System i5 Debugger

Version 6 Release 1

Note

Before using this information and the product it supports, read the information in “Notices,” on page 7.

This edition applies to version 6, release 1, modification 0 of IBM Toolbox for Java (product number 5761-JC1) and to all subsequent releases and modifications until otherwise indicated in new editions. This version does not run on all reduced instruction set computer (RISC) models nor does it run on CISC models.

IBM i Debugger

IBM® i Debugger provides a graphical user debugging environment on the IBM i platform. Use the Debugger to debug and test programs that run on your system, including programs written in ILE and OPM languages, Java™, and programs that run in the PASE environment.

IBM i Debugger is packaged in a JAR file with IBM Toolbox for Java.

PDF file for IBM i Debugger

You can view and print a PDF file of this information.

To view or download the PDF version of this document, select [IBM i Debugger \(about 134 KB\)](#).

You can view or download these related topic PDFs:

- [IBM Developer Kit for Java \(4585 KB\)](#)
- [IBM Toolbox for Java \(6700 KB\)](#)
- [ILE Concepts !\[\]\(00454fbbe8db418db0de5eebfa916a08_img.jpg\) \(1517 KB\)](#)
- [IBM i PASE \(645 KB\)](#)

Saving PDF files

To save a PDF on your workstation for viewing or printing:

1. Right-click the PDF link in your browser.
2. Click the option that saves the PDF locally.
3. Navigate to the directory in which you want to save the PDF.
4. Click **Save**.

Downloading Adobe Reader

You need Adobe Reader installed on your system to view or print these PDFs. You can download a free copy from the Adobe Web site ([!\[\]\(c444627dab9fee9a1550c053ffaaaae2_img.jpg\)](http://www.adobe.com/products/acrobat/readstep.html)).

IBM i Debugger components

The components of the IBM i Debugger work together to provide a powerful debugging tool.

IBM i Debugger consists of the following components:

- Client-based
 - “Debug Manager” on page 2
 - “System Debugger” on page 2
 - “IBM i PASE System Debugger” on page 2
- Host-based
 - “Debug Hub” on page 2
 - “Debug Server” on page 3

The following descriptions provide only general information about the IBM i Debugger components. To learn more about the components, run IBM i Debugger, and from any Debugger window, click **Help**.

Debug Manager

Debug Manager registers the client with the Debug Hub, which enables using the graphical debugging mode for the selected systems. A registered client that issues the Start Debugging (STRDBG) CL command from an emulation session starts System Debugger.

Use Debug Manager to manage your debugging operations and connections:

- Add and remove systems
- Add and remove users
- Start debugging operations
- Start System Debugger and IBM i PASE System Debugger

System Debugger

Use System Debugger to debug programs written in ILE and OPM languages and Java that run on the system. You can debug programs that are running in existing jobs on the server or use System Debugger to open and then debug programs in a system batch job.

You can configure System Debugger to start automatically, manually from a workstation command prompt, or by using the Debug Manager interface.

Use System Debugger to perform debugging activities that include:

- Setting breakpoints
- Stepping through programs
- Inspecting variables
- Examining the callstack
- Examining memory associated with program variables
- Examining thread activity

IBM i PASE System Debugger

Use IBM i PASE Debugger to debug programs that run in an IBM i PASE environment. You can debug programs that are running in an existing process on the system or use PASE Debugger to open and then debug a program.

You can start PASE Debugger directly from the command line or by using the Debug Manager interface.

In addition to the debugging activities listed previously for System Debugger, you can use PASE Debugger to perform PASE-specific debugging activities that include:

- Using the program loadmap to debug
- Viewing a list of source files and methods
- Tracking parent and child processes
- Examining registers

Debug Hub

Debug Hub provides the following functions:

- Serves as a registry for clients that want to use System Debugger or PASE Debugger
- Handles incoming requests for starting debug servers

Use the Debug Manager interface to register your client with Debug Hub. Registering a client stores both the user information and the TCP/IP address of the client in the registry. Using the Start Debugging

(STRDBG) CL command from an emulation session contacts Debug Hub to see if the user executing the command is registered with Debug Manager. It also checks to see if the command being executed is from the same TCP/IP address as Debug Manager. If these qualifications are met, IBM i Debugger (the graphical application) is started instead of the traditional debug environment.

