About this document

This document describes how to monitor the network, manage resources, and maintain performance of z/OS Communications Server. This includes the ability to perform the following functions:

• Configure a system, using TSO and MVS™ commands
• Monitor the network
• Query name servers
• Manage network resources

The information in this document includes descriptions of support for both IPv4 and IPv6 networking protocols. Unless explicitly noted, descriptions of IP protocol support concern IPv4. IPv6 support is qualified within the text.

This document refers to Communications Server data sets by their default SMP/E distribution library name. Your installation might, however, have different names for these data sets where allowed by SMP/E, your installation personnel, or administration staff. For instance, this document refers to samples in SEZAINST library as simply in SEZAINST. Your installation might choose a data set name of SYS1.SEZAINST, CS390.SEZAINST or other high-level qualifiers for the data set name.

A companion to this document is the z/OS Communications Server: IP User’s Guide and Commands, which describes how to use the applications available in z/OS Communications Server V2R3.

Who should read this document

This document is written for system administrators who need to understand how to monitor applications and network resources provided by z/OS Communications Server V2R3.

Before using this document, you should be familiar with the IBM® Multiple Virtual Storage (MVS) operating system, the IBM Time Sharing Option (TSO), and z/OS UNIX System Services and the z/OS UNIX shell. In addition, z/OS Communications Server V2R3 should already be installed and customized for your network. For information about installing, see the z/OS Program Directory. For information about customizing, see the z/OS Communications Server: IP Configuration Reference.

How this document is organized

This document contains the following information:

• Chapter 1, “Operator commands and system administration,” on page 1 is a reference of commonly used commands for experienced system programmers.
• Chapter 2, “Monitoring the TCP/IP network,” on page 273 describes how to use the following TCP/IP commands to obtain information from the network:
  – The TSO NETSTAT and z/OS UNIX netstat commands
  – The TSO PING and z/OS UNIX ping commands
  – The TSO RPCINFO and z/OS UNIX rpcinfo/orpcinfo commands
  – The TSO TRACERTE and z/OS UNIX traceroute commands
• Chapter 3, “Managing network security,” on page 643 describes how to use the following commands to obtain or modify security information in the network:
  – The z/OS UNIX certbundle command
  – The z/OS UNIX ipsec command
  – The z/OS UNIX nssct1 command
• Chapter 4, “Displaying policy-based networking information,” on page 749 describes how to use the z/OS UNIX pasearch command and the z/OS UNIX trmdstat command to display policy based networking information from the network.

• Chapter 5, “Querying and administering a Domain Name System (DNS),” on page 815 describes the Domain Name System (DNS) domain names, domain name servers, resolvers, and resource records.

• Chapter 6, “Managing TCP/IP network resources with SNMP,” on page 871 describes how to use the Simple Network Management Protocol (SNMP) commands and details what support the z/OS Communications Server SNMP agent and subagents provide.

• Chapter 7, “SNTP daemon: Simple Network Time Protocol,” on page 909 describes how to use the SNTP daemon.

• Chapter 8, “Browsing and searching syslog daemon files and archives,” on page 911

• Appendix B, “SNMP capability statement,” on page 919 includes the SNMP agent and subagents capability statement for z/OS Communications Server.

• Appendix C, “Management Information Base (MIB) objects,” on page 941 lists the objects defined by the Management Information Base (MIB), which are supported by the SNMP agent and subagents on the z/OS Communications Server, and the maximum access allowed.

• Appendix D, “IBM 3172 attribute index,” on page 1107 shows the 3172 attributes and their corresponding MIB variables.

• Appendix E, “SNMP trap types,” on page 1109 lists the generic and enterprise-specific trap types that can be received by SNMP.

• Appendix F, “ICMP/ICMPv6 types and codes,” on page 1115 lists the Internet Control Message Protocol (ICMP) types and codes from TCP/IP Illustrated, Volume 1 The Protocols, by W. Richard Stevens.

• Appendix G, “Related protocol specifications,” on page 1117 lists the related protocol specifications for TCP/IP.

• “Accessibility,” describes accessibility features to help users with physical disabilities.

• “Notices” contains notices and trademarks used in this document.

• “Bibliography” contains descriptions of the documents in the z/OS Communications Server library.

How to use this document

To use this document, you should be familiar with z/OS TCP/IP Services and the TCP/IP suite of protocols.

How to contact IBM service

For immediate assistance, visit this website: http://www.software.ibm.com/support

Most problems can be resolved at this website, where you can submit questions and problem reports electronically, and access a variety of diagnosis information.

For telephone assistance in problem diagnosis and resolution (in the United States or Puerto Rico), call the IBM Software Support Center anytime (1-800-IBM-SERV). You will receive a return call within 8 business hours (Monday – Friday, 8:00 a.m. – 5:00 p.m., local customer time).

Outside the United States or Puerto Rico, contact your local IBM representative or your authorized IBM supplier.

If you would like to provide feedback on this publication, see “Communicating your comments to IBM” on page 1157.

Conventions and terminology that are used in this information

Commands in this information that can be used in both TSO and z/OS UNIX environments use the following conventions:
• When describing how to use the command in a TSO environment, the command is presented in uppercase (for example, NETSTAT).

• When describing how to use the command in a z/OS UNIX environment, the command is presented in bold lowercase (for example, netstat).

• When referring to the command in a general way in text, the command is presented with an initial capital letter (for example, Netstat).

All the exit routines described in this information are installation-wide exit routines. The installation-wide exit routines also called installation-wide exits, exit routines, and exits throughout this information.

The TPF logon manager, although included with VTAM®, is an application program; therefore, the logon manager is documented separately from VTAM.

Samples used in this information might not be updated for each release. Evaluate a sample carefully before applying it to your system.

**Note:** In this information, you might see the following Shared Memory Communications over Remote Direct Memory Access (SMC-R) terminology:

- RoCE Express®, which is a generic term representing IBM 10 GbE RoCE Express, IBM 10 GbE RoCE Express2, and IBM 25 GbE RoCE Express2 feature capabilities. When this term is used in this information, the processing being described applies to both features. If processing is applicable to only one feature, the full terminology, for instance, IBM 10 GbE RoCE Express will be used.

- RoCE Express2, which is a generic term representing an IBM RoCE Express2® feature that might operate in either 10 GbE or 25 GbE link speed. When this term is used in this information, the processing being described applies to either link speed. If processing is applicable to only one link speed, the full terminology, for instance, IBM 25 GbE RoCE Express2 will be used.

- RDMA network interface card (RNIC), which is used to refer to the IBM® 10 GbE RoCE Express, IBM® 10 GbE RoCE Express2, or IBM 25 GbE RoCE Express2 feature.

- Shared RoCE environment, which means that the "RoCE Express" feature can be used concurrently, or shared, by multiple operating system instances. The feature is considered to operate in a shared RoCE environment even if you use it with a single operating system instance.

**Clarification of notes**

Information traditionally qualified as Notes is further qualified as follows:

- **Attention**
  - Indicate the possibility of damage

- **Guideline**
  - Customary way to perform a procedure

- **Note**
  - Supplemental detail

- **Rule**
  - Something you must do; limitations on your actions

- **Restriction**
  - Indicates certain conditions are not supported; limitations on a product or facility

- **Requirement**
  - Dependencies, prerequisites

- **Result**
  - Indicates the outcome

- **Tip**
  - Offers shortcuts or alternative ways of performing an action; a hint
How to read a syntax diagram

This syntax information applies to all commands and statements that do not have their own syntax described elsewhere.

The syntax diagram shows you how to specify a command so that the operating system can correctly interpret what you type. Read the syntax diagram from left to right and from top to bottom, following the horizontal line (the main path).

Symbols and punctuation
The following symbols are used in syntax diagrams:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>►►</td>
<td>Marks the beginning of the command syntax.</td>
</tr>
<tr>
<td>►</td>
<td>Indicates that the command syntax is continued.</td>
</tr>
<tr>
<td></td>
<td>Marks the beginning and end of a fragment or part of the command syntax.</td>
</tr>
<tr>
<td>&lt;-◄</td>
<td>Marks the end of the command syntax.</td>
</tr>
</tbody>
</table>

You must include all punctuation such as colons, semicolons, commas, quotation marks, and minus signs that are shown in the syntax diagram.

Commands
Commands that can be used in both TSO and z/OS UNIX environments use the following conventions in syntax diagrams:

- When describing how to use the command in a TSO environment, the command is presented in uppercase (for example, NETSTAT).
- When describing how to use the command in a z/OS UNIX environment, the command is presented in bold lowercase (for example, netstat).

Parameters
The following types of parameters are used in syntax diagrams.

Required
- Required parameters are displayed on the main path.

Optional
- Optional parameters are displayed below the main path.

Default
- Default parameters are displayed above the main path.

Parameters are classified as keywords or variables. For the TSO and MVS console commands, the keywords are not case sensitive. You can code them in uppercase or lowercase. If the keyword appears in the syntax diagram in both uppercase and lowercase, the uppercase portion is the abbreviation for the keyword (for example, OPERand).

For the z/OS UNIX commands, the keywords must be entered in the case indicated in the syntax diagram.
Variables are italicized, appear in lowercase letters, and represent names or values you supply. For example, a data set is a variable.

Syntax examples
In the following example, the PUt subcommand is a keyword. The required variable parameter is `local_file`, and the optional variable parameter is `foreign_file`. Replace the variable parameters with your own values.

```
PUT local_file foreign_file
```

Longer than one line
If a diagram is longer than one line, the first line ends with a single arrowhead and the second line begins with a single arrowhead.

```
The first line of a syntax diagram that is longer than one line
```

```
The continuation of the subcommands, parameters, or both
```

Required operands
Required operands and values appear on the main path line. You must code required operands and values.

```
REQUIRED_OPERAND
```

Optional values
Optional operands and values appear below the main path line. You do not have to code optional operands and values.

```
OPERAND
```

Selecting more than one operand
An arrow returning to the left above a group of operands or values means more than one can be selected, or a single one can be repeated.

```
REPEATABLE_OPERAND_OR_VALUE_1
REPEATABLE_OPERAND_OR_VALUE_2
REPEATABLE_OPERAND_OR_VALUE_1
REPEATABLE_OPERAND_OR_VALUE_2
```
Nonalphanumeric characters
If a diagram shows a character that is not alphanumeric (such as parentheses, periods, commas, and equal signs), you must code the character as part of the syntax. In this example, you must code OPERAND=(001,0.001).

```
OPERAND = ( 001 , 0.001 )
```

Blank spaces in syntax diagrams
If a diagram shows a blank space, you must code the blank space as part of the syntax. In this example, you must code OPERAND=(001 FIXED).

```
OPERAND = ( 001 FIXED )
```

Default operands
Default operands and values appear above the main path line. TCP/IP uses the default if you omit the operand entirely.

```
DEFAULT
OPERAND
```

Variables
A word in all lowercase italics is a variable. Where you see a variable in the syntax, you must replace it with one of its allowable names or values, as defined in the text.

```
variable
```

Syntax fragments
Some diagrams contain syntax fragments, which serve to break up diagrams that are too long, too complex, or too repetitious. Syntax fragment names are in mixed case and are shown in the diagram and in the heading of the fragment. The fragment is placed below the main diagram.

```
Syntax fragment
```

Syntax fragment

```
1ST_OPERAND , 2ND_OPERAND , 3RD_OPERAND
```

Prerequisite and related information
z/OS Communications Server function is described in the z/OS Communications Server library. Descriptions of those documents are listed in “Bibliography” on page 1145, in the back of this document.
Required information
Before using this product, you should be familiar with TCP/IP, VTAM, MVS, and UNIX System Services.

Softcopy information
Softcopy publications are available in the following collection.

<table>
<thead>
<tr>
<th>Titles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBM Z Redbooks</td>
<td>The IBM Z® subject areas range from e-business application development and enablement to hardware, networking, Linux, solutions, security, parallel sysplex, and many others. For more information about the Redbooks® publications, see <a href="http://www.redbooks.ibm.com/">http://www.redbooks.ibm.com/</a> and <a href="http://www.ibm.com/systems/z/os/zos/zfavorites/">http://www.ibm.com/systems/z/os/zos/zfavorites/</a>.</td>

</tbody>
</table>

Other documents
This information explains how z/OS references information in other documents.

When possible, this information uses cross-document links that go directly to the topic in reference using shortened versions of the document title. For complete titles and order numbers of the documents for all products that are part of z/OS, see z/OS Information Roadmap (SA23-2299). The Roadmap describes what level of documents are supplied with each release of z/OS Communications Server, and also describes each z/OS publication.

To find the complete z/OS library, visit the z/OS library in IBM Knowledge Center (www.ibm.com/support/knowledgecenter/SSLTBW/welcome).

Relevant RFCs are listed in an appendix of the IP documents. Architectural specifications for the SNA protocol are listed in an appendix of the SNA documents.

The following table lists documents that might be helpful to readers.

<table>
<thead>
<tr>
<th>Title</th>
<th>Number</th>
</tr>

### The z/OS Basic Skills Information Center
The z/OS Basic Skills Information Center is a web-based information resource intended to help users learn the basic concepts of z/OS, the operating system that runs most of the IBM mainframe computers in use today. The Information Center is designed to introduce a new generation of Information Technology professionals to basic concepts and help them prepare for a career as a z/OS professional, such as a z/OS systems programmer.

Specifically, the z/OS Basic Skills Information Center is intended to achieve the following objectives:

- Provide basic education and information about z/OS without charge
- Shorten the time it takes for people to become productive on the mainframe
- Make it easier for new people to learn z/OS

To access the z/OS Basic Skills Information Center, open your web browser to the following website, which is available to all users (no login required): [https://www.ibm.com/support/knowledgecenter/zosbasics/com.ibm.zos.zbasics/homepage.html?cp=zosbasics](https://www.ibm.com/support/knowledgecenter/zosbasics/com.ibm.zos.zbasics/homepage.html?cp=zosbasics)
Summary of changes for IP System Administrator's Commands

This document contains terminology, maintenance, and editorial changes, including changes to improve consistency and retrievability. Technical changes or additions to the text and illustrations are indicated by a vertical line to the left of the change.

Changes made in z/OS Communications Server Version 2 Release 4

This document contains information previously presented in z/OS Communications Server: IP System Administrator's Commands, which supported z/OS Version 2 Release 3.

Changed information

• AT-TLS support for TLS v1.3, see the following topics:
  – “COnn report examples” on page 534
  – “Report field descriptions” on page 536
  – “The z/OS UNIX pasearch command: Display policies” on page 749

• Communications Server miscellaneous enhancements, see the following topics:
  – “MODIFY command: Resolver address space” on page 187
  – “DETAIL or DETAIL NEGATIVE reports” on page 482

• Network support for z/OS Container Extensions, see the following topics:
  – “Netstat VIPADyn/-v report” on page 597
    - “Not IPv6 enabled (SHORT format)” on page 599
    - “IPv6 enabled or request for LONG format” on page 600
    - “For a SHORT or LONG format report” on page 601
  – “Netstat VIPADCFG/-F report” on page 579
    - “Not IPv6 enabled (SHORT format)” on page 582
    - “IPv6 enabled or request for LONG format” on page 585
    - “Report field descriptions” on page 589

Changes made in z/OS Communications Server Version 2 Release 3

This document contains information previously presented in z/OS Communications Server: IP System Administrator's Commands, which supported z/OS Version 2 Release 2.

June 2019

Changed information

• Communications Server support for OSA-Express7S 25 GbE features, see “Reply field descriptions” on page 95.

December 2018

Changed information

Technical and terminology changes about Shared Memory Communications
July 2018

Changed information

- IWQ support for IPSec, see “DISPLAY TCPIP,,OSAINFO” on page 92.
- Code page enhancements for CSSMTP, see “MODIFY command: Communications Server SMTP application (CSSMTP)” on page 152.

March 2018

Changed information

- HiperSockets Converged Interface support, see the following topics:
  - “Netstat ARp/-R report” on page 340
  - “Report examples” on page 341
  - “Report field descriptions” on page 339
  - “Netstat CONFIG/-f report” on page 353
  - “Not IPv6 enabled (SHORT format)” on page 354
  - “IPv6 enabled or request for LONG format” on page 356
  - “Report field descriptions” on page 357
  - “Netstat DEvlinks/-d report” on page 392
  - “Not IPv6 enabled (SHORT format)” on page 395
  - “IPv6 enabled or request for LONG format” on page 403
  - “Report field descriptions” on page 414
  - “Netstat ND/-n report” on page 466
  - “Report examples” on page 467
  - “Report field descriptions” on page 468
- z/OS Encryption Readiness Technology (zERT) aggregation, see the following topics:
  - “Netstat CONFIG/-f report” on page 353
  - “Not IPv6 enabled (SHORT format)” on page 354
  - “IPv6 enabled or request for LONG format” on page 356
  - “Report field descriptions” on page 357

September 2017

Changed information

- AT-TLS currency with System SSL, see “Report field descriptions” on page 536.
- Communications Server support for RoCE Express2 feature, see the following topics:
  - Netstat ALL/-A report
  - Netstat CONFIG/-f report
  - Netstat DEvlinks/-d report
- Communications Server support for 8 character TSO User IDs, see “Stopping OMPROUTE” on page 182.
- CSSMTP customizable ATSIGN character for mail addresses, see “MODIFY command: Communications Server SMTP application (CSSMTP)” on page 152.
- Enhanced wildcard support for jobname on PORT and PORTRANGE statements, see “Report field descriptions” on page 471.
- Improved CSSMTP code page compatibility with target servers, see “MODIFY command: Communications Server SMTP application (CSSMTP)” on page 152.
- Shared Memory Communications - Direct Memory Access, see “Netstat CONFIG/-f report” on page 353.
• IBM Configuration Assistant for z/OS Communications Server support for import of TCPIP configuration, see “VARY TCPIP,,EXPORTPROF” on page 215.

• z/OS Encryption Readiness Technology, see Netstat CONFIG/-f report.

Deleted information
• Removal of SMTPD & sendmail, all references to SMTP and sendmail are deleted.

Changes made in z/OS Communications Server Version 2 Release 2, as updated June 2017

This document contains information previously presented in z/OS Communications Server: IP System Administrator's Commands, which supported z/OS Version 2 Release 2.

Changed information
• Improved CSSMTP code page compatibility with target servers, see “MODIFY command: Communications Server SMTP application (CSSMTP)” on page 152.
• IBM Configuration Assistant for z/OS Communications Server support for import of TCPIP configuration, see “VARY TCPIP,,EXPORTPROF” on page 215.

Changes made in z/OS Version 2 Release 2, as updated September 2016

This document contains information previously presented in z/OS Communications Server: IP System Administrator's Commands, SC27-3661-04, which supported z/OS Version 2 Release 2.

Changes made in z/OS Version 2 Release 2, as updated March 2016

This document contains information previously presented in z/OS Communications Server: IP System Administrator's Commands, SC27-3661-03, which supported z/OS Version 2 Release 2.

Changed information
• Shared Memory Communications - Direct Memory Access, see the following topics:
  – “DISPLAY TCPIP,,NETSTAT” on page 9
  – “DISPLAY TCPIP,,STOR” on page 99
  – “The TSO NETSTAT command syntax” on page 276
  – “The z/OS UNIX netstat command syntax” on page 281
  – “The Netstat command filter” on page 288
  – “Netstat ALL/-A report” on page 298
  – “Netstat ALLConn/-a report” on page 334
  – “Netstat CONFIG/-f report” on page 353
  – “Netstat CONn/-c report” on page 383
  – “Netstat DEvlinks/-d report” on page 392
  – “Netstat HEIp/-? report” on page 445
  – “Netstat PORTList/-o report” on page 469
  – “Netstat STATS/-S report” on page 509
  – “z/OS UNIX and TSO Netstat option comparison” on page 604
• SMC Applicability Tool, see the following topics:
Changes made in z/OS Version 2 Release 2

This document contains information previously presented in z/OS Communications Server: IP System Administrator's Commands, SC27-3661-02, which supported z/OS Version 2 Release 1.

New information

• SMC Applicability Tool (SMCAT), see “VARY TCPIP,,SMCAT” on page 235.

Changed information

• CSSMTP migration enablement, see “MODIFY command: Communications Server SMTP application (CSSMTP)” on page 152
• Reordering of cached Resolver results, see “MODIFY command: Resolver address space” on page 187.
• SMC Applicability Tool (SMCAT), see the following topics:
  – “VARY TCPIP command” on page 209
  – “VARY command: TCP/IP address space” on page 210
• TCP autonomic tuning enhancements, see the following topics:
  – “Netstat ALL/-A report” on page 298
    - “Not IPv6 enabled (SHORT format)” on page 302
    - “IPv6 enabled or request for LONG format” on page 307
    - “Report field descriptions” on page 312
  – “Netstat CONFIG/-f report” on page 353
    - “Report field descriptions” on page 357
• Shared Memory Communications over RDMA enhancements, see the following topics:
  – “Netstat ALL/-A report” on page 298
    - “Not IPv6 enabled (SHORT format)” on page 302
    - “IPv6 enabled or request for LONG format” on page 307
    - “Report field descriptions” on page 312
  – “Netstat CONFIG/-f report” on page 353
    - “Not IPv6 enabled (SHORT format)” on page 354
    - “IPv6 enabled or request for LONG format” on page 356
    - “Report field descriptions” on page 357
  – “Netstat PORTList/-o report” on page 469
    - “Not IPv6 enabled (SHORT format)” on page 470
    - “IPv6 enabled or request for LONG format” on page 471
    - “Report field descriptions” on page 471
• VIPAROUTE fragmentation avoidance, see the following topics:
  – “Netstat ALL/-A report” on page 298
    - “Report field descriptions” on page 312
  – “Netstat CONFIG/-f report” on page 353
    - “Report field descriptions” on page 357
• Removed support for the GATEWAY statement in the TCP/IP profile, see the following topics:
  – “Netstat CONFIG/-f report” on page 353
  - “Report field descriptions” on page 357
  – “Netstat Gate/-g report” on page 441
  - “Report field descriptions” on page 443
  – “Netstat ROUTe/-r report” on page 484
  - “Report field descriptions” on page 492
• TLS session reuse support for FTP and AT-TLS applications, see “Netstat TTLS/-x report” on page 532.
• AT-TLS certificate processing enhancements, see the following topics:
  – “Netstat TTLS/-x report” on page 532
  - “Report field descriptions” on page 536
Chapter 1. Operator commands and system administration

This information describes TSO commands, MVS commands, and related information used to configure TCP/IP and monitor and control the operations of its functions. It is provided as a reference of commonly used commands for experienced system programmers.

MVS commands

After your TCP/IP system is configured, you can use these MVS commands to dynamically start, stop, and control the servers:

- “START command” on page 1
- “STOP command” on page 2
- “DISPLAY TCPIP command” on page 2
- “MODIFY command” on page 135
- “VARY TCPIP command” on page 209
- “EZACMD command” on page 262

Recommendation: Although the MVS commands can accept procname.identifier to specify the server or address space, the AUTOLOG statement in hlq.PROFILE.TCPIP ignores the identifier portion. Therefore, it is recommended that you use the member name of the cataloged procedure on the AUTOLOG statements in hlq.PROFILE.TCPIP.

START command

Use the START command to dynamically start a TCP/IP server or address space (including the TCP/IP address space). The abbreviated version of the command is the letter S.

Start proname

,PARMS=’(CTRACE(xxxxxxxx))’

,REUSASID=YES

proname

The name of a member in a cataloged procedure library. For the servers, this should be the same name specified on the PORT statement in the PROFILE.TCPIP data set.

,PARMS=’(CTRACE(xxxxxxxx))’

Used to start an address space that supports component tracing services (CTRACE). Starts the address space with the specified CTRACE initialization PARMLIB member parameters. Some valid values for xxxxxxxx include:

- CTIRES00 for the Resolver address space
- CTIEZB00 for the TCP/IP address space
- CTIORA00 for the OMPROUTE address space

REUSASID=YES

Specifies that MVS should assign a reusable address space identifier (ASID) to the address space that is being started. This parameter applies only to the following TCP/IP servers and address spaces:

- TCP/IP stack
- Resolver
- TN3270 server
STOP command

Use the STOP command to stop a TCP/IP server or address space (including the TCP/IP address space) that is in execution. The STOP command can also be used to stop the name server. The abbreviated version of the command is the letter P.

When you issue the STOP command for the TCP/IP address space, one of the following scenarios occurs, depending on whether connected servers have outstanding calls to TCP/IP.

For each server with outstanding calls to TCP/IP

The TCP/IP address space notifies the server that TCP/IP is coming down and requests that the server terminate normally.

If the server does not terminate normally, TCP/IP causes the server to abend with abend code 422. The abend does not appear in a dump; however, it is recorded in the SYS1.LOGREC data set. The outstanding socket call receives error number 1041 EIBMBADPOSTCODE.

For each connected server that does not have outstanding calls

The TCP/IP address space notifies the server that TCP/IP is coming down and drives the server asynchronous error exit routine, if there is one.

\[ \text{STOP} \quad \text{P} \quad \text{procname} \]

procname

The name of the procedure you want to stop. This should be the same member name used to start the server, either on the START command or the AUTOLOG statement in the PROFILE.TCPIP data set.

DISPLAY TCPIP command

Use the DISPLAY TCPIP command from the MVS operator console to display help for a supported command, or to display information received from supported functions. The abbreviated version of the command is the letter D.

The general format of the DISPLAY command is:

\[ \text{Display} \quad \text{TCPIP} \quad , \quad \text{procname} \quad , \quad \text{function} \]

procname

The name of the member in a procedure library that was used to start the server or address space. You can omit the procname parameter when you direct the command to a TCP/IP stack address space and only one TCP/IP stack is currently active. See Table 1 on page 3 for a list of servers that support the command when a procname is specified.

