## At a glance

IBM® Security SiteProtector System V2.9 management console helps reduce capital costs, operations costs, training costs, and operational complexity. Security SiteProtector System:

- Equips security operations teams to efficiently create and distribute security policies
- Delivers command and control for diverse security agents, such as network intrusion prevention, server protection, and desktop security
- Monitors security events and correlates with vulnerability data
- Analyzes risks and reports compliance to demonstrate and communicate value
- Scales to manage up to thousands of agents
- Easily configured to manage simple and complex distributed environments
- Establishes flexible management foundation for expansion and change

For ordering, contact your IBM representative or an IBM Business Partner. For more information, contact the Americas Call Centers at 800-IBM-CALL (426-2255).

## Overview

IBM Security SiteProtector System V2.9 centralized management console enhances control of the expanding universe of core security operations elements. Security SiteProtector System is available as software to install on a server or as a self-contained hardware appliance.

IBM Security SiteProtector System V2.9 delivers:

- Updated hardware appliance with more processing power to handle increased transactions for next generation protection
- Updated software components to enhance usability, analysis, and access to core functionality
- Updated software packages and licensing to improve flexibility and ease of configuration

Security SiteProtector System preserves the span of command and control capabilities and provides breadth and depth of coverage for security agents and appliances.

The combination of hardware, software, and packaging improvements reinforce the value of Security SiteProtector System for centralized management of the IBM security portfolio.

## Description

---

IBM Security SiteProtector System offers a flexible console to command and control a broad array of security agents. This console monitors exposure to vulnerabilities and demonstrates regulatory compliance. Security SiteProtector System can reduce the burden of an IT security team by unifying the management of IBM security platform offerings across gateways, networks, servers, and desktops, as well as select third-party security solutions. Because Security SiteProtector System centralizes management of diverse security agents, it is a key element of an IBM security solution, along with security agents, application and vulnerability scanners, and security information and event management tools.

IBM Security SiteProtector System V2.9 enhancements:

- SP3001 hardware appliance - Updated chassis configuration with improved performance.
- Solution-specific interfaces - Contextualized interfaces present relevant information for the task at hand. For example, you can hide unused types using the "Show/Hide Agents" settings.
- Improved UI - Streamlined menus allow a focus on key tasks without distraction. Policy view displays a gallery of agent types specific to the organization's network, with selection of versions available. Automatic column resizing is provided in order to accommodate data displayed. Customized settings can be saved.
- Analysis improvements - Context-sensitive actions are available for any displayed columns. You can define additional right-click actions and lookups, as needed. You can double-click to review event details quickly.
- System response time - Enhancements to improve database performance, especially when working with larger data sets.
- Expanded limits - Up to 400 event rules, doubling the number of event rules available.
- Updated components - Java™, Apache, and Geronimo version updates for access to the latest security safeguards.
- New software packages - Standard, Professional, and Unlimited package options to meet size and functional needs. Additional protection available in batch quantities to fine tune coverage for a given organization.

Security SiteProtector System helps reduce operational costs by automating and simplifying tasks such as setting policies, applying updates, scanning, and enabling protection. From a single interface, a user can monitor events and manage IBM technologies, including network and host intrusion prevention, scanning, desktop security, and multifunction security. Security SiteProtector System reporting capabilities not only help ease compliance measures but can also provide specific details regarding security breaches. Reports on asset security, vulnerability remediation, and trends provide an enterprise view of improvements to the security posture over time and help enable intelligent, cost-effective decisions regarding network and security investments.

## Accessibility by people with disabilities

---

A U.S. Section 508 Voluntary Product Accessibility Template (VPAT) containing details on accessibility compliance can be requested at

## IBM Electronic Services

---

IBM has transformed its delivery of hardware and software support services to help you achieve higher system availability. Electronic Services is a web-enabled solution that offers an exclusive, no-additional-charge enhancement to the service and support available for IBM servers. These services are designed to provide the opportunity for greater system availability with faster problem resolution and preemptive monitoring. Electronic Services comprises two separate, but complementary, elements: Electronic Services news page and Electronic Services Agent.

The Electronic Services news page is a single Internet entry point that replaces the multiple entry points traditionally used to access IBM Internet services and support. The news page enables you to gain easier access to IBM resources for assistance in resolving technical problems.

The Electronic Service Agent™ is no-additional-charge software that resides on your server. It monitors events and transmits system inventory information to IBM on a periodic, client-defined timetable. The Electronic Service Agent automatically reports hardware problems to IBM. Early knowledge about potential problems enables IBM to deliver proactive service that may result in higher system availability and performance. In addition, information collected through the Service Agent is made available to IBM service support representatives when they help answer your questions or diagnose problems. Installation and use of IBM Electronic Service Agent for problem reporting enables IBM to provide better support and service for your IBM server.