Debug Hub also serves as a single point of contact for all system debugging applications. When a Debugger component performs a start debug operation, Debug Hub submits a Debug Server job on behalf of the user and passes the associated TCP/IP connection to the job.

Debug Server

Debug Server is a TCP/IP server that is started by the Debug Hub when one of the debuggers issues a request to start debugging. The server job then services the job that is being debugged and issues the appropriate debugging APIs and commands.

Installing IBM i Debugger

Before installing IBM i Debugger on your workstation, you must meet some hardware and software requirements.

Hardware requirements

You must have the following hardware installed on your client:

- CPU: 400 - 500 MHz
- Memory: minimum 128 MB (256 MB recommended)

Software requirements

You must have the following software installed on your client:

- One of the following:
 - Java 2 Platform, either the Standard Edition (J2SE) or the Enterprise Edition (J2EE), version 1.4 or later
 - Java 2 Runtime Environment (JRE), Standard Edition, version 1.4 or later
- jhall.jar (one of the jar files in JavaHelp)

Note: Be sure to add jhall.jar to your client CLASSPATH environment variable.

For information about installing the previously mentioned software, see the Sun Java Web site  .

Installing the IBM i Debugger jar file

Before installing IBM i Debugger, ensure that your client system meets the previously listed hardware and software requirements.

IBM i Debugger is packaged in a jar file, called tes.jar, as part of IBM Toolbox for Java. If you have not installed IBM Toolbox for Java on your client, you need to install it when you install the jar file that contains IBM i Debugger.

To install IBM i Debugger, complete the following steps:

1. Install IBM Toolbox for Java, making sure to copy jt400.jar and tes.jar to your client. For more information about installing IBM Toolbox for Java, see the Installing and managing IBM Toolbox for Java topic.

Note: If you already installed IBM Toolbox for Java on your server, both the jt400.jar and the tes.jar files are in the same directory on the server:

```
/QIBM/ProdData/HTTP/Public/jt400/lib/
```

2. After copying the jar files to your client, add them to your client CLASSPATH environment variable.

Now you can use your client to run IBM i Debugger.

Running IBM i Debugger

Start the IBM i Debugger components using these instructions.

Starting Debug Manager

To start Debug Manager from a command prompt on your client, run the following command:

```
java utilities.DebugMgr
```

Starting System Debugger

To start System Debugger from a command prompt on your client, run the following command:

```
java utilities.Debug <args>
```

where <args> represents any of the following command arguments:

- -u = User
- -s = System name
- -j = Job description, in the form of: job number/job user/job name
- -p = Program to run, in the form of: program library/program name

Note: Once you use Debug Manager to register your client, you can issue the Start Debugging (STRDBG) CL command from an emulation session to start System Debugger. You can also start System Debugger directly from System Debug Manager.

Starting IBM i PASE Debugger

To start IBM i PASE Debugger from a command prompt on your client, run the following command:

```
java utilities.DebugPASE <args>
```

where <args> represents any of the following command arguments:

- -u = User
- -s = System name
- -p = Fully qualified path of program to run
- -pid = Process ID

Note: You can start IBM i PASE Debugger directly from System Debug Manager. Unlike System Debugger, you cannot start IBM i PASE Debugger from an emulator session.

To learn more about IBM i Debugger, start IBM i Debugger and review the help information by performing one of the following actions:

- From the **Help** menu in any IBM i Debugger window, click **Help**.
- Press **F1**.

Appendix. Notices

This information was developed for products and services offered in the U.S.A.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

IBM World Trade Asia Corporation

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

This information is for planning purposes only. The information herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

COPYRIGHT LICENSE:
