON Receive Data Rate (MiB/s)

The average number of MiB per second that is received for FICON usage.

**Total Port FICON Data Rate (MiB/s)**

The average number of MiB per second that is transferred for FICON usage. This value includes both send and receive FICON operations.

**Port FICON Send Response Time (ms/op)**

The average number of milliseconds to complete a send operation for FICON usage.

**Port FICON Receive Response Time (ms/op)**

The average number of milliseconds to complete a receive operation for FICON usage.

**Total Port FICON Response Time (ms/op)**

The average number of milliseconds to complete a send or receive operation for FICON usage. This value includes both send and receive FICON operations.

**Port PPRC Send I/O Rate (ops/s)**

The average number of operations per second that are sent using the Peer-to-Peer Remote Copy protocol.

**Port PPRC Receive I/O Rate (ops/s)**

The average number of operations per second that are received using the Peer-to-Peer Remote Copy protocol.

**Total Port PPRC I/O Rate (ops/s)**

The average number of send operations and receive operations per second using the Peer-to-Peer Remote Copy protocol.

**Port PPRC Send Data Rate (MiB/s)**

The average number of MiB per second that are sent using the Peer-to-Peer Remote Copy protocol.

**Port PPRC Receive Data Rate (MiB/s)**

The average number of MiB per second that are received using the Peer-to-Peer Remote Copy protocol.

**Total Port PPRC Data Rate (MiB/s)**

The average number of MiB per second that are transferred using the Peer-to-Peer Remote Copy (PPRC) protocol. This value includes both send and receive PPRC operations.

**Port PPRC Send Response Time (ms/op)**

The average number of milliseconds to complete a send operation using the Peer-to-Peer Remote Copy protocol.

**Port PPRC Receive Response Time (ms/op)**

The average number of milliseconds to complete a receive operation using the Peer-to-Peer Remote Copy protocol.

**Total Port PPRC Response Time (ms/op)**

The average number of milliseconds to complete a send or receive operation using the Peer-to-Peer Remote Copy (PPRC) protocol.

**Port Send Utilization Percentage**

The average percentage of time that the port is busy sending data.

**Port Receive Utilization Percentage**

The average percentage of time that the port is busy receiving data.

**Overall Port Utilization Percentage**

The average percentage of time that the port is busy sending or receiving data.

**Port FCP Send I/O Rate (ops/s)**

The average number of send operations per second for Fibre Channel Protocol (FCP) usage.

**Port FCP Receive I/O Rate (ops/s)**

The average number of receive operations per second for FCP usage.

**Total Port FCP I/O Rate (ops/s)**

The average number of send operations and receive operations per second for FCP usage.

**Port FCP Send Data Rate (MiB/s)**

The average number of MiB per second that are sent for FCP usage.

**Port FCP Receive Data Rate (MiB/s)**

The average number of MiB per second that are received for FCP usage.

**Total Port FCP Data Rate (MiB/s)**

The average number of MiB per second that are transferred for FCP usage. This value includes both send and receive FCP operations.

**Port FCP Send Response Time (ms/op)**

The average number of milliseconds to complete a send operation for FCP usage.

**Port FCP Receive Response Time (ms/op)**

The average number of milliseconds to complete a receive operation for FCP usage.

**Total Port FCP Response Time (ms/op)**

The average number of milliseconds to complete a send or receive operation for FCP usage.

**Port Send Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Port Receive Bandwidth Percentage**

The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Overall Port Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Port error data**

You can create performance reports that include the following information:

**Error Frame Rate (count/s)**

The average number of error frames per second that are received. An error frame is a frame that violates the Fibre Channel Protocol.

**Link Failure Rate (count/s)**

The average number of link errors per second.

**Loss of Sync Rate (count/s)**

The average number of times per second that synchronization is lost. Synchronization is assumed lost after a timeout interval expires.

**Loss of Signal Rate (count/s)**

The average number of times per second that the signal is lost.

**CRC Error Rate (count/s)**

The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

**Primitive Sequence Protocol Error Rate (count/s)**

The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

**Invalid Transmission Word Rate (count/s)**

The average number of bit errors per second that are detected.

**Out of Order Data Rate (count/s)**

The average number of times per second that an out-of-order frame is detected.

**Out of Order ACK Rate (count/s)**

The average number of times per second that an out-of-order acknowledge (ACK) frame is detected.

An ACK frame is used for end-to-end flow control and is sent to verify receipt of a frame.

**Duplicate Frame Rate (count/s)**

The average number of duplicate frames per second that are received. A duplicate frame is one that was previously processed for the port.

**Invalid Relative Offset Rate (count/s)**

The average number of times per second that frames are received with an invalid relative offset in the frame header.

**Sequence Timeout Rate (count/s)**

The average number of times per second that the port detects a timeout condition after receiving a sequence initiative for a Fibre Channel exchange.

**Link Reset Transmitted Rate (count/s)**

The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR1) state.

**Link Reset Received Rate (count/s)**

The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR2) state.

**Statistics for storage system ports on block servers in performance reports:**

You can include performance data for storage system ports on block servers in performance reports.

**Port data**

You can create performance reports that include the following information:

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

**Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

**Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

**Port Send I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which data is sent from a port.

**Port Receive I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which the port receives data.

**Total Port I/O Rate (ops/s)**

The average number of send operations and receive operations per second.

**Statistics for ports on an XIV system in performance reports:**

You can include performance data for storage system ports on an XIV system in performance reports.

**Port data**

You can create performance reports that include the following information:

**Port Send I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which data is sent from a port.

**Port Receive I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which the port receives data.

**Total Port I/O Rate (ops/s)**

The average number of send operations and receive operations per second.

**Port Send Data Rate (MiB/s)**

The average rate at which data is sent through the port. The rate is measured in MiB per second.

**Port Receive Data Rate (MiB/s)**

The average rate at which data is received by the port. The rate is measured in MiB per second.

**Total Port Data Rate (MiB/s)**

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

**Port Send Response Time (ms/op)**

The average number of milliseconds to complete a send operation.

**Port Receive Response Time (ms/op)**

The average number of milliseconds to complete a receive operation.

**Overall Port Response Time (ms/op)**

The average number of milliseconds to complete a send or receive operation.

**Port Send Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Port Receive Bandwidth Percentage**

The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Overall Port Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Data for storage system arrays in performance reports**

You can include general information, capacity data, and properties of storage system arrays in performance reports.

**Information about storage system arrays**

You can create performance reports that include the following information:

**Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

**Storage System Controller Name**

The name that was assigned to the controller when it was added to the system.

**Storage Pool Name**

The name that was assigned to the pool when it was added to the system.

**Storage System Array Name**

The name that was assigned to the array when it was added to the system.

**Capacity and usage data**

You can create performance reports that include the following information:

**Storage System Array DDM Capacity (GiB)**

The amount of storage space on the disk drive modules in an array.

**Component properties**

You can create performance reports that include the following information:

**Storage System Array RAID Level**

The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

**Storage System Array Width**

The number of disks that are in the storage array.

**Storage System Array DDM Speed (RPM)**

The speed of the disk drive module in the array.

**Storage System Array Description**

Shows the array site that the array is associated with.

**Storage System Array Tag**

A number that identifies an array.

**Statistics for storage system arrays in performance reports:**

You can include front end data, cache data, back-end data, and other data for storage system arrays in performance reports.

**Front end data**

You can create performance reports that include the following information:

**Normal Read I/O Rate (ops/s)**

The average number of nonsequential read operations per second.

**Sequential Read I/O Rate (ops/s)**

The average number of sequential read operations per second.

**Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

**Normal Write I/O Rate (ops/s)**

The average number of nonsequential write operations per second.

**Sequential Write I/O Rate (ops/s)**

The average number of sequential write operations per second.

**Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

**Total Normal I/O Rate (ops/s)**

The average number of nonsequential I/O operations per second. This value includes both read and write operations.

**Total Sequential I/O Rate (ops/s)**

The average number of sequential I/O operations per second. This value includes both read and write operations.

**Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

**Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

**Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

**Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

**Record Mode Read I/O Rate (ops/s)**

The average number of I/O operations per second for record-mode read operations.

For record-mode read operations, only the requested data is managed in the cache rather than a full track of data.

**Cache data**

You can create performance reports that include the following information:

**Normal Read Cache Hit Percentage**

The percentage of nonsequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Sequential Read Cache Hit Percentage**

The percentage of sequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Normal Write Cache Hit Percentage**

The percentage of nonsequential write operations that are handled in the cache.

**Sequential Write Cache Hit Percentage**

The percentage of sequential write operations that are handled in the cache.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Total Normal Cache Hit Percentage**

The percentage of nonsequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Total Sequential Cache Hit Percentage**

The percentage of sequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Total Overall Cache Hit Percentage**

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Record Mode Read Cache Hit Percentage**

The percentage of cache hits for record-mode read operations.

For record-mode read operations, only the requested data, rather than a full track of data, is managed in the cache.

**Disk to Cache Transfer Rate (ops/s)**

The average number of tracks that are transferred per second from the disks to the cache.

**Cache to Disk Transfer Rate (ops/s)**

The average number of tracks per second that are transferred from the cache to the disks.

**Write Cache Delay Percentage**

The percentage of I/O operations that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as a percentage of all I/O operations.

**Write Cache Delay I/O Rate (ops/s)**

The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as an average of all I/O operations.

**Back-end data**

You can create performance reports that include the following information:

**Back-End Read I/O Rate (ops/s)**

The average number of read operations per second that are issued to the back-end storage resources.

**Back-End Write I/O Rate (ops/s)**

The average number of write operations per second that are issued to the back-end storage resources.

**Total Back-End I/O Rate (ops/s)**

The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

**Back-End Read Data Rate (MiB/s)**

The average number of MiB per second that are read from the back-end storage resources.

**Back-End Write Data Rate (MiB/s)**

The average number of MiB per second that are written to the back-end storage resources.

**Total Back-End Data Rate (MiB/s)**

The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

**Back-End Read Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Write Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Overall Back-End Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation from the back-end storage resources.

**Back-End Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation to the back-end storage resources.

**Overall Back-End Transfer Size (KiB/op)**

The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

**Sequential Back-End I/O Percentage**

The percentage of all I/O operations that are issued to the back-end storage resources. The operations are for the array and are sequential operations.

## Other data

You can create performance reports that include the following information:

### Disk Utilization Percentage

The average percentage of time that the disks that are associated with an array are busy.

No value is calculated for this column if there are multiple ranks in the extent pool where the thin-provisioned volumes are allocated. In this case, N/A appears in this column. This limitation applies only to DS8000 storage systems.

If there is only a single rank in the extent pool, the value for this column is calculated regardless of the thin-provisioned volumes.

### PPRC Transfer Rate (ops/s)

The average number of tracks per second that are transferred to the secondary device of a Peer-to-Peer Remote Copy (PPRC) pair. This value shows the activity for the source of the PPRC relationship, but shows no activity for the target.

### HPF Read I/O Rate (ops/s)

The average number of read operations per second that are issued by the High Performance FICON feature of the storage system.

### HPF Write I/O Rate (ops/s)

The average number of write operations per second that are issued by the High Performance FICON feature of the storage system.

### Total HPF I/O Rate (ops/s)

The average number of I/O operations per second that are issued by the High Performance FICON feature of the storage system. This value includes both read and write operations.

### HPF I/O Percentage

The percentage of all I/O operations that are issued by the High Performance FICON feature of the storage system.

## Data for storage system controllers in performance reports

You can include general information about storage system controllers in performance reports.

### Information about storage system controllers

You can create performance reports that include the following information:

#### Storage System Name

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

#### Storage System Controller Name

The name that was assigned to the controller when it was added to the system.

### Statistics for storage system controllers on DS6000 and DS8000 systems in performance reports:

You can include front end data, cache data, back-end data, and other data for storage system controllers on DS6000 and DS8000 series systems in performance reports.

## Front end data

You can create performance reports that include the following information:

### **Normal Read I/O Rate (ops/s)**

The average number of nonsequential read operations per second.

### **Sequential Read I/O Rate (ops/s)**

The average number of sequential read operations per second.

### **Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

### **Normal Write I/O Rate (ops/s)**

The average number of nonsequential write operations per second.

### **Sequential Write I/O Rate (ops/s)**

The average number of sequential write operations per second.

### **Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

### **Total Normal I/O Rate (ops/s)**

The average number of nonsequential I/O operations per second. This value includes both read and write operations.

### **Total Sequential I/O Rate (ops/s)**

The average number of sequential I/O operations per second. This value includes both read and write operations.

### **Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

### **Record Mode Read I/O Rate (ops/s)**

The average number of I/O operations per second for record-mode read operations.

For record-mode read operations, only the requested data is managed in the cache rather than a full track of data.

### **Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

### **Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

### **Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

### **Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

### **Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

### **Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Cache data**

You can create performance reports that include the following information:

**Normal Read Cache Hit Percentage**

The percentage of nonsequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Sequential Read Cache Hit Percentage**

The percentage of sequential read operations that find data in the cache.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Normal Write Cache Hit Percentage**

The percentage of nonsequential write operations that are handled in the cache.

**Sequential Write Cache Hit Percentage**

The percentage of sequential write operations that are handled in the cache.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Total Normal Cache Hit Percentage**

The percentage of nonsequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Total Sequential Cache Hit Percentage**

The percentage of sequential I/O operations that are handled in the cache. This value includes both read and write operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Total Overall Cache Hit Percentage**

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Record Mode Read Cache Hit Percentage**

The percentage of cache hits for record-mode read operations.

For record-mode read operations, only the requested data, rather than a full track of data, is managed in the cache.

**Write Cache Delay Percentage**

The percentage of I/O operations that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as a percentage of all I/O operations.

**Disk to Cache Transfer Rate (ops/s)**

The average number of tracks that are transferred per second from the disks to the cache.

**Cache to Disk Transfer Rate (ops/s)**

The average number of tracks per second that are transferred from the cache to the disks.

**Write Cache Delay I/O Rate (ops/s)**

The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as an average of all I/O operations.

**Back-end data**

You can create performance reports that include the following information:

**Back-End Read I/O Rate (ops/s)**

The average number of read operations per second that are issued to the back-end storage resources.

**Back-End Write I/O Rate (ops/s)**

The average number of write operations per second that are issued to the back-end storage resources.

**Total Back-End I/O Rate (ops/s)**

The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

**Back-End Read Data Rate (MiB/s)**

The average number of MiB per second that are read from the back-end storage resources.

**Back-End Write Data Rate (MiB/s)**

The average number of MiB per second that are written to the back-end storage resources.

**Total Back-End Data Rate (MiB/s)**

The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

**Back-End Read Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Write Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Overall Back-End Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation from the back-end storage resources.

**Back-End Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation to the back-end storage resources.

**Overall Back-End Transfer Size (KiB/op)**

The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

**Other data**

You can create performance reports that include the following information:

**Cache Holding Time (s)**

The average number of seconds that I/O data for a storage system controller is held in the cache. A short cache holding time indicates adverse performance.

**PPRC Transfer Rate (ops/s)**

The average number of tracks per second that are transferred to the secondary device of a Peer-to-Peer Remote Copy (PPRC) pair. This value shows the activity for the source of the PPRC relationship, but shows no activity for the target.

**HPF Read I/O Rate (ops/s)**

The average number of read operations per second that are issued by the High Performance FICON feature of the storage system.

**HPF Write I/O Rate (ops/s)**

The average number of write operations per second that are issued by the High Performance FICON feature of the storage system.

**Total HPF I/O Rate (ops/s)**

The average number of I/O operations per second that are issued by the High Performance FICON feature of the storage system. This value includes both read and write operations.

**HPF I/O Percentage**

The percentage of all I/O operations that are issued by the High Performance FICON feature of the storage system.

**Statistics for storage system controllers on block servers in performance reports:**

You can include performance data for volumes and caches for storage system controllers on block servers in performance reports.

**Volume data**

You can create performance reports that include the following information:

**Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

**Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

**Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

**Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

**Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

**Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

**Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Overall Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Cache data**

You can create performance reports that include the following information:

**Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Total Overall Cache Hit Percentage**

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Data for storage system modules in performance reports**

You can include properties of storage system modules, and other information about storage system modules in performance reports.

**Information about storage system modules**

You can create performance reports that include the following information:

**Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

**Module Name**

The name that was assigned to the module when it was added to the system.

**Component properties**

You can create performance reports that include the following information:

**XIV System Module IP Address**

The IP address of the resource.

**XIV System Module WWN**

The worldwide name of the module.

**Status information**

You can create performance reports that include the following information:

**XIV System Module Status**

The condition of the resource, for example normal, warning, or error.

### **XIV System Module Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

### **Statistics for storage system modules on an XIV system in performance reports:**

You can include performance data for volumes, caches, and other data for storage system modules on an XIV system in performance reports.

#### **Volume data**

You can create performance reports that include the following information:

##### **Read I/O Rate (ops/s)**

The average number of read operations per second.

##### **Write I/O Rate (ops/s)**

The average number of write operations per second.

##### **Total I/O Rate (ops/s)**

The average number of I/O operations per second for both read and write operations.

##### **Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

##### **Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

##### **Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

##### **Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

##### **Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

##### **Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

##### **Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

##### **Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

##### **Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

#### **Cache data**

You can create performance reports that include the following information:

##### **Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Total Overall Cache Hit Percentage**

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Read Data Cache Hit Percentage**

The percentage of all read data that is read from the cache.

**Write Data Cache Hit Percentage**

The percentage of all write data that is written to cache slots that are marked as modified.

**Total Data Cache Hit Percentage**

The percentage of all data that is handled in the cache. This value includes read data that is read from the cache and write data that is written to cache slots that are marked as modified.

**Read Cache Hit Response Time (ms/op)**

The average number of milliseconds to complete a read-cache hit operation.

**Write Cache Hit Response Time (ms/op)**

The average number of milliseconds to complete a write-cache hit operation.

**Overall Cache Hit Response Time (ms/op)**

The average number of milliseconds to complete a cache hit operation. This value includes both read-cache hit and write-cache hit operations.

**Read Cache Miss Response Time (ms/op)**

The average number of milliseconds to complete a read-cache miss operation.

**Write Cache Miss Response Time (ms/op)**

The average number of milliseconds to complete a write-cache miss operation.

**Overall Cache Miss Response Time (ms/op)**

The average number of milliseconds to complete a cache miss operation. This value includes both read-cache miss and write-cache miss operations.

**Other data**

You can create performance reports that include the following information:

**Small Transfers Data Percentage**

The percentage of data that is transferred as a result of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

**Medium Transfers Data Percentage**

The percentage of data that is transferred as a result of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

**Large Transfers Data Percentage**

The percentage of data that is transferred as a result of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

**Very Large Transfers Data Percentage**

The percentage of data that is transferred as a result of I/O operations with a very large data transfer size. A very large data transfer has a size that is greater than 512 KiB.

**Small Transfers I/O Percentage**

The percentage of I/O operations with a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

**Medium Transfers I/O Percentage**

The percentage of I/O operations with a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

**Large Transfers I/O Percentage**

The percentage of I/O operations with a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

**Very Large Transfers I/O Percentage**

The percentage of I/O operations with a very large data transfer size. A very large data transfer has a size that is greater than 512 KiB.

**Small Transfers Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation that has a small data transfer size. A small data transfer has a size that is less than or equal to 8 KiB.

**Medium Transfers Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation that has a medium data transfer size. A medium data transfer has a size that is greater than 8 KiB and less than or equal to 64 KiB.

**Large Transfers Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation that has a large data transfer size. A large data transfer has a size that is greater than 64 KiB and less than or equal to 512 KiB.

**Very Large Transfers Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation that has a very large data transfer size. A very large data transfer has a size that is greater than 512 KiB.

**Data for storage virtualizers in performance reports**

You can include general information, capacity data, properties, and other information about storage virtualizers in performance reports.

**Information about storage virtualizers**

You can create performance reports that include the following information:

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Capacity and usage data**

You can create performance reports that include the following information:

**Storage Virtualizer Total Pool Capacity (GiB)**

The amount of storage space in pools on the storage virtualizer.

**Storage Virtualizer Pool Used Space (GiB)**

The amount of storage space that is used in the pool on the storage virtualizer.

**Storage Virtualizer Pool Available Space (GiB)**

The amount of unused storage space in a storage virtualizer pool.

**Storage Virtualizer Total Volume Capacity (GiB)**

The amount of virtual volume space on all volumes on the storage virtualizer.

**Storage Virtualizer Volume Allocated Space (GiB)**

The amount of storage space that is allocated to volumes.

**Storage Virtualizer Volume Assigned Space (GiB)**

The amount of virtual volume space that is assigned to the server or storage virtualizer.

**Storage Virtualizer MDisk Available Space (GiB)**

The amount of space on managed disks that is available to be added to a pool.

**Storage Virtualizer MDisk Capacity (GiB)**

The amount of storage space on the managed disk.

**Storage Virtualizer Disk Capacity (GiB)**

The amount of local disk storage on the storage virtualizer.

**Storage Virtualizer Number of MDisks**

The number of managed disks on a resource.

**Storage Virtualizer Number of Volumes**

The number of volumes on a resource.

**Storage Virtualizer Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Component properties**

You can create performance reports that include the following information:

**Storage Virtualizer Access Information**

The URL from which you can access the storage system or storage virtualizer.

**Storage Virtualizer Alias**

Shows an alternative name for a storage virtualizer.

**Storage Virtualizer Code Level**

The microcode or firmware level of the storage virtualizer.

**Storage Virtualizer Time Zone**

The time zone in which a resource is located.

**Storage Virtualizer Custom Tag 1**

User-defined text that is associated with the resource.

**Storage Virtualizer Custom Tag 2**

User-defined text that is associated with the resource.

**Storage Virtualizer Custom Tag 3**

User-defined text that is associated with the resource.

**Storage Virtualizer User Provided Name**

The name that was specified for the storage virtualizer in the storage environment.

**Status information**

You can create performance reports that include the following information:

**Storage Virtualizer Status**

The condition of the resource, for example normal, warning, or error.

**Storage Virtualizer Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Storage Virtualizer Last Data Collection**

The date and time when storage statistics were last collected from the resource.

**Storage Virtualizer Last Data Collection Status**

The condition of the last data collection. The status can show if the collection was a success, a failure, or if data was collected from the resource.

**Vendor, model, and device information**

You can create performance reports that include the following information:

**Storage Virtualizer IP Address**

The IP address of the resource.

**Storage Virtualizer Serial Number**

The serial number of the resource.

**Storage Virtualizer Type**

The type of storage virtualizer. For example, the storage virtualizer can be a Storwize V7000 system, a Storwize V7000 Unified system, or a SAN Volume Controller.

**Storage Virtualizer Model**

The model name or model number of the resource.

**Storage Virtualizer Vendor**

The vendor who supplied the resource.

**Statistics for storage virtualizers in performance reports:**

You can include performance data for ports, port errors, volumes, caches, back-end arrays, and other data for storage virtualizers in performance reports.

## Port data

You can create performance reports that include the following information:

### **Port Send I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which data is sent from a port.

### **Port Receive I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which the port receives data.

### **Total Port I/O Rate (ops/s)**

The average number of send operations and receive operations per second.

### **Port Send Data Rate (MiB/s)**

The average rate at which data is sent through the port. The rate is measured in MiB per second.

### **Port Receive Data Rate (MiB/s)**

The average rate at which data is received by the port. The rate is measured in MiB per second.

### **Total Port Data Rate (MiB/s)**

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

### **Port to Host Send I/O Rate (ops/s)**

The average number of exchanges per second that are sent to host computers.

### **Port to Host Receive I/O Rate (ops/s)**

The average number of exchanges per second that are received from host computers.

### **Total Port to Host I/O Rate (ops/s)**

The average number of exchanges per second that are transmitted between host computers and the component.

### **Port to Disk Send I/O Rate (ops/s)**

The average number of exchanges per second that are sent to back-end storage resources.

### **Port to Disk Receive I/O Rate (ops/s)**

The average number of exchanges per second that are received from back-end storage resources.

### **Total Port to Disk I/O Rate (ops/s)**

The average number of exchanges per second that are transmitted between back-end storage resources and the component. This value includes both send and receive operations.

### **Port to Local Node Send I/O Rate (ops/s)**

The average number of exchanges per second that are sent to other nodes that are in the local SAN Volume Controller cluster.

### **Port to Local Node Receive I/O Rate (ops/s)**

The average number of exchanges per second that are received from other nodes that are in the local SAN Volume Controller cluster.

**Total Port to Local Node I/O Rate (ops/s)**

The average number of exchanges per second that are transmitted between the component and other nodes that are in the local SAN Volume Controller cluster.

**Port to Remote Node Send I/O Rate (ops/s)**

The average number of exchanges per second that are sent to nodes that are in the remote SAN Volume Controller cluster.

**Port to Remote Node Receive I/O Rate (ops/s)**

The average number of exchanges per second that are received from nodes that are in the remote SAN Volume Controller cluster.

**Total Port to Remote Node I/O Rate (ops/s)**

The average number of exchanges per second that are transmitted between the component and nodes that are in the remote SAN Volume Controller cluster.

**Port to Host Send Data Rate (MiB/s)**

The average rate at which data is sent to host computers. The rate is measured in MiB per second.

**Port to Host Receive Data Rate (MiB/s)**

The average rate at which data is received from host computers. The rate is measured in MiB per second.

**Total Port to Host Data Rate (MiB/s)**

The average rate at which data is transmitted between host computers and the component. The rate is measured in MiB per second and includes both send and receive operations.

**Port to Disk Send Data Rate (MiB/s)**

The average rate at which data is sent to back-end storage resources. The rate is measured in MiB per second.

**Port to Disk Receive Data Rate (MiB/s)**

The average rate at which data is received from back-end storage resources. The rate is measured in MiB per second.

**Total Port to Disk Data Rate (MiB/s)**

The average rate at which data is transmitted between back-end storage resources and the component. The rate is measured in MiB per second and includes both send and receive operations.

**Port to Local Node Send Data Rate (MiB/s)**

The average rate at which data is sent to other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Local Node Receive Data Rate (MiB/s)**

The average rate at which data is received from other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

**Total Port to Local Node Data Rate (MiB/s)**

The average rate at which data is transmitted between the component and other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Remote Node Send Data Rate (MiB/s)**

The average rate at which data is sent to nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Remote Node Receive Data Rate (MiB/s)**

The average rate at which data is received from nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

**Total Port to Remote Node Data Rate (MiB/s)**

The average rate at which data is transmitted between the component and nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Local Node Send Response Time (ms/op)**

The average number of milliseconds to complete a send operation to another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Port to Local Node Receive Response Time (ms/op)**

The average number of milliseconds to complete a receive operation from another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Overall Port to Local Node Response Time (ms/op)**

The average number of milliseconds to complete a send or receive operation with another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Port to Local Node Send Queue Time (ms/op)**

The average time in milliseconds that a send operation spends in the queue before being processed. This value represents the queue time for send operations that are issued to other nodes that are in the local SAN Volume Controller cluster.

**Port to Local Node Receive Queue Time (ms/op)**

The average time in milliseconds that a receive operation spends in the queue before being processed. This value represents the queue time for receive operations that are issued from other nodes that are in the local SAN Volume Controller cluster.

**Overall Port to Local Node Queue Time (ms/op)**

The average number of milliseconds that a send or receive operation spends in the queue before being processed. This value is for send and receive operations that are issued between the component and other nodes that are in the local SAN Volume Controller cluster.

**Port to Remote Node Send Response Time (ms/op)**

The average number of milliseconds to complete a send operation to a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Port to Remote Node Receive Response Time (ms/op)**

The average number of milliseconds to complete a receive operation from a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Overall Port to Remote Node Response Time (ms/op)**

The average number of milliseconds to complete a send operation to, or a receive operation from a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Port to Remote Node Send Queue Time (ms/op)**

The average time in milliseconds that a send operation spends in the

queue before being processed. This value represents the queue time for send operations that are issued to a node that is in the remote SAN Volume Controller cluster.

**Port to Remote Node Receive Queue Time (ms/op)**

The average time in milliseconds that a receive operation spends in the queue before being processed. This value represents the queue time for receive operations that are issued from a node that is in the remote SAN Volume Controller cluster.

**Overall Port to Remote Node Queue Time (ms/op)**

The average number of milliseconds that a send or receive operation spends in the queue before being processed. This value is for send and receive operations that are issued between the component and a node that is in the remote SAN Volume Controller cluster.

**Port error data**

You can create performance reports that include the following information:

**Link Failure Rate (count/s)**

The average number of link errors per second.

**Loss of Sync Rate (count/s)**

The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

**Loss of Signal Rate (count/s)**

The average number of times per second that the signal is lost.

**CRC Error Rate (count/s)**

The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

**Primitive Sequence Protocol Error Rate (count/s)**

The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

**Invalid Transmission Word Rate (count/s)**

The average number of bit errors per second that are detected.

**Volume data**

You can create performance reports that include the following information:

**Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

**Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

**Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

**Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

**Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

**Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

**Cache data**

You can create performance reports that include the following information:

**Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Total Overall Cache Hit Percentage**

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Disk to Cache Transfer Rate (ops/s)**

The average number of tracks that are transferred per second from the disks to the cache.

**Cache to Disk Transfer Rate (ops/s)**

The average number of tracks per second that are transferred from the cache to the disks.

**Write Cache Delay Percentage**

The percentage of I/O operations that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as a percentage of all I/O operations.

**Write Cache Delay I/O Rate (ops/s)**

The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as an average of all I/O operations.

**Read Ahead Percentage of Cache Hits**

The percentage of all read-cache hits that occur on pre-staged data.

**Dirty Write Percentage of Cache Hits**

The percentage of all cache write operations that occur on data in the cache that is marked as modified. This value represents how effectively writes are coalesced before being written to disk.

**Write Cache Overflow Percentage**

The percentage of write operations that are delayed because there is not enough space in the write cache.

**Write Cache Overflow I/O Rate (ops/s)**

The average number of write operations per second that are delayed because there is not enough space in the write cache.

**Write Cache Flush Through Percentage**

The percentage of tracks that are written to disk in flush-through mode.

**Write Cache Flush Through I/O Rate (ops/s)**

The average number of tracks per second that are written to disk in flush-through mode.

**Write Cache Write Through Percentage**

The percentage of tracks that are written to disk in write-through mode.

**Write Cache Write Through I/O Rate (ops/s)**

The average number of tracks per second that are written to disk in write-through mode.

**Back-end array data**

You can create performance reports that include the following information:

**Back-End Read I/O Rate (ops/s)**

The average number of read operations per second that are issued to the back-end storage resources.

**Back-End Write I/O Rate (ops/s)**

The average number of write operations per second that are issued to the back-end storage resources.

**Total Back-End I/O Rate (ops/s)**

The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

**Back-End Read Data Rate (MiB/s)**

The average number of MiB per second that are read from the back-end storage resources.

**Back-End Write Data Rate (MiB/s)**

The average number of MiB per second that are written to the back-end storage resources.

**Total Back-End Data Rate (MiB/s)**

The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

**Back-End Read Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Write Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Overall Back-End Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Read Queue Time (ms/op)**

The average number of milliseconds that a read operation spends in the queue before being sent to the back-end storage resources.

**Back-End Write Queue Time (ms/op)**

The average number of milliseconds that write operations spend in the queue before being sent to the back-end storage resources.

**Overall Back-End Queue Time (ms/op)**

The average number of milliseconds that a read or a write operation spends in the queue before being sent to the back-end storage resources.

**Back-End Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation from the back-end storage resources.

**Back-End Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation to the back-end storage resources.

**Overall Back-End Transfer Size (KiB/op)**

The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

**Peak Back-End Read Response Time (ms)**

The longest time for a back-end storage resource to respond to a read operation.

**Peak Back-End Write Response Time (ms)**

The longest time for a back-end storage resource to respond to a write operation.

**Peak Back-End Read Queue Time (ms)**

The longest time that a read operation spends in the queue before being sent to the back-end storage resources.

**Peak Back-End Write Queue Time (ms)**

The longest time that a write operation spends in the queue before being sent to the back-end storage resources.

**Other data**

You can create performance reports that include the following information:

**Global Mirror Write I/O Rate (op/s)**

The average number of write operations per second that are issued to the Global Mirror secondary site.

**Global Mirror Overlapping Write Percentage**

The percentage of overlapping write operations that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

**Global Mirror Overlapping Write I/O Rate (op/s)**

The average number of overlapping write operations per second that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

**Peak Read Response Time (ms)**

The longest time to complete a read operation.

**Peak Write Response Time (ms)**

The longest time to complete a write operation.

**Global Mirror Secondary Write Lag (ms/op)**

The average number of milliseconds to service a secondary write operation for Global Mirror. This value does not include the time to service the primary write operation.

You monitor the value of **Global Mirror Secondary Write Lag** to identify delays that occurred while writing data to the secondary site.

**Processor Utilization Percentage**

The average percentage of time that the processors are busy.

**Overall Host Attributed Response Time Percentage**

The percentage of the average response time that can be attributed to delays from host systems. This value includes both read response times and write response times, and can help you diagnose slow hosts and fabrics that are not working efficiently.

The value is based on the following conditions:

- For read response time, the time that it takes for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes.
- For write response time, the time that it takes for hosts to send the write data after the node responds to a transfer-ready notification.

#### **Zero Buffer to Buffer Credit Timer (microseconds)**

The number of microseconds that the port is unable to send frames because there is not enough buffer credit.

Buffer credits are used in Fibre Channel technology to control the flow of frames between ports. This value is measured from the time of the last node reset.

### **Data for managed disks on storage virtualizers in performance reports**

You can include general information, capacity data, properties, and other information about managed disks on storage virtualizers in performance reports.

#### **Information about managed disks on storage virtualizers**

You can create performance reports that include the following information:

##### **Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

##### **Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

##### **Storage Virtualizer MDisk Name**

The name that was assigned to the managed disk on a storage virtualizer when it was added to the system.

#### **Capacity and usage data**

You can create performance reports that include the following information:

##### **Storage Virtualizer MDisk Capacity (GiB)**

The amount of storage space on the managed disk.

##### **Storage Virtualizer MDisk Available Space (GiB)**

The amount of space on managed disks that is available to be added to a pool.

##### **Storage Virtualizer MDisk Strip Size (KB)**

The number of blocks in a strip on a storage virtualizer managed disk.

#### **Component properties**

You can create performance reports that include the following information:

##### **Storage Virtualizer MDisk RAID Level**

The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

##### **Storage Virtualizer MDisk Spare Goal**

The number of spare drives that are needed to maintain redundancy. Use spare drives to protect against drive failures in the array on a managed disk on a storage virtualizer.

**Storage Virtualizer MDisk Type**

The type of managed disk on a storage virtualizer. For example, the storage virtualizer can be a local or virtual managed disk.

**Storage Virtualizer MDisk Mode**

The access mode of a managed disk on a storage virtualizer. The access mode describes how extents are provided for virtual disks. Extents can be provided to virtual disks in the following ways:

**Array** Extents are provided from local disks.

**Managed**

Extents are provided from a back-end storage volume.

**Unmanaged**

The managed disk is not used in the system.

**Storage Virtualizer MDisk Is Balanced**

Shows whether logical unit numbers (LUNs) are properly balanced across storage controllers on the managed disk. If this value is Yes, the LUNs are properly balanced.

**Storage Virtualizer MDisk Fast Write State**

Shows whether the cache for a volume on a disk that is managed by a storage virtualizer is empty, contains data, or is corrupted.

**Storage Virtualizer MDisk Write Verify**

Shows whether all write operations on the storage virtualizer managed disk are verified by an immediate follow-up read operation. The follow-up read operation verifies that the write operation was successful. If this value is Yes, all write operations are verified by a follow-up read operation.

**Status information**

You can create performance reports that include the following information:

**Storage Virtualizer MDisk Status**

The condition of the resource, for example normal, warning, or error.

**Storage Virtualizer MDisk Native Status**

Shows the level of access of nodes in the system to the storage virtualizer managed disk or volume. The level of access can be online, offline, degraded, or excluded.

**Statistics for managed disks on storage virtualizers in performance reports:**

You can include performance data for back-end arrays on storage-virtualizer managed disks in performance reports.

**Back-end array data**

You can create performance reports that include the following information:

**Back-End Read I/O Rate (ops/s)**

The average number of read operations per second that are issued to the back-end storage resources.

**Back-End Write I/O Rate (ops/s)**

The average number of write operations per second that are issued to the back-end storage resources.

**Total Back-End I/O Rate (ops/s)**

The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

**Back-End Read Data Rate (MiB/s)**

The average number of MiB per second that are read from the back-end storage resources.

**Back-End Write Data Rate (MiB/s)**

The average number of MiB per second that are written to the back-end storage resources.

**Total Back-End Data Rate (MiB/s)**

The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

**Back-End Read Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Write Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Overall Back-End Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Read Queue Time (ms/op)**

The average number of milliseconds that a read operation spends in the queue before being sent to the back-end storage resources.

**Back-End Write Queue Time (ms/op)**

The average number of milliseconds that write operations spend in the queue before being sent to the back-end storage resources.

**Overall Back-End Queue Time (ms/op)**

The average number of milliseconds that a read or a write operation spends in the queue before being sent to the back-end storage resources.

**Back-End Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation from the back-end storage resources.

**Back-End Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation to the back-end storage resources.

**Overall Back-End Transfer Size (KiB/op)**

The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

**Peak Back-End Read Response Time (ms)**

The longest time for a back-end storage resource to respond to a read operation.

**Peak Back-End Write Response Time (ms)**

The longest time for a back-end storage resource to respond to a write operation.

**Peak Back-End Read Queue Time (ms)**

The longest time that a read operation spends in the queue before being sent to the back-end storage resources.

**Peak Back-End Write Queue Time (ms)**

The longest time that a write operation spends in the queue before being sent to the back-end storage resources.

**Data for storage virtualizer volumes in performance reports**

You can include general information, capacity data, properties, and other information about storage virtualizer volumes in performance reports.

**Information about storage virtualizer volumes**

You can create performance reports that include the following information:

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

**Storage Virtualizer I/O Group Name**

The name that was assigned to the I/O group on a storage virtualizer when it was added to the system.

**Storage Virtualizer Volume Name**

The name that was assigned to the storage virtualizer volume when it was added to the system.

**Capacity and usage data**

You can create performance reports that include the following information:

**Storage Virtualizer Volume Capacity (GiB)**

The amount of storage space on the volume.

**Storage Virtualizer Volume Used Space (GiB)**

The amount of virtual space that is used on a thin-provisioned volume. For volumes that are not thin provisioned, this value is same as the **Storage Virtualizer Volume Capacity** value.

**Storage Virtualizer Volume Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Component properties**

You can create performance reports that include the following information:

- Storage Virtualizer Volume Type**  
The type of storage virtualizer volume. For example, the storage virtualizer volume can be striped, sequential, or another type of storage virtualizer volume.
- Storage Virtualizer Volume WWN**  
The worldwide name of the volume.
- Storage Virtualizer Volume Fast Write State**  
Shows whether the cache for a volume on a disk that is managed by a storage virtualizer is empty, contains data, or is corrupted.
- Storage Virtualizer Volume Grain Size (KiB)**  
The unit in which space is allocated from a volume. Larger grain sizes maximize performance. Smaller grain sizes maximize space efficiency.
- Storage Virtualizer Volume Is Assigned**  
Shows whether the volume is assigned to a server. If this value is Yes, the volume is assigned to a server.
- Storage Virtualizer Volume Is Auto Expand Enabled**  
Shows whether a volume or volume copy can allocate new extents from a pool automatically. Volumes or volume copies might allocate new extents to expand the real capacity of the storage virtualizer volume or volume copy. If this value is Yes, the volume or volume copy can allocate new extents from a pool automatically.
- Storage Virtualizer Volume Is Encryptable**  
Shows whether the resource can be encrypted. If this value is Yes, the resource can be encrypted.
- Storage Virtualizer Volume Is Encrypted**  
Shows whether the resource is encrypted. If this value is Yes, the resource is encrypted.
- Storage Virtualizer Volume Is Thin Provisioned**  
Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is Yes, the resource is thin-provisioned.
- Storage Virtualizer Volume Metro Mirror Name**  
The name of the Metro Mirror that keeps the synchronous copy of the storage virtualizer volume.
- Storage Virtualizer Volume Mirror Count**  
The number of mirrors that keep a synchronous copy of the resource.
- Storage Virtualizer Volume Preferred Node**  
The number of the storage virtualizer node that is used for I/O operations for the storage virtualizer volume.
- Storage Virtualizer Volume Throttle**  
The maximum number of commands that the storage virtualizer volume can queue.
- Storage Virtualizer Volume Warning Level**  
The percentage of used capacity of the resource at which a warning is generated.
- Storage Virtualizer Volume Copy Relationship**  
Shows whether a volume or a copy of a volume is in a FlashCopy relationship or a point-in-time relationship. This property can contain the following values:

**Source Relationship**

The volume is the source of the relationship.

**Target Relationship**

The volume is the target of the relationship.

**Both Source and Target Relationship**

The volume is both the source and target of the relationship.

This property applies only to SAN Volume Controller.

**Status information**

You can create performance reports that include the following information:

**Storage Virtualizer Volume Status**

The condition of the resource, for example normal, warning, or error.

**Storage Virtualizer Volume Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Storage Virtualizer Volume Native Status**

Shows the level of access of nodes in the system to the storage virtualizer managed disk or volume. The level of access can be online, offline, degraded, or excluded.

**Statistics for storage virtualizer volumes in performance reports:**

You can include performance data for volumes, caches, and other data for storage virtualizer volumes in performance reports.

**Volume data**

You can create performance reports that include the following information:

**Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

**Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

**Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

**Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Overall Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

**Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

**Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

**Volume Utilization**

The average percentage of time that the volume is busy.

**Cache data**

You can create performance reports that include the following information:

**Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Total Overall Cache Hit Percentage**

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Disk to Cache Transfer Rate (ops/s)**

The average number of tracks that are transferred per second from the disks to the cache.

**Cache to Disk Transfer Rate (ops/s)**

The average number of tracks per second that are transferred from the cache to the disks.

**Write Cache Delay Percentage**

The percentage of I/O operations that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as a percentage of all I/O operations.

**Write Cache Delay I/O Rate (ops/s)**

The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as an average of all I/O operations.

**Read Ahead Percentage of Cache Hits**

The percentage of all read-cache hits that occur on pre-staged data.

**Dirty Write Percentage of Cache Hits**

The percentage of all cache write operations that occur on data in the cache that is marked as modified. This value represents how effectively writes are coalesced before being written to disk.

**Write Cache Overflow Percentage**

The percentage of write operations that are delayed because there is not enough space in the write cache.

**Write Cache Overflow I/O Rate (ops/s)**

The average number of write operations per second that are delayed because there is not enough space in the write cache.

**Write Cache Flush Through Percentage**

The percentage of tracks that are written to disk in flush-through mode.

**Write Cache Flush Through I/O Rate (ops/s)**

The average number of tracks per second that are written to disk in flush-through mode.

**Write Cache Write Through Percentage**

The percentage of tracks that are written to disk in write-through mode.

**Write Cache Write Through I/O Rate (ops/s)**

The average number of tracks per second that are written to disk in write-through mode.

**Other data**

You can create performance reports that include the following information:

**Global Mirror Write I/O Rate (op/s)**

The average number of write operations per second that are issued to the Global Mirror secondary site.

**Global Mirror Overlapping Write Percentage**

The percentage of overlapping write operations that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

**Global Mirror Overlapping Write I/O Rate (op/s)**

The average number of overlapping write operations per second that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

**Peak Read Response Time (ms)**

The longest time to complete a read operation.

**Peak Write Response Time (ms)**

The longest time to complete a write operation.

**Global Mirror Secondary Write Lag (ms/op)**

The average number of milliseconds to service a secondary write operation for Global Mirror. This value does not include the time to service the primary write operation.

You monitor the value of **Global Mirror Secondary Write Lag** to identify delays that occurred while writing data to the secondary site.

**Overall Host Attributed Response Time Percentage**

The percentage of the average response time that can be attributed to delays from host systems. This value includes both read response times and write response times, and can help you diagnose slow hosts and fabrics that are not working efficiently.

The value is based on the following conditions:

- For read response time, the time that it takes for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes.
- For write response time, the time that it takes for hosts to send the write data after the node responds to a transfer-ready notification.

**Nonpreferred Node Usage Percentage**

The overall percentage of I/O performed or data transferred over the non-preferred nodes of the virtual disks.

**Data for storage virtualizer nodes in performance reports**

You can include properties, and other information about storage virtualizer nodes in performance reports.

**Information about storage virtualizer nodes**

You can create performance reports that include the following information:

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Storage Virtualizer Node Name**

The name that was assigned to the storage virtualizer node when it was added to the system.

**Storage Virtualizer I/O Group Name**

The name that was assigned to the I/O group on a storage virtualizer when it was added to the system.

**Component properties**

You can create performance reports that include the following information:

**Storage Virtualizer Node IP Address**

The IP address of the resource.

**Storage Virtualizer Node WWN**

The worldwide name of the node.

**Storage Virtualizer Node Configuration**

## Status information

You can create performance reports that include the following information:

### Storage Virtualizer Node Status

Shows whether a storage virtualizer node is online.

### Statistics for storage virtualizer nodes in performance reports:

You can include port data, front end data, cache data, back-end data, and other data for storage virtualizer nodes in performance reports.

### Port data

You can create performance reports that include the following information:

#### Port Send I/O Rate (ops/s)

The average number of I/O operations per second for operations in which data is sent from a port.

#### Port Receive I/O Rate (ops/s)

The average number of I/O operations per second for operations in which the port receives data.

#### Total Port I/O Rate (ops/s)

The average number of send operations and receive operations per second.

#### Port Send Data Rate (MiB/s)

The average rate at which data is sent through the port. The rate is measured in MiB per second.

#### Port Receive Data Rate (MiB/s)

The average rate at which data is received by the port. The rate is measured in MiB per second.

#### Total Port Data Rate (MiB/s)

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

#### Port to Host Send I/O Rate (ops/s)

The average number of exchanges per second that are sent to host computers.

#### Port to Host Receive I/O Rate (ops/s)

The average number of exchanges per second that are received from host computers.

#### Total Port to Host I/O Rate (ops/s)

The average number of exchanges per second that are transmitted between host computers and the component.

#### Port to Disk Send I/O Rate (ops/s)

The average number of exchanges per second that are sent to back-end storage resources.

#### Port to Disk Receive I/O Rate (ops/s)

The average number of exchanges per second that are received from back-end storage resources.

**Total Port to Disk I/O Rate (ops/s)**

The average number of exchanges per second that are transmitted between back-end storage resources and the component. This value includes both send and receive operations.

**Port to Local Node Send I/O Rate (ops/s)**

The average number of exchanges per second that are sent to other nodes that are in the local SAN Volume Controller cluster.

**Port to Local Node Receive I/O Rate (ops/s)**

The average number of exchanges per second that are received from other nodes that are in the local SAN Volume Controller cluster.

**Total Port to Local Node I/O Rate (ops/s)**

The average number of exchanges per second that are transmitted between the component and other nodes that are in the local SAN Volume Controller cluster.

**Port to Remote Node Send I/O Rate (ops/s)**

The average number of exchanges per second that are sent to nodes that are in the remote SAN Volume Controller cluster.

**Port to Remote Node Receive I/O Rate (ops/s)**

The average number of exchanges per second that are received from nodes that are in the remote SAN Volume Controller cluster.

**Total Port to Remote Node I/O Rate (ops/s)**

The average number of exchanges per second that are transmitted between the component and nodes that are in the remote SAN Volume Controller cluster.

**Port to Host Send Data Rate (MiB/s)**

The average rate at which data is sent to host computers. The rate is measured in MiB per second.

**Port to Host Receive Data Rate (MiB/s)**

The average rate at which data is received from host computers. The rate is measured in MiB per second.

**Total Port to Host Data Rate (MiB/s)**

The average rate at which data is transmitted between host computers and the component. The rate is measured in MiB per second and includes both send and receive operations.

**Port to Disk Send Data Rate (MiB/s)**

The average rate at which data is sent to back-end storage resources. The rate is measured in MiB per second.

**Port to Disk Receive Data Rate (MiB/s)**

The average rate at which data is received from back-end storage resources. The rate is measured in MiB per second.

**Total Port to Disk Data Rate (MiB/s)**

The average rate at which data is transmitted between back-end storage resources and the component. The rate is measured in MiB per second and includes both send and receive operations.

**Port to Local Node Send Data Rate (MiB/s)**

The average rate at which data is sent to other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Local Node Receive Data Rate (MiB/s)**

The average rate at which data is received from other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

**Total Port to Local Node Data Rate (MiB/s)**

The average rate at which data is transmitted between the component and other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Remote Node Send Data Rate (MiB/s)**

The average rate at which data is sent to nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Remote Node Receive Data Rate (MiB/s)**

The average rate at which data is received from nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

**Total Port to Remote Node Data Rate (MiB/s)**

The average rate at which data is transmitted between the component and nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Local Node Send Response Time (ms/op)**

The average number of milliseconds to complete a send operation to another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Port to Local Node Receive Response Time (ms/op)**

The average number of milliseconds to complete a receive operation from another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Overall Port to Local Node Response Time (ms/op)**

The average number of milliseconds to complete a send or receive operation with another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Port to Local Node Send Queue Time (ms/op)**

The average time in milliseconds that a send operation spends in the queue before being processed. This value represents the queue time for send operations that are issued to other nodes that are in the local SAN Volume Controller cluster.

**Port to Local Node Receive Queue Time (ms/op)**

The average time in milliseconds that a receive operation spends in the queue before being processed. This value represents the queue time for receive operations that are issued from other nodes that are in the local SAN Volume Controller cluster.

**Overall Port to Local Node Queue Time (ms/op)**

The average number of milliseconds that a send or receive operation spends in the queue before being processed. This value is for send and receive operations that are issued between the component and other nodes that are in the local SAN Volume Controller cluster.

**Port to Remote Node Send Response Time (ms/op)**

The average number of milliseconds to complete a send operation to a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Port to Remote Node Receive Response Time (ms/op)**

The average number of milliseconds to complete a receive operation from a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Overall Port to Remote Node Response Time (ms/op)**

The average number of milliseconds to complete a send operation to, or a receive operation from a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Port to Remote Node Send Queue Time (ms/op)**

The average time in milliseconds that a send operation spends in the queue before being processed. This value represents the queue time for send operations that are issued to a node that is in the remote SAN Volume Controller cluster.

**Port to Remote Node Receive Queue Time (ms/op)**

The average time in milliseconds that a receive operation spends in the queue before being processed. This value represents the queue time for receive operations that are issued from a node that is in the remote SAN Volume Controller cluster.

**Overall Port to Remote Node Queue Time (ms/op)**

The average number of milliseconds that a send or receive operation spends in the queue before being processed. This value is for send and receive operations that are issued between the component and a node that is in the remote SAN Volume Controller cluster.

**Front end data**

You can create performance reports that include the following information:

**Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

**Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

**Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

**Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

**Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Overall Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

**Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

**Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Cache data**

You can create performance reports that include the following information:

**Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Total Overall Cache Hit Percentage**

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Write Cache Delay Percentage**

The percentage of I/O operations that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as a percentage of all I/O operations.

**Read Ahead Percentage of Cache Hits**

The percentage of all read-cache hits that occur on pre-staged data.

**Dirty Write Percentage of Cache Hits**

The percentage of all cache write operations that occur on data in the cache that is marked as modified. This value represents how effectively writes are coalesced before being written to disk.

**Write Cache Overflow Percentage**

The percentage of write operations that are delayed because there is not enough space in the write cache.

**Write Cache Flush Through Percentage**

The percentage of tracks that are written to disk in flush-through mode.

**Write Cache Write Through Percentage**

The percentage of tracks that are written to disk in write-through mode.

**Write Cache Delay I/O Rate (ops/s)**

The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as an average of all I/O operations.

**Write Cache Overflow I/O Rate (ops/s)**

The average number of write operations per second that are delayed because there is not enough space in the write cache.

**Write Cache Flush Through I/O Rate (ops/s)**

The average number of tracks per second that are written to disk in flush-through mode.

**Write Cache Write Through I/O Rate (ops/s)**

The average number of tracks per second that are written to disk in write-through mode.

**Disk to Cache Transfer Rate (ops/s)**

The average number of tracks that are transferred per second from the disks to the cache.

**Cache to Disk Transfer Rate (ops/s)**

The average number of tracks per second that are transferred from the cache to the disks.

**Back-end data**

You can create performance reports that include the following information:

**Back-End Read I/O Rate (ops/s)**

The average number of read operations per second that are issued to the back-end storage resources.

**Back-End Write I/O Rate (ops/s)**

The average number of write operations per second that are issued to the back-end storage resources.

**Total Back-End I/O Rate (ops/s)**

The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

**Back-End Read Data Rate (MiB/s)**

The average number of MiB per second that are read from the back-end storage resources.

**Back-End Write Data Rate (MiB/s)**

The average number of MiB per second that are written to the back-end storage resources.

**Total Back-End Data Rate (MiB/s)**

The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

**Back-End Read Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Write Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Overall Back-End Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Read Queue Time (ms/op)**

The average number of milliseconds that a read operation spends in the queue before being sent to the back-end storage resources.

**Back-End Write Queue Time (ms/op)**

The average number of milliseconds that write operations spend in the queue before being sent to the back-end storage resources.

**Overall Back-End Queue Time (ms/op)**

The average number of milliseconds that a read or a write operation spends in the queue before being sent to the back-end storage resources.

**Back-End Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation from the back-end storage resources.

**Back-End Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation to the back-end storage resources.

**Overall Back-End Transfer Size (KiB/op)**

The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

**Peak Back-End Read Response Time (ms)**

The longest time for a back-end storage resource to respond to a read operation.

**Peak Back-End Write Response Time (ms)**

The longest time for a back-end storage resource to respond to a write operation.

**Peak Back-End Read Queue Time (ms)**

The longest time that a read operation spends in the queue before being sent to the back-end storage resources.

**Peak Back-End Write Queue Time (ms)**

The longest time that a write operation spends in the queue before being sent to the back-end storage resources.

**Other data**

You can create performance reports that include the following information:

**Global Mirror Write I/O Rate (op/s)**

The average number of write operations per second that are issued to the Global Mirror secondary site.

**Global Mirror Overlapping Write Percentage**

The percentage of overlapping write operations that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

**Global Mirror Overlapping Write I/O Rate (op/s)**

The average number of overlapping write operations per second that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

**Global Mirror Secondary Write Lag (ms/op)**

The average number of milliseconds to service a secondary write operation for Global Mirror. This value does not include the time to service the primary write operation.

You monitor the value of **Global Mirror Secondary Write Lag** to identify delays that occurred while writing data to the secondary site.

**Peak Read Response Time (ms)**

The longest time to complete a read operation.

**Peak Write Response Time (ms)**

The longest time to complete a write operation.

**Link Failure Rate (count/s)**

The average number of link errors per second.

**Loss of Sync Rate (count/s)**

The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

**Loss of Signal Rate (count/s)**

The average number of times per second that the signal is lost.

**CRC Error Rate (count/s)**

The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

**Primitive Sequence Protocol Error Rate (count/s)**

The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

**Invalid Transmission Word Rate (count/s)**

The average number of bit errors per second that are detected.

**Processor Utilization Percentage**

The average percentage of time that the processors are busy.

### **Overall Host Attributed Response Time Percentage**

The percentage of the average response time that can be attributed to delays from host systems. This value includes both read response times and write response times, and can help you diagnose slow hosts and fabrics that are not working efficiently.

The value is based on the following conditions:

- For read response time, the time that it takes for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes.
- For write response time, the time that it takes for hosts to send the write data after the node responds to a transfer-ready notification.

### **Zero Buffer to Buffer Credit Timer (microseconds)**

The number of microseconds that the port is unable to send frames because there is not enough buffer credit.

Buffer credits are used in Fibre Channel technology to control the flow of frames between ports. This value is measured from the time of the last node reset.

## **Data for storage virtualizer I/O groups in performance reports**

You can include general information, capacity data, and properties of storage virtualizer I/O groups in performance reports.

### **Information about storage virtualizer I/O groups**

You can create performance reports that include the following information:

#### **Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

#### **Storage Virtualizer I/O Group Name**

The name that was assigned to the I/O group on a storage virtualizer when it was added to the system.

### **Capacity and usage data**

You can create performance reports that include the following information:

#### **Storage Virtualizer I/O Group Mirroring Total Memory (MiB)**

The total amount of memory on the nodes in an I/O group that provides volume mirroring functions.

#### **Storage Virtualizer I/O Group Mirroring Free Memory (MiB)**

The amount of available memory on the nodes in an I/O group that provides volume mirroring functions.

#### **Storage Virtualizer I/O Group FlashCopy Total Memory (MiB)**

The total amount of memory on the nodes in an I/O group that provides FlashCopy mirroring functions.

#### **Storage Virtualizer I/O Group FlashCopy Free Memory (MiB)**

The amount of available memory on the nodes in an I/O group that provides FlashCopy mirroring functions.

#### **Storage Virtualizer I/O Group Remote Copy Total Memory (MiB)**

The total amount of memory on the nodes in an I/O group that provides mirroring functions using a remote copy.

**Storage Virtualizer I/O Group Remote Copy Free Memory (MiB)**

The amount of available memory on the nodes in an I/O group that provides mirroring functions using a remote copy.

**Storage Virtualizer I/O Group RAID Total Memory (MiB)**

The total amount of memory on the nodes in an I/O group that provides RAID mirroring functions.

**Storage Virtualizer I/O Group RAID Free Memory (MiB)**

The amount of available memory on the nodes in an I/O group that provides RAID mirroring functions.

**Component properties**

You can create performance reports that include the following information:

**Storage Virtualizer I/O Group Maintenance**

Shows whether the I/O group is in maintenance mode. If this value is Yes, the I/O group is in maintenance mode.

**Statistics for storage virtualizer I/O groups in performance reports:**

You can include performance data for ports, volumes, caches, back-end arrays, and other data for storage virtualizer I/O groups in performance reports.

**Port data**

You can create performance reports that include the following information:

**Port Send I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which data is sent from a port.

**Port Receive I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which the port receives data.

**Total Port I/O Rate (ops/s)**

The average number of send operations and receive operations per second.

**Port Send Data Rate (MiB/s)**

The average rate at which data is sent through the port. The rate is measured in MiB per second.

**Port Receive Data Rate (MiB/s)**

The average rate at which data is received by the port. The rate is measured in MiB per second.

**Total Port Data Rate (MiB/s)**

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

**Port to Host Send I/O Rate (ops/s)**

The average number of exchanges per second that are sent to host computers.

**Port to Host Receive I/O Rate (ops/s)**

The average number of exchanges per second that are received from host computers.

**Total Port to Host I/O Rate (ops/s)**

The average number of exchanges per second that are transmitted between host computers and the component.

**Port to Disk Send I/O Rate (ops/s)**

The average number of exchanges per second that are sent to back-end storage resources.

**Port to Disk Receive I/O Rate (ops/s)**

The average number of exchanges per second that are received from back-end storage resources.

**Total Port to Disk I/O Rate (ops/s)**

The average number of exchanges per second that are transmitted between back-end storage resources and the component. This value includes both send and receive operations.

**Port to Local Node Send I/O Rate (ops/s)**

The average number of exchanges per second that are sent to other nodes that are in the local SAN Volume Controller cluster.

**Port to Local Node Receive I/O Rate (ops/s)**

The average number of exchanges per second that are received from other nodes that are in the local SAN Volume Controller cluster.

**Total Port to Local Node I/O Rate (ops/s)**

The average number of exchanges per second that are transmitted between the component and other nodes that are in the local SAN Volume Controller cluster.

**Port to Remote Node Send I/O Rate (ops/s)**

The average number of exchanges per second that are sent to nodes that are in the remote SAN Volume Controller cluster.

**Port to Remote Node Receive I/O Rate (ops/s)**

The average number of exchanges per second that are received from nodes that are in the remote SAN Volume Controller cluster.

**Total Port to Remote Node I/O Rate (ops/s)**

The average number of exchanges per second that are transmitted between the component and nodes that are in the remote SAN Volume Controller cluster.

**Port to Host Send Data Rate (MiB/s)**

The average rate at which data is sent to host computers. The rate is measured in MiB per second.

**Port to Host Receive Data Rate (MiB/s)**

The average rate at which data is received from host computers. The rate is measured in MiB per second.

**Total Port to Host Data Rate (MiB/s)**

The average rate at which data is transmitted between host computers and the component. The rate is measured in MiB per second and includes both send and receive operations.

**Port to Disk Send Data Rate (MiB/s)**

The average rate at which data is sent to back-end storage resources. The rate is measured in MiB per second.

**Port to Disk Receive Data Rate (MiB/s)**

The average rate at which data is received from back-end storage resources. The rate is measured in MiB per second.

**Total Port to Disk Data Rate (MiB/s)**

The average rate at which data is transmitted between back-end storage resources and the component. The rate is measured in MiB per second and includes both send and receive operations.

**Port to Local Node Send Data Rate (MiB/s)**

The average rate at which data is sent to other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Local Node Receive Data Rate (MiB/s)**

The average rate at which data is received from other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

**Total Port to Local Node Data Rate (MiB/s)**

The average rate at which data is transmitted between the component and other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Remote Node Send Data Rate (MiB/s)**

The average rate at which data is sent to nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Remote Node Receive Data Rate (MiB/s)**

The average rate at which data is received from nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

**Total Port to Remote Node Data Rate (MiB/s)**

The average rate at which data is transmitted between the component and nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Local Node Send Response Time (ms/op)**

The average number of milliseconds to complete a send operation to another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Port to Local Node Receive Response Time (ms/op)**

The average number of milliseconds to complete a receive operation from another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Overall Port to Local Node Response Time (ms/op)**

The average number of milliseconds to complete a send or receive operation with another node that is in the local SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Port to Local Node Send Queue Time (ms/op)**

The average time in milliseconds that a send operation spends in the queue before being processed. This value represents the queue time for send operations that are issued to other nodes that are in the local SAN Volume Controller cluster.

**Port to Local Node Receive Queue Time (ms/op)**

The average time in milliseconds that a receive operation spends in the queue before being processed. This value represents the queue time for receive operations that are issued from other nodes that are in the local SAN Volume Controller cluster.

**Overall Port to Local Node Queue Time (ms/op)**

The average number of milliseconds that a send or receive operation

spends in the queue before being processed. This value is for send and receive operations that are issued between the component and other nodes that are in the local SAN Volume Controller cluster.

**Port to Remote Node Send Response Time (ms/op)**

The average number of milliseconds to complete a send operation to a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Port to Remote Node Receive Response Time (ms/op)**

The average number of milliseconds to complete a receive operation from a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Overall Port to Remote Node Response Time (ms/op)**

The average number of milliseconds to complete a send operation to, or a receive operation from a node that is in the remote SAN Volume Controller cluster. This value represents the external response time of the transfers.

**Port to Remote Node Send Queue Time (ms/op)**

The average time in milliseconds that a send operation spends in the queue before being processed. This value represents the queue time for send operations that are issued to a node that is in the remote SAN Volume Controller cluster.

**Port to Remote Node Receive Queue Time (ms/op)**

The average time in milliseconds that a receive operation spends in the queue before being processed. This value represents the queue time for receive operations that are issued from a node that is in the remote SAN Volume Controller cluster.

**Overall Port to Remote Node Queue Time (ms/op)**

The average number of milliseconds that a send or receive operation spends in the queue before being processed. This value is for send and receive operations that are issued between the component and a node that is in the remote SAN Volume Controller cluster.

**Volume data**

You can create performance reports that include the following information:

**Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

**Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

**Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

**Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

**Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

**Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

**Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

**Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

**Overall Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

**Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

**Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

**Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

**Back-end array data**

You can create performance reports that include the following information:

**Back-End Read Data Rate (MiB/s)**

The average number of MiB per second that are read from the back-end storage resources.

**Back-End Write Data Rate (MiB/s)**

The average number of MiB per second that are written to the back-end storage resources.

**Total Back-End I/O Rate (ops/s)**

The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

**Back-End Read I/O Rate (ops/s)**

The average number of read operations per second that are issued to the back-end storage resources.

**Back-End Write I/O Rate (ops/s)**

The average number of write operations per second that are issued to the back-end storage resources.

**Total Back-End Data Rate (MiB/s)**

The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

**Back-End Read Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Write Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Overall Back-End Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Read Queue Time (ms/op)**

The average number of milliseconds that a read operation spends in the queue before being sent to the back-end storage resources.

**Back-End Write Queue Time (ms/op)**

The average number of milliseconds that write operations spend in the queue before being sent to the back-end storage resources.

**Overall Back-End Queue Time (ms/op)**

The average number of milliseconds that a read or a write operation spends in the queue before being sent to the back-end storage resources.

**Back-End Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation from the back-end storage resources.

**Back-End Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation to the back-end storage resources.

**Overall Back-End Transfer Size (KiB/op)**

The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

**Peak Back-End Read Response Time (ms)**

The longest time for a back-end storage resource to respond to a read operation.

**Peak Back-End Write Response Time (ms)**

The longest time for a back-end storage resource to respond to a write operation.

**Peak Back-End Read Queue Time (ms)**

The longest time that a read operation spends in the queue before being sent to the back-end storage resources.

**Peak Back-End Write Queue Time (ms)**

The longest time that a write operation spends in the queue before being sent to the back-end storage resources.

**Cache data**

You can create performance reports that include the following information:

**Overall Read Cache Hit Percentage**

The percentage of all read operations that find data in the cache. This value includes both sequential and nonsequential read operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Overall Write Cache Hit Percentage**

The percentage of all write operations that are handled in the cache. This value includes both sequential and nonsequential write operations.

**Total Overall Cache Hit Percentage**

The percentage of all read operations and write operations that are handled in the cache. This value includes sequential and nonsequential operations.

You can use this value to understand throughput or response times. Low-cache-hit percentages can increase response times because a cache miss requires access to the back-end storage resources.

**Disk to Cache Transfer Rate (ops/s)**

The average number of tracks that are transferred per second from the disks to the cache.

**Cache to Disk Transfer Rate (ops/s)**

The average number of tracks per second that are transferred from the cache to the disks.

**Write Cache Delay Percentage**

The percentage of I/O operations that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as a percentage of all I/O operations.

**Write Cache Delay I/O Rate (ops/s)**

The average number of I/O operations per second that are delayed because there is not enough space in the write cache.

Only write operations can be delayed but the value is calculated as an average of all I/O operations.

**Read Ahead Percentage of Cache Hits**

The percentage of all read-cache hits that occur on pre-staged data.

**Dirty Write Percentage of Cache Hits**

The percentage of all cache write operations that occur on data in the cache that is marked as modified. This value represents how effectively writes are coalesced before being written to disk.

**Write Cache Overflow Percentage**

The percentage of write operations that are delayed because there is not enough space in the write cache.

**Write Cache Overflow I/O Rate (ops/s)**

The average number of write operations per second that are delayed because there is not enough space in the write cache.

**Write Cache Flush Through Percentage**

The percentage of tracks that are written to disk in flush-through mode.

**Write Cache Flush Through I/O Rate (ops/s)**

The average number of tracks per second that are written to disk in flush-through mode.

**Write Cache Write Through Percentage**

The percentage of tracks that are written to disk in write-through mode.

**Write Cache Write Through I/O Rate (ops/s)**

The average number of tracks per second that are written to disk in write-through mode.

**Other data**

You can create performance reports that include the following information:

**Global Mirror Write I/O Rate (op/s)**

The average number of write operations per second that are issued to the Global Mirror secondary site.

**Global Mirror Overlapping Write Percentage**

The percentage of overlapping write operations that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

**Global Mirror Overlapping Write I/O Rate (op/s)**

The average number of overlapping write operations per second that are issued by the Global Mirror primary site.

For SAN Volume Controller software releases 4.3.1 and later, some overlapping writes are processed in parallel and are excluded from this value. For SAN Volume Controller software releases 4.3.0 and earlier, all overlapping writes are serialized.

**Peak Read Response Time (ms)**

The longest time to complete a read operation.

**Peak Write Response Time (ms)**

The longest time to complete a write operation.

**Global Mirror Secondary Write Lag (ms/op)**

The average number of milliseconds to service a secondary write operation for Global Mirror. This value does not include the time to service the primary write operation.

You monitor the value of **Global Mirror Secondary Write Lag** to identify delays that occurred while writing data to the secondary site.

**Link Failure Rate (count/s)**

The average number of link errors per second.

**Loss of Sync Rate (count/s)**

The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

**Loss of Signal Rate (count/s)**

The average number of times per second that the signal is lost.

**CRC Error Rate (count/s)**

The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

**Processor Utilization Percentage**

The average percentage of time that the processors are busy.

### **Overall Host Attributed Response Time Percentage**

The percentage of the average response time that can be attributed to delays from host systems. This value includes both read response times and write response times, and can help you diagnose slow hosts and fabrics that are not working efficiently.

The value is based on the following conditions:

- For read response time, the time that it takes for hosts to respond to transfer-ready notifications from the SAN Volume Controller nodes.
- For write response time, the time that it takes for hosts to send the write data after the node responds to a transfer-ready notification.

### **Nonpreferred Node Usage Percentage**

The overall percentage of I/O performed or data transferred over the non-preferred nodes of the virtual disks.

### **Primitive Sequence Protocol Error Rate (count/s)**

The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

### **Invalid Transmission Word Rate (count/s)**

The average number of bit errors per second that are detected.

### **Zero Buffer to Buffer Credit Timer (microseconds)**

The number of microseconds that the port is unable to send frames because there is not enough buffer credit.

Buffer credits are used in Fibre Channel technology to control the flow of frames between ports. This value is measured from the time of the last node reset.

## **Data for storage virtualizer ports in performance reports**

You can include properties and other information about storage virtualizer ports in performance reports.

### **Information about storage virtualizer ports**

You can create performance reports that include the following information:

#### **Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

#### **Storage Virtualizer Node Name**

The name that was assigned to the storage virtualizer node when it was added to the system.

#### **Storage Virtualizer Port Name**

An alphanumeric string that identifies a storage virtualizer port.

### **Component properties**

You can create performance reports that include the following information:

#### **Storage Virtualizer Port Number**

The port number on the resource.

#### **Storage Virtualizer Port Type**

The type of port on the storage system, storage virtualizer, or switch. For example, the port type can be N\_Port, F\_Port, or another type of port.

**Storage Virtualizer Port Speed (GiB)**

The speed of a port, measured in GiB per second.

**Status information**

You can create performance reports that include the following information:

**Storage Virtualizer Port Status**

The condition of the resource, for example normal, warning, or error.

**Storage Virtualizer Port Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Storage Virtualizer Port Enabled State**

Shows whether a port is enabled, disabled, or is enabled but offline.

**Statistics for storage virtualizer ports in performance reports:**

You can include performance data about storage virtualizer ports and port errors in performance reports.

**Port data**

You can create performance reports that include the following information:

**Port Send I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which data is sent from a port.

**Port Receive I/O Rate (ops/s)**

The average number of I/O operations per second for operations in which the port receives data.

**Total Port I/O Rate (ops/s)**

The average number of send operations and receive operations per second.

**Port Send Data Rate (MiB/s)**

The average rate at which data is sent through the port. The rate is measured in MiB per second.

**Port Receive Data Rate (MiB/s)**

The average rate at which data is received by the port. The rate is measured in MiB per second.

**Total Port Data Rate (MiB/s)**

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

**Port to Host Send I/O Rate (ops/s)**

The average number of exchanges per second that are sent to host computers.

**Port to Host Receive I/O Rate (ops/s)**

The average number of exchanges per second that are received from host computers.

**Total Port to Host I/O Rate (ops/s)**

The average number of exchanges per second that are transmitted between host computers and the component.

- Port to Disk Send I/O Rate (ops/s)**  
The average number of exchanges per second that are sent to back-end storage resources.
- Port to Disk Receive I/O Rate (ops/s)**  
The average number of exchanges per second that are received from back-end storage resources.
- Total Port to Disk I/O Rate (ops/s)**  
The average number of exchanges per second that are transmitted between back-end storage resources and the component. This value includes both send and receive operations.
- Port to Local Node Send I/O Rate (ops/s)**  
The average number of exchanges per second that are sent to other nodes that are in the local SAN Volume Controller cluster.
- Port to Local Node Receive I/O Rate (ops/s)**  
The average number of exchanges per second that are received from other nodes that are in the local SAN Volume Controller cluster.
- Total Port to Local Node I/O Rate (ops/s)**  
The average number of exchanges per second that are transmitted between the component and other nodes that are in the local SAN Volume Controller cluster.
- Port to Remote Node Send I/O Rate (ops/s)**  
The average number of exchanges per second that are sent to nodes that are in the remote SAN Volume Controller cluster.
- Port to Remote Node Receive I/O Rate (ops/s)**  
The average number of exchanges per second that are received from nodes that are in the remote SAN Volume Controller cluster.
- Total Port to Remote Node I/O Rate (ops/s)**  
The average number of exchanges per second that are transmitted between the component and nodes that are in the remote SAN Volume Controller cluster.
- Port to Host Send Data Rate (MiB/s)**  
The average rate at which data is sent to host computers. The rate is measured in MiB per second.
- Port to Host Receive Data Rate (MiB/s)**  
The average rate at which data is received from host computers. The rate is measured in MiB per second.
- Total Port to Host Data Rate (MiB/s)**  
The average rate at which data is transmitted between host computers and the component. The rate is measured in MiB per second and includes both send and receive operations.
- Port to Disk Send Data Rate (MiB/s)**  
The average rate at which data is sent to back-end storage resources. The rate is measured in MiB per second.
- Port to Disk Receive Data Rate (MiB/s)**  
The average rate at which data is received from back-end storage resources. The rate is measured in MiB per second.
- Total Port to Disk Data Rate (MiB/s)**  
The average rate at which data is transmitted between back-end storage

resources and the component. The rate is measured in MiB per second and includes both send and receive operations.

**Port to Local Node Receive Data Rate (MiB/s)**

The average rate at which data is received from other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Local Node Send Data Rate (MiB/s)**

The average rate at which data is sent to other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

**Total Port to Local Node Data Rate (MiB/s)**

The average rate at which data is transmitted between the component and other nodes that are in the local SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Remote Node Receive Data Rate (MiB/s)**

The average rate at which data is received from nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port to Remote Node Send Data Rate (MiB/s)**

The average rate at which data is sent to nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

**Total Port to Remote Node Data Rate (MiB/s)**

The average rate at which data is transmitted between the component and nodes that are in the remote SAN Volume Controller cluster. The rate is measured in MiB per second.

**Port Send Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Port Receive Bandwidth Percentage**

The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Overall Port Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Port error data**

You can create performance reports that include the following information:

**Link Failure Rate (count/s)**

The average number of link errors per second.

**Loss of Sync Rate (count/s)**

The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

**Loss of Signal Rate (count/s)**

The average number of times per second that the signal is lost.

**CRC Error Rate (count/s)**

The average number of frames per second that are received in which a

cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

**Primitive Sequence Protocol Error Rate (count/s)**

The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

**Invalid Transmission Word Rate (count/s)**

The average number of bit errors per second that are detected.

**Zero Buffer to Buffer Credit Timer (microseconds)**

The number of microseconds that the port is unable to send frames because there is not enough buffer credit.

Buffer credits are used in Fibre Channel technology to control the flow of frames between ports. This value is measured from the time of the last node reset.

**Data for storage virtualizer pools in performance reports**

You can include general information, capacity data, properties, and other information about storage virtualizer pools in performance reports.

**Information about storage virtualizer pools**

You can create performance reports that include the following information:

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

**Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

**Capacity and usage data**

You can create performance reports that include the following information:

**Storage Virtualizer Pool Capacity (GiB)**

The amount of storage space in the pool on the storage virtualizer. For SAN Volume Controller, this value represents the amount of managed disk space that is assigned to the managed disk group.

**Storage Virtualizer Pool Available Space (GiB)**

The amount of unused storage space in a storage virtualizer pool.

**Storage Virtualizer Pool Virtual Volume Capacity (GiB)**

The amount of virtual volume space on all volumes in the pool.

**Storage Virtualizer Pool Real Volume Capacity (GiB)**

The amount of space on all allocated extents in a pool. The allocated extents include the used extents and extents that were assigned to volumes when they were allocated.

**Storage Virtualizer Pool Used Volume Space (GiB)**

The amount of used space on all the volumes and volume copies in the pool.

**Storage Virtualizer Pool Overallocation Percentage**

The percentage of space that is allocated to virtual capacity on volumes in the pool.

**Storage Virtualizer Pool Extent Size (MiB)**

The size of the extents that were specified when a pool was created.

**Storage Virtualizer Pool Assigned Volume Space (GiB)**

The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

**Storage Virtualizer Pool Unassigned Volume Space (GiB)**

The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

**Storage Virtualizer Pool Number of Storage Volumes**

The number of volumes in the storage virtualizer pool.

**Storage Virtualizer Pool Number of MDisks**

The number of managed disks on a resource.

**Component properties**

You can create performance reports that include the following information:

**Storage Virtualizer Pool Is Encryptable**

Shows whether the resource can be encrypted. If this value is Yes, the resource can be encrypted.

**Storage Virtualizer Pool Is Encrypted**

Shows whether the resource is encrypted. If this value is Yes, the resource is encrypted.

**Storage Virtualizer Pool Is Solid State**

Shows whether there are solid-state drives in the pool. This property can contain the following values:

**Mixed** The pool contains both hard disk drives and solid-state drives.

**Non solid state**

The pool contains no solid-state drives.

**Solid state**

The pool contains a least one solid-state drive.

**Storage Virtualizer Pool Is Thin Provisioned**

Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is Yes, the resource is thin-provisioned.

**Storage Virtualizer Pool RAID Level**

The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

**Storage Virtualizer Pool Warning Level**

The percentage of used capacity of the resource at which a warning is generated.

**Status information**

You can create performance reports that include the following information:

**Storage Virtualizer Pool Status**

The condition of the resource, for example normal, warning, or error.

### **Storage Virtualizer Pool Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

### **Statistics for storage virtualizer pools in performance reports:**

You can include performance data for volumes and back-end arrays for storage virtualizer pools in performance reports.

#### **Volume data**

You can create performance reports that include the following information:

#### **Overall Read I/O Rate (ops/s)**

The average number of read operations per second. This value includes both sequential and nonsequential read operations.

#### **Overall Write I/O Rate (ops/s)**

The average number of write operations per second. This value includes both sequential and nonsequential write operations.

#### **Total Overall I/O Rate (ops/s)**

The average number of read operations and write operations per second. This value includes both sequential and nonsequential operations.

#### **Read Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations.

#### **Write Data Rate (MiB/s)**

The average number of MiB per second that are transferred for write operations.

#### **Total Data Rate (MiB/s)**

The average number of MiB per second that are transferred for read operations and write operations.

#### **Read Response Time (ms/op)**

The average number of milliseconds to complete a read operation.

#### **Write Response Time (ms/op)**

The average number of milliseconds to complete a write operation.

#### **Total Response Time (ms/op)**

The average number of milliseconds to complete an I/O operation. This value includes both read and write operations.

#### **Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation.

#### **Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation.

#### **Total Transfer Size (KiB/op)**

The average number of KiB that are transferred per I/O operation. This value includes both read and write operations.

#### **Back-end array data**

You can create performance reports that include the following information:

**Back-End Read I/O Rate (ops/s)**

The average number of read operations per second that are issued to the back-end storage resources.

**Back-End Write I/O Rate (ops/s)**

The average number of write operations per second that are issued to the back-end storage resources.

**Total Back-End I/O Rate (ops/s)**

The average number of I/O operations per second that are transmitted between the back-end storage resources and the component. This value includes both read and write operations.

**Back-End Read Data Rate (MiB/s)**

The average number of MiB per second that are read from the back-end storage resources.

**Back-End Write Data Rate (MiB/s)**

The average number of MiB per second that are written to the back-end storage resources.

**Total Back-End Data Rate (MiB/s)**

The average rate at which data is transmitted between the back-end storage resources and the component. The rate is measured in MiB per second and includes both read and write operations.

**Back-End Read Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Write Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Overall Back-End Response Time (ms/op)**

The average number of milliseconds for the back-end storage resources to respond to a read or a write operation.

For SAN Volume Controller models, this value represents the external response time of the managed disks.

**Back-End Read Queue Time (ms/op)**

The average number of milliseconds that a read operation spends in the queue before being sent to the back-end storage resources.

**Back-End Write Queue Time (ms/op)**

The average number of milliseconds that write operations spend in the queue before being sent to the back-end storage resources.

**Overall Back-End Queue Time (ms/op)**

The average number of milliseconds that a read or a write operation spends in the queue before being sent to the back-end storage resources.

**Back-End Read Transfer Size (KiB/op)**

The average number of KiB that are transferred per read operation from the back-end storage resources.

**Back-End Write Transfer Size (KiB/op)**

The average number of KiB that are transferred per write operation to the back-end storage resources.

**Overall Back-End Transfer Size (KiB/op)**

The average transfer size, in KiB, of a read or a write operation to the back-end storage resources.

**Peak Back-End Read Response Time (ms)**

The longest time for a back-end storage resource to respond to a read operation.

**Peak Back-End Write Response Time (ms)**

The longest time for a back-end storage resource to respond to a write operation.

**Peak Back-End Read Queue Time (ms)**

The longest time that a read operation spends in the queue before being sent to the back-end storage resources.

**Peak Back-End Write Queue Time (ms)**

The longest time that a write operation spends in the queue before being sent to the back-end storage resources.

**Data for switches in performance reports**

You can include properties and other information about switches in performance reports.

**Information about switches**

You can create performance reports that include the following information:

**Switch Logical Name**

The logical name of a switch or switch port.

**Component properties**

You can create performance reports that include the following information:

**Switch WWN**

The worldwide name of the switch.

**Parent Switch WWN**

The worldwide name of the parent switch.

**Switch Name**

The user-defined name for the switch, or the name that was assigned to the switch by the vendor.

**Switch Management Telnet Address**

The Telnet address that you access to manage the switch.

**Switch Management SNMP Address**

The Simple Network Management Protocol (SNMP) address that you access to manage the switch.

**Switch Management URL Address**

The URL that you access to manage the switch.

**Switch Domain**

The domain of the switch.

**Switch Version**

The version number of the operating system that is running on the switch.

**Status information**

You can create performance reports that include the following information:

**Switch Status**

The condition of the resource, for example normal, warning, or error.

**Switch Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Vendor, model, and device information**

You can create performance reports that include the following information:

**Switch IP Address**

The IP address of the resource.

**Switch Serial Number**

The serial number of the resource.

**Switch Vendor**

The vendor who supplied the resource.

**Switch Model**

The model name or model number of the resource.

**Statistics for switches in performance reports:**

You can include performance data for switches, including switch error data, in performance reports.

**Switch data**

You can create performance reports that include the following information:

**Port Send Frame Rate (frames/s)**

The average number of frames per second that are sent through the port.

**Port Receive Frame Rate (frames/s)**

The average number of frames per second that are received by the port.

**Total Port Frame Rate (frames/s)**

The average number of frames per second that are transferred. This value includes frames that are sent and frames that are received by the port.

**Port Send Data Rate (MiB/s)**

The average rate at which data is sent through the port. The rate is measured in MiB per second.

**Port Receive Data Rate (MiB/s)**

The average rate at which data is received by the port. The rate is measured in MiB per second.

**Total Port Data Rate (MiB/s)**

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

**Port Send Frame Size (KiB/op)**

The average size of a frame, in KiB, that is sent through the port.

**Port Receive Frame Size (KiB/op)**

The average size of a frame, in KiB, that is received by the port.

**Overall Port Frame Size (KiB/op)**

The average frame transfer size. This value is measured in KiB and includes frames that are sent and frames that are received by the port.

**Port Send Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Port Receive Bandwidth Percentage**

The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Overall Port Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Switch error data**

You can create performance reports that include the following information:

**Error Frame Rate (count/s)**

The average number of error frames per second that are received. An error frame is a frame that violates the Fibre Channel Protocol.

**Discarded Frame Rate (count/s)**

The average number of frames per second that are discarded because host buffers are unavailable for the port.

**Link Failure Rate (count/s)**

The average number of link errors per second.

**Loss of Sync Rate (count/s)**

The average number of times per second that synchronization is lost.

Synchronization is assumed lost after a timeout interval expires.

**Loss of Signal Rate (count/s)**

The average number of times per second that the signal is lost.

**CRC Error Rate (count/s)**

The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

**Encoding Disparity Error Rate (count/s)**

The average number of disparity errors per second that are received.

**Discarded Class 3 Frame Rate (count/s)**

The average number of class 3 frames per second that are discarded.

**Primitive Sequence Protocol Error Rate (count/s)**

The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

**Invalid Transmission Word Rate (count/s)**

The average number of bit errors per second that are detected.

**Link Reset Transmitted Rate (count/s)**

The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR1) state.

**Link Reset Received Rate (count/s)**

The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR2) state.

**Short Frame Rate (count/s)**

The average number of frames that are received per second that are shorter than 28 octets. This number excludes start-of-frame bytes and end-of-frame bytes.

The 28 octet limit is calculated based on the assumption that a frame has 24 header bytes, and 4 CRC bytes.

**Long Frame Rate (count/s)**

The average number of frames that are received per second that are longer than 2140 octets. This number excludes start-of-frame bytes and end-of-frame bytes.

The 2140 octet limit is calculated based on the assumption that a frame has 24 header bytes, 4 CRC bytes, and 2112 data bytes.

**F-BSY Frame Rate (count/s)**

The average number of F-BSY frames per second that are generated.

An F-BSY frame is issued by the fabric to indicate that a frame cannot be delivered because the fabric or destination N\_port is busy.

**F-RJT Frame Rate (count/s)**

The average number of F-RJT frames per second that are generated.

An F-RJT frame is issued by the fabric to indicate that delivery of a frame was denied.

**Data for switch ports in performance reports**

You can include properties and other information about switch ports in performance reports.

**Information about switch ports**

You can create performance reports that include the following information:

**Switch Logical Name**

The logical name of a switch or switch port.

**Switch Port WWPN**

The worldwide port name of the port on the switch.

**Component properties**

You can create performance reports that include the following information:

**Switch Port Number**

The port number on the resource.

**Switch Port Type**

The type of port on the storage system, storage virtualizer, or switch. For example, the port type can be N\_Port, F\_Port, or another type of port.

**Switch Port Speed (GiB/s)**

The speed of a port, measured in GiB per second.

**Status information**

You can create performance reports that include the following information:

**Switch Port Status**

The condition of the resource, for example normal, warning, or error.

**Switch Port Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Switch Port Enabled State**

Shows whether a port is enabled, disabled, or is enabled but offline.

**Statistics for switch ports in performance reports:**

You can include performance data for switch ports, including port error data, in performance reports.

**Switch port data**

You can create performance reports that include the following information:

**Port Send Frame Rate (frames/s)**

The average number of frames per second that are sent through the port.

**Port Receive Frame Rate (frames/s)**

The average number of frames per second that are received by the port.

**Total Port Frame Rate (frames/s)**

The average number of frames per second that are transferred. This value includes frames that are sent and frames that are received by the port.

**Port Send Data Rate (MiB/s)**

The average rate at which data is sent through the port. The rate is measured in MiB per second.

**Port Receive Data Rate (MiB/s)**

The average rate at which data is received by the port. The rate is measured in MiB per second.

**Total Port Data Rate (MiB/s)**

The average rate at which data is transferred through the port. The rate is measured in MiB per second and includes both send and receive operations.

**Port Peak Send Data Rate (MiB/s)**

The fastest rate at which data is sent through this switch port.

**Port Peak Receive Data Rate (MiB/s)**

The fastest rate at which data is received through this switch port.

**Port Send Frame Size (KiB/op)**

The average size of a frame, in KiB, that is sent through the port.

**Port Receive Frame Size (KiB/op)**

The average size of a frame, in KiB, that is received by the port.

**Overall Port Frame Size (KiB/op)**

The average frame transfer size. This value is measured in KiB and includes frames that are sent and frames that are received by the port.

**Port Send Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Port Receive Bandwidth Percentage**

The percentage of the port bandwidth that is used for receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Overall Port Bandwidth Percentage**

The percentage of the port bandwidth that is used for send operations and receive operations. This value is an indicator of port bandwidth usage based on the speed of the port.

**Data for errors on switch ports**

You can create performance reports that include the following information:

**Error Frame Rate (count/s)**

The average number of error frames per second that are received. An error frame is a frame that violates the Fibre Channel Protocol.

**Discarded Frame Rate (count/s)**

The average number of frames per second that are discarded because host buffers are unavailable for the port.

**Link Failure Rate (count/s)**

The average number of link errors per second.

**Loss of Sync Rate (count/s)**

The average number of times per second that synchronization is lost. Synchronization is assumed lost after a timeout interval expires.

**Loss of Signal Rate (count/s)**

The average number of times per second that the signal is lost.

**CRC Error Rate (count/s)**

The average number of frames per second that are received in which a cyclic redundancy check (CRC) error is detected. A CRC error is detected when the CRC in the transmitted frame does not match the CRC computed by the receiver.

**Encoding Disparity Error Rate (count/s)**

The average number of disparity errors per second that are received.

**Discarded Class 3 Frame Rate (count/s)**

The average number of class 3 frames per second that are discarded.

**Primitive Sequence Protocol Error Rate (count/s)**

The average number of primitive sequence protocol errors per second that are detected.

This error occurs when there is a link failure for a port.

**Invalid Transmission Word Rate (count/s)**

The average number of bit errors per second that are detected.

**Link Reset Transmitted Rate (count/s)**

The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR1) state.

**Link Reset Received Rate (count/s)**

The average number of times per second that the port changes from an active (AC) state to a Link Recovery (LR2) state.

**Short Frame Rate (count/s)**

The average number of frames that are received per second that are shorter than 28 octets. This number excludes start-of-frame bytes and end-of-frame bytes.

The 28 octet limit is calculated based on the assumption that a frame has 24 header bytes, and 4 CRC bytes.

**Long Frame Rate (count/s)**

The average number of frames that are received per second that are longer than 2140 octets. This number excludes start-of-frame bytes and end-of-frame bytes.

The 2140 octet limit is calculated based on the assumption that a frame has 24 header bytes, 4 CRC bytes, and 2112 data bytes.

**F-BSY Frame Rate (count/s)**

The average number of F-BSY frames per second that are generated.

An F-BSY frame is issued by the fabric to indicate that a frame cannot be delivered because the fabric or destination N\_port is busy.

**F-RJT Frame Rate (count/s)**

The average number of F-RJT frames per second that are generated.

An F-RJT frame is issued by the fabric to indicate that delivery of a frame was denied.

---

## Custom reports about resources

You can use Tivoli Common Reporting to create custom resource reports. Resource reports can contain detailed information about the properties of monitored resources, and the available space and capacity of those resources.

Resource reports can contain information about the following resources and their components:

- Servers
- Hypervisors
- Network-attached storage servers
- Storage virtualizers
- Storage systems
- Storage resource groups

## Creating custom resource reports in Tivoli Common Reporting

You can create custom reports that show resource and capacity data in IBM Tivoli Common Reporting.

Before you can create a custom resource report, ensure that data was collected from the resources. The following table shows where the data must be collected from for each resource:

Resource	Prerequisite
Server	Data must be collected from the server by the Storage Resource Agent.
Hypervisor	Data must be collected from the VMware ESX server.
NAS	Data must be collected from any NetApp or IBM Scale Out Network Attached Storage resources that are in your storage environment.
Storage virtualizer	Data must be collected from the any of the following storage virtualizers that are in your storage environment: <ul style="list-style-type: none"> <li>• Storwize V7000</li> <li>• Storwize V7000 Unified</li> <li>• SAN Volume Controller</li> </ul>
Storage system	Data must be collected from the storage system.

**Tip:** Before you run a report, you can preview the report with no data. For more information about how to preview and run reports, see the *IBM Cognos 8 v4 Business Intelligence Information Center* at <http://publib.boulder.ibm.com/infocenter/c8bi/v8r4m0/index.jsp>, and search for run report query studio.

#### Restriction:

You cannot create custom reports from the following packages:

- IBM Tivoli Storage Productivity Center Historical Information
  - IBM Tivoli Storage Productivity Center Storage Tiering
1. Select the **IBM Tivoli Storage Productivity Center Resources** package.
  2. Expand **Tivoli Storage Productivity Center** in the list.
  3. Expand **Servers to Storage Systems** in the list.
  4. Explore the folders in the list to locate the resources, properties, and statistics that you want to include in the report.
  5. Depending on your browser, do one of the following steps to add properties and statistics to the report:
    - Internet Explorer: Drag the items that you want to see information about to the right pane.
    - Firefox: Select the items that you want to see information about, and then click **Insert**.
  6. Click **Save**.

#### Adding filters to reports

You can use filters with reports that show resource information in IBM Tivoli Common Reporting.

Filters allow you to show only certain records which comply with your criteria. You can use filters when you create reports about resources. Filters for resources

are in the same list as the resources, in the appropriate resource folder. For example, to view the filters for servers, select **Server Resources > Server Resource Filters > Server Filters**.

Filters are available for all resources, except network-attached storage resources.

1. To apply a filter to the data in the right pane, locate the filter that you require in the folders in the list.
2. Depending on your browser, do one of the following steps to add a filter to the report:
  - Internet Explorer: Drag the filter that you want to use to the right pane.
  - Firefox: Select the filter that you want to use, and then click **Insert**.

The filter is applied to the report. If you did not add properties and statistics to the report, the filter is applied when you add the properties and statistics.

3. Optional: To delete the filter, right-click the filter in the right pane then select **Delete**. For information about filters for resources, see the IBM Tivoli Storage Productivity Center Information Center (<http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp>). For more information about how to use filters with reports, see the *IBM Cognos 8 v4 Business Intelligence Information Center* at <http://publib.boulder.ibm.com/infocenter/c8bi/v8r4m0/index.jsp>, and search for filters query studio.

## Filters for servers in resource reports

You can filter resource reports to include only the servers, server file systems, and server logical volumes that meet specific criteria.

### Filters for servers

You can create resource reports that include the following filters:

#### Servers Connected to Virtualizers or Storage Systems

Shows servers that are connected to storage virtualizers or storage systems. You can use this filter to identify servers that are connected directly to storage virtualizers, or connected directly or indirectly to storage systems. This filter excludes local disks from the report.

#### Servers Directly Connected to Storage Systems

Shows servers that are directly connected to a back-end storage system. You can use this filter to identify servers or server disks that are connected to a storage system, but are not connected through a storage virtualizer.

For example, you might want to migrate data from one storage system to another. In this case, you can use this filter to identify file systems or server disks that are not virtualized. These file systems or server disks might be affected if a storage system is removed.

#### Servers Directly Connected to Virtualizers

Shows servers that are directly connected to a storage virtualizer. You can use this filter to identify servers that are connected to a storage virtualizer, but are not connected directly to a back-end storage system.

For example, you can use this filter to identify only server disks that are on a SAN Volume Controller.

### Filters for server file systems

You can create resource reports that include the following filters:

### **Rows with File System Mount Points**

Shows the file systems that have a mount point on the server.

### **Rows without File System Mount Points**

Shows resources that do not have a mount point on the server. You can use this filter to identify disks that do not have file systems, that is, disks that are not in use.

For example, to identify unused space include the **Server Name** property and the **Server Disk Path** property in a report, and then include the **Rows without File System Mount Points** filter.

## **Filters for server logical volumes**

You can create resource reports that include the following filters:

### **Rows with Logical Volume Path**

Shows the logical volumes that have a path to the server.

### **Rows without Logical Volume Path**

Shows resources that do not have a logical volume path to the server. You can use this filter to identify volumes that do not have paths, that is, volumes that are not in use.

For example, to identify unused space include the **Server Name** property and the **Server Disk Path** property in a report, and then include the **Rows without Logical Volume Path** filter.

## **Filters for hypervisors in resource reports**

You can filter resource reports to include only the hypervisors, hypervisor file systems, and hypervisor logical volumes that meet specific criteria.

## **Filters for hypervisors**

You can create resource reports that include the following filters:

### **Hypervisor with Probed Servers**

Shows hypervisors that are connected to servers. You can use this filter to include only hypervisors and their associated servers from which data was collected. For example, you might collect data only from your critical production servers on a hypervisor, but not your test servers. In this case, you can use this filter to exclude information for the test servers from the report.

### **Hypervisors Connected to Virtualizers or Storage Systems**

Shows hypervisors that are connected to storage virtualizers or storage systems. You can use this filter to identify hypervisors that are connected directly to storage virtualizers, or connected directly or indirectly to storage systems. This filter excludes local disks from the report.

### **Hypervisors Directly Connected to Storage Systems**

Shows hypervisors that are directly connected to a back-end storage system. You can use this filter to identify hypervisors or hypervisor disks that are connected to a storage system, but are not connected through a storage virtualizer.

For example, you might want to migrate data from one storage system to another. In this case, you can use this filter to identify file systems or hypervisor disks that are not virtualized. These file systems or hypervisor disks might be affected if a storage system is removed.

### **Hypervisors Directly Connected to Virtualizers**

Shows hypervisors that are directly connected to a storage virtualizer. You can use this filter to identify hypervisors that are connected to a storage virtualizer, but are not connected directly to a back-end storage system.

For example, you can use this filter to identify only hypervisor disks that are on a SAN Volume Controller.

### **Filters for hypervisor file systems**

You can create resource reports that include the following filters:

#### **Hypervisors with File System Mount Points**

Shows the file systems that have a mount point on the hypervisor.

#### **Hypervisors without File System Mount Points**

Shows resources that do not have a mount point on the hypervisor. You can use this filter to identify disks that do not have file systems, that is, disks that are not in use.

For example, to identify unused space include the **Hypervisor Name** property and the **Hypervisor Disk Path** property in a report, and then include the **Hypervisors without File System Mount Points** filter.

### **Filters for hypervisor logical volumes**

You can create resource reports that include the following filters:

#### **Hypervisors with Logical Volume Path**

Shows the logical volumes that have a path to the hypervisor.

#### **Hypervisors without Logical Volume Path**

Shows resources that do not have a logical volume path to the hypervisor. You can use this filter to identify volumes that do not have paths, that is, volumes that are not in use.

For example, to identify unused space include the **Hypervisor Name** property and the **Hypervisor Disk Path** property in a report, and then include the **Hypervisors without Logical Volume Path** filter.

### **Filters for storage virtualizers in resource reports**

You can filter resource reports to include only the storage virtualizers and storage virtualizer volumes that meet specific criteria.

### **Storage virtualizer filters**

You can create resource reports that include the following filters:

#### **Virtualizers Not Connected to Servers**

Shows storage virtualizers that are not connected to servers.

### **Filters for storage virtualizer volumes**

You can create resource reports that include the following filters:

#### **Rows with Virtualizer Volumes**

Shows storage virtualizer disks that are connected to the storage virtualizer that have an associated volume.

**Rows without Virtualizer Volumes**

Shows storage virtualizer disks that are connected to the storage virtualizer that do not have an associated volume.

**Virtualizer Primary Volume Information**

Shows primary volumes that are connected to the storage virtualizer. You can use this filter if you want to get a total of the used space on primary volumes in your storage environment.

**Virtualizer Volume Copy Information**

Shows copy volumes that are connected to the storage virtualizer. You can use this filter if you want to get a total of the used space on volume copies in your storage environment.

**Filters for storage systems in resource reports**

You can filter resource reports to include only the storage systems or storage volumes that meet specific criteria.

**Filters for storage systems**

You can create resource reports that include the following filters:

**Storage Systems Directly Connected to Servers**

Shows back-end storage systems that are directly connected to a server. You can use this filter to identify storage systems that are connected to a server, but are not connected through a storage virtualizer.

For example, you might want to migrate data from one storage system to another. In this case, you can use this filter to identify file systems or server disks that are not virtualized. These file systems or server disks might be affected if a storage system is removed.

**Storage Systems Connected to Servers through Virtualizers**

Shows storage systems that are indirectly connected to a server through a storage virtualizer. You can use this filter to identify storage systems that are connected to a storage virtualizer, but are not connected directly to a server.

For example, you can use this filter to identify only server disks that are on a SAN Volume Controller.

**Storage Systems not Connected to Servers**

Shows storage systems that are not connected to a server either directly, or indirectly through a storage virtualizer.

**Rows with Storage Volumes**

Shows storage resources that have an associated storage volume.

**Rows without Storage Volumes**

Shows storage resources that do not have an associated storage volume.

**Filters for storage resource groups in resource reports**

You can filter resource reports to include only the storage resource groups that meet specific criteria.

**Filters for storage resource groups**

You can create resource reports that include the following filters:

**Storage Resource Group for Volumes**

Shows only the volumes that are in a storage resource group.

### **Storage Resource Group for Pools**

Shows only the pools that are in a storage resource group.

## **Data and properties in resource reports**

You can include capacity data, properties, and other information about resources in your storage environment in resource reports.

### **Data for clusters in resource reports**

You can include general information about clusters in resource reports.

#### **Information about clusters**

You can create resource reports that include the following information:

##### **Cluster Name**

The name that was assigned to the cluster when it was created.

##### **Cluster Type**

The type of the cluster. The cluster can be a Microsoft Cluster Server or a High-Availability Cluster Multiprocessing (HACMP) server.

##### **Cluster IP Address**

The IP address of the resource.

##### **Cluster Domain Name**

The domain name of the cluster.

### **Data for servers in resource reports**

You can include general information, capacity data, properties of components, and other information about servers in resource reports.

#### **Information about servers**

You can create resource reports that include the following information:

##### **Server Name**

The fully qualified domain name of the server. For example, the name of a server might be `server.example.com`.

##### **Server Domain Name**

The domain name of the server.

##### **Server Short Name**

The host name from the fully qualified domain name of the server. For example, if the fully qualified domain name of the server is `mycomputer.example.com`, the host name is `mycomputer`.

##### **Server Custom Tag 1**

User-defined text that is associated with the resource.

##### **Server Custom Tag 2**

User-defined text that is associated with the resource.

##### **Server Custom Tag 3**

User-defined text that is associated with the resource.

### **Capacity and usage data**

You can create resource reports that include the following information:

**Server Swap Space (GiB)**

The amount of disk space on a resource that is available to store some of the contents of the RAM when the RAM is full.

**Server Total Disk Capacity (GiB)**

The amount of storage space that is on a server.

**Server Total Disk Available Space (GiB)**

The amount of unused storage space on all disks on a server.

**Server Total File System Available Space (GiB)**

The amount of unused storage space that is available on the file systems on a server.

**Component properties**

You can create resource reports that include the following information:

**Server Cluster Current Hosting Node**

The name of the server that is hosting the cluster resource group.

**Server Cluster Resource Type**

Shows whether the cluster is a node or a cluster resource group.

**Server IP Address**

The IP address of the resource.

**Server Is Virtual Machine**

Shows whether a resource is a virtual machine. If this value is Yes, the resource is a virtual machine.

**Server OS Type**

The operating system that is running on the server.

**Server OS Version**

The version number of the operating system that is running on the resource.

**Server Processor Architecture**

The architecture of the processor on the server or hypervisor. For example, the architecture of a processor might be Intel 64bit (IA64) or Intel 32bit(IA32).

**Server Processor Count**

The number of processors on the server or hypervisor.

**Server Processor Speed (MHz)**

The speed of the processor on the server or hypervisor.

**Server Processor Type**

Shows information about the processor, such as the family and model of the processor.

**Server RAM (GiB)**

The amount of RAM on the server or hypervisor.

**Server Time Zone**

The time zone in which a resource is located.

**Vendor, model, and device information**

You can create resource reports that include the following information:

**Server Model**

The model name or model number of the resource.

**Server Serial Number**

The serial number of the resource.

**Server Vendor**

The vendor who supplied the resource.

**Status information**

You can create resource reports that include the following information:

**Server Status**

The condition of the resource, for example normal, warning, or error.

**Server Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Server Last Data Collection**

The date and time when storage statistics were last collected from the resource.

**Server Last Start Time**

The last time that the resource was started.

**Data for file systems on servers in resource reports**

You can include general information, capacity data, and status information about file systems on servers in resource reports.

**Information about file systems on servers**

You can create resource reports that include the following information:

**File System Mount Point**

The name or mount point of the file system for the resource. For example, on Microsoft Windows systems, the value in this column header might be c:\ or d:\. On operating systems such as AIX, Linux, Solaris, or HP-UX, the mount point might be /opt or /export/home.

**File System Export Name**

The name of the exported file system.

**File System Type**

The type of file system that the resource uses.

**Capacity and usage data**

You can create resource reports that include the following information:

**File System Capacity (GiB)**

The amount of storage space on the file system of the resource.

**File System Used Space (GiB)**

The amount of used storage space in the file system of the resource.

**File System Available Space (GiB)**

The amount of unused storage space in the file system of the resource.

**File System Physical Size (GiB)**

The amount of physical storage space on the file systems on a resource. The physical size is the size of all the clusters that the file system uses.

**File System Directory Count**

The number of directories in the file systems that are on a server.

**File System File Count**

The number of files in the file system.

**File System Available Inodes**

The number of unused inodes in file systems on the operating system.

**Tip:** For Microsoft Windows systems, this column is blank.

**File System Used Inodes**

The number of used inodes in file systems on the operating system.

**Tip:** For Microsoft Windows systems, this column is blank.

**File System Maximum Files**

The maximum number of files that the file system on the resource can contain.

**Status information**

You can create resource reports that include the following information:

**File System Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**File System Last Scan**

The date and time when file statistics were last collected from the resource.

**Data for logical volumes on servers in resource reports**

You can include general information, capacity data, and status information about logical volumes on servers in resource reports.

**Information about logical volumes on servers**

You can create resource reports that include the following information:

**Logical Volume Path**

The path to a logical volume on a resource, for example `/dev/hd1`.

**Logical Volume Is Swap Space**

Shows whether a logical volume is used to store some of the contents of the RAM when the RAM is full. If this value is Yes, the logical volume is used to store some of the contents of the RAM.

**Logical Volume Mirror Count**

The number of mirrors that keep a synchronous copy of the resource.

**Logical Volume Type**

The type of server logical volume. For example, the logical volume type can be concatenation or stripe set.

**Capacity and usage data**

You can create resource reports that include the following information:

**Logical Volume Allocation on Server Disk (GiB)**

The amount of disk storage space that is allocated to the logical volume.

**Logical Volume Capacity (GiB)**

The amount of storage space that is on a logical volume.

**Logical Volume Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Status information**

You can create resource reports that include the following information:

**Logical Volume Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Data for volume groups on servers in resource reports**

You can include general information and capacity data about volume groups on servers in resource reports.

**Information about volume groups on servers**

You can create resource reports that include the following information:

**Volume Group Name**

The name that was assigned to the volume group when it was added to the system.

**Volume Group Type**

The type of the volume manager that manages the volume group. The volume manager can be a logical volume manager (LVM) or a Veritas volume manager.

**Capacity and usage data**

You can create resource reports that include the following information:

**Volume Group Capacity (GiB)**

The amount of storage space that is on a volume group.

**Volume Group Available Space (GiB)**

The amount of unused storage space on a server volume group.

**Volume Group Number of Logical Volumes**

The number of logical volumes on a resource.

**Volume Group Number of Server Disks**

The number of server disks in a volume group.

**Data for server disks in resource reports**

You can include general information, capacity data, properties of components, and other information about server disks in resource reports.

**Information about server disks**

You can create resource reports that include the following information:

**Server Disk Path**

The identifier that specifies a path to a server disk, for example /dev/hdisk0.

A server disk might have one or more disk paths. To identify unique server disks, add the Server Disk Serial Number column to the report, and group the server disks by the serial number.

### **Capacity and usage data**

You can create resource reports that include the following information:

#### **Server Disk Capacity (GiB)**

The amount of storage space that is on a server disk.

#### **Server Disk Available Space (GiB)**

The amount of unused storage space that is on a server disk.

### **Component properties**

You can create resource reports that include the following information:

#### **Server Disk Is Removable**

Shows whether the disk can be removed from the server. If this value is Yes, the disk can be removed from the server.

### **Status information**

You can create resource reports that include the following information:

#### **Server Disk Status**

The condition of the resource, for example normal, warning, or error.

#### **Server Disk Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

### **Vendor, model, and device information**

You can create resource reports that include the following information:

#### **Server Disk Firmware Version**

The version number of the firmware that is running on the disk.

#### **Server Disk Model**

The model name or model number of the resource.

#### **Server Disk Serial Number**

The serial number of the resource.

#### **Server Disk Vendor**

The vendor who supplied the resource.

### **Path information**

You can create resource reports that include the following information:

#### **Server Disk LUN**

The logical unit within a small computer system interface target on a disk.

#### **Server Disk SCSI Target**

The bus address for the small computer system interface of the target on a disk.

### **Server Disk Target WWPN**

The worldwide port name of the storage port that the volume is mapped to.

## **Data for server groups in resource reports**

You can include general information and properties of server groups in resource reports.

### **Information about server groups**

You can create resource reports that include the following information:

#### **Server Group Name**

The name that was assigned to the server group when it was added to the system.

### **Component properties**

You can create resource reports that include the following information:

#### **Server Group Creator**

The ID of the user who created the group.

#### **Server Group Last Modified**

The date and time that the resource was last modified.

#### **Server Group Last Modified by User**

The ID of the user who last modified the resource.

## **Data for file system groups on servers in resource reports**

You can include general information about file system groups on servers, and properties of file system groups in resource reports.

### **Information about file system groups on servers**

You can create resource reports that include the following information:

#### **File System Group Name**

The name that was assigned to the file system group when it was added to the system.

### **Component properties**

You can create resource reports that include the following information:

#### **File System Group Creator**

The ID of the user who created the group.

#### **File System Group Last Modified**

The date and time that the resource was last modified.

#### **File System Group Last Modified by User**

The ID of the user who last modified the resource.

## **Data for hypervisors in resource reports**

You can include general information, capacity data, properties, and other information about hypervisors in resource reports.

## Information about hypervisors

You can create resource reports that include the following information:

### Hypervisor Name

The fully qualified domain name of the hypervisor. For example, the name of a hypervisor might be `hypervisor.example.com`.

### Hypervisor Short Name

The host name from the fully qualified domain name of the hypervisor. For example, if the fully qualified domain name of the hypervisor is `mycomputer.example.com`, the host name is `mycomputer`.

### Hypervisor Custom Tag 1

User-defined text that is associated with the resource.

### Hypervisor Custom Tag 2

User-defined text that is associated with the resource.

### Hypervisor Custom Tag 3

User-defined text that is associated with the resource.

## Capacity and usage data

You can create resource reports that include the following information:

### Hypervisor Kernel Memory (GiB)

The amount of memory on a hypervisor that is used for kernel memory. Kernel memory is used to perform internal operating system processes.

### Hypervisor Service Console Memory (GiB)

The amount of memory on a hypervisor that is used for the VMware ESX Service Console. Service Console is the operating system that is used to interact with ESX and the virtual machines that run on the hypervisor.

### Hypervisor Swap Space (GiB)

The amount of disk space on a resource that is available to store some of the contents of the RAM when the RAM is full.

### Hypervisor Total Disk Capacity (GiB)

The amount of storage space on disks on a hypervisor.

### Hypervisor Total Disk Available Space (GiB)

The amount of unused storage space on disks on the hypervisor.

### Hypervisor Total File System Available Space (GiB)

The amount of unused storage space that is available on the file systems on a hypervisor.

## Component properties

You can create resource reports that include the following information:

### Hypervisor IP Address

The IP address of the resource.

### Hypervisor OS Type

The software that runs the hypervisor, that is, VMware ESX.

### Hypervisor OS Version

The version number of the operating system that is running on the resource.

**Hypervisor Processor Architecture**

The architecture of the processor on the server or hypervisor. For example, the architecture of a processor might be Intel 64bit (IA64) or Intel 32bit(IA32).

**Hypervisor Processor Count**

The number of processors on the server or hypervisor.

**Hypervisor Processor Speed (MHz)**

The speed of the processor on the server or hypervisor.

**Hypervisor Processor Type**

Shows information about the processor, such as the family and model of the processor.

**Hypervisor RAM (GiB)**

The amount of RAM on the server or hypervisor.

**Hypervisor Software API Version**

The version number of the software API that runs on the hypervisor.

**Hypervisor Software Full Name**

The name, version number, and build number of the software that runs the hypervisor.

**Hypervisor Time Zone**

The time zone in which a resource is located.

**Vendor, model, and device information**

You can create resource reports that include the following information:

**Hypervisor Model**

The model name or model number of the resource.

**Hypervisor Serial Number**

The serial number of the resource.

**Hypervisor Vendor**

The vendor who supplied the resource.

**Status information**

You can create resource reports that include the following information:

**Hypervisor Status**

The condition of the resource, for example normal, warning, or error.

**Hypervisor Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Hypervisor Last Data Collection**

The date and time when storage statistics were last collected from the resource.

**Hypervisor Last Start Time**

The last time that the resource was started.

**Data for file systems on hypervisors in resource reports**

You can include general information, capacity data, and other information about file systems on hypervisors in resource reports.

## Information about file systems on hypervisors

You can create resource reports that include the following information:

### Hypervisor File System Mount Point

The name or mount point of the file system for the resource. For example, on Microsoft Windows systems, the value in this column header might be c:\ or d:\. On operating systems such as AIX, Linux, Solaris, or HP-UX, the mount point might be /opt or /export/home.

### Hypervisor File System Export Name

The name of the exported file system.

### Hypervisor File System Type

The type of file system that the hypervisor uses.

## Capacity and usage data

You can create resource reports that include the following information:

### Hypervisor File System Capacity (GiB)

The amount of storage space on the file system of the resource.

### Hypervisor File System Directory Count

The number of directories in the file systems that are on a server.

### Hypervisor File System File Count

The number of files in the file system.

### Hypervisor File System Available Space (GiB)

The amount of unused storage space in the file system of the resource.

### Hypervisor File System Available Inodes

The number of unused inodes in file systems on the operating system.

**Tip:** For Microsoft Windows systems, this column is blank.

### Hypervisor File System Used Inodes

The number of used inodes in file systems on the operating system.

**Tip:** For Microsoft Windows systems, this column is blank.

### Hypervisor File System Maximum Files

The maximum number of files that the file system on the resource can contain.

### Hypervisor File System Used Space (GiB)

The amount of used storage space in the file system of the resource.

### Hypervisor File System Physical Size (GiB)

The amount of physical storage space on the file systems on a resource. The physical size is the size of all the clusters that the file system uses.

## Status information

You can create resource reports that include the following information:

### Hypervisor File System Is Detected

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

### Hypervisor File System Last Scan

The date and time when file statistics were last collected from the resource.

## Data for logical volumes on hypervisors in resource reports

You can include general information, capacity data, and other information about logical volumes on hypervisors in resource reports.

### Information about logical volumes on hypervisors

You can create resource reports that include the following information:

#### Hypervisor Logical Volume Path

The path to the VMware ESX data store on the hypervisor, for example `datastore_svc3c`.

#### Hypervisor Logical Volume Type

The type of logical volume, such as raw, concatenation, and mirror.

#### Hypervisor Logical Volume File System Type

The type of file system that the hypervisor logical volume uses. For example, the file system can be NFS or VMFS.

#### Hypervisor NAS Name

The name of the network-attached storage (NAS) that the logical volume is obtained from.

#### Hypervisor NAS Path Name

The path name on the network-attached storage of the logical volume.

### Capacity and usage data

You can create resource reports that include the following information:

#### Hypervisor Logical Volume Capacity (GiB)

The amount of storage space that is on the hypervisor logical volume.

#### Hypervisor Logical Volume Available Space (GiB)

The amount of unused storage space on a hypervisor logical volume.

#### Hypervisor Logical Volume Overhead (GiB)

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

#### Hypervisor Logical Volume Block Size

The size of the blocks in the logical volume.

#### Hypervisor Logical Volume Allocation on Hypervisor Disk (GiB)

The amount of storage space that is allocated to the hypervisor logical volume on hypervisor server disks.

#### Hypervisor Logical Volume Is Swap Space

Shows whether a logical volume is used to store some of the contents of the RAM when the RAM is full. If this value is Yes, the logical volume is used to store some of the contents of the RAM.

#### Hypervisor Logical Volume Mirror Count

The number of mirrors that keep a synchronous copy of the resource.

#### Hypervisor Logical Volume VM File System Version

The version number of the virtual machine file system on the hypervisor logical volume.

### Status information

You can create resource reports that include the following information:

### **Hypervisor Logical Volume Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

### **Hypervisor Logical Volume Last Scan**

The date and time when file statistics were last collected from the resource.

## **Data for server disks on hypervisors in resource reports**

You can include general information, capacity data, path information, and other information about server disks on hypervisors in resource reports.

### **Information about server disks**

You can create resource reports that include the following information:

#### **Hypervisor Disk Path**

The identifier that specifies a path to a hypervisor server disk, for example `vmhba1:0:0`.

### **Capacity and usage data**

You can create resource reports that include the following information:

#### **Hypervisor Disk Capacity (GiB)**

The amount of storage space that is on the hypervisor disk.

#### **Hypervisor Disk Available Space (GiB)**

The amount of unused storage space on a hypervisor server disk.

### **Status information**

You can create resource reports that include the following information:

#### **Hypervisor Disk Status**

The condition of the resource, for example normal, warning, or error.

#### **Hypervisor Disk Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

### **Vendor, model, and device information**

You can create resource reports that include the following information:

#### **Hypervisor Disk Firmware Version**

The version number of the firmware that is running on the disk.

#### **Hypervisor Disk Model**

The model name or model number of the resource.

#### **Hypervisor Disk Serial Number**

The serial number of the resource.

#### **Hypervisor Disk Vendor**

The vendor who supplied the resource.

### **Path information**

You can create resource reports that include the following information:

#### **Hypervisor Disk LUN**

The logical unit within a small computer system interface target on a disk.

**Hypervisor Disk SCSI Target**

The bus address for the small computer system interface of the target on a disk.

**Hypervisor Disk Target WWPN**

The worldwide port name of the storage port that the volume is mapped to.

**Data for virtual machines managed by hypervisors in resource reports**

You can include general information, and file and disk information for virtual machines in resource reports.

**Information about virtual machines**

You can create resource reports that include the following information:

**Virtual Machine Name**

The name that was assigned to the virtual machine when it was added to the system.

**Virtual Machine Configuration File**

The path to the virtual machine configuration file for a hypervisor virtual machine, for example [datastore1] example/example.vmx.

**Virtual Machine Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Virtual Machine Number of CPU**

The number of processors on the virtual machine.

**Virtual Machine Status**

The condition of the resource, for example normal, warning, or error.

**Virtual Machine Total Memory (GiB)**

The amount of memory on a hypervisor virtual machine.

**Virtual machine file information**

You can create resource reports that include the following information:

**Virtual Machine File Path**

The path to the virtual machine configuration file, or to the virtual machine disk file for the virtual machine. The virtual machine configuration file is a .vmx file, and the virtual machine disk file is a .vmdk file.

**Virtual Machine File Logical Size (GiB)**

The logical size of a virtual machine disk file for a hypervisor virtual machine.

**Virtual Machine File Type**

The type of the file for the virtual machine. For example, the file can be a virtual machine configuration file, a virtual machine disk file, an ISO image file, or other types of virtual machine file.

**Virtual machine disk information**

You can create resource reports that include the following information:

**Virtual Machine Disk Name**

The name that was assigned to the virtual machine disk when it was added to the system.

**Virtual Machine Disk SCSI Target**

The bus address for the small computer system interface of the target on a disk.

**Virtual Machine Disk Type**

The type of virtual machine disk, for example, collection mirroring or logical disk mirroring.

**Data for network-attached storage systems in resource reports**

You can include general information, capacity data, properties, and other information about network-attached storage (NAS) systems in resource reports.

**Information about NAS systems**

You can create resource reports that include the following information:

**NAS Name**

The fully qualified domain name of the NAS device. For example, the name of a NAS device might be `nas.example.com`.

**NAS Domain Name**

The domain name of the cluster, server, or NAS server.

**NAS Short Name**

The host name from the fully qualified domain name of the NAS device. For example, if the fully qualified domain name of the NAS device is `mycomputer.example.com`, the host name is `mycomputer`.

**NAS Custom Tag 1**

User-defined text that is associated with the resource.

**NAS Custom Tag 2**

User-defined text that is associated with the resource.

**NAS Custom Tag 3**

User-defined text that is associated with the resource.

**Capacity and usage data**

You can create resource reports that include the following information:

**NAS Total Disk Capacity (GiB)**

The amount of storage space on all disks on a NAS resource.

**NAS Total Disk Available Space (GiB)**

The amount of unused storage space on all disks on a NAS resource.

**NAS Total File System Available Space (GiB)**

The amount of unused storage space on the file systems on a NAS resource.

**Component properties**

You can create resource reports that include the following information:

**NAS OS Type**

The operating system that is running on the server.

**NAS OS Version**

The version number of the operating system that is running on the resource.

**Vendor, model, and device information**

You can create resource reports that include the following information:

**NAS Model**

The model name or model number of the resource.

**NAS Serial Number**

The serial number of the resource.

**NAS Vendor**

The vendor who supplied the resource.

**Status information**

You can create resource reports that include the following information:

**NAS Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**NAS Last Data Collection**

The date and time when storage statistics were last collected from the resource.

**NAS Last Start Time**

The last time that the resource was started.

**NAS system components information**

You can create resource reports that include the following information:

**NAS System Name**

The name that was assigned to the NAS system when it was added to the system.

**NAS System IP Address**

The IP address of the resource.

**NAS System Custom Tag 1**

User-defined text that is associated with the resource.

**NAS System Custom Tag 2**

User-defined text that is associated with the resource.

**NAS System Custom Tag 3**

User-defined text that is associated with the resource.

**Data for file systems on network-attached storage systems in resource reports**

You can include general information, capacity data, and other information about file systems on network-attached storage (NAS) systems in resource reports.

**Information about file systems on NAS systems**

You can create resource reports that include the following information:

**NAS File System Mount Point**

The name or mount point of the file system for the resource. For example, on Microsoft Windows systems, the value in this column header might be c:\ or d:\. On operating systems such as AIX, Linux, Solaris, or HP-UX, the mount point might be /opt or /export/home.

**NAS File System Export Name**

The name of the exported file system.

**NAS File System Type**

The type of file system that the resource uses.

**Capacity and usage data**

You can create resource reports that include the following information:

**NAS File System Capacity (GiB)**

The amount of storage space on the file system of the resource.

**NAS File System Directory Count**

The number of directories in the file systems that are on a server.

**NAS File System File Count**

The number of files in the file system.

**NAS File System Available Space (GiB)**

The amount of unused storage space in the file system of the resource.

**NAS File System Available Inodes**

The number of unused inodes on the file system on a NAS server.

**NAS File System Used Inodes**

The number of used inodes on the file system on a NAS server.

**NAS File System Maximum Files**

The maximum number of files that the file system on the resource can contain.

**NAS File System Physical Size (GiB)**

The amount of physical storage space on the file systems on a resource.  
The physical size is the size of all the clusters that the file system uses.

**NAS File System Used Space (GiB)**

The amount of used storage space in the file system of the resource.

**Status information**

You can create resource reports that include the following information:

**NAS File System Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**NAS File System Last Scan**

The date and time when file statistics were last collected from the resource.

**Data for network-attached storage exports in resource reports**

You can include general information and status information about network-attached storage (NAS) exports in resource reports.

**Information about network-attached storage exports**

You can create resource reports that include the following information:

**NAS Export Name**

The name of the network-attached storage export. Use this name to mount the network-attached storage export on a server.

**NAS Export Path**

The path to a logical volume on a resource, for example /dev/hd1.

**NAS Export State**

Shows whether the network-attached storage export is active.

**Status information**

You can create resource reports that include the following information:

**NAS Export Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Data for logical volumes on network-attached storage systems in resource reports**

You can include general information, capacity data, and other information about logical volumes on network-attached storage (NAS) systems in resource reports.

**Information about logical volumes on NAS systems**

You can create resource reports that include the following information:

**NAS Logical Volume Name**

The name that was assigned to the NAS logical volume when it was added to the system.

**NAS Logical Volume Type**

The type of NAS logical volume. The logical volume type can be a NetApp traditional volume or a NetApp flexible volume.

**Capacity and usage data**

You can create resource reports that include the following information:

**NAS Logical Volume Capacity (GiB)**

The amount of storage space on the NAS logical volume.

**NAS Logical Volume Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Status information**

You can create resource reports that include the following information:

**NAS Logical Volume Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**NAS Logical Volume Last Scan**

The date and time when file statistics were last collected from the resource.

**Data for network-attached storage disks in resource reports**

You can include general information, capacity data, properties, and other information about network-attached storage (NAS) disks in resource reports.

## Information about NAS disks

You can create resource reports that include the following information:

### NAS Disk Name

The name that was assigned to the NAS disk when it was added to the system.

## Capacity and usage data

You can create resource reports that include the following information:

### NAS Disk Total Capacity (GiB)

The amount of storage space that is on the NAS disk.

### NAS Disk Available Space (GiB)

The amount of unused storage space on a NAS disk.

## Status information

You can create resource reports that include the following information:

### NAS Disk Status

The condition of the resource, for example normal, warning, or error.

### NAS Disk Is Detected

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

## IBM Scale Out Network Attached Storage and Storwize V7000 Unified information

You can create resource reports that include the following information:

### NSD Available Fragments

The number of fragments of disk space that are unused on the Network Shared Disk (NSD).

### NSD Failover Group

The failover group that the NSD belongs to. A failover group is a group of resources that are grouped together to ensure that some of those resources are available if one or more of the resources fail.

### NSD Type

The type of the NSD. For example, the type can be:

- Data and metadata
- Metadata only
- Data only

### NSD Last Data Collection

The date and time when storage statistics were last collected from the resource.

## NetApp information

You can create resource reports that include the following information:

### NAS Disk Flag

Shows whether the NAS disk is a spare device. If this value is Spare device, the NAS disk is a spare device.

**NAS Disk Is Encrypted**

Shows whether the resource is encrypted. If this value is Yes, the resource is encrypted.

**NAS Disk Is Removable**

Shows whether the disk can be removed from the server. If this value is Yes, the disk can be removed from the server.

**NAS Disk Is Solid State**

Shows whether the disk is a solid-state drive.

**NetApp paths information**

You can create resource reports that include the following information:

**NAS Disk LUN**

The logical unit within a small computer system interface target on a disk.

**NAS Disk SCSI Target**

The bus address for the small computer system interface of the target on a disk.

**NAS Disk Target WWPN**

The worldwide port name of the storage port that the volume is mapped to.

**NetApp vendor, model, and device information**

You can create resource reports that include the following information:

**NAS Disk Firmware Version**

The version number of the firmware that is running on the disk.

**NAS Disk Model**

The model name or model number of the resource.

**NAS Disk Serial Number**

The serial number of the resource.

**NAS Disk Vendor**

The vendor who supplied the resource.

**Data for pools on IBM SONAS and Storwize V7000 Unified systems in resource reports**

You can include general information and capacity data about pools on IBM Scale Out Network Attached Storage and Storwize V7000 Unified systems in resource reports.

**Information about pools on network-attached storage systems**

You can create resource reports that include the following information:

**NAS Pool Name**

The name that was assigned to the NAS pool when it was added to the system.

**Capacity and usage data**

You can create resource reports that include the following information:

**NAS Pool Capacity (GiB)**

The amount of storage space that is in a NAS pool.

**NAS Pool Available Space (GiB)**

The amount of unused storage space in a NAS pool.

**NAS Pool Number of Logical Volumes**

The number of logical volumes on a resource.

**Data for IBM SONAS and Storwize V7000 Unified file sets in resource reports**

You can include general information, capacity data, and other information about IBM Scale Out Network Attached Storage and Storwize V7000 Unified file sets in resource reports.

**Information about network-attached storage file sets**

You can create resource reports that include the following information:

**NAS File Set Name**

The name that was assigned to the network-attached storage (NAS) file set when it was added to the system.

**NAS File Set Comment**

A comment that is associated with the NAS file set.

**NAS File Set Path**

The path to a logical volume on a resource, for example `/dev/hd1`.

**Capacity and usage data**

You can create resource reports that include the following information:

**NAS File Set Used Space (GiB)**

The amount of used storage space in the file set of the NAS resource.

**NAS File Set Used Inodes**

The number of used inodes in file systems on operating systems such as AIX, Linux, Solaris, or HP-UX.

**Status information**

You can create resource reports that include the following information:

**NAS File Set Status**

Shows whether the network-attached storage file set is linked or unlinked.

**NAS File Set Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Data for storage virtualizers in resource reports**

You can include general information, capacity data, properties, and other information about storage virtualizers in resource reports.

**Information about storage virtualizers**

You can create resource reports that include the following information:

**Storage Virtualizer Name**

The user-defined name for the storage virtualizer, or the name that was assigned to the storage virtualizer by the vendor.

## Capacity and usage data

You can create resource reports that include the following information:

**Storage Virtualizer Total Pool Capacity (GiB)**

The amount of storage space in pools on the storage virtualizer.

**Storage Virtualizer Pool Used Space (GiB)**

The amount of used storage space in the pools in a storage virtualizer pool.

**Storage Virtualizer Pool Available Space (GiB)**

The amount of unused storage space in the pools in a storage virtualizer pool.

**Storage Virtualizer Total Volume Capacity (GiB)**

The amount of virtual volume space on all volumes on the storage virtualizer.

**Storage Virtualizer Volume Allocated Space (GiB)**

The amount of storage space that is allocated to volumes.

**Storage Virtualizer Volume Assigned Space (GiB)**

The amount of virtual volume space that is assigned to the server or storage virtualizer.

**Storage Virtualizer MDisk Available Space (GiB)**

The amount of space on managed disks that is available to be added to a pool.

**Storage Virtualizer MDisk Capacity (GiB)**

The amount of storage space on the managed disk.

**Storage Virtualizer Disk Capacity (GiB)**

The amount of local disk storage on the storage virtualizer.

**Storage Virtualizer Disk Capacity (GiB)**

The amount of local disk storage on the storage virtualizer.

**Storage Virtualizer Number of MDisks**

The number of managed disks on a resource.

**Storage Virtualizer Number of Volumes**

The number of volumes on a resource.

**Storage Virtualizer Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Storage Virtualizer Tier Available Space (GiB)**

The amount of unused tier storage of a particular type. The type is identified in the **Storage Virtualizer Tier Type** property, in the **Component Properties** folder.

**Storage Virtualizer Tier Capacity (GiB)**

The amount of tier storage of a particular type. The type is identified in the **Storage Virtualizer Tier Type** property, in the **Component Properties** folder.

## Component properties

You can create resource reports that include the following information:

**Storage Virtualizer Access Information**

The URL from which you can access the storage system or storage virtualizer.

**Storage Virtualizer Alias**

Shows an alternative name for a storage virtualizer.

**Storage Virtualizer Code Level**

The microcode or firmware level of the storage virtualizer.

**Storage Virtualizer Time Zone**

The time zone in which a resource is located.

**Storage Virtualizer Custom Tag 1**

User-defined text that is associated with the resource.

**Storage Virtualizer Custom Tag 2**

User-defined text that is associated with the resource.

**Storage Virtualizer Custom Tag 3**

User-defined text that is associated with the resource.

**Storage Virtualizer Location**

The site location of the storage system or storage virtualizer.

**Storage Virtualizer User Provided Name**

The name that was specified for the storage virtualizer in the storage environment.

**Storage Virtualizer Tier Type**

The type of tier that is used on the storage virtualizer or storage virtualizer pool. For example, the tier type can be hard disk drive (HDD) or solid-state drive (SSD).

**Status information**

You can create resource reports that include the following information:

**Storage Virtualizer Status**

The condition of the resource, for example normal, warning, or error.

**Storage Virtualizer Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Storage Virtualizer Last Data Collection**

The date and time when storage statistics were last collected from the resource.

**Storage Virtualizer Last Data Collection Status**

The condition of the last data collection. The status can show if the collection was a success, a failure, or if data was collected from the resource.

**Vendor, model, and device information**

You can create resource reports that include the following information:

**Storage Virtualizer IP Address**

The IP address of the resource.

**Storage Virtualizer Serial Number**

The serial number of the resource.

**Storage Virtualizer Type**

The type of storage virtualizer. For example, the storage virtualizer can be a Storwize V7000 system, a Storwize V7000 Unified system, or a SAN Volume Controller.

**Storage Virtualizer Model**

The model name or model number of the resource.

**Storage Virtualizer Vendor**

The vendor who supplied the resource.

**Data for storage virtualizer pools in resource reports**

You can include general information, capacity data, properties, and other information about storage virtualizer pools in resource reports.

**Information about storage virtualizer pools**

You can create resource reports that include the following information:

**Storage Virtualizer Pool Name**

The name that was assigned to the pool when it was added to the system.

**Capacity and usage data**

You can create resource reports that include the following information:

**Storage Virtualizer Pool Capacity (GiB)**

The amount of storage space in the pool on the storage virtualizer. For SAN Volume Controller, this value represents the amount of managed disk space that is assigned to the managed disk group.

**Storage Virtualizer Pool Available Space (GiB)**

The amount of unused storage space in a storage virtualizer pool.

**Storage Virtualizer Pool Virtual Volume Capacity (GiB)**

The amount of virtual volume space on all volumes in the pool.

**Storage Virtualizer Pool Real Volume Capacity (GiB)**

The amount of space on all allocated extents in a pool. The allocated extents include the used extents and extents that were assigned to volumes when they were allocated.

**Storage Virtualizer Pool Used Volume Space (GiB)**

The amount of used space on all the volumes and volume copies in the pool.

**Storage Virtualizer Pool Overallocation Percentage**

The percentage of space that is allocated to virtual capacity on volumes in the pool.

**Storage Virtualizer Pool Extent Size (MiB)**

The size of the extents that were specified when a pool was created.

**Storage Virtualizer Pool Assigned Volume Space (GiB)**

The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

**Storage Virtualizer Pool Unassigned Volume Space (GiB)**

The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

**Storage Virtualizer Pool Tier Capacity (GiB)**

The amount of pool tier storage of a particular type. The type is identified in the **Storage Virtualizer Pool Tier Type** property, in the **Component Properties** folder.

**Storage Virtualizer Pool Tier Available Space (GiB)**

The amount of pool tier storage of a particular type that is unused. The type is identified in the **Storage Virtualizer Tier Type** property, in the **Component Properties** folder.

**Storage Virtualizer Pool Tier Number of MDisks**

The number of managed disks on a resource.

**Storage Virtualizer Pool Number of Storage Volumes**

The number of volumes in the storage virtualizer pool.

**Storage Virtualizer Pool Number of MDisks**

The number of managed disks on a resource.

**Component properties**

You can create resource reports that include the following information:

**Storage Virtualizer Pool Is Encryptable**

Shows whether the resource can be encrypted. If this value is Yes, the resource can be encrypted.

**Storage Virtualizer Pool Is Encrypted**

Shows whether the resource is encrypted. If this value is Yes, the resource is encrypted.

**Storage Virtualizer Pool Is Solid State**

Shows whether there are solid-state drives in the pool. This property can contain the following values:

**Mixed** The pool contains both hard disk drives and solid-state drives.

**Non solid state**

The pool contains no solid-state drives.

**Solid state**

The pool contains a least one solid-state drive.

**Storage Virtualizer Pool Is Thin Provisioned**

Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is Yes, the resource is thin-provisioned.

**Storage Virtualizer Pool RAID Level**

The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

**Storage Virtualizer Pool Warning Level**

The percentage of used capacity of the resource at which a warning is generated.

**Storage Virtualizer Pool Tier Type**

The type of tier that is used on the storage virtualizer or storage virtualizer pool. For example, the tier type can be hard disk drive (HDD) or solid-state drive (SSD).

**Storage Virtualizer Pool Is Easy Tier**

Shows whether the IBM System Storage Easy Tier<sup>®</sup> feature is enabled. The IBM System Storage Easy Tier feature can be set to auto, on, or off.

The IBM System Storage Easy Tier feature automatically helps optimize solid-state storage deployments in multitier systems.

**Status information**

You can create resource reports that include the following information:

**Storage Virtualizer Pool Status**

The condition of the resource, for example normal, warning, or error.

**Storage Virtualizer Pool Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Storage Virtualizer Pool Easy Tier Status**

Shows whether the Easy Tier feature is active or inactive.

**Data for storage virtualizer volumes in resource reports**

You can include general information, capacity data, properties, information about copies of volumes, and other information about storage virtualizer volumes in resource reports.

**Information about storage virtualizer volumes**

You can create resource reports that include the following information:

**Storage Virtualizer Volume Name**

The name that was assigned to the storage virtualizer volume when it was added to the system.

**Capacity and usage data**

You can create resource reports that include the following information:

**Storage Virtualizer Volume Capacity (GiB)**

The amount of storage space on the volume.

**Storage Virtualizer Volume Real Space (GiB)**

The physical space for a thin-provisioned volume that was allocated when the volume was created.

**Storage Virtualizer Volume Used Space (GiB)**

The amount of virtual space that is used on a thin-provisioned volume. For volumes that are not thin provisioned, this value is same as the **Storage Virtualizer Volume Capacity** value.

**Storage Virtualizer Volume Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Component properties**

You can create resource reports that include the following information:

**Storage Virtualizer Volume Type**

The type of storage virtualizer volume. For example, the storage virtualizer volume can be striped, sequential, or another type of storage virtualizer volume.

**Storage Virtualizer Volume WWN**

The worldwide name of the volume.

**Storage Virtualizer Volume Fast Write State**

Shows whether the cache for a volume on a disk that is managed by a storage virtualizer is empty, contains data, or is corrupted.

**Storage Virtualizer Volume Grain Size (KiB)**

The unit in which space is allocated from a volume. Larger grain sizes maximize performance. Smaller grain sizes maximize space efficiency.

**Storage Virtualizer Volume Is Assigned**

Shows whether the volume is assigned to a server. If this value is Yes, the volume is assigned to a server.

**Storage Virtualizer Volume Is Auto Expand Enabled**

Shows whether a volume or volume copy can allocate new extents from a pool automatically. Volumes or volume copies might allocate new extents to expand the real capacity of the storage virtualizer volume or volume copy. If this value is Yes, the volume or volume copy can allocate new extents from a pool automatically.

**Storage Virtualizer Volume Is Encryptable**

Shows whether the resource can be encrypted. If this value is Yes, the resource can be encrypted.

**Storage Virtualizer Volume Is Encrypted**

Shows whether the resource is encrypted. If this value is Yes, the resource is encrypted.

**Storage Virtualizer Volume Is Formatted**

Shows whether a storage virtualizer volume is formatted. If this value is Yes, the storage virtualizer volume is formatted.

**Storage Virtualizer Volume Is Thin Provisioned**

Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is Yes, the resource is thin-provisioned.

**Storage Virtualizer Volume Metro Mirror Name**

The name of the Metro Mirror that keeps the synchronous copy of the storage virtualizer volume.

**Storage Virtualizer Volume Mirror Count**

The number of mirrors that keep a synchronous copy of the resource.

**Storage Virtualizer Volume Preferred Node**

The number of the storage virtualizer node that is used for I/O operations for the storage virtualizer volume.

**Storage Virtualizer Volume Throttle**

The maximum number of commands that the storage virtualizer volume can queue.

**Storage Virtualizer Volume Warning Level**

The percentage of used capacity of the resource at which a warning is generated.

**Storage Virtualizer Volume Copy Relationship**

Shows whether a volume or a copy of a volume is in a FlashCopy relationship or a point-in-time relationship. This property can contain the following values:

**Source Relationship**

The volume is the source of the relationship.

**Target Relationship**

The volume is the target of the relationship.

**Both Source and Target Relationship**

The volume is both the source and target of the relationship.

This property applies only to SAN Volume Controller.

**Status information**

You can create resource reports that include the following information:

**Storage Virtualizer Volume Status**

The condition of the resource, for example normal, warning, or error.

**Storage Virtualizer Volume Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Storage Virtualizer Volume Native Status**

Shows the level of access of nodes in the system to the storage virtualizer managed disk or volume. The level of access can be online, offline, degraded, or excluded.

**Volume copy information**

You can create resource reports that include the following information:

**Storage Virtualizer Volume Copy ID**

The identifier of the storage virtualizer volume copy.

**Storage Virtualizer Volume Copy Grain Size (KiB)**

The unit in which space is allocated from a volume. Larger grain sizes maximize performance. Smaller grain sizes maximize space efficiency.

**Storage Virtualizer Volume Copy Is Auto Expand Enabled**

Shows whether a volume or volume copy can allocate new extents from a pool automatically. Volumes or volume copies might allocate new extents to expand the real capacity of the storage virtualizer volume or volume copy. If this value is Yes, the volume or volume copy can allocate new extents from a pool automatically.

**Storage Virtualizer Volume Copy Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Storage Virtualizer Volume Copy Is Primary**

Shows whether the storage virtualizer volume copy is the primary volume copy.

**Storage Virtualizer Volume Copy Is Thin Provisioned**

Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is Yes, the resource is thin-provisioned.

**Storage Virtualizer Volume Copy Total Number of Extents**

The number of extents that are used by the storage virtualizer volume copy.

**Storage Virtualizer Volume Copy Type**

The type of copy of the storage virtualizer volume. For example, the copy of the storage virtualizer volume can be sequential, a mirror copy, or another type of copy.

**Storage Virtualizer Volume Copy Warning Level**

The percentage of used capacity of the resource at which a warning is generated.

**Data for managed disks on storage virtualizers in resource reports**

You can include general information, capacity data, properties, and other information about managed disks on storage virtualizers in resource reports.

**Information about managed disks on storage virtualizers**

You can create resource reports that include the following information:

**Storage Virtualizer MDisk Name**

The name that was assigned to the managed disk on a storage virtualizer when it was added to the system.

**Capacity and usage data**

You can create resource reports that include the following information:

**Storage Virtualizer MDisk Capacity (GiB)**

The amount of storage space on the managed disk.

**Storage Virtualizer MDisk Available Space (GiB)**

The amount of space on managed disks that is available to be added to a pool.

**Storage Virtualizer MDisk Strip Size (KB)**

The number of blocks in a strip on a storage virtualizer managed disk.

**Component properties**

You can create resource reports that include the following information:

**Storage Virtualizer MDisk RAID Level**

The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

**Storage Virtualizer MDisk Spare Goal**

The number of spare drives that are needed to maintain redundancy. Use spare drives to protect against drive failures in the array on a managed disk on a storage virtualizer.

**Storage Virtualizer MDisk Type**

The type of managed disk on a storage virtualizer. For example, the storage virtualizer can be a local or virtual managed disk.

**Storage Virtualizer MDisk Mode**

The access mode of a managed disk on a storage virtualizer. The access

mode describes how extents are provided for virtual disks. Extents can be provided to virtual disks in the following ways:

**Array** Extents are provided from local disks.

**Managed**

Extents are provided from a back-end storage volume.

**Unmanaged**

The managed disk is not used in the system.

**Storage Virtualizer MDisk Is Balanced**

Shows whether logical unit numbers (LUNs) are properly balanced across storage controllers on the managed disk. If this value is Yes, the LUNs are properly balanced.

**Storage Virtualizer MDisk Fast Write State**

Shows whether the cache for a volume on a disk that is managed by a storage virtualizer is empty, contains data, or is corrupted.

**Storage Virtualizer MDisk Write Verify**

Shows whether all write operations on the storage virtualizer managed disk are verified by an immediate follow-up read operation. The follow-up read operation verifies that the write operation was successful. If this value is Yes, all write operations are verified by a follow-up read operation.

**Status information**

You can create resource reports that include the following information:

**Storage Virtualizer MDisk Status**

The condition of the resource, for example normal, warning, or error.

**Storage Virtualizer MDisk Native Status**

Shows the level of access of nodes in the system to the storage virtualizer managed disk or volume. The level of access can be online, offline, degraded, or excluded.

**Data for local disks on storage virtualizers in resource reports**

You can include general information, capacity data, properties, and other information about local disks on storage virtualizers in resource reports.

**Information about local disks on storage virtualizers**

You can create resource reports that include the following information:

**Storage Virtualizer Local Disk Name**

The name that was assigned to the local disk on the storage virtualizer when it was added to the system.

**Capacity and usage data**

You can create resource reports that include the following information:

**Storage Virtualizer Local Disk Capacity (GiB)**

The amount of storage space on the local disk.

**Component properties**

You can create resource reports that include the following information:

**Storage Virtualizer Local Disk Is Encryptable**

Shows whether the resource can be encrypted. If this value is Yes, the resource can be encrypted.

**Storage Virtualizer Local Disk Is Encrypted**

Shows whether the resource is encrypted. If this value is Yes, the resource is encrypted.

**Storage Virtualizer Local Disk Storage Class**

The storage technology of the storage virtualizer local disk. For example, the storage class can be serial-attached SCSI (SAS) or solid-state drive (SSD).

**Storage Virtualizer Local Disk Is Solid State**

Shows whether the disk is a solid-state drive.

**Storage Virtualizer Local Disk Speed (RPM)**

The speed of the storage virtualizer local disk.

**Status information**

You can create resource reports that include the following information:

**Storage Virtualizer Local Disk Status**

The condition of the resource, for example normal, warning, or error.

**Vendor, model, and device information**

You can create resource reports that include the following information:

**Storage Virtualizer Local Disk Firmware Version**

The version number of the firmware that is running on the disk.

**Storage Virtualizer Local Disk Model**

The model name or model number of the resource.

**Storage Virtualizer Local Disk Serial Number**

The serial number of the resource.

**Storage Virtualizer Local Disk Vendor**

The vendor who supplied the resource.

**Data for storage systems in resource reports**

You can include general information, capacity data, properties of components, and other information about storage systems in resource reports.

**Information about storage systems**

You can create resource reports that include the following information:

**Storage System Name**

The user-defined name for the storage system, or the name that was assigned to the system by the vendor.

**Capacity and usage data**

You can create resource reports that include the following information:

**Storage System Pool Capacity (GiB)**

The amount of storage space in pools that are on the storage system. For an XIV system, this value represents the physical capacity of the pool, not

the virtual capacity. For other storage systems, this value might also include overhead space if the pool is unformatted.

**Storage System Used Pool Space (GiB)**

The amount of space that is in use in all pools on a storage system.

**Storage System Available Pool Space (GiB)**

The amount of unused space in pools that are on the storage system.

**Storage System Volume Capacity (GiB)**

The amount of space on all volumes on the storage system.

**Storage System Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

**Storage System Assigned Volume Space (GiB)**

The amount of space on the storage system that is on volumes that are assigned to a server or storage virtualizer.

**Storage System Unallocated Disk Space (GiB)**

The amount of disk space that can be added to a pool.

**Storage System Number of Disks**

The number of disks on the storage system.

**Storage System Number of Volumes**

The number of volumes on a resource.

**Storage System Cache (GiB)**

The size of the cache on the storage system.

**Storage System Real Available Pool Space (GiB)**

The amount of unused space in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

**Storage System Real Configured Pool Space (GiB)**

The amount of storage space that is in pools that have an associated soft size on an XIV system. The soft size of a pool is the virtual size of a thin-provisioned pool.

**Storage System Volume Capacity for z/OS (GiB)**

The amount of space on all volumes on the storage system that the z/OS operating system can use.

**Storage System Volume Capacity Assigned to MDisks (GiB)**

The amount of space that is on volumes that are assigned to a storage virtualizer to use as managed disks.

**Storage System Disk Capacity (GiB)**

The amount of storage space on physical disks on the storage system, excluding spare disks.

**Storage System Total Disk Capacity (GiB)**

The amount of space on physical disks on a storage system, including spare disks.

## **Component properties**

You can create resource reports that include the following information:

**Storage System Access Information**

The URL from which you can access the storage system or storage virtualizer.

**Storage System Code Level**

The Shared Ethernet Adapter level of a DS8000 storage system. For other storage systems, this value is the firmware version.

**Storage System Custom Tag 1**

User-defined text that is associated with the resource.

**Storage System Custom Tag 2**

User-defined text that is associated with the resource.

**Storage System Custom Tag 3**

User-defined text that is associated with the resource.

**Storage System User Provided Name**

The name that was specified for the storage system in the storage environment.

**Status information**

You can create resource reports that include the following information:

**Storage System Status**

The condition of the resource, for example normal, warning, or error.

**Storage System Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Storage System Last Data Collection**

The date and time when storage statistics were last collected from the resource.

**Storage System Last Data Collection Status**

The condition of the last data collection. The status can show if the collection was a success, a failure, or if data was collected from the resource.

**Vendor, model, and device information**

You can create resource reports that include the following information:

**Storage System Type**

The type of storage system. For example, the storage system can be a DS8000, or an XIV system, or another type of storage system.

**Storage System IP Address**

The IP address of the resource.

**Storage System Model**

The model name or model number of the resource.

**Storage System Vendor**

The vendor who supplied the resource.

**Storage System Serial Number**

The serial number of the resource.

## Data for storage system pools in resource reports

You can include general information, capacity data, properties of components, and other information about storage system pools in resource reports.

### Information about storage systems pools

You can create resource reports that include the following information:

#### Storage Pool Name

The name that was assigned to the pool when it was added to the system.

### Capacity and usage data

You can create resource reports that include the following information:

#### Storage Pool Capacity (GiB)

The amount of storage space in the storage pool.

#### Storage Pool Available Space (GiB)

The amount of unused storage space in the pool.

#### Storage Pool Assigned Volume Space (GiB)

The amount of space in the pool that is on volumes that are assigned to a server or storage virtualizer.

#### Storage Pool Unassigned Volume Space (GiB)

The amount of volume space in the pool that is not assigned to a server or storage virtualizer.

#### Storage Pool Virtual Volume Capacity (GiB)

The amount of virtual volume space on all volumes in the pool.

#### Storage Pool Used Volume Space (GiB)

The amount of used space on all the volumes in the pool.

#### Storage Pool Real Configured Space (GiB)

The amount of storage space that is in an XIV system pool that has an associated soft size. The soft size of a pool is the virtual size of a thin-provisioned pool.

#### Storage Pool Real Available Space (GiB)

The amount of unused space that is in an XIV system pool that has an associated soft size. The soft size of a pool is the virtual size of a thin-provisioned pool.

#### Storage Pool Repository Capacity (GiB)

The amount of space on all extents in the repository of a pool. This space can be used to allocate track space-efficient volumes. This attribute applies only to DS8000 storage systems.

#### Storage Pool Used Repository Space (GiB)

The amount of space on all extents in the repository of a pool that are allocated. This space can be used to allocate track space-efficient volumes. This attribute applies only to the DS8000 storage systems.

#### Storage Pool Overallocation Percentage

The percentage of space that is allocated to virtual capacity on volumes in the pool.

### Component properties

You can create resource reports that include the following information:

**Storage Pool RAID Level**

The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

**Storage Pool Is Solid State**

Shows whether there are solid-state drives in the pool. This property can contain the following values:

**Mixed** The pool contains both hard disk drives and solid-state drives.

**Non solid state**

The pool contains no solid-state drives.

**Solid state**

The pool contains a least one solid-state drive.

**Storage Pool Is Encrypted**

Shows whether the resource is encrypted. If this value is Yes, the resource is encrypted.

**Storage Pool Format**

Shows the format of the volume or pool. The format can be a Count Key Data (CKD) format, or a fixed block format.

**Storage Pool Is Thin Provisioned**

Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is Yes, the resource is thin-provisioned.

**Storage Pool Logical Subsystem**

The logical subsystem (LSS) to which a volume or pool belongs.

**Storage Pool Rank Group**

The rank group to which a pool is assigned, that is, 0 or 1. This property applies only to the DS8000 and DS6000 storage systems.

**Storage Pool Lock Behavior**

Shows whether the pool is locked for write operations, or is disabled for both read and write operations when storage space is limited. This property applies only to an XIV system.

**Status information**

You can create resource reports that include the following information:

**Storage Pool Status**

The condition of the resource, for example normal, warning, or error.

**Storage Pool Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

**Data for storage system volumes in resource reports**

You can include general information, capacity data, properties, and other information about storage system volumes in resource reports.

**Information about storage system volumes**

You can create resource reports that include the following information:

**Storage Volume Name**

The name that was assigned to the storage volume when it was added to the system.

## Capacity and usage data

You can create resource reports that include the following information:

### **Storage Volume Capacity (GiB)**

The amount of storage space on the volume.

### **Storage Volume Used Space (GiB)**

The amount of virtual space that is used on a thin-provisioned volume. For volumes that are not thin provisioned, this value is same as the **Storage Volume Capacity** value. This property applies only to DS8000 storage systems.

### **Storage Volume Overhead (GiB)**

The amount of space that is used for system management. The amount of space also includes space reserved for redundancy.

## Component properties

You can create resource reports that include the following information:

### **Storage Volume RAID Level**

The RAID level of the resource, such as RAID 5 or RAID 10. The RAID level affects the performance and fault tolerance of the volumes that are allocated from the resource.

### **Storage Volume Is Thin Provisioned**

Shows whether a pool, volume, or volume copy is thin-provisioned. If this value is Yes, the resource is thin-provisioned.

### **Storage Volume Is Assigned**

Shows whether the volume is assigned to a server. If this value is Yes, the volume is assigned to a server.

### **Storage Volume Is Encryptable**

Shows whether the resource can be encrypted. If this value is Yes, the resource can be encrypted.

### **Storage Volume Is Encrypted**

Shows whether the resource is encrypted. If this value is Yes, the resource is encrypted.

### **Storage Volume Is Volume Control Manager Database**

Shows whether a volume is used as the Volume Control Manager Database. If this value is Yes, the volume is used as the Volume Control Manager Database. This property applies only to EMC storage systems.

### **Storage Volume Format**

Shows the format of the volume or pool. The format can be a Count Key Data (CKD) format, or a fixed block format.

### **Storage Volume Serial Number**

The serial number of the resource.

### **Storage Volume Number**

The number of the volume that is assigned by the system.

### **Storage Volume WWN**

The worldwide name of the volume.

### **Storage Volume Logical Subsystem**

The logical subsystem (LSS) to which a volume or pool belongs.

## Status information

You can create resource reports that include the following information:

### Storage Volume Status

The condition of the resource, for example normal, warning, or error.

### Storage Volume Is Detected

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

## Data for storage system disks in resource reports

You can include properties, and other data about storage system disks in resource reports.

## Information about storage system disks

You can create resource reports that include the following information:

### Storage Disk Name

The name that was assigned to the storage disk when it was added to the system.

## Capacity and usage data

You can create resource reports that include the following information:

### Storage Disk Capacity (GiB)

The amount of storage space that is on a physical disk on the storage system.

## Component properties

You can create resource reports that include the following information:

### Storage Disk Flags

Shows whether a device is a spare device. This property applies only to DS8000 storage systems. DS5000

### Storage Disk Is Encryptable

Shows whether the resource can be encrypted. If this value is Yes, the resource can be encrypted.

### Storage Disk Is Encrypted

Shows whether the resource is encrypted. If this value is Yes, the resource is encrypted.

### Storage Disk Is Solid State

Shows whether the disk is a solid-state drive.

### Storage Disk Speed (RPM)

The speed of the disk.

### Storage Disk Tag

A number that identifies the array to which a disk belongs. This property applies only to DS8000 and DS6000 storage systems, and to ESS servers.

### Storage Disk Class

The storage technology of the disk. This property applies only to DS8000, DS5000, and DS4000 storage systems. This property can contain the following values:

**FC** The disk is a Fibre Channel disk.

**Nearline ATA**

The disk is a nearline Advanced Technology Attachment disk.

**Nearline SAS**

The disk is a nearline serial-attached SCSI disk.

**SAS** The disk is a serial-attached SCSI disk.

**SATA** The disk is a Serial Advanced Technology Attachment disk.

**SSD** The disk is a solid-state drive.

**Unavailable**

The disk is on a DS5000 or DS4000 series system, and is not a solid-state drive.

**Unsupported**

The disk is on a system that is not a DS8000, DS5000, or DS4000 series system.

## **Status information**

You can create resource reports that include the following information:

**Storage Disk Status**

The condition of the resource, for example normal, warning, or error.

**Storage Disk Is Detected**

Shows whether the resource was detected the last time that data was collected. If this value is Yes, the resource was detected.

## **Vendor, model, and device information**

You can create resource reports that include the following information:

**Storage Disk Firmware Version**

The version number of the firmware that is running on the disk.

**Storage Disk Model**

The model name or model number of the resource.

**Storage Disk Serial Number**

The serial number of the resource.

**Storage Disk Vendor**

The vendor who supplied the resource.

## **Data for storage system groups in resource reports**

You can include general information about, and properties of, storage system groups in resource reports.

## **Information about storage system groups**

You can create resource reports that include the following information:

**Storage System Group Name**

The name that was assigned to the storage system group when it was added to the system.

## Component properties

You can create resource reports that include the following information:

### Storage System Group Creator

The ID of the user who created the group.

### Storage System Group Last Modified

The date and time that the resource was last modified.

### Storage System Group Last Modified by User

The ID of the user who last modified the resource.

## Data for storage resource groups in resource reports

You can include general information about storage resource groups in resource reports.

## Information about storage resource groups

You can create resource reports that include the following information:

### Storage Resource Group Name

The name that was assigned to the storage resource group when it was created.

### Storage Resource Group Last Modified by User

The ID of the user who last modified the resource.

### Storage Resource Group Custom Tag 1

User-defined text that is associated with the resource.

### Storage Resource Group Custom Tag 2

User-defined text that is associated with the resource.

### Storage Resource Group Custom Tag 3

User-defined text that is associated with the resource.

---

## Troubleshooting reports

Find answers to questions about resolving issues with reports in Tivoli Common Reporting.

### Problem

When you run a report, the report opens in a new web browser window rather than a new tab of the existing web browser window.

### Solution

Configure the browser to open new windows in a tab.

#### Internet Explorer

1. Click **Tools > Internet Options**.
2. In the Tabs section of the **General** tab, click **Settings**.
3. Select **Always open pop-ups in a new tab**.
4. In the Tabbed Browsing Settings window, click **OK**.
5. Click **OK** to close the Internet Options window.

**Learn more:** For more information, check the documentation that is provided with your browser. The instructions that are provided here are based on Internet Explorer version 8.

#### Firefox

1. Click **Tools > Options**.
2. Click **Tabs**.
3. Select **Open new windows in a new tab instead**.
4. Click **OK**.

**Learn more:** For more information, check the documentation that is provided with your browser. The instructions that are provided here are based on Firefox version 10.0.3.

### Problem

In Tivoli Common Reporting, you right-click a property in the navigation tree, and click **Lineage** to identify the data source of properties, such as resources and performance metrics. When you click **Lineage**, a parsing error, MSR-LIN-0006, might be generated.

### Solution

To prevent the error message from being generated, you disable the feature in the following two packages:

- **IBM Tivoli Storage Productivity Center Resources**
- **IBM Tivoli Storage Productivity Center Performance**

Repeat the following procedure to disable the two packages:

1. In the **Public Folders** tab, click the **Set** properties icon next to the package.
2. Click the **Capabilities** tab.
3. Select **Override the parent capabilities acquired from the parent entry with**.
4. Select the **Everyone** check box.
5. In the Lineage row, clear the **Grant** check box, and select **Deny**.
6. Click **OK**.

### Problem

When you run reports, Tivoli Common Reporting times out.

### Solution

Based on your operating system, complete the following steps to change the timeout:

#### Windows

1. Open a command-line interface.
2. Stop Tivoli Common Reporting:  
c:\program files\IBM\tipv2Components\TCRComponent\bin  
\stopTCRserver.cmd
3. Open the configuration directory:  
c:\program files\IBM\tipv2Components\TCRComponent  
\cognos\configuration
4. Copy the cogstartup.xml file and, then change the name of the copied file to cogstartup.orig.
5. Open the cogstartup.xml file:  
c:\program files\IBM\tipv2Components\TCRComponent\cognos  
\configuration\cogstartup.xml
6. In the cogstartup.xml file, enter the new timeout value in seconds for the *inactivityTimeout* setting.

7. In the cogstartup.xml file, enter new timeout value in minutes for the *mdmSessionTimeout* setting.
8. Save the cogstartup.xml file.
9. Start Tivoli Common Reporting:  

```
c:\program files\IBM\tipv2Components\TCRComponent\bin
\startTCRserver.cmd
```

#### AIX or Linux

1. Open a command-line interface.
2. Stop Tivoli Common Reporting:  

```
/opt/IBM/tipv2Components/TCRComponent/bin/stopTCRserver.sh
```
3. Open the configuration directory:  

```
/opt/IBM/tipv2Components/TCRComponent/cognos/configuration
```
4. Copy the cogstartup.xml file and, then change the name of the copied file to cogstartup.orig.
5. Open the cogstartup.xml file:  

```
/opt/IBM/tipv2Components/TCRComponent/cognos
/configuration/cogstartup.xml
```
6. In the cogstartup.xml file, enter the new timeout value in seconds for the *inactivityTimeout* setting.
7. In the cogstartup.xml file, enter new timeout value in minutes for the *mdmSessionTimeout* setting.
8. Save the cogstartup.xml file.
9. Start Tivoli Common Reporting:  

```
/opt/IBM/tipv2Components/TCRComponent/bin/startTCRserver.sh
```

#### Problem

In Internet Explorer 8, when you open a report in Report Studio for the first time, a CM-REQ-4158 error might be displayed.

#### Solution

For information about how to resolve this problem, see the *IBM Tivoli Systems Management Information Center* at <http://publib.boulder.ibm.com/infocenter/tivihelp/v3r1/index.jsp>, and search for *CM-REQ-4158*.

#### Problem

You can set output format options for reports either when you schedule a report or run a report. If you choose PDF format for your report and the report contains many columns, all of the columns might not fit on one page. For example, if a report contains 20 columns, then the row for a specific resource might be shown on more than one page: 10 columns on the first page and 10 columns on the second page.

#### Solution

To fit the maximum number of columns on one page, set the PDF options in one of the following ways:

##### When you schedule a report

1. Navigate to a report in Tivoli Common Reporting.
2. Click the **Schedule** icon (.
3. Select **Override the default values**.
4. Select **PDF**, and then click **Set**.
5. From the **Orientation** list, select **Landscape**.
6. From the **Paper size** list, select **11 × 17**.

### When you run a report

1. Navigate to a report in Tivoli Common Reporting.
2. Click the **Run with options** icon ().
3. Click **advanced options** in the upper right of the "Run with options" window.
4. Click **Run in the background**.
5. Select **PDF**, and then click **Set**.
6. From the **Orientation** list, select **Landscape**.
7. From the **Paper size** list, select **11 × 17**.

### Problem

When you create a custom report, you cannot find online help that describes the columns that you can include in your reports.

### Solution

To view the online help, follow these steps:

1. Navigate to the dashboard of the Tivoli Storage Productivity Center web-based GUI.
2. Click the **Help** icon ().
3. Click **Tivoli Storage Productivity Center Reporting**.
4. Navigate to the help content that you want to view.

### Problem

If the Tivoli Storage Productivity Center database (TPCDB) is not accessible, you are prompted to reenter your user ID and password although you previously entered the correct user ID and password.

### Solution

Check that the server that hosts TPCDB is available. Check that the firewall settings on the server are not preventing you from accessing TPCDB.

### Problem

If the password to access the Tivoli Storage Productivity Center database (TPCDB) is changed, you must also change the password in Tivoli Common Reporting.

### Solution

In Tivoli Common Reporting, complete the following steps:

1. In the **Public Folders** tab, click **Launch > Administration**.
2. Click the **Configuration** tab.
3. Click **TPCDB**, and then click **TPCDB** again.
4. In the Actions column, click the **Set properties** icon, and then click the **Signon** tab.
5. Click **Edit the signon**.
6. Make your changes, and then click **OK**.

---

## Setting up multiple connections to the TPCDB data source in Tivoli Common Reporting

In Tivoli Common Reporting, you can add multiple connections to the Tivoli Storage Productivity Center data source so that you can run reports against multiple Tivoli Storage Productivity Center databases (TPCDBs). If you create multiple connections, you can run reports for multiple Tivoli Storage Productivity

Center servers from one Tivoli Common Reporting server. You can also develop and test reports on multiple TPCDB databases in your storage environment.

After you add multiple connections to the TPCDB data source, when you run a report you select the TPCDB database to connect to.

1. On the Tivoli Common Reporting server, add the remote TPCDB database to the system database catalog, and assign an alias to the database. For example, you can catalog the remote TPCDB database as TPCSRV1. For information about how to catalog a remote database, go to the IBM Tivoli Storage Productivity Center Information Center (<http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp>), and search for *Installing Tivoli Common Reporting on a remote server*.
2. In the Tivoli Storage Productivity Center web-based GUI, select **Reporting > View predefined reports**.
3. Click **Launch > Administration**, and click the **Configuration** tab.
4. Click the **TPCDB** data source, and click the **New Connection** icon ().
5. Enter the alias that you created in step 1 in the **Name** field, and then click **Next**.
6. From the **Type** list, select **DB2**, and then click **Next**.
7. Enter the alias that you created in step 1 in the **DB2 database name** field.
8. Click **Signons**, select **Password**, and then enter a user ID and password for the remote database.
9. Click **Test the connection**, and then click **Test**. Verify that the status of the connection is Succeeded.
10. Click **Close**, and then click **Close** again.
11. Click **Finish**.
12. If you scheduled reports, modify the parameters of all scheduled reports to specify the database against which to run the report. For more information about report schedules, go to the IBM Cognos 8 v4 Business Intelligence Information Center (<http://publib.boulder.ibm.com/infocenter/c8bi/v8r4m0/index.jsp>), and search for *schedule management*.

---

## Appendix A. Reference

This topic contains reference material.

---

### Alerts and schedules associated with monitoring groups and templates

Use alerts to notify you when conditions for storage devices are detected by a data collection schedule. Include storage devices in monitoring groups or templates to automatically associate alerts and schedules with those devices.

IBM Tivoli Storage Productivity Center includes predefined groups and templates that are associated with different sets of alerts and schedules. The group or template that you select for a storage device determines what conditions are checked when data is collected for those devices. Use the information in this topic to help you determine the groups and templates that you want to use for the storage devices in your environment.

**Notes:**

- If you want to include a storage device in a group, you can select a user-defined group rather than a predefined group. Any alerts and schedules associated with that user-defined group are automatically applied to the devices.
- When not using the Configure Devices wizard, you are not required to include a storage device in a group or template to collect data or associate alerts with it. You can include storage devices individually in schedules and associate alerts with them at any time. Monitoring groups and templates are intended to help you assign the same schedules and alerts to a number of related devices at the same time.
- You can edit predefined monitoring groups and their associated probes, pings, and alerts at any time. You can also edit the probes, pings, and alerts that are created based on templates.

## Storage Subsystems

Table 98. Predefined monitoring groups, templates, schedules, and alerts for storage subsystems

Group name / Template name	The data collection schedule associated with a group or template	Alert conditions that are checked for devices in the group or template during data collection <sup>1, 2</sup>
<p><b>Group:</b> Subsystem Basic Group</p> <p><b>Template:</b> Basic Subsystem Monitoring</p>	<p><b>Schedule name:</b> Subsystem Basic Probe</p> <p><b>When it is run:</b> 1x/week on Tuesday at 1:00 am</p> <p>The schedule name and time are different for templates. See table note <sup>3</sup> for more information.</p>	<p>Subsystem Discovered            Disk Not Found            Storage Subsystem Not Found            Subsystem Status Change Offline            Subsystem Status Change Online            Volume Status Change Offline            Volume Status Change Online            Pool Status Change            Pool Discovered            Pool Status Change Offline            Pool Status Change Online            Volume Not Found            File System Is Missing            Cluster Was Rediscovered            Cluster Was Removed            NSD Is Missing            NSD State Changed</p>
<p><b>Group:</b> Subsystem Standard Group</p> <p><b>Template:</b> Standard Subsystem Monitoring</p>	<p><b>Schedule name:</b> Subsystem Standard Probe</p> <p><b>When it is run:</b> 2x/week on Monday and Wednesday at 1:00 am</p> <p>The schedule name and time are different for templates. See table note <sup>3</sup> for more information.</p>	<p>Subsystem Discovered            Disk Not Found            Storage Subsystem Not Found            Subsystem Status Change Offline            Subsystem Status Change Online            Backend Controller Status Change Offline            Backend Controller Status Change Online            Volume Status Change Offline            Volume Status Change Online            Volume Capacity Change            Pool Status Change            Pool Discovered            Pool Status Change Offline            Pool Status Change Online            Pool Capacity Change            Volume Not Found            File System Is Missing            File System Reconfigured            Cluster Was Rediscovered            Cluster Was Removed            Export Is Missing            Export State Changed            NSD Is Missing            NSD State Changed</p>

Table 98. Predefined monitoring groups, templates, schedules, and alerts for storage subsystems (continued)

Group name / Template name	The data collection schedule associated with a group or template	Alert conditions that are checked for devices in the group or template during data collection <sup>1, 2</sup>
<p><b>Group:</b> Subsystem Advanced Group</p> <p><b>Template:</b> Advanced Subsystem Monitoring</p>	<p><b>Schedule name:</b> Subsystem Advanced Probe</p> <p><b>When it is run:</b> 1x/day at 10:00 pm</p> <p>The schedule name and time are different for templates. Group name / Template name	The data collection schedule associated with a group or template
<p><b>Notes:</b></p> <ol style="list-style-type: none"> <li>There are no alerting conditions available for tape libraries.</li> <li>Note the following differences between schedules created from templates and groups: <ul style="list-style-type: none"> <li>The name of a probe schedule created from a template contains a prefix that is defined in the Configure Devices wizard. For example, if the Basic Tape Monitoring template is selected and "ABC" is entered as a prefix, the resulting schedule is named "<i>userID</i>.ABCTapeBasicProbe", where <i>userID</i> represents the ID of the user that is logged in to Tivoli Storage Productivity Center.</li> <li>The probe schedule created from a template might not run at the time specified in this table. Tivoli Storage Productivity Center determines the time at which the probe is run to ensure optimal server performance.</li> </ul> </li> <li>The Default Tape Library Group is not automatically associated with a schedule. However, you can manually include this group in a schedule at any time.</li> </ol>	

## Supported Fabric Agent Types

The following table shows the supported agent types for Switch and Fabric functions.

Table 102. Supported agent types for Switch and Fabric Functions

Function > Switch	Brocade	Cisco <sup>1</sup>	QLogic
Switch Performance Monitoring	CIMOM agent	CIMOM agent	CIMOM agent
Zone Control <sup>2</sup>	CIMOM agent	Storage Resource agent required in each VSAN <sup>6</sup>	Storage Resource agent <sup>6</sup>
Zone Control with Zone Aliases	CIMOM agent	Not supported	Not supported
Switch and switch port information collected	Recommended: CIMOM agent  Also supported: Out-of-band Fabric agent or Storage Resource agent	Recommended: CIMOM agent  Also supported: Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent
Topology connectivity information collected	Recommended: CIMOM agent  Also supported: Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent
Zoning information collected <sup>2</sup>	Recommended: CIMOM agent	Storage Resource agent required in each VSAN <sup>3 4 5</sup>	Storage Resource agent
Tivoli Storage Productivity Center Alerts	Recommended: CIMOM agent  Also supported: Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent

Table 102. Supported agent types for Switch and Fabric Functions (continued)

Function > Switch	Brocade	Cisco <sup>1</sup>	QLogic
Hosts, endpoint devices, device-centric and host-centric information collected	Storage Resource agent	Storage Resource agent	Storage Resource agent
Switch "Sensors and Events"	Out-of-band Fabric agent	Out-of-band Fabric agent	Out-of-band Fabric agent

**Notes<sup>®</sup>:**

<sup>1</sup> The Storage Resource agent gets the information about a VSAN basis. Each VSAN is viewed as an individual SAN. The Out-of-band Fabric agent and CIMOM agent get the physical fabric information and can correlate the VSAN information to a physical infrastructure. The Out-of-band Fabric agent also collects some VSAN information.

<sup>2</sup> Zone Control refers to the ability to actively configure zoning. "Zone information collected" indicates that the active zone set and the inactive zoning library information is collected during a fabric probe.

<sup>3</sup> For many Cisco proprietary zone members, the values are displayed as zeros.

<sup>4</sup> If a zoning configuration has Cisco proprietary zone members, then you will not be able to modify the zoning for that configuration through Tivoli Storage Productivity Center. You need to use the element manager to remove proprietary zone members or do zoning.

<sup>5</sup> Orphan Cisco zones are not reported.

<sup>6</sup> Tivoli Storage Productivity Center does not get a transaction lock on the switch while making zone changes on the fabric.

## Supported storage systems providing full disk encryption and solid-state drives

IBM Tivoli Storage Productivity Center supports full disk encryption and solid-state drives in the IBM System Storage DS8000 and IBM System Storage DS5000 Storage Manager systems described in this topic.

### DS8000 4.2 and later

Tivoli Storage Productivity Center supports full disk encryption and solid-state drives in DS8000 4.2 and later.

### IBM System Storage DS5000 Storage Manager series

IBM Tivoli Storage Productivity Center supports full disk encryption and solid-state drives in the following DS5000 series systems:

- DS5100 and DS5300 - full disk encryption, solid-state drives, 1 TB SATA drives
- DS5020 - full disk encryption

To support full disk encryption and solid-state drives in DS5000, the LSI SMI-S Provider is required. For more information about the LSI SMI-S Provider, see the LSI Web site at <http://www.lsi.com>.

## Frequently Asked Questions

Use this section to view answers to common questions about IBM Tivoli Storage Productivity Center. These questions are organized according to the manager to which they apply.

## General and Migration Information

Learn about the issues when working with IBM Tivoli Storage Productivity Center, upgrading to a new version of the product, or migrating from another product.

### What Java version is officially supported by Tivoli Storage Productivity Center version 4.1 graphical user interface?

Java 5 is the level supported for the Tivoli Storage Productivity Center GUI. For information about how to start the Tivoli Storage Productivity Center graphical user interface, see the information center. Search for **Starting and stopping the console**.

### You are entering namespaces manually for CIM agents and switches in the Tivoli Storage Productivity Center user interface. What are the current namespaces for the supported brands?

Table 103. Interop Namespaces for CIM Agents for switches and storage systems

Switch or system	Namespace
IBM (other than IBM System Storage TS3310 Tape Library)	/root/ibm
IBM System Storage TS3310 Tape Library	/root/cimv2
Brocade	/interop
Cisco	/root/cimv2  For version 3.2.1 or later: /root/pg_interop
Engenio	/interop
EMC	/root/emc
HDS	For HiCommand 5.6 or later, use: /root/smis/current  For a HiCommand version that supports SMI-S 1.2, use following namespace to traverse the model as SMI-S 1.1: /root/smis/smis11  For HiCommand versions earlier than HiCommand 5.6, use: /root/hitachi/dmxx, where xx is represents the level of HiCommand.
HP	/root
LSI	/root/PG_InterOp
SUN	/root/sun3510 or /interop  Note: This namespace is for a system and not a switch.
XYRATEX	/root/PG_interop

Check with your switch vendor to ensure you use the most current namespaces.

### What if you specify an incorrect namespace?

If you specify an incorrect namespace the following issues might occur:

- The connection test fails when the CIMOM is added.
- The discovery does not discover all information of the system managed by the CIMOM.
- The probe fails.
- The function you want to perform on the system might fail (for example, collecting performance data).

**What are the required steps when upgrading the Tivoli Storage Productivity Center to the latest version?**

See the Tivoli Storage Productivity Center information center for detailed information about how to upgrade the product:<http://publib.boulder.ibm.com/infocenter/tivihelp/v4r1/index.jsp>. To access information about upgrading, expand the **Tivoli Storage Productivity Center > Upgrading** node in the information center.

**You are using an older version of IBM Tivoli Storage Productivity Center for Data. How can I upgrade to this latest version?**

See the Tivoli Storage Productivity Center information center for detailed information about how to upgrade the product: <http://publib.boulder.ibm.com/infocenter/tivihelp/v4r1/index.jsp>. To access information about upgrading, expand the **Tivoli Storage Productivity Center > Upgrading** node in the navigation tree.

## Data Manager

Use the questions in this section to answer questions about working with the Data Manager component of IBM Tivoli Storage Productivity Center.

**How do you know if your storage system is supported by Data Manager and which SMI-S agents are supported?**

To confirm whether your storage system is supported and which SMI-S agent is supported for that system, review the supported products list for the current release of Tivoli Storage Productivity Center. Go to [http://www-01.ibm.com/support/docview.wss?rs=40&context=SWJ50&q1=matrix&uid=swg21386446&loc=en\\_US&cs=utf-8&lang=en](http://www-01.ibm.com/support/docview.wss?rs=40&context=SWJ50&q1=matrix&uid=swg21386446&loc=en_US&cs=utf-8&lang=en) and click the applicable Tivoli Storage Productivity Center release in the Storage column.

## Fabric Manager

Use the questions in this section to answer questions about working with the Fabric Manager component of Tivoli Storage Productivity Center.

Keep in mind the following information and considerations:

**What type of fabric agents should you be using in Tivoli Storage Productivity Center?**

The following table shows the current agent types supported for the Switch Performance Management functionality and the Fabric Zone Configuration functionality.

*Table 104. Supported agent types for Switch and Fabric Functions*

Function > Switch	Brocade	Cisco <sup>1</sup>	QLogic
Switch Performance Monitoring	CIMOM agent	CIMOM agent	CIMOM agent
Zone Control <sup>2</sup>	CIMOM agent	Storage Resource agent required in each VSAN <sup>6</sup>	Storage Resource agent <sup>6</sup>
Zone Control with Zone Aliases	CIMOM agent	Not supported	Not supported

Table 104. Supported agent types for Switch and Fabric Functions (continued)

Function > Switch	Brocade	Cisco <sup>1</sup>	QLogic
Switch and switch port information collected	Recommended: CIMOM agent  Also supported: Out-of-band Fabric agent or Storage Resource agent	Recommended: CIMOM agent  Also supported: Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent
Topology connectivity information collected	Recommended: CIMOM agent  Also supported: Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent
Zoning information collected <sup>2</sup>	Recommended: CIMOM agent	Storage Resource agent required in each VSAN <sup>3 4 5</sup>	Storage Resource agent
Tivoli Storage Productivity Center Alerts	Recommended: CIMOM agent  Also supported: Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent	Out-of-band Fabric agent or Storage Resource agent
Hosts, endpoint devices, device-centric and host-centric information collected	Storage Resource agent	Storage Resource agent	Storage Resource agent
Switch "Sensors and Events"	Out-of-band Fabric agent	Out-of-band Fabric agent	Out-of-band Fabric agent

**Notes:**

- <sup>1</sup> The Storage Resource agent gets the information about a VSAN basis. Each VSAN is viewed as an individual SAN. The Out-of-band Fabric agent and CIMOM agent get the physical fabric information and can correlate the VSAN information to a physical infrastructure. The Out-of-band Fabric agent also collects some VSAN information.
- <sup>2</sup> Zone Control refers to the ability to actively configure zoning. "Zone information collected" indicates that the active zone set and the inactive zoning library information is collected during a fabric probe.
- <sup>3</sup> For many Cisco proprietary zone members, the values are displayed as zeros.
- <sup>4</sup> If a zoning configuration has Cisco proprietary zone members, then you will not be able to modify the zoning for that configuration through Tivoli Storage Productivity Center. You need to use the element manager to remove proprietary zone members or do zoning.
- <sup>5</sup> Orphan Cisco zones are not reported.
- <sup>6</sup> Tivoli Storage Productivity Center does not get a transaction lock on the switch while making zone changes on the fabric.

**What are the prerequisites for using the Switch Performance functionalities in Tivoli Storage Productivity Center?**

The prerequisite steps for using the Switch Performance functionalities are:

1. Add a CIMOM as a data source to the Tivoli Storage Productivity Center system that manages the switch.
2. Run a CIMOM discovery and wait for it to complete successfully for that CIMOM.
3. Run a probe against the fabric and wait for it to complete successfully.

After you complete these steps, create a Switch Performance monitor to trigger defined switch performance alert conditions or generate switch performance reports.

**Why does an Out of Band Fabric (SNMP) agent show a state of "not contacted"?**

Perform the following tasks to help determine why an Out of Band Fabric (SNMP) agent show a state of "not contacted":

- Check that the IP Address or name is entered correctly in the Out of Band Fabric agent details panel.
- Ensure the FA MIB is enabled on the switch.
- Ensure that the Tivoli Storage Productivity Center server IP address is included in any SNMP Access Control List that exists on the switches.
- Ensure you are using SNMP v1.
- Ensure the string on the Tivoli Storage Productivity Center Out of Band Fabric agent details panel in the SNMP Community field matches one of the community strings on the switch.

**Can you add a storage subsystem as an Out of Band Fabric (SNMP) agent?**

No. Out of Band Fabric agents within Tivoli Storage Productivity Center are meant for switches only. Disk Manager uses CIMOMs to gather subsystem information.

**Why aren't all the properties of a switch populated in the Topology Switch views?**

A combination of Inband and CIMOM agents or a combination of Inband and Out of Band fabric agents might be required to gather all topology information for a switch. However, all of the properties are not normally needed.

**How can you specify a different management application to launch for a switch?**

Launch the Element Manager for a switch from the topology viewer. To do this, access the Switch view, right-click a switch, and select **Launch Element Manager**. To change what is launched, right-click a switch and select the **Launch Details Panel**. The element manager information is displayed in the Details tab. To change this information, press **Set** and enter the HTTP, Telnet, or application information into the pop-up dialog and press **OK**.

**How do you manually change a fabric or switch label that is displayed throughout the system?**

Access the topology viewer in the Fabric or Switch view as appropriate. Right-click the entity you want to label to and select **Launch Details Panel**. Within the Details Panel, change the data in the **Label** field and click the save icon (or press Ctrl S).

**Why do you get the error "Agent capable of configuration zoning could not be found on this Fabric" for a fabric?**

For Brocade switches you must have a CIMOM agent configured for this fabric. A CIMOM agent is used by default if present. If a CIMOM for the fabric is present, you must run a CIMOM discovery and probe of the fabric before you can perform zone control.

For all other supported switches, you must have a Tivoli Storage Productivity Center Inband Fabric agent in the fabric.

## Disk Manager

Use the questions in this section to answer questions about working with the Disk Manager component of IBM Tivoli Storage Productivity Center.

Keep in mind the following information and considerations:

**You encounter errors while collecting performance data on SAN Volume Controller. You fail to associate SAN Volume Controller performance data from non-configuration node with SAN Volume Controller performance data from configuration node. You encounter incomplete SAN Volume Controller performance data sample.**

This issue is caused by a configuration issue with SAN Volume Controller (time zone). Reset the time zone on SAN Volume Controller by logging into the SAN Volume Controller through putty. Run this command first:

```
svctask settimezone -timezone 509
```

This forces the cluster into the Universal time zone. To get the time zone you want the cluster to be in, run this command:

```
svctask settimezone -timezone
```

**Click on Launch Element Manager. The URL that appears is http://0.0.0.0/ica**

This error is caused by the wrong configuration of the SAN Volume Controller ICAT. Use the SAN Volume Controller GUI to remove and add the cluster again to the ICAT. This populates the correct value for the access point which is stored in the database repository during the next discovery. Use this cli command to set the IP address and port of the user interface.

For example: `svcluster -x modify -p 9.155.62.91:9080`

This is the same command used by the user interface and CIMOM.

---

## Arguments and window locations available with the inbound launch in context feature

This section describes the arguments and window locations available with the inbound launch in context feature.

### Launch in context parameters

You can use the launch in context parameters, definitions, and examples.

The command format for Java Web Start is unique in that a parameter and its value are separated by an equal sign (=). Parameter=value pairs are separated by an ampersand (&).

Not all parameters can be used with all launch types. Where this is true, it is noted in the parameter definition.

### Parameters

**-user** The user ID. The value must be a valid user ID to log on to the IBM Tivoli Storage Productivity Center server, for example, `-user admin`.

**Note:** This parameter is not supported in a Web Browser's URL when using Java Web Start to launch the Tivoli Storage Productivity Center user interface.

**-passwd**

The password. The value must be a valid password to log on to the Tivoli Storage Productivity Center server, for example, `-passwd MyPassword`.

**Note:** This parameter is not supported in a Web Browser's URL when using Java Web Start to launch the Tivoli Storage Productivity Center user interface.

**-encpasswd**

The password encrypted. This is used if you choose to encrypt the password instead of entering the text password, for example, `-encpasswd 48735`.

**Tip:** To encrypt a password using Tivoli Storage Productivity Center (the preferred method), enter the following command in the Command Prompt window:

```
TPC-HOME\data\server\tools\tpctool encrypt text password
```

The encrypted password is returned.

**Note:** This parameter is not supported in a Web Browser's URL when using Java Web Start to launch the Tivoli Storage Productivity Center user interface.

**-encmethod**

The encryption method used to encrypt the password. The password can be encrypted using Tivoli Storage Productivity Center or Tivoli Enterprise Portal. The preferred method is to use Tivoli Storage Productivity Center to encrypt the password. If **encpasswd** is selected, you must also select **encmethod** with a value. The default is TPC. For example, `-encpasswd 48735 -encmethod TPC`

**Note:** This parameter is not supported in a Web Browser's URL when using Java Web Start to launch the Tivoli Storage Productivity Center user interface.

**Tip:** The Tivoli Enterprise Portal graphical user interface (GUI) does not start the Tivoli Storage Productivity Center GUI properly with a Tivoli Enterprise Portal-encrypted password if that encryption creates a string with spaces in it. Such a string is handled as multiple values unless it is enclosed in double quotation marks ("").

**Tip:** Encryption using Tivoli Enterprise Portal creates a string pattern. There are multiple string patterns that can result in the same decrypted value, so it is possible that different string patterns used as an encrypted password might result in same decrypted password.

**-function**

Specify one of the following values:

- The task to perform on the remote data server. See "Launch in context task parameters" on page 1434 for tasks and their specific parameters. For example, `-function disk.create_volume -subsystem_id <ID of the subsystem>`.
- The window name to open on the target system. The window name is mapped to the name of the node on the navigation tree. See "Available windows" on page 1435 for a list of available windows. For example, `-function topology.computer`.

**-server**

The Tivoli Storage Productivity Center server to log on to. This argument specifies a single server. For example, `-server tivoli11:9549`.

**-servers**

**Not used with the Web Browser.** The Tivoli Storage Productivity Center server or servers to log on to, in the format `server:port`. You can specify multiple server ports separated by commas. For example, `-servers "tivoli11:9549,wanda:9549,invader:9549"`. If you specify multiple server ports, Tivoli Storage Productivity Center will connect to the first server. If you later initiate a new connection from the main window (**Connection > New Connection**), the server list box will include the available servers in the **Connection** dialog.

**-help**

**Not used with the Web Browser.** The help argument is used alone in the Arguments text field. It is entered as `-help functions`. This argument returns a list of the windows representing nodes in the navigation tree that can be launched. Typing `-help` with no arguments will return an error message.

You can also enter **help** as a command in the Command Prompt window as `tpc.bat -help functions` for Windows, and `TPCD.sh -help functions` for AIX, Linux, or UNIX.

## Launch in context task parameters

Use the launch in context feature task parameters to perform tasks.

Task parameters associated with actions taken on the Data server also use the `-function` parameter. For example: `-function data.filesystem_capacity_by_computer -computer_id "<computer_id>"`.

### Create a volume (`disk.create_volume`)

**-subsystem\_id**

The ID of the system on which the volume will be created. The `subsystem_id` is the name of the system as seen in the IBM Tivoli Storage Productivity Center graphical user interface (GUI). This parameter is required.

**-name**

The name of the volume. The name is not valid for IBM TotalStorage Enterprise Storage Server and is ignored. If more than one volume is to be created, this value is treated as a prefix.

**-size**

The size of the volume.

**-unit**

The units to be used while creating the volume. Permissible values are KB, MB, and GB. The default unit is MB.

**-number**

The number of volumes to be created.

### SAN Planner (`disk.san_planner`)

**-computer\_id**

The ID of the computer for which the plan is to be created. The `computer_id` is the name of the computer as seen in the Tivoli Storage Productivity Center GUI.

### **-subsystem\_id**

The ID of the system for which the plan is to be created. The `subsystem_id` is the name of the system as seen in the Tivoli Storage Productivity Center GUI Disk Manager.

### **-plan\_id**

The ID of the previously saved plan. When the `computer_id` and `subsystem_id` are provided, `plan_id` is ignored. When you open a plan in the SAN Planner using `launch` in context, you must enter the exact name of the plan. The value for `-plan_id` is case-sensitive and must match the name of the plan when it was created. For example, if you created a plan named **UserPlan1**, you must use `-plan_id UserPlan1` in the `launch` in context command.

## **Capacity report (data.filesystem\_capacity\_by\_computer)**

### **-computer\_id**

The ID of the computer for which the report is to be created. If this value is not specified, the Tivoli Storage Productivity Center GUI opens the default report panel for **Data Manager > Reporting > Capacity > FileSystem Capacity > By Computer**.

You must enter a value for `-computer_id` that matches the ID for that computer that is stored in the Tivoli Storage Productivity Center database repository. You will receive a warning message if the ID for the computer you enter in the command line does not match the ID stored in the data repository. To ensure that this report is displayed properly when using `launch` in context, make sure to enter an ID for the computer that matches the ID that is displayed for it through the Topology Viewer or appropriate report in the product's user interface.

## **Wasted space report (TPC.reports\_data.wasted\_space)**

This report has no parameters. The Tivoli Storage Productivity Center GUI opens the default report panel for **Data Manager > Reporting > System Reports > Data > Wasted Space**.

## **Available windows**

You can use windows with the inbound `launch` in context feature to start IBM Tivoli Storage Productivity Center. These windows are called with the `-function window name` argument.

### **Available window names for function argument**

Table 105. Available windows for inbound launch in context

Tree Node	Window Name
Administrative Services->Data Sources->CIMOM Agents	datasource.cimom
Administrative Services->Data Sources->Data Agents	datasource.data
Administrative Services->Data Sources->Inband fabric Agents	datasource.inband_fabric
Administrative Services->Data Sources->Out of band fabric Agents	datasource.out_of_band_fabric
Administrative Services->Data Sources->IBM Tivoli Storage Productivity Center Servers <sup>1</sup>	datasource.tpc_servers

Table 105. Available windows for inbound launch in context (continued)

Tree Node	Window Name
Administrative Services->Data Sources->VMWare VI data source <sup>1</sup>	datasource.vmware
IBM Tivoli Storage Productivity Center->Alerting->Alert Log->All	alert.all

<sup>1</sup> This window is not available in IBM Tivoli Storage Productivity Center Basic Edition.	

---

## Alerts

You can set up Tivoli Storage Productivity Center so that it examines the data that it collects about your storage infrastructure and writes an alert to a log when an event occurs. You also can specify that an action is initiated, such as sending an SNMP trap, sending an e-mail, or running a script when the event occurs.

Alerts that are triggered based on the data collected by monitoring jobs (for example, pings, scans, and probes) must be defined before the monitoring jobs are run. Alerts that are triggered based on an external source, such as an SNMP trap, must be defined after the SNMP server is configured properly.

You can define an alert in the following ways:

- As part of a data collection schedule
- As part of an alert definition

When an event occurs and triggers an alert, the alert is written to a log. You can also select one or more other ways to be notified of the event. These alert notifications include SNMP traps, IBM Tivoli Enterprise Console events, Tivoli Storage Productivity Center login notifications, operating-system event logs, or email.

**Note:** Alerts are not generated in a Tivoli Storage Productivity Center instance for actions that you perform from that instance. For example, if you start Tivoli Storage Productivity Center and use Disk Manager to assign or unassign volumes for a subsystem, you do not receive alerts for those volume changes in that instance. However, if you assign and unassign volumes outside of that Tivoli Storage Productivity Center instance, an alert is generated.

### Triggering conditions for alerts

In general, the following types of conditions can trigger alerts:

- A data collection schedule failed to complete.
- A change occurred in the storage infrastructure.
- A performance threshold was violated.

The specific conditions that can trigger events vary, depending on the type of storage resource that is being monitored. See “Triggering conditions for alerts” on page 1439 for more information about triggering conditions.

### Alert notifications and triggered actions

Notification methods, or triggered actions, define the method by which you are notified of an alert: SNMP Trap, Tivoli Enterprise Console Event, Login Notification, Windows Event Log, UNIX Syslog, and email. Alerts are always written to the error log. Additionally, if a Data agent or Storage Resource agent is deployed on a monitored computer, you can run a script or start an IBM Tivoli Storage Manager job in response to the alert. See “Triggered actions for alerts” on page 1453 for more information about triggered actions.

### Prerequisites for successfully using alerts

The following conditions must be met in order to successfully use alerts:

- Data collection schedules are configured and scheduled to run on a regular basis.
- If you want to be notified about an alert in some way other than an entry in the log file, such as using SNMP traps, Tivoli Enterprise Console events, or email, alert notification instructions must be configured before using the alert. See “Configuring alert destinations” on page 395).
- If an alert is triggered based on an SNMP trap from the monitored resource, you must properly configure the SNMP server of the monitor resource to enable Tivoli Storage Productivity Center to listen to SNMP traps. The default port number is 162, and the default community is public.

## Default alerts

The following types of alerts are set for your system by default:

- New entity found
- Job failed

You can change the triggered actions and enable or disable these alerts, but you cannot delete them.

## Triggering conditions for alerts

You can define alerts so that IBM Tivoli Storage Productivity Center notifies you when a specified event occurs. Such events are the *triggering conditions* for the alert. The specific triggering conditions that you can use to define an alert depend on the sort of storage resource that you are monitoring.

Some triggering conditions, like thresholds, require you to enter values. If input is not required for the triggering condition you select, the value fields will be grayed out. For information about thresholds, see “Performance thresholds” on page 1457.

### Triggering conditions for computer alerts

Triggering conditions are events on a computer that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a computer.

**Remember:** The term “computer” is used in the stand-alone GUI to refer to a server.

Table 106. Triggering conditions and related error messages for computer alerts

Triggering Condition	Explanation	Related Error Message*
RAM Increased	The amount of RAM on a monitored computer is increased.	ALR0001I
RAM Decreased	The amount of RAM on a monitored computer is decreased.	ALR0001W
Virtual Memory Increased	The amount of virtual memory on a monitored computer is increased.	ALR0002I
Virtual Memory Decreased	The amount of virtual memory on a monitored computer is decreased.	ALR0002I
New Disk Detected	A new disk is discovered on a monitored computer.	ALR0003I
Disk Not Found	A disk is removed from a monitored computer.	ALR0004E
New Disk Defect Found	A new grown disk defect is detected on a monitored disk.	ALR0011W

Table 106. Triggering conditions and related error messages for computer alerts (continued)

Triggering Condition	Explanation	Related Error Message*
Grown Disk Defects Exceed <i>n</i> value	The grown disk defect threshold is exceeded. Enter a value for <i>n</i> .	ALR0012W
Disk Failure Predicted	A managed disk predicts that a disk failure is imminent.	ALR0007E
Cluster Resource Group Added	A new cluster resource group is added.	ALR0055I
Cluster Resource Group Removed	A cluster resource group is removed.	ALR0056I
Cluster Resource Group Moved	A cluster resource group is moved.	ALR0057I
Computer Discovered	A new, unmanaged computer is discovered. This alert condition is not triggered when hypervisor virtual machines are discovered.	ALR0022I
Computer Status Change Offline	A monitored computer goes offline.	ALR4273E, ALR4044W
Computer Status Change Online	A monitored computer comes online.	ALR4274I, ALR4045I
Computer Property Change	An HBA or HBA to a computer node is newly discovered, is missing, or is rediscovered.	ALR4275W
HBA Driver Version Change	The driver version of host bus adapter changes.	ALR4034W
HBA Firmware Version Change	The firmware version of host bus adapter changes.	ALR4035W
<p><b>Note:</b> * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the <i>Messages</i> section of the <i>IBM Tivoli Storage Productivity Center Information Center</i> or the <i>IBM Tivoli Storage Productivity Center Messages Guide</i>.</p>		

### Triggering conditions for file system alerts

Triggering conditions are events on a file system that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is shown when the condition is detected on a file system.

Table 107. Triggering conditions and related error messages for file system alerts

Triggering Condition	Explanation	Related Error Message*
New File System Detected	A file system was detected for the first time. This alert applies to a file system on a Storwize V7000 Unified or a server managed by a Storage Resource agent.	ALR0005I, ALR0005W
File System Was Not Found	A file system is removed or unmounted from a cluster. This alert applies to a file system on a Storwize V7000 Unified or a server managed by a Storage Resource agent.	ALR0006E
File System Was Reconfigured	The physical space definition of a managed file system is reconfigured. This alert applies to a file system on a Storwize V7000 Unified or a server managed by a Storage Resource agent.	ALR0008I
File System Free Space Less Than	A file system is low on available storage space. This value is usually entered as a percent.	ALR0009W

Table 107. Triggering conditions and related error messages for file system alerts (continued)

Triggering Condition	Explanation	Related Error Message*
Available UNIX File System I-Nodes Less Than	A UNIX file system is low on free inodes. This value is usually as a percent.	ALR0010W
New File System Was Detected	A file system was detected for the first time.	ALR4427I, ALR0005W
File System Is Low on Relative Free Space	A file system is low on free space based on a percentage value threshold. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 Unified.	ALR4433W
File System Is Low on Absolute Free Space	A file system is low on free space based on an absolute value threshold. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 Unified.	ALR4433W
File System Mount State Changed to Normal	The mount state for a file system reached normal level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 Unified.	ALR4358I
File System Mount State Changed to Error	The mount state for a file system reached error level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 Unified.	ALR4356E
File System Is Low On Relative Free I-Nodes	A file system is low on free i-nodes based on a percentage value threshold. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 Unified.	ALR4458W
File System Is Low On Absolute Free I-Nodes	A file system is low on free i-nodes based on an absolute value threshold. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 Unified.	ALR4458W
New File Set Was Detected	A file set was detected for the first time. This alert applies only to Storwize V7000 Unified.	ALR4447I
File Set Is Missing	A file set that was found during a previous probe was not found in the current probe. This alert applies only to Storwize V7000 Unified.	ALR4474W
File Set Is Linked	A file set was linked to a file system. This alert applies only to Storwize V7000 Unified.	ALR4448I
File Set Is Unlinked	A file set was unlinked from a file system. This alert applies only to Storwize V7000 Unified.	ALR4455I
File Set Was Rediscovered	A file set that was missing was found by the current probe. This alert applies only to Storwize V7000 Unified.	ALR4475I
Quota Was Exceeded	A quota was exceeded. This alert applies only to Storwize V7000 Unified.	ALR4482W
New Quota Was Detected	A quota was detected for the first time. This alert applies only to Storwize V7000 Unified.	ALR4496I
<p><b>Note:</b> * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the <i>Messages</i> section of the <i>IBM Tivoli Storage Productivity Center Information Center</i> or the <i>IBM Tivoli Storage Productivity Center Messages Guide</i>.</p>		

## Triggering conditions for directory alerts

Triggering conditions are events in a monitored directory that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is shown when the condition is detected in a directory.

Table 108. Triggering conditions and related error messages for directory alerts

Triggering Condition	Explanation	Related Error Message*
Directory Not Found	A directory cannot be found.	ALR0014E
Directory Consumes More Than	A user or directory storage quota is exceeded. Enter a value, usually in megabytes.	ALR0015W
<b>Note:</b> * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the <i>Messages</i> section of the <i>IBM Tivoli Storage Productivity Center Information Center</i> or the <i>IBM Tivoli Storage Productivity Center Messages Guide</i> .		

## Triggering conditions for instance alerts

Triggering conditions are events on a database instance that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on an instance.

Table 109. Triggering conditions and related error messages for instance alerts

Database Application	Triggering Condition	Explanation	Related Error Message*
All	New Database - Tablespace Discovered	A new database-tablespace is discovered.	ALR0028I
Oracle	Archive Log Directory Contains More Than	An archived log directory quota is exceeded. Enter a value for quota.	ALR0027W
	New Tablespace Discovered	A new tablespace is discovered.	ALR0028I
SQL Server	New Database Discovered	A new database is discovered.	ALR0028I
Sybase	Total Device Freespace Less Than	The total amount of device free space is less than a specified amount.	ALR0044W
	Total Device Freespace Greater Than	The total amount of device free space is greater than a specified amount.	ALR0045W
	New Device Discovered	A new device is discovered.	ALR0042I
	Device Dropped	A device is dropped.	ALR0043E
	New Database Discovered	A new database is discovered.	ALR0028I
DB2	New Tablespace Discovered	A new database-tablespace is discovered.	ALR0028I
<b>Note:</b> * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the <i>Messages</i> section of the <i>IBM Tivoli Storage Productivity Center Information Center</i> or the <i>IBM Tivoli Storage Productivity Center Messages Guide</i> .			

## Triggering conditions for database-tablespace alerts

Triggering conditions are events on a database-tablespace that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a database-tablespace.

Table 110. Triggering conditions and related error messages for database-tablespace alerts

Database application	Triggering Condition	Explanation	Related Error Message*
All	Database - Tablespace Freespace Less Than	The free space on a database-tablespace is less than a specified amount.	ALR0031W
	Database - Tablespace Offline	A database-tablespace is taken offline.	ALR0030E
	Database - Tablespace Dropped	A database-tablespace is dropped.	ALR0029E
Oracle	Tablespace Freespace Less Than	The free space on a tablespace is less than a specified amount.	ALR0031W
	Freespace Fragmented into More Than	The free space on a tablespace is fragmented into more than the specified number of extents.	ALR0032W
	Largest Free Extent Less Than	The largest free extent is less than the specified size.	ALR0033W
	Tablespace Offline	A tablespace is taken offline	ALR0030E
	Tablespace Dropped	A tablespace is dropped.	ALR0029E
SQL Server	Database Data Freespace Less Than	The free space on a database is less than a specified amount.	ALR0031W
	Database Log Freespace Less Than	The free space on a database log is less than the specified percent.	ALR0041W
	Database Offline	A database is taken offline.	ALR0030E
	Database Dropped	A database is dropped.	ALR0029E
Sybase	Database Data Freespace less Than	The free space on a database is less than a specified amount.	ALR0031W
	Database Log Freespace Less Than	The free space on a database log is less than the specified percent.	ALR0027W
	Last Dump Time Less Than	The last dump time was the less than the specified number of days.	ALR1111W
	Database Offline	A database is taken offline.	ALR0030E
	Database Dropped	A database is dropped	ALR0029E
DB2	Tablespace Freespace Less Than	The free space on a tablespace is less than a specified amount.	ALR0031W
	Tablespace Offline	A tablespace is taken offline.	ALR0030E
	Tablespace Dropped	A tablespace is dropped	ALR0029E
<p><b>Note:</b> * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the <i>Messages</i> section of the <i>IBM Tivoli Storage Productivity Center Information Center</i> or the <i>IBM Tivoli Storage Productivity Center Messages Guide</i>.</p>			

### Triggering conditions for table alerts

Triggering conditions are events on a database table that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a table.

Table 111. Triggering conditions and related error messages for table alerts

Database application	Triggering Condition	Explanation	Related Error Message*
All	Total Table Size Greater Than	The total size of a table is greater than a specified size.	ALR0036W
	Table Dropped	A table is dropped.	ALR0039E
Oracle	Max Extents - Allocated Extents	A table segment is near its maximum allowed extents.	ALR0035W
	Segment Has More Than	A table segment has taken too many extents.	ALR0034W
	Chained Row Count Greater Than	A table has too many chained rows.	ALR0037W
	Empty Used Segment Space Exceeds	An empty used segment space exceeds the specified size.	ALR0038W
	Total Table Size Greater Than	The total size of a table is greater than a specified size.	ALR0036W
	Table Dropped	A table is dropped.	ALR0039E
SQL Server	Total Table Size Greater Than	The total size of a table is greater than a specified size.	ALR0036W
	Table Dropped	A table is dropped.	ALR0039E
Sybase	Forwarded Row Count Greater Than	A forwarded row count is greater than the specified percent.	ALR0037W
	Total Table Size Greater Than	The total size of a table is greater than a specified size.	ALR0036W
	Table Dropped	A table is dropped.	ALR0039E
DB2	Overflow Row Count Greater Than	An overflow row count is greater than the specified percent.	ALR0037W
	Total Table Size Greater Than	The total size of a table is greater than a specified size.	ALR0036W
	Table Dropped	A table is dropped.	ALR0039E

**Note:** \* Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the *Messages* section of the *IBM Tivoli Storage Productivity Center Information Center* or the *IBM Tivoli Storage Productivity Center Messages Guide*.

### Triggering conditions for storage system alerts

Triggering conditions are events in a storage system that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a storage system.

Table 112. Triggering conditions and related error messages for storage-system alerts

Triggering Condition	Explanation	Related Error Message <sup>1</sup>
New Storage System discovered	A new storage system is discovered.	ALR1114I
Cache Increased	A storage system cache increases.	ALR0050W
Cache Decreased	A storage system cache decreases.	ALR0050W
New Disk Detected <sup>2</sup>	A new disk is detected.	ALR4323I
Disk Not Found <sup>2</sup>	A previously detected disk is not found.	ALR4324W

Table 112. Triggering conditions and related error messages for storage-system alerts (continued)

Triggering Condition	Explanation	Related Error Message <sup>1</sup>
Storage System Not Found	A previously detected storage system is not found.	ALR0048W
Storage System Status Change Offline	A storage system goes offline.	ALR4241E
Storage System Status Change Online	A storage system comes online.	ALR4242W
Storage System Version Change	A storage system version changes.	ALR4243W
Storage System Property Change	A port on a storage system is newly discovered, missing, or rediscovered.	ALR4278W
Storage System Allocated Capacity Change	The allocated capacity of a storage system changes.	ALR4244W
Storage System Available Capacity Change	The available capacity of a storage system changes.	ALR4245W
Storage System Backend Capacity Change	The allocated capacity of a storage system changes.	ALR4246W
Backend Storage System Status Change Offline	A back-end storage system goes offline.	ALR4247W
Backend Storage System Status Change Online	A back-end storage system comes online.	ALR4248I
Volume Status Change Offline	A volume goes offline.	ALR4249W
Volume Status Change Online	A volume comes online.	ALR4250I
Volume Capacity Change	The capacity of a volume changes.	ALR4251W
Pool Status Change	A pool is missing or rediscovered.	ALR4252W
Pool Discovered	A pool is discovered.	ALR4253I
Pool Status Change Offline	A pool goes offline.	ALR4254W
Pool Status Change Online	A pool comes online.	ALR4255I
Pool Capacity Change	The capacity of a pool changes.	ALR4256W
Pool Available Space Change	The available space in a pool changes.	ALR4257W
Node Status Change Offline	A node goes offline.	ALR4226W
Node Status Change Online	A node comes online.	ALR4227I
Node State Change	A IBM System Storage SAN Volume Controller node is missing or rediscovered.	ALR4224W
Node Discovered	A SAN Volume Controller node is discovered.	ALR4225I

Table 112. Triggering conditions and related error messages for storage-system alerts (continued)

Triggering Condition	Explanation	Related Error Message <sup>1</sup>
Datapath State Change	The state of a data path changes.	ALR4353W
Datapath Discovered	A data path is discovered.	ALR4354I
New Volume discovered	A new volume is discovered during a probe of a storage system.	ALR4325W
Volume not found	A volume which had existed before is not found during a probe of a storage system.	ALR4326W
Link Failure Rate Threshold	The average number of miscellaneous fibre channel link errors (for example, an unexpected Not Operational (NOS) received or a link state machine failure detected) per second that were encountered by a port over a period of time.	ALR0548E, ALR0549W, ALR0550W, ALR0551E
Error Frame Rate Threshold	The threshold for the number of frames per second that violated Fibre Channel protocol for a port over a period of time.	ALR0544E, ALR0545W, ALR0546W, ALR0547E
Overall Port Response Time Threshold	The threshold for the average number of milliseconds that it took to service each operation (send and receive), by a particular port over a particular time interval.	ALR0540E, ALR0541W, ALR0542W, ALR0543E
Total Port Data Rate Threshold	The threshold for the average number of megabytes transferred (send and receive) for a particular port over a particular time interval	ALR0536E, ALR0537W, ALR0538W, ALR0539E
Total Port IO Rate Threshold	The threshold for the average number of send and receive operations processed per second, for a particular port over a particular time interval	ALR0532E, ALR0533W, ALR0534W, ALR0535E
CPU Utilization Threshold	The threshold is based on the average utilization percentage of the CPUs in the SAN Volume Controller nodes. This value for each node is checked against the threshold boundaries for each collection interval.	ALR0556E, ALR0557W, ALR0558W, ALR0559E
Cache Holding Time Threshold	The threshold is reached for the average cache holding time, in seconds, for I/O data in a particular component over a particular time interval. Shorter time periods indicate adverse performance	ALR0528E, ALR0529W, ALR0530W, ALR0531E
Write-cache Delay Percentage Threshold	The threshold is based on the percentage of I/O operations that were delayed due to write-cache space constraints. This value for each node is checked against the threshold boundaries for each collection interval	ALR0524E, ALR0525W, ALR0526W, ALR0527E
Total Data Rate Threshold	For the storage system controllers or I/O groups, the threshold for the average number of MB per second for read and write operations is reached	ALR0520E, ALR0521W, ALR0522W, ALR0523E
Total I/O Rate Threshold	For the storage system controllers or I/O groups, the threshold for the average number of I/O operations per second is reached	ALR0516E, ALR0517W, ALR0518W, ALR0519E
Overall Backend Response Time Threshold	The threshold for the average number of milliseconds that it takes to respond to MDisk I/O operations is reached	ALR0512E, ALR0513W, ALR0514W, ALR0515E
Total Backend Data Rate Threshold	For MDisk groups, the threshold for the average number of megabytes per second that are transferred for MDisk read and write operations is reached	ALR0508E, ALR0509W, ALR0510W, ALR0511E
Zero Buffer-Buffer Credit Timer	The number of microseconds for which the port has been unable to send frames due to lack of buffer credit since the last node reset.	ALR0624E, ALR0625W, ALR0626W, ALR0627E

Table 112. Triggering conditions and related error messages for storage-system alerts (continued)

Triggering Condition	Explanation	Related Error Message <sup>1</sup>
Total Backend I/O Rate Threshold	For MDisk groups, the threshold for the average number of MDisk read and write operations per second is reached.	ALR0504E , ALR0505W, ALR0506W, ALR0507E
Invalid Transmission Word Rate Threshold	The threshold for the average number of times per second that "bit" errors are detected on a port over a period of time.	ALR0620E, ALR0621W, ALR0622W, ALR0623E
CRC Error Rate Threshold	The threshold for the average number of frames received per second where the CRC in the frame did not match the CRC computed by the receiver for a component over a period of time.	ALR0616E, ALR0617W, ALR0618W, ALR0619E
Disk Utilization Percentage Threshold	The threshold is reached for the approximate utilization percentage of a particular array over a particular time interval. For example, the average percentage of time that the disk associated with the array was busy	ALR0500E, ALR0501W, ALR0502W, ALR0503E
Port Receive Bandwidth Percentage Threshold <sup>3</sup>	The threshold for the average port bandwidth utilization percentage for receive operations.	ALR0612E, ALR0613W, ALR0614W, ALR0615E
Port Send Bandwidth Percentage Threshold <sup>3</sup>	The threshold for the average port bandwidth utilization percentage for send operations.	ALR0608E, ALR0609W, ALR0610W, ALR0611E
Port Receive Utilization Percentage Threshold	The threshold for the average amount of time that ports are busy receiving data.	ALR0604E, ALR0605W, ALR0606W, ALR0607E
Port Send Utilization Percentage Threshold	The threshold for the average port bandwidth utilization percentage for send operations.	ALR0600E, ALR0601W, ALR0602W, ALR0603E
Peak Back-end Write Response Time Threshold	The threshold for the peak (worst) response time among all MDisk write operations by a node.	ALR0596E, ALR0597W, ALR0598W, ALR0599E
Non-preferred Node Usage Percentage Threshold	The threshold for the non-preferred node usage percentage of an I/O group.	ALR0592E, ALR0593W, ALR0594W, ALR0595E
Port to Local Node Receive Queue Time Threshold	The threshold for the average number of milliseconds that each receive operation issued to another node in the local SVC cluster spent on the queue before being issued.	ALR0588E, ALR0589W, ALR0590W, ALR0591E
Port to Local Node Send Queue Time Threshold	The threshold for the average number of milliseconds that each send operation issued to another node in the local SVC cluster spent on the queue before being issued.	ALR0584E, ALR0585W, ALR0586W, ALR0587E
Port to Local Node Receive Response Time Threshold	The threshold for the average number of milliseconds it took to service each receive operation from another node in the local SVC cluster.	ALR0580E, ALR0581W, ALR0582W, ALR0583E
Port to Local Node Send Response Time Threshold	The threshold for the average number of milliseconds it took to service each send operation from another node in the local SVC cluster.	ALR0576E, ALR0577W, ALR0578W, ALR0579E
Back-end Write Queue Time Threshold	The threshold for the average number of milliseconds that each write operation spent on the queue before being issued to the back-end device.	ALR0572E, ALR0573W, ALR0574W, ALR0575E
Back-end Read Queue Time Threshold	The threshold for the average number of milliseconds that each read operation spent on the queue before being issued to the back-end device.	ALR0568E, ALR0569W, ALR0570W, ALR0571E

Table 112. Triggering conditions and related error messages for storage-system alerts (continued)

Triggering Condition	Explanation	Related Error Message <sup>1</sup>
Back-end Write Response Time Threshold	The threshold for the average number of milliseconds that it took to service each array and MDisk write operation.	ALR0564E, ALR0565W, ALR0566W, ALR0567E
Back-end Read Response Time Threshold	The threshold for the average number of milliseconds that it took to service each array and MDisk read operation.	ALR0560E, ALR0561W, ALR0562W, ALR0563E

**Related tasks:**

“Creating a performance threshold within an alert” on page 148

You can monitor the performance of your enterprise by creating alerts with performance thresholds for storage subsystems and SAN switches. By defining alerts that are triggered by performance thresholds, you can get timely information about performance issues in your enterprise.

**Related reference:**

“Performance thresholds” on page 1457

Performance thresholds are triggering conditions which are used to monitor a component with user-defined values.

**Triggering conditions for fabric alerts**

Triggering conditions are events in a fabric that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected in a fabric.

Table 113. Triggering conditions and related error messages for fabric alerts

Triggering Condition	Explanation	Related Error Message <sup>*</sup>
Fabric Discovered	A fabric is discovered.	ALR4046I
Fabric State Change	A fabric is missing or rediscovered.	ALR4047W, ALR4048I
Fabric to Switch Change	A switch to fabric association is discovered, rediscovered, or missing.	ALR4066I, ALR4067W, ALR4068I
Zone State Change	A zone is missing or rediscovered.	ALR4052W, ALR4053I, ALR4090W, ALR4094I
Zone Discovered	A zone is discovered.	ALR4051I, ALR4091I
Zone Set State Change	A zone set in a fabric was activated, deactivated, or has gone missing.	ALR4055W, ALR4089W, ALR4093E, ALR4056I, ALR4095I
Zone Set Discovered	A zone set is discovered.	ALR4054I, ALR4092I
Zone to Zone Alias Change	A zone to zone alias association is discovered, missing, or rediscovered.	ALR4079W, ALR4080I, ALR4110W, ALR4111I, ALR4078I, ALR4109I

Table 113. Triggering conditions and related error messages for fabric alerts (continued)

Triggering Condition	Explanation	Related Error Message*
Zone to Zone Member Change	A zone to zone member association is discovered, missing, or rediscovered.	ALR4081I, ALR4096I, ALR4082I, ALR4083I, ALR4097I, ALR4098I
Zone Set to Zone Change	A zone set to zone association is discovered, missing, or rediscovered.	ALR4084I, ALR4099I, ALR4085I, ALR4086I, ALR4107I, ALR4108I
New Connection	A new connection is detected.	ALR4063I
Connection State Change	A connection is missing or rediscovered.	ALR4064W, ALR4065I
Zone Alias to Member Change	A zone alias to member association is discovered, rediscovered, or missing.	ALR4329I, ALR4330I, ALR4331I
Endpoint Discovered	An endpoint is discovered.	ALR4000I
Endpoint State Change	An endpoint is missing or rediscovered.	ALR4001W, ALR4002I
<p><b>Note:</b> * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the <i>Messages</i> section of the <i>IBM Tivoli Storage Productivity Center Information Center</i> or the <i>IBM Tivoli Storage Productivity Center Messages Guide</i>.</p>		

### Triggering conditions for switch alerts

Triggering conditions are events on a switch that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a switch.

**Important:** The following triggering conditions are performance thresholds. A performance monitor must collect data about a switch before Tivoli Storage Productivity Center can determine if a performance threshold has generated an alert.

- Total Port Data Rate Threshold
- Port Receive Bandwidth Percentage Threshold
- Port Send Bandwidth Percentage Threshold
- Link Failure Rate Threshold
- Error Frame Rate Threshold
- Total Port Packet Rate Threshold

Table 114. Triggering conditions and related error messages for switch alerts

Triggering Condition	Explanation	Related Error Message*
Switch Discovered	A switch is discovered.	ALR4020I
Switch State Change	A switch is missing or is rediscovered.	ALR4021E, ALR4022I
Switch Property Changes	A port on the switch has changed to online or offline, is discovered, is missing, or is rediscovered.	ALR4015I, ALR4016W, ALR4017I, ALR4018W, ALR4019I,
Switch Status Degraded	The status of the switch has changed from OK to a reduced level. This condition does not necessarily mean that the switch is missing.	ALR4024W
Switch Status Improved	The status of the switch has been upgraded to OK.	ALR4025I
Switch Version Change	The version of a switch changes.	ALR4023W
Switch to Port Change	A switch to switch port association is discovered, is missing, or is rediscovered.	ALR4069I, ALR4070W, ALR4071I

Table 114. Triggering conditions and related error messages for switch alerts (continued)

Triggering Condition	Explanation	Related Error Message*
Switch Blade Change	A switch module is discovered, is missing, or is rediscovered.	ALR4026I, ALR4027W, ALR4028I
Switch Blade Change Offline	A switch module goes offline.	ALR4029E
Switch Blade Change Online	A switch module comes online.	ALR4030I
Total Port Data Rate Threshold	A total port data rate threshold is reached.	ALR0536E, ALR0537W, ALR0538W, ALR0539E
Port Receive Bandwidth Percentage Threshold	The threshold on the average port bandwidth utilization percentage for receive operations. The Port Send Utilization Percentage metric is checked against the threshold boundaries for each collection interval. This threshold uses the following default values: 85,75,-1,-1.	ALR0612E, ALR0613W, ALR0614W, ALR0615E
Port Send Bandwidth Percentage Threshold	The threshold on the average port bandwidth utilization percentage for send operations. The Port Send Utilization Percentage metric is checked against the threshold boundaries for each collection interval. This threshold uses the following default values: 85,75,-1,-1.	ALR0608E, ALR0609W, ALR0610W, ALR0611E
Link Failure Rate Threshold	A link failure rate threshold is reached.	ALR0548E, ALR0549W, ALR0550W, ALR0551E
Error Frame Rate Threshold	An error frame rate threshold is reached.	ALR0544E, ALR0545W, ALR0546W, ALR0547E
Total Port Packet Rate Threshold	A total port packet rate threshold is reached.	ALR0552E, ALR0553W, ALR0554W, ALR0555E
<p><b>Note:</b> * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the <i>Messages</i> section of the <i>IBM Tivoli Storage Productivity Center Information Center</i> or the <i>IBM Tivoli Storage Productivity Center Messages Guide</i>.</p>		

### Triggering conditions for endpoint device alerts

Use this topic to view the events that can trigger endpoint device alerts and their related error message identifiers.

Table 115. Triggering conditions and related error messages for endpoint device alerts

Triggering Condition	Explanation	Related Error Message*
Endpoint Discovered	An endpoint device is discovered.	ALR4239W
Endpoint State Change	An endpoint device is missing or is rediscovered.	ALR4231W
Endpoint Version Change	The version for an endpoint device changes.	ALR4313W
<p><b>Note:</b> * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the <i>Messages</i> section of the <i>IBM Tivoli Storage Productivity Center Information Center</i> or the <i>IBM Tivoli Storage Productivity Center Messages Guide</i>.</p>		

### Triggering conditions for hypervisor alerts

Triggering conditions are events on a hypervisor that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a hypervisor.

Table 116. Triggering conditions and related error messages for hypervisor alerts

Triggering Condition	Explanation	Related Error Message*
Hypervisor Discovered	A hypervisor is discovered.	ALR4315I
Hypervisor Missing	A hypervisor that was previously discovered is missing.	ALR4321W
Virtual Machine Added	A new virtual machine was added.	ALR4316I
Virtual Machine Removed	A virtual machine was removed.	ALR4317W
<p><b>Note:</b> * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the <i>Messages</i> section of the <i>IBM Tivoli Storage Productivity Center Information Center</i> or the <i>IBM Tivoli Storage Productivity Center Messages Guide</i>.</p>		

### Triggering conditions for Other NAS alerts

Triggering conditions are events on network-attached storage (NAS) that generate alerts in Tivoli Storage Productivity Center. Each condition has a related error message identifier that is displayed when the condition is detected on a NAS device.

Table 117. Triggering conditions and related error messages for NAS alerts

Triggering Condition	Explanation	Related Error Message*
Node Status Changed to Normal	The clustered Common Internet File System (CIFS) for a NAS device is active. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4365I
Node Status Changed to Warning	The clustered CIFS for a NAS device is disabled. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4366W
Node Status Changed to Error	The status of a clustered CIFS for a NAS device reached the error level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4367E
GPFS Status Reached Normal Level	The General Parallel File System (GPFS) for a NAS device is active. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4368I
GPFS Status Reached Warning Level	The GPFS state for a NAS device reached the warning level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4369W
GPFS Status Reached Error Level	The GPFS for a NAS device is down. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4370E
Node State Changed	The state of a node changed.	ALR1245W
Node Was Discovered	A node was discovered.	ALR1246W
Node Status Changed to Online	A node status changed to online.	ALR4227W
Node Status Changed to Offline	A node status changed to offline.	ALR4226W
Processor Usage Reached Normal Level	Processor use for a network-attached storage (NAS) device reached the normal level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4361I

Table 117. Triggering conditions and related error messages for NAS alerts (continued)

Triggering Condition	Explanation	Related Error Message*
Processor Usage Reached Warning Level	Processor use for a NAS device reached the warning level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4360W
Processor Usage Reached Error Level	Processor use for a NAS device reached the error level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4359E
Memory Usage Reached Normal Level	Memory use for a NAS device reached the normal level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4364I
Memory Usage Reached Error Level	Memory use for a NAS device reached the error level. This alert is triggered when the corresponding SNMP trap is received from Storwize V7000 File Module.	ALR4362E
Cluster Was Discovered	A cluster was discovered.	ALR4528I
Cluster Was Removed	A cluster that was found during a probe was not found in the current probe.	ALR4529I
Cluster Was Rediscovered	A cluster that was missing was found by the current probe.	ALR4530I
New Export Was Detected	An export was detected for the first time.	ALR4460I
Export Is Missing	An export that was found during a previous probe was not found in the current probe.	ALR4470W
Export Was Rediscovered	An export that was missing was found by the current probe.	ALR4471I
Export State Changed	The state of an export changed.	ALR4461W
Export Path Changed	An export was linked to a new path.	ALR4462W
Export Protocol Changed	The protocols that were configured for an export changed.	ALR4463W
New NSD Detected	A Network Shared Disk (NSD) was detected for the first time.	ALR4503I
NSD Is Missing	An NSD that was found during a previous probe was not found in the current probe.	ALR4505W
NSD State Changed	The state of an NSD changed.	ALR4507W
NSD Status Reached Normal Level	NSD use for a NAS device reached the normal level.	ALR4387I
NSD Status Reached Warning Level	NSD use for a NAS device reached the warning level.	ALR4386W
NSD Status Reached Error Level	NSD use for a NAS device reached the error level.	ALR4385E
<p><b>Note:</b> * Use the error message identifiers in this column to locate any additional information about the error messages related to triggering conditions in the <i>Messages</i> section of the <i>IBM Tivoli Storage Productivity Center Information Center</i> or the <i>IBM Tivoli Storage Productivity Center Messages Guide</i>.</p>		

## Alert suppression actions

If you selected a threshold as a triggering condition for alerts, you can specify the conditions under which alerts are triggered and choose whether you want to suppress repeating alerts. Alerts can be suppressed to avoid generating too many alert log entries or too many actions when the triggering condition occurs often. You can view suppressed alerts in the constraint violation reports.

You can define the following options that enable you to specify conditions that trigger and suppress alerts. If a threshold is not selected as a triggering condition, these options are not available.

### **Trigger alerts for both critical and warning conditions**

Generates an alert upon the violation of either critical or warning threshold boundaries. This is the default.

### **Trigger alerts for critical conditions only**

Generates alerts only upon violation of one of the critical threshold boundaries. Violation of a warning boundary creates an entry in the constraint violation report, but does not result in an entry in the alert log or an action being triggered.

### **Trigger no alerts**

Does not generate an alert upon violation of any threshold boundaries. Creates entries only in the constraint violation report.

### **Do not suppress repeating alerts**

Does not suppress any repeating alerts. This is the default.

### **Suppress alerts unless the Triggering Condition has been violated continuously for a specified length of time**

Generates alerts only if the triggering condition has occurred continuously within the length of time specified in the **Length of time** field. Alerts for the first and any subsequent occurrences of the triggering condition within the specified time in minutes will be suppressed. At the point that there have been consecutive occurrences with the specified number of minutes, an alert is generated. When the specified suppression period has expired, the cycle starts again. Note that the timing for this feature is based on the IBM Tivoli Storage Productivity Center server clock rather than the various system clocks.

This option is useful for cases when a single occurrence of the triggering condition may be insignificant, but repeated occurrences can signal a potential problem.

### **Suppress alerts if a repeat violation has occurred within a specified length of time after the initial violation of the Triggering Condition**

Generates alerts only for the first occurrence of the triggering condition. Alerts for repeated occurrences of the triggering condition within the length of time specified in the **Length of time** field are suppressed. When the specified suppression period has expired, the cycle starts again. Note that the timing for this feature is based on the IBM Tivoli Storage Productivity Center server clock rather than the various system clocks.

This option is useful for avoiding e-mail messages or similar disruptive alerts if the same triggering condition occurs repeatedly in successive sample passes. This option generally useful for all threshold types.

## Triggered actions for alerts

You define triggered actions to occur as a result of the alert.

An alert is always entered in the error log file each time it occurs. In addition, you can define the following notifications or triggered actions:

#### **SNMP Trap**

Generates an SNMP trap message to any network-management system, console, or terminal. You must set up the SNMP trap ringer with the `fabric.mib` and `tivoliSRM.mib` files.

#### **TEC / OMNIBus Event**

Sends an alert to the IBM Tivoli Enterprise Console or OMNIBus EIF probe server in your environment. The Tivoli Enterprise Console administrator can write correlation and automation rules to analyze the IBM Tivoli Storage Productivity Center events. Tivoli Enterprise Console also performs responses such as sending further notifications, creating or updating trouble tickets, and running programs. You must load the `tivoliSRM.baroc` and `fabric.baroc` files into the active rulebase of the Tivoli Enterprise Console server.

#### **Login Notification**

Tivoli Storage Productivity Center lists the alerts for the specified users when they log in. Use the **Preferences > Edit General** option on the Tivoli Storage Productivity Center menu bar to control which alerts a user views upon logging in to the product.

#### **Windows Event Log, UNIX Syslog**

Writes the alerts to the operating-system log. You can select from the following levels of operating-system events:

- UNIX: Informational, Notice, Warning, Error, Critical, or Alert
- Microsoft Windows: Error, Warning, and Information.

For UNIX, you also can select User or Local.

#### **Run Script**

Runs a script in response to the alert. Use this option to run third-party tools for such actions as recovery and provisioning.

1. Click **Define** to specify the script that is run when the triggering condition occurs. The **Specify Script** window opens.
2. Type the name of the script in the **Script Name** field.
3. Select where to run the script.

If parameters are given for the triggering condition, they are listed in the **Specify Script** window. These parameters are used when the alert is triggered.

**Note:** Scripts can only be run against systems on which a Storage Resource agent or Data agent is deployed.

#### **Archive/Backup**

(Constraints only) Runs an IBM System Storage Productivity Center backup or archive job in response to an alert associated with a constraint. Click the Define button.

**Email** Sends an email. Use this section to view, add, and delete email addresses and edit the text of the message in the email.

For **Directory Alerts**, if the **Directory Consumes More Than** triggering condition is selected, additional fields are available to send email to the quota violator. The email address can be based on **Directory Owner** or **Directory Name**.

## Alert display colors

Status symbols for alerts are shown in the colors listed for the alert action.

When you have active alerts shown within the subnodes under the **IBM Tivoli Storage Productivity Center-> Alerting -> Alert Log** node, the indicator next to those subnodes will appear as green or red depending on their corresponding alerts. The following table shows the colors that are generated for the subnodes by their different alerts:

*Table 118. Alert colors*

Alert	Color
Probe failed	Red
RAM increase	Green
RAM decrease	Red
Memory increase	Green
Memory decrease	Red
New disk	Green
Missing disk	Red
Disk defect	Red
Disk failure predicted	Red
New filesystem	Green

## Performance data

Use the IBM Tivoli Storage Productivity Center to view the performance data of devices in your environment.

### General performance guidelines

This topic provides some general performance considerations for configuring the IBM Tivoli Storage Productivity Center environment.

- Do not overpopulate the SLP discovery panel with SLP agent hosts. Remember that Tivoli Storage Productivity Center includes a built-in SLP User Agent (UA) that receives information about SLP Service Agents and Directory Agents (DA) that reside in the same subnet as the Tivoli Storage Productivity Center server.
- Ensure that you have not more than one DA per subnet.
- Misconfiguring the Tivoli Storage Productivity Center Common Information Model Object Manager (CIMOM) discovery preferences might affect performance on auto discovery or on device presence checking. It might also result in application timeouts, as attempts are made to resolve and communicate with hosts that are unavailable. CIMOMs are not required to communicate with storage systems that use native interfaces. Tivoli Storage Productivity Center uses native interfaces to communicate with IBM System Storage DS8000 Storage Manager, IBM XIV Storage System, and IBM System Storage SAN Volume Controller.
- It should be considered mandatory to run the CIM Agent software on a separate host from the Tivoli Storage Productivity Center server. Attempting to run a full Tivoli Storage Productivity Center implementation on the same host as the CIM agent, can result in dramatically increased wait times for data retrieval. You might also experience resource contention and port conflicts.

### Performance thresholds

Performance thresholds are triggering conditions which are used to monitor a component with user-defined values.

You can monitor the performance of your enterprise by creating alerts on performance thresholds for switches and storage subsystems. By creating alerts that are triggered by performance thresholds, you can be informed about performance issues in your enterprise. Threshold events tell you when a

component has fallen outside of the user-defined values. For example, when a threshold value has reached critical stress.

## Threshold boundaries

You can establish your boundaries for the normal expected subsystem performance when defining storage subsystem alerts for performance threshold events. When the collected performance data samples fall outside the range you have set, you are notified of this threshold violation so you are aware of the potential problem. The upper-threshold boundaries are **Critical Stress** and **Warning Stress**. The lower-threshold boundaries are **Warning Idle** and **Critical Idle**. Usually you will want the stress boundaries to be high numbers and the idle to be low numbers. The exception to this rule is **Cache Holding Time Threshold**, where you want the stress numbers to be low and the idle numbers to be high.

If you do not want to be notified of threshold violations for any boundaries, you can leave the boundary field blank and the performance data will not be checked against any value. For example, if you leave the **Critical Idle** and **Warning Idle** fields blank, no alerts will be sent for any idle conditions.

The **Ignore triggering condition when the sequential I/O percentage exceeds** check box is active only for the triggering condition **Disk Utilization Percentage Threshold**. It is a filter condition. The default is 80%.

The **Ignore triggering condition when the Back-end Read I/O Rate is less than** check box only applies to the **Back-end Read Response Time** and **Back-end Read Queue Time** thresholds.

The **Ignore triggering condition when the Back-end Write I/O Rate is less than** check box only applies to the **Back-end Write Response Time** and **Back-end Write Queue Time** thresholds.

The **Ignore triggering condition when the Total Back-end I/O Rate is less than** check box only applies to the **Overall Back-end Response Time** threshold.

The **Ignore triggering condition when the Total I/O Rate is less than** check box only applies to the **Non-preferred Node Usage Percentage** threshold.

The **Ignore triggering condition when the Write-cache Delay I/O Rate is less than** check box only applies to the **Write-cache Delay Percentage** threshold.

## Setting the thresholds

Only a few thresholds have defaults and on the other thresholds you will have to determine the best values for stress, idle, critical, and warning values so you can derive the maximum benefit without generating too many false alerts. Since suitable stress thresholds are highly dependant on the type of workload you are running, your exact hardware configuration, the number of physical disks, exact model numbers, and so forth, there are no easy or standard default rules.

One of the best approaches is to monitor your performance for a number of weeks and, using this historical data, determine reasonable values for each threshold setting. Once that is done you can fine tune these settings to minimize the number of false alerts.

**Related tasks:**

“Archive and delete files” on page 142

This scenario shows you how to reclaim storage space by archiving and deleting files that meet criteria you define.

**Related reference:**

“Controller thresholds” on page 1463

The following table lists and describes the Controller thresholds.

“Port thresholds” on page 1464

Port thresholds are used to set limits for such things as bandwidth utilization, data rates, and I/O operations.

“Array thresholds”

The following table lists and describes the Array thresholds.

**Array thresholds**

The following table lists and describes the Array thresholds.

*Table 119. Array thresholds*

Threshold (Metric)	Device/Component Type	Description
<b>Array Thresholds</b>		
Disk Utilization Percentage	TotalStorage Enterprise Storage Server, DS6000, DS8000 array	Sets thresholds on the approximate utilization percentage of the arrays in a particular subsystem; for example, the average percentage of time that the disks associated with the array were busy. The Disk Utilization metric for each array is checked against the threshold boundaries for each collection interval. This threshold is enabled by default for TotalStorage Enterprise Storage Server systems and disabled by default for others. The default threshold boundaries are 80%, 50%, -1, -1. For DS6000 and DS8000 subsystems, this threshold applies only to those ranks which are the only ranks in their associated extent pool.
Total Back-end I/O Rate	SAN Volume Controller MDisk group and MDisk, TotalStorage Enterprise Storage Server, DS6000, DS8000 array	Sets thresholds on the average number of I/O operations per second for array and MDisk read and write operations. The Total I/O Rate metric for each array or MDisk is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.
Total Back-end Data Rate	SAN Volume Controller MDisk group and MDisk, TotalStorage Enterprise Storage Server, DS6000, DS8000 array	Sets thresholds on the average number of MB per second that were transferred for array and MDisk read and write operations. The Total Data Rate metric for each array or MDisk is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.

Table 119. Array thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Back-end Read Response Time	SAN Volume Controller MDisk, TotalStorage Enterprise Storage Server, DS6000, DS8000 array	Sets thresholds on the average number of milliseconds that it took to service each array and MDisk read operation. The Back-end Read Response Time metric for each array or MDisk is checked against the threshold boundaries for each collection interval. Though this threshold is disabled by default, suggested boundary values of 35,25,-1,-1 are pre-populated. A filter is available for this threshold which will ignore any boundary violations if the Back-end Read I/O Rate is less than a specified filter value. The pre-populated filter value is 5.
Back-end Write Response Time	SAN Volume Controller MDisk, TotalStorage Enterprise Storage Server, DS6000, DS8000 array	Sets thresholds on the average number of milliseconds that it took to service each array and MDisk write operation. The Back-end Write Response Time metric for each array or MDisk is checked against the threshold boundaries for each collection interval. Though this threshold is disabled by default, suggested boundary values of 120,80,-1,-1 are pre-populated. A filter is available for this threshold which will ignore any boundary violations if the Back-end Write I/O Rate is less than a specified filter value. The pre-populated filter value is 5.
Overall Back-end Response Time	SAN Volume Controller MDisk	Sets thresholds on the average number of milliseconds that it took to service each MDisk I/O operation, measured at the MDisk level. The Total Response Time (external) metric for each MDisk is checked against the threshold boundaries for each collection interval. This threshold is disabled by default. A filter is available for this threshold which will ignore any boundary violations if the Total Back-end I/O Rate is less than a specified filter value. The pre-populated filter value is 10.

Table 119. Array thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Back-end Read Queue Time	SAN Volume Controller MDisk	Sets thresholds on the average number of milliseconds that each read operation spent on the queue before being issued to the back-end device. The Back-end Read Queue Time metric for each MDisk is checked against the threshold boundaries for each collection interval. Though this threshold is disabled by default, suggested boundary values of 5,3,-1,-1 are pre-populated. A filter is available for this threshold which will ignore any boundary violations if the Back-end Read I/O Rate is less than a specified filter value. The pre-populated filter value is 5. Violation of these threshold boundaries means that the SVC deems the MDisk to be overloaded. There is a queue algorithm that determines the number of concurrent I/O operations that the SVC will send to a given MDisk. If there is any queuing (other than during a backup process) then this suggests performance can be improved by resolving the queuing issue.
Back-end Write Queue Time	SAN Volume Controller MDisk	Sets thresholds on the average number of milliseconds that each write operation spent on the queue before being issued to the back-end device. The Back-end Write Queue Time metric for each MDisk is checked against the threshold boundaries for each collection interval. Though this threshold is disabled by default, suggested boundary values of 5,3,-1,-1 are pre-populated. A filter is available for this threshold which will ignore any boundary violations if the Back-end Read I/O Rate is less than a specified filter value. The pre-populated filter value is 5. Violation of these threshold boundaries means that the SVC deems the MDisk to be overloaded. There is a queue algorithm that determines the number of concurrent I/O operations that the SVC will send to a given MDisk. If there is any queuing (other than during a backup process) then this suggests performance can be improved by resolving the queuing issue.

Table 119. Array thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Peak Back-end Write Response Time	SAN Volume Controller Node	Sets thresholds on the peak (worst) response time among all MDisk write operations by a node. The Back-end Peak Write Response Time metric for each node is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundary values of 30000,10000,-1,-1. Violation of these threshold boundaries means that the SVC cache is having to "partition-limit" for a given MDisk group. The de-staged data from the SVC cache for this MDisk group is causing the cache to fill up (writes are being received faster than they can be de-staged to disk). If delays reach 30 seconds or more, then the SVC will switch into "short-term mode" where writes are no longer cached for the MDisk Group.
Port to Local Node Send Response Time	SAN Volume Controller Node	Sets thresholds on the average number of milliseconds it took to service each send operation to another node in the local SVC cluster. The Port to Local Node Send Response Time metric for each node is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundary values of 3,1.5,-1,-1. Violation of these threshold boundaries means that it is taking too long to send data between nodes (on the fabric), and suggests that there is either congestion around these FC ports, or an internal SVC microcode problem.
Port to Local Node Receive Response Time	SAN Volume Controller Node	Sets thresholds on the average number of milliseconds it took to service each receive operation from another node in the local SVC cluster. The Port to Local Node Receive Response Time metric for each node is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundary values of 1,0.5,-1,-1. Violation of these threshold boundaries means that it is taking too long to send data between nodes (on the fabric), and suggests that there is either congestion around these FC ports, or an internal SVC microcode problem.

Table 119. Array thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Port to Local Node Send Queue Time	SAN Volume Controller Node	Sets thresholds on the average number of milliseconds that each send operation issued to another node in the local SVC cluster spent on the queue before being issued. The Port to Local Node Send Queue Time metric for each node is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundary values of 2,1,-1,-1. Violation of these threshold boundaries means that the node has to wait too long to send data to other nodes (on the fabric), and suggests congestion on the fabric.
Port to Local Node Receive Queue Time	SAN Volume Controller Node	Sets thresholds on the average number of milliseconds that each receive operation issued to another node in the local SVC cluster spent on the queue before being issued. The Port to Local Node Receive Queue Time metric for each node is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundary values of 1,0.5,-1,-1. Violation of these threshold boundaries means that the node has to wait too long to receive data from other nodes (on the fabric), and suggests congestion on the fabric.

## Controller thresholds

The following table lists and describes the Controller thresholds.

Table 120. Controller thresholds

Threshold (Metric)	Device/Component Type	Description
<b>Controller Thresholds</b>		
Total I/O Rate (overall)	TotalStorage Enterprise Storage Server, DS6000, DS8000 controller  SAN Volume Controller I/O group	Sets threshold on the average number of I/O operations per second for read and write operations, for the subsystem controllers (clusters) or I/O groups. The Total I/O Rate metric for each controller or I/O group is checked against the threshold boundaries for each collection interval. These thresholds are disabled by default.
Total Data Rate	TotalStorage Enterprise Storage Server, DS6000, DS8000 controller  SAN Volume Controller I/O group	Sets threshold on the average number of MB per second for read and write operations for the subsystem controllers (clusters) or I/O groups. The Total Data Rate metric for each controller or I/O group is checked against the threshold boundaries for each collection interval. These thresholds are disabled by default.

Table 120. Controller thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
NVS Full Percentage	TotalStorage Enterprise Storage Server, DS6000, DS8000 controller	Sets thresholds on the percentage of time that NVS space constraints caused I/O operations to be delayed, for the subsystem controllers (clusters). The NVS Full Percentage metric for each controller is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundaries of 10, 3, -1, -1.
Cache Holding Time	TotalStorage Enterprise Storage Server, DS6000, DS8000 controller	Sets thresholds on the average cache holding time, in seconds, for I/O data in the subsystem controllers (clusters). Shorter time periods indicate adverse performance. The Cache Holding Time metric for each controller is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundaries of 30, 60, -1, -1.
Write-cache Delay Percentage	TotalStorage Enterprise Storage Server, DS6000, DS8000 controller, SAN Volume Controller node	Sets thresholds on the percentage of I/O operations that were delayed due to write-cache space constraints. This metric for each controller or node is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundaries of 10, 3, -1, -1. In addition, a filter is available for this threshold which will ignore any boundary violations if the Write-cache Delay I/O Rate is less than a specified filter value. The pre-populated filter value is 10 I/Os per second.
Non-Preferred Node Usage Percentage	SAN Volume Controller I/O group	Sets thresholds on the Non-Preferred Node Usage Percentage of an I/O group. This metric of each I/O group is checked against the threshold boundaries at each collection interval. This threshold is disabled by default. In addition, a filter is available for this threshold which will ignore any boundary violations if the Total I/O Rate of the I/O group is less than a specified filter value.

## Port thresholds

Port thresholds are used to set limits for such things as bandwidth utilization, data rates, and I/O operations.

Table 121. Port thresholds

Threshold (Metric)	Device/Component Type	Description
<b>Port Thresholds</b>		

Table 121. Port thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Total Port I/O Rate	TotalStorage Enterprise Storage Server, DS6000, DS8000 switch port, XIV	Sets thresholds for ports on the average number of I/O operations or packets per second for send and receive operations. The Total I/O Rate metric for each port is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.
Total Port Data Rate	TotalStorage Enterprise Storage Server, DS6000, DS8000 switch port, XIV	Sets thresholds for ports on the average number of MB per second for send and receive operations. The Total Data Rate metric for each port is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.
Overall Port Response Time	TotalStorage Enterprise Storage Server, DS6000, DS8000	Sets thresholds for ports on the average number of milliseconds that it takes to service each send and receive I/O operation. The Total Response Time metric for each port is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.
Error Frame Rate	DS8000	Sets thresholds on the average number of frames per second received in error by ports. The Error Frame Rate metric for each port is checked against the threshold boundary for each collection interval. This threshold is disabled by default.
Link Failure Rate	DS8000 SAN Volume Controller	Sets thresholds on the average number of link errors per second for ports. The Link Failure Rate metric for each port is checked against the threshold boundary for each collection interval. The default boundaries are 0.0030,-1,-1,-1 cnt/s. This threshold is disabled by default.

Table 121. Port thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Total Port Data Rate	Switch port	Sets thresholds on the critical and warning data rates for stress and idle in MB per second. The Total Port Data Rate metric for each port is checked against the threshold boundary for each collection interval. This threshold is disabled by default.
Total Port Packet Rate	Switch port	Sets thresholds on critical and warning data rates for stress and idle conditions in packets per second. For example, a critical stress or warning stress condition occurs when the upper-threshold boundary for the packet rate of a switch is detected. A critical idle or warning idle condition occurs when the lower-threshold boundary for the packet rate of a switch is detected. The Total Port Packet Rate metric for each port is checked against the threshold boundary for each collection interval. This threshold is disabled by default.
Port Send Utilization Percentage	TotalStorage Enterprise Storage Server, DS6000, DS8000	Sets thresholds on the average amount of time that ports are busy sending data. The metric for each port is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.
Port Receive Utilization Percentage	TotalStorage Enterprise Storage Server, DS6000, DS8000	Sets thresholds on the average amount of time that ports are busy receiving data. The metric for each port is checked against the threshold boundaries for each collection interval. This threshold is disabled by default.

Table 121. Port thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Port Send Bandwidth Percentage	TotalStorage Enterprise Storage Server, DS8000, SAN Volume Controller switch port, XIV	Sets thresholds on the average port bandwidth utilization percentage for send operations. The Port Send Utilization Percentage metric is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundaries 85,75,-1,-1.
Port Receive Bandwidth Percentage	TotalStorage Enterprise Storage Server, DS8000, SAN Volume Controller switch port, XIV	Sets thresholds on the average port bandwidth utilization percentage for receive operations. The Port Send Utilization Percentage metric is checked against the threshold boundaries for each collection interval. This threshold is enabled by default, with default boundaries 85,75,-1,-1.
CRC Error Rate	DS8000 port, SAN Volume Controller switch port	Sets thresholds on the average number of frames received in which the cyclic redundancy check (CRC) in a frame does not match the CRC computed by the receiver. The CRC Error Rate metric for each port is checked against the threshold boundary for each collection interval. The default boundaries are 0.033, 0.01, -1, -1 cnt/s. This threshold is disabled by default.
Invalid Transmission Word Rate	DS8000, SAN Volume Controller switch port	Sets thresholds on the average number of bit errors detected on a port. The Invalid Transmission Word Rate metric for each port is checked against the threshold boundary for each collection interval. The default boundaries are 0.033, 0.01, -1, -1 cnt/s. This threshold is disabled by default.

Table 121. Port thresholds (continued)

Threshold (Metric)	Device/Component Type	Description
Zero Buffer - Buffer Credit Timer	SAN Volume Controller	Sets thresholds on the number of microseconds that a port has been unable to send frames because of a lack of buffer credit since the last node reset. The Zero Buffer-Buffer Credit Timer metric for each port is checked against the threshold boundary for each collection interval. The default boundaries are 198000000,75000000,-1,-1 us. This threshold is disabled by default.

## Performance metrics

A description of the metrics that are displayed in the columns of performance reports is provided.

### Common columns

The following table contains information about the columns that are common among performance reports.

Column	Description
Time	Date and time that the data was collected
Interval	<p>Size of the sample interval in seconds. You can specify a minimum interval length of five minutes and a maximum interval length of sixty minutes for the following models:</p> <ul style="list-style-type: none"> <li>• TotalStorage Enterprise Storage Server</li> <li>• DS6000</li> <li>• DS8000</li> <li>• the XIV system</li> </ul> <p>For SAN Volume Controller models earlier than V4.1, you can specify a minimum interval length of 15 minutes and a maximum interval length of sixty minutes. For SAN Volume Controller models V4.1 and later, you can specify a minimum interval length of 5 minutes, and a maximum interval length of sixty minutes.</p>

**Note:** When you view metrics for the ESS and DS6000 and DS8000 storage systems, you must take into account the following differences between IBM Tivoli Storage Productivity Center reports and the native reports of those systems:

- Tivoli Storage Productivity Center reports display port performance metrics as send and receive metrics (for example, **Send Data Rate** and **Receive Data Rate**).
- Storage system native reports (for example, reports based on data collected by the DS CLI) display port performance metrics as read and write metrics (for example, **Bytread** and **Bytewrite**).

When a host performs a read operation, the DS port sends data to the host. Therefore "read" metrics in DS6000 and DS8000 reports correspond to "send"

metrics in Tivoli Storage Productivity Center reports. When a host performs a write operation, DS6000 and DS8000 ports receive data from the host. Therefore "write" metrics in DS6000 and DS8000 reports correspond to "receive" metrics in Tivoli Storage Productivity Center reports.

When you view port Peer-to-Peer Remote Copy (PPRC) performance metrics, you must take into account the following additional differences between Tivoli Storage Productivity Center reports and native reports for storage systems:

- Metrics for PPRC reads in storage system native reports are represented as PPRC receives in Tivoli Storage Productivity Center (reads = receives).
- Metrics for PPRC writes in storage system native reports are represented as PPRC sends in Tivoli Storage Productivity Center (writes = sends).

## XIV system metrics

To distinguish between metrics that were introduced in different versions of the XIV systems, the following convention was used in this topic:

- <sup>1</sup> is displayed next to metrics that are available in the XIV system version 10.2.2 or later.
- <sup>2</sup> is displayed next to metrics that are available in the XIV system version 10.2.4 or later.

For example:

- The Read I/O Rate (overall) metric is available for the XIV systems version 10.2.2 and later. In the **Devices: components** column of the list of metrics, the entry for Read I/O Rate (overall) is displayed like this: XIV<sup>1</sup>: volume, module, subsystem
- The Small Transfers Response Time metric is available for the XIV systems version 10.2.4 and later. In the **Devices: components** column of the list of metrics, the entry for Small Transfers Response Time is displayed like this: XIV<sup>2</sup>: volume, module, subsystem

## Volume-based metrics

The following table contains information about volume-based metrics.

**Note:** Tivoli Storage Productivity Center does not calculate volume-based metrics if there are space efficient volumes allocated in an extent pool consisting of multiple ranks. In this case, the columns for volume-based metrics display the value **N/A** in the Storage Subsystem Performance > By Array report for the arrays associated with that extent pool. However, if there are no space efficient volumes allocated in a multi-rank extent pool, or if the space efficient volumes are allocated in an extent pool consisting of a single rank, then this limitation does not apply and all volume-based metrics are displayed in the By Array report.

Column	Devices: components	Description
<b>I/O Rates</b>		
Read I/O Rate (normal)	ESS/DS6000/DS8000: volume, array, controller, subsystem	Average number of I/O operations per second for nonsequential read operations for a component over a specified time interval.
Read I/O rate (sequential)	ESS/DS6000/DS8000: volume, array, controller, subsystem	Average number of I/O operations per second for sequential read operations for a component over a specified time interval.

Column	Devices: components	Description
Read I/O Rate (overall)	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, MDisk group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Average number of I/O operations per second for both sequential and nonsequential read operations for a component over a specified time interval.
Write I/O Rate (normal)	ESS/DS6000/DS8000: volume, array, controller, subsystem	Average number of I/O operations per second for nonsequential write operations for a component over a specified time interval.
Write I/O Rate (sequential)	ESS/DS6000/DS8000: volume, array, controller, subsystem	Average number of I/O operations per second for sequential write operations for a component over a specified time interval.
Write I/O Rate (overall)	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, MDisk group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Average number of I/O operations per second for both sequential and nonsequential write operations for a component over a specified time interval.
Total I/O Rate (normal)	ESS/DS6000/DS8000: volume, array, controller, subsystem	Average number of I/O operations per second for nonsequential read and write operations for a component over a specified time interval.
Total I/O Rate (sequential)	ESS/DS6000/DS8000: volume, array, controller, subsystem	Average number of I/O operations per second for sequential read and write operations for a component over a specified time interval.
Total I/O Rate (overall)	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, MDisk group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Average number of I/O operations per second for both sequential and nonsequential read and write operations for a component over a specified time interval.
Global Mirror Write I/O Rate	SVC: VDisk, node, I/O group, subsystem	Average number of write operations per second issued to the Global Mirror secondary site for a component over a specified time interval.

Column	Devices: components	Description
Global Mirror Overlapping Write Percentage	SVC: VDisk, node, I/O group, subsystem	Average percentage of write operations issued by the Global Mirror primary site which were serialized overlapping writes for a component over a specified time interval. For SVC 4.3.1 and later, some overlapping writes are processed in parallel (are not serialized) and are excluded. For earlier SVC versions, all overlapping writes were serialized.
Global Mirror Overlapping Write I/O Rate	SVC: VDisk, node, I/O group, subsystem	Average number of serialized overlapping write operations per second encountered by the Global Mirror primary site for a component over a specified time interval. For SVC 4.3.1 and later, some overlapping writes are processed in parallel (are not serialized) and are excluded. For earlier SVC versions, all overlapping writes are serialized.
HPF Read I/O Rate	DS8000: volume, array, controller, subsystem	Average number of read operations per second that were issued via the High Performance FICON (HPF) feature of the storage subsystem for a component over a specified time interval.
HPF Write I/O Rate	DS8000: volume, array, controller, subsystem	Average number of write operations per second that were issued via the High Performance FICON (HPF) feature of the storage subsystem for a component over a specified time interval.
Total HPF I/O Rate	DS8000: volume, array, controller, subsystem	Average number of read and write operations per second that were issued via the High Performance FICON (HPF) feature of the storage subsystem for a component over a specified time interval.
HPF I/O Percentage	DS8000: volume, array, controller, subsystem	The percentage of all I/O operations that were issued via the High Performance FICON (HPF) feature of the storage subsystem for a component over a specified time interval.
PPRC Transfer Rate	ESS/DS6000/DS8000: volume, array, controller, subsystem	Average number of track transfer operations per second for PPRC usage for a component over a specified time interval. This metric shows the activity for the source of the PPRC relationship, but shows no activity for the target.
Small Transfers I/O Percentage	XIV <sup>2</sup> : volume, module, subsystem	Percentage of I/O operations over a specified interval. Applies to data transfer sizes that are <= 8 KB.
Medium Transfers I/O Percentage	XIV <sup>2</sup> : volume, module, subsystem	Percentage of I/O operations over a specified interval. Applies to data transfer sizes that are > 8 KB and <= 64 KB.
Large Transfers I/O Percentage	XIV <sup>2</sup> : volume, module, subsystem	Percentage of I/O operations over a specified interval. Applies to data transfer sizes that are > 64 KB and <= 512 KB.
Very Large Transfers I/O Percentage	XIV <sup>2</sup> : volume, module, subsystem	Percentage of I/O operations over a specified interval. Applies to data transfer sizes that are > 512 KB.
<b>Cache hit percentages</b>		

Column	Devices: components	Description
Read Cache Hits Percentage (normal)	ESS/DS6000/DS8000: volume, array, controller, subsystem	Percentage of cache hits for nonsequential read operations for a component over a specified time interval.
Read Cache Hits Percentage (sequential)	ESS/DS6000/DS8000: volume, array, controller, subsystem	Percentage of cache hits for sequential read operations for a component over a specified time interval.
Read Cache Hits Percentage (overall)	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Percentage of cache hits for both sequential and nonsequential read operations for a component over a specified time interval.
Write Cache Hits Percentage (normal)	ESS/DS6000/DS8000: volume, array, controller, subsystem	Percentage of cache hits for nonsequential write operations for a component over a specified time interval.
Write Cache Hits Percentage (sequential)	ESS/DS6000/DS8000: volume, array, controller, subsystem	Percentage of cache hits for sequential write operations for a component over a specified time interval.
Write Cache Hits Percentage (overall)	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Percentage of cache hits for both sequential and nonsequential write operations for a component over a specified time interval.
Total Cache Hits Percentage (normal)	ESS/DS6000/DS8000: volume, array, controller, subsystem	Percentage of cache hits for nonsequential read and write operations for a component over a specified time interval.
Total Cache Hits Percentage (sequential)	ESS/DS6000/DS8000: volume, array, controller, subsystem	Percentage of cache hits for sequential read and write operations for a component over a specified time interval.

Column	Devices: components	Description
Total Cache Hits Percentage (overall)	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Percentage of cache hits for both sequential and nonsequential read and write operations for a component over a specified time interval.
Readahead Percentage of Cache Hits	SVC: VDisk, node, I/O group, subsystem	Percentage of all read cache hits which occurred on prestaged data.
Dirty Write Percentage of Cache Hits	SVC: VDisk, node, I/O group, subsystem	Percentage of all write cache hits which occurred on already dirty data in the cache.
Read Data Cache Hit Percentage	XIV <sup>2</sup> : volume, module, subsystem	Percentage of read data that was read from the cache over a specified time interval.
Write Data Cache Hit Percentage	XIV <sup>2</sup> : volume, module, subsystem	Percentage of write data that was written to the cache over a specified time interval.
Total Data Cache Hit Percentage	XIV <sup>2</sup> : volume, module, subsystem	Percentage of all data that was read from or written to the cache for a component over a specified time interval.
<b>Data rates</b>		
Read Data Rate	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, MDisk group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read operations for a component over a specified time interval.
Write Data Rate	ESSDS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, MDisk group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for write operations for a component over a specified time interval.

Column	Devices: components	Description
Total Data Rate	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, MDisk group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for read and write operations for a component over a specified time interval.
Small Transfers Data Percentage	XIV <sup>2</sup> : volume, module, subsystem	Percentage of data that was transferred over a specified interval. Applies to I/O operations with data transfer sizes that are <= 8 KB.
Medium Transfers Data Percentage	XIV <sup>2</sup> : volume, module, subsystem	Percentage of data that was transferred over a specified interval. Applies to I/O operations with data transfer sizes that are > 8 KB and <= 64 KB.
Large Transfers Data Percentage	XIV <sup>2</sup> : volume, module, subsystem	Percentage of data that was transferred over a specified interval. Applies to I/O operations with data transfer sizes that are > 64 KB and <= 512 KB.
Very Large Transfers Data	XIV <sup>2</sup> : volume, module, subsystem	Percentage of data that was transferred over a specified interval. Applies to I/O operations with data transfer sizes that are > 512 KB.
<b>Response times</b>		
Read Response Time	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, MDisk group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Average number of milliseconds that it took to service each read operation for a component over a specified time interval.
Write Response Time	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, MDisk group, subsystem  SMI-S BSP volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Average number of milliseconds that it took to service each write operation for a component over a specified time interval.

Column	Devices: components	Description
Overall Response Time	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, MDisk group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Average number of milliseconds that it took to service each I/O operation (read and write) for a component over a specified time interval.
Peak Read Response Time	SVC: VDisk, node, I/O group, subsystem	The peak (worst) response time among all read operations.
Peak Write Response Time	SVC: VDisk, node, I/O group, subsystem	The peak (worst) response time among all write operations.
Global Mirror Write Secondary Lag	SVC: VDisk, node, I/O group, subsystem	The average number of additional milliseconds it takes to service each secondary write operation for Global Mirror, beyond the time that is required to service primary writes.
Overall Host Attributed Response Time Percentage	SVC: VDisk, node, I/O group, subsystem	The percentage of the average response time, both read response time and write response time, that can be attributed to delays from host systems. This metric is provided to help diagnose slow hosts and poorly performing fabrics. The value is based on the time taken for hosts to respond to transfer-ready notifications from the SVC nodes (for read) and the time taken for hosts to send the write data after the node has responded to a transfer-ready notification (for write).
Read Cache Hit Response Time	XIV <sup>2</sup> : volume, module, subsystem	Average number of milliseconds that it takes to service each read cache hit operation over a specified time interval.
Write Cache Hit Response Time	XIV <sup>2</sup> : volume, module, subsystem	Average number of milliseconds that it takes to service each write cache hit operation over a specified time interval.
Overall Cache Hit Response Time	XIV <sup>2</sup> : volume, module, subsystem	Average number of milliseconds that it takes to service each read cache hit operation and each write cache hit operation over a specified time interval.
Read Cache Miss Response Time	XIV <sup>2</sup> : volume, module, subsystem	Average number of milliseconds that it takes to service each read cache miss operation over a specified time interval.
Write Cache Miss Response Time	XIV <sup>2</sup> : volume, module, subsystem	Average number of milliseconds that it takes to service each write cache miss operation over a specified time interval.

Column	Devices: components	Description
Overall Cache Miss Response Time	XIV <sup>2</sup> : volume, module, subsystem	Average number of milliseconds that it takes to service each read cache miss operation and each write cache miss operation over a specified time interval.
Small Transfers Response Time	XIV <sup>2</sup> : volume, module, subsystem	Average number of milliseconds that it takes to service each I/O operation. Applies to data transfer sizes that are <= 8 KB.
Medium Transfers Response Time	XIV <sup>2</sup> : volume, module, subsystem	Average number of milliseconds that it takes to service each I/O operation. Applies to data transfer sizes that are > 8 KB and <= 64 KB.
Large Transfers Response Time	XIV <sup>2</sup> : volume, module, subsystem	Average number of milliseconds that it takes to service each I/O operation. Applies to data transfer sizes that are > 64 KB and <= 512 KB.
Very Large Transfers Response Time	XIV <sup>2</sup> : volume, module, subsystem	Average number of milliseconds that it takes to service each I/O operation. Applies to data transfer sizes that are > 512 KB.
<b>Transfer sizes</b>		
Read Transfer Size	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, MDisk group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Average number of KB per I/O for read operations.
Write Transfer Size	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, MDisk group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Average number of KB per I/O for write operations.

Column	Devices: components	Description
Overall Transfer Size	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, MDisk group, subsystem  SMI-S BSP: volume, controller, subsystem  XIV <sup>1</sup> : volume, module, subsystem	Average number of KB per I/O for read and write operations.
<b>Write-cache constraints</b>		
Write-cache Delay Percentage	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, subsystem	Percentage of I/O operations that were delayed due to write-cache space constraints or other conditions for a component over a specified time interval. (The ratio of delayed operations to total I/Os.)
Write-cache Delayed I/O Rate	ESS/DS6000/DS8000: volume, array, controller, subsystem  SVC: VDisk, node, I/O group, subsystem	Average number of I/O operations per second that were delayed due to write-cache space constraints or other conditions for a component over a specified time interval.
Write-cache Overflow Percentage	SVC: VDisk, node, I/O group, subsystem	Percentage of write operations that were delayed due to lack of write-cache space for a component over a specified time interval.
Write-cache Overflow I/O Rate	SVC: VDisk, node, I/O group, subsystem	Average number of tracks per second that were delayed due to lack of write-cache space for a component over a specified time interval.
Write-cache Flush-through Percentage	SVC: VDisk, node, I/O group, subsystem	Percentage of write operations that were processed in Flush-through write mode for a component over a specified time interval.
Write-cache Flush-through I/O Rate	SVC: VDisk, node, I/O group, subsystem	Average number of tracks per second that were processed in Flush-through write mode for a component over a specified time interval.
Write-cache Write-through Percentage	SVC: VDisk, node, I/O group, subsystem	Percentage of write operations that were processed in Write-through write mode for a component over a specified time interval.
Write-cache Write-through I/O Rate	SVC: VDisk, node, I/O group, subsystem	Average number of tracks per second that were processed in Write-through write mode for a component over a specified time interval.
<b>Record mode reads</b>		
Record Mode Read I/O Rate	ESSDS6000/DS8000: volume, array, controller	Average number of I/O operations per second for record mode read operations for a component over a specified time interval.

Column	Devices: components	Description
Record Mode Read Cache %	ESS/DS6000/DS8000: volume, array, controller	Percentage of cache hits for record mode read operations for a component over a specified time interval.
<b>Cache transfers</b>		
Disk to Cache I/O Rate	ESS/DS6000/DS8000: volume, array, controller SVC: VDisk, node, I/O group, subsystem	Average number of I/O operations (track transfers) per second for disk to cache transfers for a component over a specified time interval.
Cache to Disk I/O Rate	ESS/DS6000/DS8000: volume, array, controller SVC: VDisk, node, I/O group, subsystem	Average number of I/O operations (track transfers) per second for cache to disk transfers for a component over a specified time interval.
<b>Miscellaneous computed values</b>		
Cache Holding Time	ESS/DS6000/DS8000: controller, subsystem	Average cache holding time, in seconds, for I/O data in this subsystem controller (cluster). Shorter time periods indicate adverse performance.
CPU Utilization	SVC: node, I/O group, subsystem	Average utilization percentage of the processors.
Non-Preferred Node Usage Percentage	SVC: VDisk, I/O group	The overall percentage of I/O performed or data transferred via the non-preferred nodes of the VDIs, for a component over a specified time interval.
Volume Utilization	ESS/DS6000/DS8000: volume SVC: VDisk SMI-S BSP: volume XIV <sup>1</sup> : volume	The approximate utilization percentage of a volume over a specified time interval (the average percent of time that the volume was busy).

## Back-end-based metrics

The following table contains information about back-end-based metrics.

Column	Devices: components	Description
<b>I/O rates</b>		
Backend Read I/O Rate	ESS/DS6000/DS8000: rank, array, controller, subsystem SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of I/O operations per second for read operations.
Backend Write I/O Rate	ESS/DS6000/DS8000: rank, array, controller, subsystem SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of I/O operations per second for write operations.

Column	Devices: components	Description
Total Backend I/O Rate	ESS/DS6000/DS8000: rank, array, controller, subsystem  SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of I/O operations per second for read and write operations.
<b>Data rates</b>		
Backend Read Data Rate	ESS/DS6000/DS8000: rank, array, controller, subsystem  SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) that were transferred for read operations.
Backend Write Data Rate	ESS/DS6000/DS8000: rank, array, controller, subsystem  SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) that were transferred for write operations.
Total Backend Data Rate	ESS/DS6000/DS8000: rank, array, controller, subsystem  SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) that were transferred for read and write operations.
<b>Response times</b>		
Backend Read Response Time	ESS/DS6000/DS8000: rank, array, controller, subsystem  SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of milliseconds that it took to respond to each read operation. For SAN Volume Controller models, this is the external response time of the managed disks (MDisks).
Backend Write Response Time	ESS/DS6000/DS8000: rank, array, controller, subsystem  SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of milliseconds that it took to respond to each write operation. For SAN Volume Controller models, this is the external response time of the managed disks (MDisks).
Overall Backend Response Time	ESS/DS6000/DS8000: rank, array, controller, subsystem  SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of milliseconds that it took to respond to each I/O operation (read and write). For SAN Volume Controller models, this is the external response time of the managed disks (MDisks).
Backend Read Queue Time	SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of milliseconds that each read operation spent on the queue before being issued to the back-end device.

Column	Devices: components	Description
Backend Write Queue Time	SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of milliseconds that each write operation spent on the queue before being issued to the back-end device.
Overall Backend Queue Time	SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of milliseconds that read and write operations spent on the queue before being issued to the back-end device.
Peak Back-end Read Response Time	SVC: node, I/O group, MDisk, MDisk group, subsystem	The peak (worst) response time among all read operations for a component over a specified time interval. For SAN Volume Controller, it represents the external response time of the MDisks.
Peak Back-end Write Response Time	SVC: node, I/O group, MDisk, MDisk group, subsystem	The peak (worst) response time among all write operations for a component over a specified time interval. For SAN Volume Controller, it represents the external response time of the MDisks.
Peak Back-end Read Queue Time	SVC: node, I/O group, MDisk, MDisk group, subsystem	The lower bound on the peak (worst) queue time for read operations for a component over a specified time interval. The queue time is the amount of time that the read operation spent on the queue before being issued to the back-end device.
Peak Back-end Write Queue Time	SVC: node, I/O group, MDisk, MDisk group, subsystem	The lower bound on the peak (worst) queue time for write operations for a component over a specified time interval. The queue time is the amount of time that the write operation spent on the queue before being issued to the back-end device.
<b>Transfer sizes</b>		
Back-end Read Transfer Size	ESS/DS6000/DS8000: rank, array, controller, subsystem SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of KB per I/O for read operations for a component over a specified time interval.
Back-end Write Transfer Size	ESS/DS6000/DS8000: rank, array, controller, subsystem SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of KB per I/O for write operations for a component over a specified time interval.
Overall Back-end Transfer Size	ESS/DS6000/DS8000: rank, array, controller, subsystem SVC: node, I/O group, MDisk, MDisk group, subsystem	Average number of KB per I/O for read and write operations for a component over a specified time interval.
<b>Disk utilization</b>		

Column	Devices: components	Description
Disk Utilization Percentage	ESS/DS6000/DS8000: array	The approximate utilization percentage of a rank over a specified time interval (the average percent of time that the disks associated with the array were busy). <b>Note:</b> Tivoli Storage Productivity Center does not calculate a value for this column if there are multiple ranks in the extent pool where the space-efficient volumes are allocated. This column displays value of <b>N/A</b> for the reports in which it appears. However, if there is only a single rank in the extent pool, Tivoli Storage Productivity Center does calculate the value for this column regardless of the space-efficient volumes.
Sequential I/O Percentage	ESS/DS6000/DS8000: array	Percentage of all I/O operations performed for an array over a specified time interval that were sequential operations.

## Frontend and fabric-based metrics

The following table contains information on frontend and fabric-based metrics.

Column	Devices: components	Description
<b>I/O or packet rates</b>		
Port Send I/O Rate	ESS/DS6000/DS8000: port, subsystem SVC: port, node, I/O group, subsystem SMI-S BSP: port XIV <sup>2</sup> : port	Average number of I/O operations per second for send operations for a port over a specified time interval.
Port Receive I/O Rate	ESS/DS6000/DS8000: port, subsystem SVC: port, node, I/O group, subsystem SMI-S BSP: port XIV <sup>2</sup> : port	Average number of I/O operations per second for receive operations for a port over a specified time interval.
Total Port I/O Rate	ESS/DS6000/DS8000: port, subsystem SVC: port, node, I/O group, subsystem SMI-S BSP: port XIV <sup>2</sup> : port	Average number of I/O operations per second for send and receive operations for a port over a specified time interval.
Port Send Packet Rate	switch port, switch	Average number of packets per second for send operations for a port over a specified time interval.
Port Receive Packet Rate	switch port, switch	Average number of packets per second for receive operations for a port over a specified time interval.

Column	Devices: components	Description
Total port Packet Rate	switch port, switch	Average number of packets per second for send and receive operations for a port over a specified time interval.
Port to Host Send I/O Rate	SVC: port, node, I/O group, subsystem	Average number of exchanges (I/Os) per second sent to host computers by a component over a specified time interval.
Port to Host Receive I/O Rate	SVC: port, node, I/O group, subsystem	Average number of exchanges (I/Os) per second received from host computers by a component over a specified time interval.
Total Port to Host I/O Rate	SVC: port, node, I/O group, subsystem	Average number of exchanges (I/Os) per second transmitted between host computers and a component over a specified time interval.
Port to Disk Send I/O Rate A	SVC: port, node, I/O group, subsystem	Average number of exchanges (I/Os) per second sent to storage subsystems by a component over a specified time interval.
Port to Disk Receive I/O Rate	SVC: port, node, I/O group, subsystem	Average number of exchanges (I/Os) per second received from storage subsystems by a component over a specified time interval.
Total Port to Disk I/O Rate	SVC: port, node, I/O group, subsystem	Average number of exchanges (I/Os) per second transmitted between storage subsystems and a component over a specified time interval.
Port to Local Node Send I/O Rate	SVC: port, node, I/O group, subsystem	Average number of exchanges (I/Os) per second sent to other nodes in the local SAN Volume Controller cluster by a component over a specified time interval.
Port to Local Node Receive I/O Rate	SVC: port, node, I/O group, subsystem	Average number of exchanges (I/Os) per second received from other nodes in the local SAN Volume Controller cluster by a component over a specified time interval.
Total Port to Local Node I/O Rate	SVC: port, node, I/O group, subsystem	Average number of exchanges (I/Os) per second transmitted between other nodes in the local SAN Volume Controller cluster and a component over a specified time interval.
Port to Remote Node Send I/O Rate	SVC: port, node, I/O group, subsystem	Average number of exchanges (I/Os) per second sent to nodes in the remote SAN Volume Controller cluster by a component over a specified time interval.
Port to Remote Node Receive I/O Rate	SVC: port, node, I/O group, subsystem	Average number of exchanges (I/Os) per second received from nodes in the remote SAN Volume Controller cluster.
Total Port to Remote Node I/O Rate	SVC: port, node, I/O group, subsystem	Average number of exchanges (I/Os) per second transmitted between nodes in the remote SAN Volume Controller cluster and a component over a specified time interval.
Port FCP Send I/O Rate*	ESS/DS6000/DS8000: port	Average number of send operations per second using the FCP protocol, for a port over a specified time interval.
Port FCP Receive I/O Rate*	ESS/DS6000/DS8000: port	Average number of receive operations per second using the FCP protocol for a port over a specified time interval.

Column	Devices: components	Description
Total Port FCP I/O Rate*	ESS/DS6000/DS8000: port	Average number of send and receive operations per second using the FCP protocol for a port over a specified time interval.
Port FICON Send I/O Rate*	ESS/DS6000/DS8000: port	Average number of send operations per second using the FICON protocol for a port over a specified time interval.
Port FICON Receive I/O Rate*	ESS/DS6000/DS8000: port	Average number of receive operations per second using the FICON protocol for a port over a specified time interval.
Total Port FICON I/O Rate*	ESS/DS6000/DS8000: port	Average number of send and receive operations per second using the FICON protocol for a port over a specified time interval.
Port PPRC Send I/O Rate	ESS/DS6000/DS8000: port, subsystem	Average number of send operations per second for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Port PPRC Receive I/O Rate	ESS/DS6000/DS8000: port, subsystem	Average number of receive operations per second for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Total Port PPRC I/O Rate	ESS/DS6000/DS8000: port, subsystem	Average number of send and receive operations per second for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
<b>Data rates</b>		
Port Send Data Rate	ESS/DS6000/DS8000: port, subsystem  SVC: port, node, I/O group, subsystem  SMI-S BSP: port  switch port, switch  XIV <sup>2</sup> : port	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for send (read) operations for a port over a specified time interval.
Port Receive Data Rate	ESS/DS6000/DS8000: port, subsystem  SVC: port, node, I/O group, subsystem  SMI-S BSP: port  switch port, switch  XIV <sup>2</sup> : port	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for receive (write) operations for a port over a specified time interval.
Total Port Data Rate	ESS/DS6000/DS8000: port, subsystem  SVC: port, node, I/O group, subsystem  SMI-S BSP: port  switch port, switch  XIV <sup>2</sup> : port	Average number of megabytes (2 <sup>20</sup> bytes) per second that were transferred for send and receive operations for a port over a specified time interval.

Column	Devices: components	Description
Port Peak Send Data Rate	switch port	Peak number of megabytes (2 <sup>20</sup> bytes) per second that were sent by a port over a specified time interval
Port Peak Receive Data Rate	switch port	Peak number of megabytes (2 <sup>20</sup> bytes) per second that were received by a port over a specified time interval.
Port to Host Send Data Rate	SVC: port, node, I/O group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second sent to host computers by a component over a specified time interval.
Port to Host Receive Data Rate	SVC: port, node, I/O group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second received from host computers by a component over a specified time interval.
Total Port to Host Data Rate	SVC: port, node, I/O group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second transmitted between host computers and a component over a specified time interval.
Port to Disk Send Data Rate	SVC: port, node, I/O group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second sent to storage subsystems by a component over a specified time interval.
Port to Disk Receive Data Rate	SVC: port, node, I/O group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second received from storage subsystems by a component over a specified time interval.
Total Port to Disk Data Rate	SVC: port, node, I/O group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second transmitted between storage subsystems and a component over a specified time interval.
Port to Local Node Send Data Rate	SVC: port, node, I/O group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second sent to other nodes in the local SAN Volume Controller cluster by a component over a specified time interval.
Port to Local nNode Receive Data Rate	SVC: port, node, I/O group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second received from other nodes in the local SAN Volume Controller cluster by a component over a specified time interval.
Total Port to Local Node Data Rate	SVC: port, node, I/O group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second transmitted between other nodes in the local SAN Volume Controller cluster and a component over a specified time interval.
Port to Remote Node Send Data Rate	SVC: port, node, I/O group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second sent to nodes in the remote SAN Volume Controller cluster by a component over a specified time interval.
Port to Remote Node Receive Data Rate	SVC: port, node, I/O group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second received from nodes in the remote SAN Volume Controller cluster by a component over a specified time interval.
Total Port to Remote Node Data Rate	SVC: port, node, I/O group, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second transmitted between nodes in the remote SAN Volume Controller cluster and a component over a specified time interval.
Port FCP Send Data Rate	ESS/DS6000/DS8000: port	Average number of megabytes (2 <sup>20</sup> bytes) per second sent over the FCP protocol for a port over a specified time interval.

Column	Devices: components	Description
Port FCP Receive Data Rate*	ESS/DS6000/DS8000: port	Average number of megabytes (2 <sup>20</sup> bytes) per second received over the FCP protocol for a port over a specified time interval.
Total Port FCP Data Rate*	ESS/DS6000/DS8000: port	Average number of megabytes (2 <sup>20</sup> bytes) per second sent or received over the FCP protocol for a port over a specified time interval.
Port FICON Send Data Rate*	ESS/DS6000/DS8000: port	Average number of megabytes (2 <sup>20</sup> bytes) per second sent over the FICON protocol for a port over a specified time interval.
Port FICON Receive Data Rate*	ESS/DS6000/DS8000: port	Average number of megabytes (2 <sup>20</sup> bytes) per second received over the FICON protocol, for a port over a specified time interval.
Total Port FICON Data Rate*	ESS/DS6000/DS8000: port	Average number of megabytes (2 <sup>20</sup> bytes) per second sent or received over the FICON protocol for a port over a specified time interval.
Port PPRC Send Data Rate	ESS/DS6000/DS8000: port, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second sent for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Port PPRC Receive Data Rate	ESS/DS6000/DS8000: port, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second received for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Total Port PPRC Data Rate	ESS/DS6000/DS8000: port, subsystem	Average number of megabytes (2 <sup>20</sup> bytes) per second transferred for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
<b>Response times</b>		
Port Send Response Time	ESS/DS6000/DS8000: port, subsystem XIV <sup>2</sup> : port	Average number of milliseconds that it took to service each send (read) operation for a port over a specified time interval.
Port Receive Response Time	ESS/DS6000/DS8000: port, subsystem XIV <sup>2</sup> : port	Average number of milliseconds that it took to service each receive (write) operation for a port over a specified time interval.
Overall Port Response Time	ESS/DS6000/DS8000: port, subsystem XIV <sup>2</sup> : port	Average number of milliseconds that it took to service each operation (send and receive) for a port over a specified time interval.
Port to Local Node Send Response Time	SVC: node, I/O group, subsystem	Average number of milliseconds it took to service each send operation to another node in the local SAN Volume Controller cluster for a component over a specified time interval. This is the external response time of the transfers.
Port to Local Node Receive Response Time	SVC: node, I/O group, subsystem	Average number of milliseconds it took to service each receive operation from another node in the local SAN Volume Controller cluster for a component over a specified time interval. This is the external response time of the transfers.
Total Port to Local Node Response Time	SVC: node, I/O group, subsystem	Average number of milliseconds it took to service each send or receive operation between another node in the local SAN Volume Controller cluster and a component over a specified time interval. This is the external response time of the transfers.

Column	Devices: components	Description
Port to Local Node Send Queued Time	SVC: node, I/O group, subsystem	Average number of milliseconds that each send operation issued to another node in the local SAN Volume Controller cluster spent on the queue before being issued for a component over a specified time interval.
Port to Local Node Receive Queued Time	SVC: node, I/O group, subsystem	Average number of milliseconds that each receive operation from another node in the local SAN Volume Controller cluster spent on the queue before being issued for a component over a specified time interval.
Total Port to Local Node Queued Time	SVC: node, I/O group, subsystem	Average number of milliseconds that each operation issued to another node in the local SAN Volume Controller cluster spent on the queue before being issued for a component over a specified time interval.
Port to Remote Node Send Response Time	SVC: node, I/O group, subsystem	Average number of milliseconds it took to service each send operation to a node in the remote SAN Volume Controller cluster for a component over a specified time interval. This is the external response time of the transfers.
Port to Remote Node Receive Response Time	SVC: node, I/O group, subsystem	Average number of milliseconds it took to service each receive operation from a node in the remote SAN Volume Controller cluster for a component over a specified time interval. This is the external response time of the transfers.
Total Port to Remote Node Response Time	SVC: node, I/O group, subsystem	Average number of milliseconds it took to service each send or receive operation between a node in the remote SAN Volume Controller cluster and a component over a specified time interval. This is the external response time of the transfers.
Port to Remote Node Send Queued Time	SVC: node, I/O group, subsystem	Average number of milliseconds that each send operation issued to a node in the remote SAN Volume Controller cluster spent on the queue before being issued for a component over a specified time interval.
Port to Remote Node Receive Queued Time	SVC: node, I/O group, subsystem	Average number of milliseconds that each receive operation from a node in the remote SAN Volume Controller cluster spent on the queue before being issued for a component over a specified time interval.
Total Port to Remote Node Queued Time	SVC: node, I/O group, subsystem	Average number of milliseconds that each operation issued to a node in the remote SAN Volume Controller cluster spent on the queue before being issued for a component over a specified time interval.
Port FCP Send Response Time*	ESS/DS6000/DS8000: port	Average number of milliseconds it took to service all send operations over the FCP protocol for a port over a specified time interval.

Column	Devices: components	Description
Port FCP Receive Response Time*	ESS/DS6000/DS8000: port	Average number of milliseconds it took to service all receive operations over the FCP protocol for a port over a specified time interval.
Overall Port FCP Response Time*	ESS/DS6000/DS8000: port	Average number of milliseconds it took to service all I/O operations over the FCP protocol for a port over a specified time interval.
Port FICON Send Response Time*	ESS/DS6000/DS8000: port	Average number of milliseconds it took to service all send operations over the FICON protocol for a port over a specified time interval.
Port FICON Receive Response Time*	ESS/DS6000/DS8000: port	Average number of milliseconds it took to service all receive operations over the FICON protocol for a port over a specified time interval.
Overall Port FICON Response Time*	ESS/DS6000/DS8000: port	Average number of milliseconds it took to service all I/O operations over the FICON protocol for a port over a specified time interval.
Port PPRC Send Response Time	ESS/DS6000/DS8000: port, subsystem	Average number of milliseconds it took to service all send operations for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Port PPRC Receive Response Time	ESS/DS6000/DS8000: port, subsystem	Average number of milliseconds it took to service all receive operations for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
Overall Port PPRC Response Time	ESS/DS6000/DS8000: port, subsystem	Average number of milliseconds it took to service all I/O operations for Peer-to-Peer Remote Copy usage for a port over a specified time interval.
<b>Transfer sizes</b>		
Port Send Transfer Size	ESS/DS6000/DS8000: port, subsystem SMI-S BSP: port	Average number of KB sent per I/O by a port over a specified time interval.
Port Receive Transfer Size	ESS/DS6000/DS8000: port, subsystem SMI-S BSP: port	Average number of KB received per I/O by a port over a specified time interval.
Overall Port Transfer Size	ESS/DS6000/DS8000: port, subsystem SMI-S BSP: port	Average number of KB transferred per I/O by a port over a specified time interval.
Port Send Packet Size	switch port, switch	Average number of KB sent per packet by a port over a specified time interval.
Port Receive Packet Size	switch port, switch	
Overall Port Packet Size	switch port, switch	Average number of KB received per packet by a port over a specified time interval.
<b>Special computed values</b>		

Column	Devices: components	Description
Port Send Utilization Percentage	ESS/DS6000/DS8000: port	Average amount of time that the port was busy sending data over a specified time interval.
Port Receive Utilization Percentage	ESS/DS6000/DS8000: port	Average amount of time that the port was busy receiving data over a specified time interval.
Overall Port Utilization Percentage	ESS/DS6000/DS8000: port	Average amount of time that the port was busy sending or receiving data over a specified time interval.
Port Send Bandwidth Percentage	ESS/DS8000: port SVC: port switch, port XIV <sup>2</sup> : port	The approximate bandwidth utilization percentage for send operations by a port based on its current negotiated speed.
Port Receive Bandwidth Percentage	ESS/DS8000: port SVC: port switch, port XIV <sup>2</sup> : port	The approximate bandwidth utilization percentage for receive operations by this port, based on its current negotiated speed.
Overall Port Bandwidth Percentage	ESS/DS8000: port SVC: port switch, port XIV <sup>2</sup> : port	The approximate bandwidth utilization percentage for send and receive operations by this port.
<b>Error rates</b>		
Error Frame Rate	switch port, switch DS8000: port, subsystem	The number of frames per second that were received in error by a port over a specified time interval.
Dumped Frame Rate	switch port, switch	The number of frames per second that were lost due to a lack of available host buffers for a port over a specified time interval.
Link Failure Rate	switch port, switch DS8000: port, subsystem SVC: port, node, I/O group, subsystem	The number of link errors per second that were experienced by a port over a specified time interval.
Loss of Sync Rate	switch port, switch DS8000: port, subsystem SVC: port, node, I/O group, subsystem	The average number of times per second that synchronization was lost for a component over a specified time interval.

Column	Devices: components	Description
Loss of Signal Rate	switch port, switch  DS8000: port, subsystem  SVC: port, node, I/O group, subsystem	The average number of times per second that the signal was lost for a component over a specified time interval.
CRC Error Rate	switch port, switch  DS8000: port, subsystem  SVC: port, node, I/O group, subsystem	The average number of frames received per second in which the CRC in the frame did not match the CRC computed by the receiver for a component over a specified time interval.
Short Frame Rate	switch port, switch	The average number of frames received per second that were shorter than 28 octets (24 header + 4 CRC) not including any SOF/EOF bytes for a component over a specified time interval.
Long Frame Rate	switch port, switch	The average number of frames received per second that were longer than 2140 octets (24 header + 4 CRC + 2112 data) not including any SOF/EOF bytes for a component over a specified time interval.
Encoding Disparity Error Rate	switch port, switch	The average number of disparity errors received per second for a component over a specified time interval.
Discarded Class3 Frame Rate	switch port, switch	The average number of class-3 frames per second that were discarded by a component over a specified time interval.
F-BSY Frame Rate	switch port, switch	The average number of F-BSY frames per second that were generated by a component over a specified time interval.
F-RJT Frame Rate	switch port, switch	The average number of F-RJT frames per second that were generated by a component over a specified time interval.
Primitive Sequence Protocol Error Rate	switch port, switch  DS8000: port, subsystem  SVC: port, node, I/O group, subsystem	The average number of primitive sequence protocol errors detected for a component over a specified time interval.
Invalid Transmission Word Rate	switch port, switch  DS8000: port, subsystem  SVC: port, node, I/O group, subsystem	The average number of transmission words per second that had an 8b10 code violation in one or more characters; had a K28.5 in its second, third, or fourth character positions; and/or was an ordered set that had an incorrect Beginning Running Disparity.
Zero Buffer-Buffer Credit Timer	SVC: port, node, I/O group, subsystem	The number of microseconds that the port has been unable to send frames due to lack of buffer credit since the last node reset.

Column	Devices: components	Description
Link Recovery (LR) Sent Rate	switch port, switch DS8000: port, subsystem	The average number of times per second that a port has transitioned from an active (AC) state to a Link Recovery (LR1) state over a specified time interval.
Link Recovery (LR) Received Rate	switch port, switch DS8000: port, subsystem	The average number of times per second a port has transitioned from an active (AC) state to a Link Recovery (LR2) state over a specified time interval
Out of Order Data Rate	DS8000: port, subsystem	The average number of times per second that an out of order frame was detected for a port over a specified time interval.
Out of Order ACK Rate	DS8000: port, subsystem	The average number of times per second that an out of order ACK frame was detected for a port over a specified time interval.
Duplicate Frame Rate	DS8000: port, subsystem	The average number of times per second that a frame was received that has been detected as previously processed for a port over a specified time interval.
Invalid Relative Offset Rate	DS8000: port, subsystem	The average number of times per second that a frame was received with invalid relative offset in the frame header for a port over a specific time interval.
Sequence Timeout Rate	DS8000: port, subsystem	The average number of times per second the port has detected a timeout condition on receiving sequence initiative for a fiber channel exchange for a port over a specified time interval.
<b>Tip:</b> * The value N/A is displayed for this metric if you set the <b>Summation Level</b> to hourly or daily before generating the report.		

---

## Protocols and standards

This section provides an overview of the protocols and standards that are used within IBM Tivoli Storage Productivity Center.

### Web Based Enterprise Management

Web Based Enterprise Management (WBEM) is an initiative of the Distributed Management Task Force (DMTF) with the objective to enable the management of complex IT environments. It defines a set of management and internet standard technologies in order to unify the management of complex IT environments.

The WBEM initiative is composed of three main conceptual elements:

#### Common Interface Model (CIM)

CIM is a formal object-oriented modeling language that is used to describe the management aspects of systems.

#### xmlCIM

This is the grammar to describe CIM declarations and messages used by the CIM protocol.

#### Hypertext Transfer Protocol (HTTP)

HTTP is used as a way to enable communication between a management application and a device that both use CIM.

The WBEM architecture defines the following elements:

**CIM Client**

The CIM Client is a management application like IBM Tivoli Storage Productivity Center that uses CIM to manage devices. A CIM Client can reside anywhere in the network, because it uses HTTP to talk to CIM Object Managers and Agents.

**CIM Managed Object**

A Managed Object is a hardware or software component that can be managed by a management application by using CIM.

**CIM Agent**

A CIM Object Manager that includes the provider service for a limited set of resources. An agent may be embedded or hosted and can be an aggregator for multiple devices.

**CIM Provider**

A CIM Provider is the element that translates CIM calls to the device-specific commands. A provider is always closely linked to a CIM.

**CIM Object Manager (CIMOM)**

The central component of the CIM Server responsible for the communication between the CIM server components.

**CIM Server**

A server that receives and processes CIM Operation Message Requests and issues CIM Operation Message Responses.

## **Storage Management Initiative Specification**

The Storage Networking Industry Association (SNIA) defines a standard that is used within IBM Tivoli Storage Productivity Center to create and develop a universal open interface for managing storage devices including storage networks.

Information on SMI-S can be found at this Web site:

<http://www.snia.org>

SNIA has fully adopted and enhanced the Common Information Model (CIM) standard for storage management in its Storage Management Initiative - Specification (SMI-S). SMI-S was launched to create and develop a universal open interface for managing storage devices including storage networks. SMI-S provides:

- A comprehensive specification for the management of heterogeneous storage and storage area networks (SANs).
- The information available to a WBEM client from an SMI-S compliant CIM server (provider).
- Profiles organized by:
  - Storage
  - Fabric
  - Host
  - Common profiles and subprofiles
- An object-oriented CIM and XML-based interface for managing SAN devices, services, and fabrics.
- An initial discovery, which is SLP based.

The idea behind SMI-S is to standardize the management interfaces so that management applications can utilize these and provide cross-device management. This means that a newly introduced device can be immediately managed as it will conform to the standards.

The models and protocols in the SMI-S implementation are platform-independent, enabling application development for any platform, and enabling them to run on different platforms. The SNIA will also provide interoperability tests which will help vendors test their applications and devices if they conform to the standard.

## Service Location Protocol

The Service Location Protocol (SLP) is an Internet Engineering Task Force (IETF) standard. SLP provides a scalable framework for the discovery and selection of network services.

The Internet Engineering Task Force (IETF) is a large open international community of network designers, operators, vendors, and researchers concerned with the evolution of the Internet architecture and the smooth operation of the Internet. The IETF includes formal standards for SNMP and MIBs. More information on IETF can be found at this Web site:

<http://www.ietf.org>

SLP enables the discovery and selection of generic services, which could range in function from hardware services such as those for printers or fax machines, to software services such as those for file servers, e-mail servers, Web servers, databases, or any other possible services that are accessible through an IP network.

Traditionally, to use a particular service, a user or client application needed to supply the host name or network IP address of that service. With SLP, however, the user or client no longer needs to know individual host names or IP addresses. Instead, the user or client can search the network for the desired service type and an optional set of qualifying attributes.

For example, a user could specify to search for all available printers that support Postscript. Based on the given service type (printers), and the given attributes (Postscript). SLP searches the user's network for any matching services, and returns the discovered list to the user.

## Simple Network Management Protocol

The Simple Network Management Protocol (SNMP) is an Internet Engineering Task Force (IETF) protocol for monitoring and managing systems and devices in a network. Functions supported by the SNMP protocol are the request and retrieval of data, the setting or writing of data, and traps that signal the occurrence of events.

SNMP is a method that enables a management application to query information from a managed device. The managed device has software running that sends and receives the SNMP information. This software module is usually called the SNMP agent.

An SNMP manager can read information from an SNMP agent in order to monitor a device. Therefore, the device needs to be polled on an interval bases. The SNMP manager can also change the configuration of a device, by setting certain values to

corresponding variables. A device can also be set up to send a notification to the SNMP manager (this is called a trap) to asynchronously inform this SNMP manager of a status change.

Depending on the existing environment and organization it is very likely that your environment already has an SNMP management application in place. IBM Tivoli Storage Productivity Center can be set up to send traps.

SNMP uses a hierarchical structured Management Information Base (MIB) to define the meaning and the type of a particular value. A MIB defines managed objects that describe the behavior of the SNMP entity, which can be anything from an IP router to a storage subsystem. The information is organized in a tree structure.

For users planning to make use of the Tivoli Storage Productivity Center SNMP trap alert notification capabilities, an SNMP MIB is included in the server installation.

The MIB is provided for use by your SNMP management console software. Most SNMP management products provide a program called a MIB compiler that can be used to import MIBs. This will allow you to view Tivoli Storage Productivity Center generated SNMP traps from within your management console software. Refer to your management console software documentation for instructions on how to compile or import a third party MIB.

Tivoli Storage Productivity Center uses port 162 to listen for SNMP traps. This is the default port. For switches, you must configure the switch to send SNMP traps to the Device server IP address. If you need to change the default port number, use the `setdscfg` command. The attribute to set is **SNMPTrapPort**.

System administrators must set up their SNMP trap ringer with the provided MIB files in order to receive SNMP traps from Tivoli Storage Productivity Center. These files are located in the following directories on the product installation DVD:

For Data server:

```
data\snmp\tivoliSRM.mib
```

For Device server:

```
device\snmp\fabric.mib
```

## Fibre Channel Methodologies of Interconnects

IBM Tivoli Storage Productivity Center supports the ANSI T11 Fibre Channel FC-MI (Fibre Channel Methodologies of Interconnects) for the automated discovery of FC SAN assets and topology.

ANSI T11 Fibre Channel FC-MI includes the following for the automated discovery of FC SAN assets and topology:

- Hosts (HBAs)
- FC interconnects
- FC storage devices

The T11 FC-MI also includes the following:

- FC-GS-3/4 (discovery, zoning, and so forth)
- RNID (advanced device recognition)
- Platform registration (device recognition and launch)

- Common HBA API (fabric and storage views)
- Name server (connectivity)
- Management server (SAN connectivity and topology)
- RSCN (advanced event detection)
- SCSI queries (storage views, volume information, and so forth)
- SNMP Fabric Element (FE) MIB
- SNMP FC Management MIB (discovery, performance statistics, and so forth)
- SNMP alerts

---

## Appendix B. Accessibility features for Tivoli Storage Productivity Center

Accessibility features help users who have a disability, such as restricted mobility or limited vision, to use information technology products successfully.

### Accessibility features

The following list includes the major accessibility features in IBM Tivoli Storage Productivity Center:

- Tivoli Storage Productivity Center functions are available using the keyboard for navigation instead of the mouse. You can use keys or key combinations to perform operations that can also be done using a mouse. However, you must use the mouse to navigate the Topology Viewer and report graphs. Standard operating system keystrokes are used for standard operating system operations.
- You can use screen readers to read the user interface.
- The user interface communicates all information independently of color.
- The *IBM Tivoli Storage Productivity Center Information Center*, and its related publications are accessibility-enabled and include the following accessibility features:
  - The information center is provided in XHTML 1.0 format, which is viewable in most Web browsers. XHTML allows you to view documentation according to the display preferences set in your browser. With XHTML, you can use screen readers and other assistive technologies.
  - All documentation for Tivoli Storage Productivity Center is available in Adobe Portable Document Format (PDF) using the Adobe Acrobat Reader. You can access the PDFs from the Printable PDFs topic in the information center at <http://publib.boulder.ibm.com/infocenter/tivihelp/v59r1/index.jsp>.
  - All images are provided with alternative text, so that users with vision impairments can understand the contents of the images.

### Keyboard navigation

This product uses standard Microsoft Windows navigation keys.

### Displaying the interface

Click **Preferences > Look and Feel** to select how to display the Tivoli Storage Productivity Center user interface. To do so, complete the following steps:

1. Start the Tivoli Storage Productivity Center user interface.
2. Click **Preferences > Look and Feel** to change the visual appearance of the user interface to best suit your visual needs:
  - Windows Classic
  - Windows
  - CDE/Motif
  - Metal

## **Limitations for sight-impaired users on IBM Tivoli Storage Productivity Center for Replication**

There are some limitations in the product graphical user interface (GUI) that require special attention before you start using Tivoli Storage Productivity Center for Replication with a screen reader:

**Dojo components are not read by all screen readers.**

The JAWS screen reader does not read some Dojo components on Internet Explorer 7. Use the command-line interface instead of the GUI with JAWS on Internet Explorer 7.

### **IBM and accessibility**

See the IBM Human Ability and Accessibility Center Web site for more information about the commitment that IBM has to accessibility.

---

## Appendix C. Accessibility features for Tivoli Storage Productivity Center for Replication

Accessibility features help users who have a disability, such as restricted mobility or limited vision, to use information technology products successfully.

The following list includes the major accessibility features in Tivoli Storage Productivity Center for Replication:

- Keyboard-only operation
- Interfaces that are commonly used by screen readers
- Keys that are discernible by touch but do not activate just by touching them
- Industry-standard devices for ports and connectors
- The attachment of alternative input and output devices

See the IBM Human Ability and Accessibility Center website at [www.ibm.com/able](http://www.ibm.com/able) for more information about the commitment that IBM has for accessibility.

### Accessibility and keyboard shortcuts in the information center

Accessibility features help users with physical disabilities, such as restricted mobility or limited vision, to use software products successfully. Using the major accessibility features in this product, users can perform these tasks:

- Use assistive technologies, such as screen-reader software and digital speech synthesizer, to hear what is displayed on the screen. Consult the product documentation of the assistive technology for details on using those technologies with this product.
- Operate specific or equivalent features by using only the keyboard.
- Magnify what is displayed on the screen.

In addition, the documentation was modified to include the following features to aid accessibility:

- All documentation is available in HTML formats to give the maximum opportunity for users to apply screen-reader software technology.
- All images in the documentation are provided with alternative text so that users with vision impairments can understand the contents of the images.

Use the following key combinations to navigate the interface by keyboard:

- To go directly to the Topic pane, press Alt+K, and then press Tab.
- In the Topic pane, to go to the next link, press Tab.
- To go directly to the Search Results view, press Alt+R, and then press the Enter or Up-Arrow key to enter the view.
- To go directly to the Navigation (Table of Contents) view, press Alt+C, and then press the Enter or Up-Arrow key to enter the view.
- To expand and collapse a node in the navigation tree, press the Right and Left-Arrow keys.
- To move to the next topic node, press the Down-Arrow or Tab key.
- To move to the previous topic node, press the Up-Arrow key or Shift+Tab.

- To go to the next link, button, or topic node from inside on of the views, press Tab.
- To scroll all the way up or down in a pane, press Home or End.
- To go back, press Alt+Left Arrow; to go forward, press Alt+Right Arrow.
- To go to the next pane, press F6.
- To move to the previous pane, press Shift+F6.
- To print the active pane, press Ctrl+P.

## **Related accessibility information for sight-impaired users**

The following list contains hints and tips that can help you more fully use the graphical user interface:

### **Drop-down lists are positioned directly over or before the radio button that activates it.**

If you use a screen reader, you should be aware that there are radio buttons to activate drop-down lists for several GUI pages. The way to activate the drop-down list is by selecting the associated radio button. The drop-down list is positioned directly over or before the radio button that activates it. When you use a screen reader that processes the fields and controls of a page sequentially, you might select the radio button, but not know that the associated drop-down list has been activated. The screen reader processes inactive drop-down lists first, and then processes the next radio button. The drop-down list is activated if you select the radio button.

On the following pages, keep in mind that radio buttons activate a drop-down list:

- Administration
- ESS/DS Paths
- Sessions
- Session Details
- Storage Systems

### **Tables are best understood by reviewing the surrounding text and the table row and column number of the table.**

On some graphical user pages, tables use the header or row ID attributes when reading a single cell. The screen reader reads the table row and column number, along with cell data. Therefore, you can infer the column header and row ID.

### **Experiment with and fine-tune the way your screen reader pronounces some of the product abbreviations.**

Your screen reader might pronounce abbreviations as if they were words. For example, the common abbreviation for Enterprise Storage Server is ESS. Your screen reader might read ESS as the word "ess". With some screen readers you can hear alternate pronunciations. If you frequently use the software you might prefer to fine-tune such associations in your settings. When an association is created, the screen reader can recognize the abbreviation as a word. If you can add dictionary words with your screen reader, replace the capitalized character sequence with the sequence E space S space S.

Typically, this abbreviation is used in the combination form of ESS/DS. This term refers to the Enterprise Storage Server 800, the DS6000, or the DS8000.

**Some decorative artifacts might persist if the cascading style sheet is disabled.**

Enable cascading style sheets when possible; otherwise, some decorative elements might persist in the web browser GUI. These artifacts do not affect performance. If they become too distracting, consider using the command-line interface instead.

**For efficiency, confirmation dialogs place initial focus on the Yes button.**

When a confirmation dialog box is displayed, focus is given to the **Yes** button. Therefore, the screen reader reads “Yes” but does not read the confirmation text. The software processes the information in this way when you do the following types of tasks:

- Perform an action on a session
- Remove a connection to a storage system
- Click the **About link**
- Create a high-availability connection

To read the confirmation text before clicking the **Yes**, **No**, or **OK** button, view the previous heading before the button.

**Dojo components are not read by all screen readers.**

The Job Access for Windows and Speech (JAWS) screen reader does not read some Dojo components on Internet Explorer 7. Use the command-line interface instead of the GUI with JAWS on Internet Explorer 7.

**Firefox is the preferred browser for use with a screen reader.**

Use Firefox as the screen reader because other browsers might not fully expose assistive technology content to the screen reader.

---

## Notices

This information was developed for products and services offered in the U.S.A.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

*IBM Director of Licensing  
IBM Corporation  
North Castle Drive  
Armonk, NY 10504-1785  
U.S.A.*

## Glossary

This glossary includes terms and definitions for IBM Tivoli Storage Productivity Center.

The following cross-references are used in this glossary:

- *See* refers the reader from a term to a preferred synonym, or from an acronym or abbreviation to the defined full form.
- *See also* refers the reader to a related or contrasting term.

To view glossaries for other IBM products, go to: <http://www.ibm.com/software/globalization/terminology/>.

### **active management server**

A management server from which the storage environment can be monitored and managed. The active management server replicates its database to the standby server.

### **business continuity**

The capability of a business to withstand outages and to operate mission-critical services normally and without interruption in accordance with predefined service-level agreements.

**CIM** See *Common Information Model*.

### **CIM agent**

The code that consists of common building blocks that can be used instead of proprietary software or device-specific programming interfaces to manage devices that are compliant with the Common Information Model (CIM).

**CKD** See *count key data*.

### **cluster**

1. In SAN Volume Controller or Storwize V7000, a pair of nodes that provides a single configuration and service interface.
2. In IBM System Storage™ DS8000®, a partition capable of performing all DS8000 series functions. With two clusters in the DS8000 storage unit, any operational cluster can take over the processing of a failing cluster.

### **Common Information Model (CIM)**

An implementation-neutral, object-oriented schema for describing

network management information. The Distributed Management Task Force (DMTF) develops and maintains CIM specifications.

### **community name**

The part of a Simple Network Management Protocol (SNMP) message that represents a password-like name and that is used to authenticate the SNMP message.

### **consistency group**

A group of copy relationships between virtual volumes or data sets that are maintained with the same time reference so that all copies are consistent in time.

### **copy set**

The set of source volumes or target volumes involved in a FlashCopy operation.

### **count key data (CKD)**

In mainframe computing, a data-record format employing self-defining record formats in which each record is represented by up to three fields: a count field identifying the record and specifying its format, an optional key field that can be used to identify the data area contents, and an optional data field that typically contains the user data.

### **data collection**

The process of obtaining performance and availability monitoring data and providing that data to a metric evaluator. Examples of data collectors include Domain Name System (DNS) probes, web page analyzers, or database analyzers. See also *discovery*.

### **discovery**

The process of finding resources within an enterprise, including finding the new location of monitored resources that were moved. See also *schedule*.

### **enterprise repository**

A component of the Data server that records and stores all information about

the monitored computers' storage assets and their usage over time. The repository is organized into relational database tables and is accessed by Data server using Java Database Connectivity (JDBC).

**extended count key data (ECKD)**

An extension of the count key data (CKD) architecture.

**FlashCopy**

In storage systems, a feature that creates a point-in-time copy of a volume or set of volumes on a specified target volume.

**flush-through mode**

A process in which data is written to a storage device at the same time as the data is cached.

**freeze** An operation in which a storage system blocks I/O from the host system to the affected volumes on the primary site. A freeze operation stops mirroring between the primary and secondary volumes to ensure data consistency at the secondary site. See also *thaw*.

**GiB** See *gibibyte*.

**gibibyte (GiB)**

A base-2 unit of measurement that is equal to 1,073,741,824 bytes (2 to the 30th power). See also *gigabyte*.

**gigabyte (GB)**

In decimal notation, 1,073,741,824 bytes, when referring to memory capacity; in all other cases, it is defined as 1,000,000,000.

**Global Copy**

A non-synchronous long-distance copy option for data migration and backup. See also *remote mirror and copy* and *Metro Mirror*.

**Global Mirror**

An optional capability of the remote mirror and copy feature that provides a two-site extended-distance remote copy. Data that is written by the host to the storage unit at the local site is automatically maintained at the remote site. See also *Metro Mirror* and *remote mirror and copy*.

**Globally Unique Identifier (GUID)**

An algorithmically determined number that uniquely identifies an entity within a system.

**grain size**

The unit size for allocating space on thin-provisioned volumes, such as 32, 64, 128, and 256 kibibyte. The grain size is defined when a volume is created.

**GUID** See *Globally Unique Identifier*.

**Hardware Management Console (HMC)**

In a system storage environment, a system that acts as the focal point for configuration, management of Copy Services functions, and maintenance.

**heat map**

A color-coded data chart where colors are used to differentiate values in a data set.

**high availability**

Pertaining to a clustered system that is reconfigured when node or daemon failures occur, so that workloads can be redistributed to the remaining nodes in the cluster.

**high-availability solution**

A combination of hardware, software, and services that fully automates the recovery process and does not disrupt user activity. High-availability solutions must provide an immediate recovery point with a fast recovery time.

**HMC** See *Hardware Management Console*.

**host volume**

A volume that represents the volume functional role from an application point of view. The host volume can be connected to a host or server. It receives read, write, and update application I/O, depending on the site to which the application is writing.

**in-band discovery**

The process of discovering information about the storage area network (SAN), including topology and attribute data, through the Fibre Channel data paths. Contrast with *out-of-band discovery*.

**job**

A unit of work within a run for a schedule. One run can have multiple jobs. For example, a system probe schedule has one job created per system in its definition.

**job scheduler**

A component of the Data server that deploys all monitoring activities.

**journal volume**

A volume that holds a consistent copy of data until a new consistent copy is formed. The journal volume restores the last consistent point during a recovery.

**KiB** See *kibibyte*.

**kibibyte (KiB)**

A base-2 unit of measurement that is equal to 1,024 bytes (2 to the 10th power). See also *kilobyte*.

**kilobyte**

For processor storage, real and virtual storage, and channel volume, 2 to the power of 10 or 1,024 bytes. For disk storage capacity and communications volume, 1,000 bytes.

**logical unit number (LUN)**

In the Small Computer System Interface (SCSI) standard, a unique identifier that is used to differentiate devices, each of which is a logical unit (LU).

**LUN** See *logical unit number*.

**Management Information Base (MIB)**

In the Simple Network Management Protocol (SNMP), a database of objects that can be queried or set by a network management system.

**management server**

A system that provides a central point of control for managing data replication.

**management server relationship**

A connection between two replication servers, where one server acts as the active server and replicates the data that is necessary for the standby server to take control of the replication environment.

**mebibyte (MiB)**

A base-2 unit of measurement that is equal to 1,048,576 bytes (2 to the 20th power). See also *megabyte*.

**megabyte (MB)**

For processor storage, real and virtual storage, and channel volume, 2 to the 20th power or 1,048,576 bytes. For disk storage capacity and communications volume, 1,000,000 bytes.

**Metro Mirror**

A method of synchronous remote replication that operates over distances up to 300 kilometers. This method constantly

updates a secondary copy of a volume to match changes that are made to a source volume. See also *remote mirror and copy* and *Global Copy*.

**Metro Global Mirror**

A three-site, high-availability, disaster recovery solution. Metro Global Mirror uses synchronous replication to mirror data between a local site and an intermediate site, and asynchronous replication to mirror data from an intermediate site to a remote site.

**MiB** See *mebibyte*.

**MIB** See *Management Information Base*.

**native interface**

An interface that is specific to a system or subsystem.

**out-of-band discovery**

The process of discovering storage area network (SAN) information, including topology and device data, without using the fibre-channel data paths. A common mechanism for out-of-band discovery is the use of Simple Network Management Protocol (SNMP) Management Information Base (MIB) queries, which are invoked over an IP network. Contrast with *in-band discovery*.

**ping** A job that tracks the availability of assets and that is performed by an agent. Several ping jobs can be used to monitor the availability of any computer or subset of computers in the network. See also *schedule*.

**pool** A storage pool or pool is a grouping of storage space that consists of volumes, logical unit numbers (LUNs), or addresses that share a common set of administrative characteristics.

**practice volume**

A volume that can be used to test disaster-recovery actions while maintaining disaster-recovery capability.

**primordial pool**

Storage capacity that is deallocated on a storage device. Storage pools are created by allocating storage capacity from primordial pools.

**probe** A job that itemizes and creates an

inventory of assets, such as computers, controllers, disk drives, file systems, and logical units. See also *schedule*.

**recovery point objective**

The maximum amount of data loss that can be tolerated during a service interruption.

**remote mirror and copy**

A feature of a storage server that constantly updates a secondary copy of a logical volume to match changes made to a primary logical volume. The primary and secondary volumes can be on the same storage server or on separate storage servers. See also *Metro Mirror* and *Global Mirror*.

**resource**

In a storage environment, an entity that is monitored. Resources can include fabrics, switches, computers, storage systems, and tape libraries.

**role**

A job function that identifies the tasks that a user can perform and the resources to which a user has access. A user can be assigned one or more roles.

**role pair**

The association of two roles in a replication session that take part in a copy relationship. For example, in a Metro Mirror session, the role pair can be the association between the volume roles of Host1 and Host2.

**scan job**

A job that monitors the usage and consumption of storage. See also *schedule*.

**schedule**

A monitoring task that collects data about storage resources. Monitoring tasks include scans, probes, pings, discovery, and performance monitors. For example, define a probe schedule to collect data about storage systems; define a scan schedule to collect file-level information about hosts.

**session**

A collection of volumes within a logical subsystem that are managed together during the creation of consistent copies of data. All volumes in a session must transfer their data successfully to the remote site before the increment can be called complete.

**site awareness**

The association of a location (site) with each storage system and each session's volume role. When a copy set is added, only the storage systems with locations that match those locations of the volumes' roles can be selected. This constraint prevents the reversing of a hardware relationship or the selection of a volume at the wrong location.

**SMI-S** See *Storage Management Initiative Specification*.

**standby management server**

A management server that is a backup for the active server. The replication environment cannot be monitored or managed from the standby server.

**Storage Management Initiative Specification (SMI-S)**

A design specification developed by the Storage Networking Industry Association (SNIA) that specifies a secure and reliable interface with which storage management systems (SMSs) can identify, classify, monitor, and control physical and logical resources in a storage area network (SAN). The interface integrates the various devices to be managed in a SAN and the tools used to manage them.

**storage pod**

A logical entity of components of a system that consists of two storage nodes, and one or two storage subsystems directly connected with these storage nodes.

**storage resource group**

A named collection of logically related resources that are monitored by Tivoli Storage Productivity Center. Monitored resources can include fabrics, switches, computers, storage systems, tape libraries, and other storage resource groups.

**target volume**

A volume that receives data from a host volume or another intermediate volume. It is used only in FlashCopy sessions.

**thaw**

An operation in which a storage system releases the block of the I/O from the host system to the affected volumes on the primary site. A thaw operation can

occur after a freeze operation ends and consistency is formed on the secondary site. See also *freeze*.

**track space-efficient (TSE) volume**

A volume in which storage space is allocated on an as-needed basis by using space on the target volume only when tracks are copied from the source volume to the target volume.

**virtualization**

The substitution of virtual resources for actual resources, where the virtual resources have the same functions and external interfaces as their counterparts, but differ in attributes, such as size, performance, and cost. Virtualization is commonly applied to physical hardware resources by combining multiple physical resources into shared pools from which users receive virtual resources.

**virtual storage area network (VSAN)**

A fabric within the storage area network (SAN).

**VSAN** See *virtual storage area network*.

**zone** A logical grouping of switches, switch ports, and their attached devices in a fabric.

**zone alias**

A name that is given to a collection of one or more zone members that you want to manage together.

**zone set**

A group of zones that function together on a fabric.