TELNET

Use this parameter to display the name, version, and status of all the TN3270E Telnet servers (Telnet) that are or were running. See “DISPLAY TCPIP,TELNET” on page 132 for more information about this command.
function
Any of the functions that are valid for the server. These functions are described in the following sections.

The following servers or address spaces support the MVS DISPLAY TCPIP command. Not all servers support the same parameters. For further descriptions of the supported parameters, see Table 1 on page 3.

*** END TCPIP STATUS REPORT ***
EZAOP41I 'DISPLAY TCPIP' COMMAND COMPLETED SUCCESSFULLY
```

**DISPLAY command: TCP/IP address space**

When you specify a TCP/IP stack name as the **procname** value on the command, you can display information about the TCP/IP stack or about functions that are associated with the stack. For the **D TCPIP,,NETSTAT,RESCACHE** command, the information is retrieved from the system-wide resolver and is not specific to the TCP/IP stack whose name you specify with the **procname** value.

The functions listed in Table 2 on page 3 support the DISPLAY TCPIP command when it is directed to a TCP/IP stack address space.

Parameters

Main parameters

HELP
   Shows help on the DISPLAY TCPIP,, HELP command.
DATtrace
   Shows help on the VARY TCPIP,, DATTRACE command.
Display
   Shows help on the DISPLAY TCPIP command.
DRop
   Shows help on the VARY TCPIP,, DROP command.
EXPortprof
   Shows help on the VARY TCPIP,, EXPORTPROF command.
Netstat
   Shows help on the DISPLAY TCPIP,, NETSTAT command.
Obeyfile
   Shows help on the VARY TCPIP,, OBEYFILE command.
OMProute
   Shows help on the DISPLAY TCPIP,, OMPROUTE command.
OSAInfo
   Shows help on the DISPLAY TCPIP,, OSAINFO command.
OSAENTA
   Shows help on the VARY TCPIP,, OSAENTA command.
PKTtrace
   Shows help on the VARY TCPIP,, PKTTRACE command.
PURGECache
   Shows help on the VARY TCPIP,, PURGECACHE command.
STAtr
   Shows help on the VARY TCPIP,, START command.
STOP
   Shows help on the VARY TCPIP,, STOP command.
STOR
   Shows help on the DISPLAY TCPIP,, STOR command.

6 z/OS Communications Server: IP System Administrator's Commands
SYNTAXcheck
  Shows help on the VARY TCPIP,, SYNTAXCHECK command.

SYSplox
  Shows help on the DISPLAY TCPIP,, SYSPLEX and VARY TCPIP,, SYSPLEX commands.

TRACE
  Shows help on the DISPLAY TCPIP,, TRACE command.

Vary
  Shows help on the VARY TCPIP command.

DISPLAY TCPIP,, NETSTAT parameters

ACCess
  Shows help on the DISPLAY TCPIP,, NETSTAT, ACCess, NETWORK command.

ALL
  Shows help on the DISPLAY TCPIP,, NETSTAT,ALL command.

ALLConn
  Shows help on the DISPLAY TCPIP,, NETSTAT,ALLConn command.

ARp
  Shows help on the DISPLAY TCPIP,, NETSTAT,ARP command.

BYTEinfo
  Shows help on the DISPLAY TCPIP,, NETSTAT,BYTEinfo command.

CACHinfo
  Shows help on the DISPLAY TCPIP,, NETSTAT,CACHinfo command.

CONFIG
  Shows help on the DISPLAY TCPIP,, NETSTAT,CONFIG command.

CONn
  Shows help on the DISPLAY TCPIP,, NETSTAT,CONn commands.

DEFADDR
  Shows help on the DISPLAY TCPIP,, NETSTAT,DEFADDRT command.

DEVlinks
  Shows help on the DISPLAY TCPIP,, NETSTAT,DEVlinks command.

HOme
  Shows help on the DISPLAY TCPIP,, NETSTAT,H0me command.

ND
  Shows help on the DISPLAY TCPIP,, NETSTAT,ND command.

IDS
  Shows help on the DISPLAY TCPIP,, NETSTAT,IDS command.

PORTList
  Shows help on the DISPLAY TCPIP,, NETSTAT,PORTList command.

RESCache
  Shows help on the DISPLAY TCPIP,, NETSTAT,RESCache command.

ROUTE
  Shows help on the DISPLAY TCPIP,, NETSTAT,ROUTE command.

SOCKets
  Shows help on the DISPLAY TCPIP,, NETSTAT,SOCKets command.

SRCIP
  Shows help on the DISPLAY TCPIP,, NETSTAT,SRCIP command.

STATS
  Shows help on the DISPLAY TCPIP,, NETSTAT,STATS command.

VCRT
  Shows help on the DISPLAY TCPIP,, NETSTAT,VCRT command.
TTLS
Shows help on the DISPLAY TCPIP,, NETSTAT,TTLS command.

VDPT
Shows help on the DISPLAY TCPIP,, NETSTAT,VDPT command.

VIPADCFG
Shows help on the DISPLAY TCPIP,, NETSTAT,VIPADCFG command.

VIPADyn
Shows help on the DISPLAY TCPIP,, NETSTAT,VIPADyn and the DISPLAY TCPIP,, SYSPLEX,VIPADyn commands.

DISPLAY TCPIP,, OMPROUTE parameters

OSPF
Shows help on the DISPLAY TCPIP,, OMPROUTE,OSPF command.

RIP
Shows help on the DISPLAY TCPIP,, OMPROUTE,RIP command.

GENERIC
Shows help on the DISPLAY TCPIP,, OMPROUTE,GENERIC command.

RTTABLE
Shows help on the DISPLAY TCPIP,, OMPROUTE,RTTABLE command.

IPV6OSPF
Shows help on the DISPLAY TCPIP,, OMPROUTE,IPV6OSPF command.

IPV6RIP
Shows help on the DISPLAY TCPIP,, OMPROUTE,IPV6RIP command.

GENERIC6
Shows help on the DISPLAY TCPIP,, OMPROUTE,GENERIC6 command.

RT6TABLE
Shows help on the DISPLAY TCPIP,, OMPROUTE,RT6TABLE command.

DISPLAY TCPIP,, SYSPLEX parameters

GROUP
Shows help on the DISPLAY TCPIP,, SYSPLEX,GROUP command.

PORTS
Shows help on the DISPLAY TCPIP,, SYSPLEX,PORTS command.

VIPADyn
Shows help on the DISPLAY TCPIP,,NETSTAT,VIPADyn and the DISPLAY TCPIP,, SYSPLEX,VIPADyn commands.

VARY TCPIP,, SYSPLEX parameters

LEAVEGROUP
Shows help on the VARY TCPIP,, SYSPLEX,LEAVEGROUP command.

JOINgroup
Shows help on the VARY TCPIP,, SYSPLEX,JOINGROUP command.

DEACTIVATE
Shows help on the VARY TCPIP,, SYSPLEX,DEACTIVATE command.

REACTIVATE
Shows help on the VARY TCPIP,, SYSPLEX,REACTIVATE command.

QUIesce
Shows help on the VARY TCPIP,, SYSPLEX,QUIESCE commands.

RESUME
Shows help on the VARY TCPIP,, SYSPLEX,RESUME commands.
Examples

To view the available help for NETSTAT, issue the following command:

```
d tcpip,,help,netstat
```

To get more information about the syntax of a particular Netstat command (for example, CONN), issue the following command:

```
d tcpip,,help,conn
```

To get more information about the syntax of a command (for example, START), issue the following command:

```
d tcpip,tcpa,help,start
```

where XDEVNAME is the device name.

DISPLAY TCPIP,,NETSTAT

Use the DISPLAY TCPIP,,NETSTAT command from an operator console to request Netstat information. For a detailed description of each report, see “Netstat report details and examples” on page 293. This command can display only 65 533 lines of output for each report. If the command cannot display all of the report output, the report is truncated and the END OF THE REPORT output line is not displayed. Instead, the following output line is displayed at the end of the report:

```
REPORT TRUNCATED DUE TO GREATER THAN 65533 LINES OF OUTPUT
```

You can use the MAX parameter or filter parameters to limit the number of records that are displayed for a report.
Notes:
1. The CLIent filter is valid only with ALL, ALLConn, BYTEinfo, COnn, and SOCKets.
2. The POrt filter is valid only with ALL, ALLConn, COnn, PORTList, SOCKets, VCRT, and VDPT.
3. The IPAddr filter is valid only with ALL, ALLConn, BYTEinfo, COnn, ND, RESCache, ROUTe, SOCKets, VCRT, VDPT, and VIPADCFG.
4. The NOTN3270 filter is valid only with ALL, ALLConn, BYTEinfo, COnn, and SOCKets.
5. The IPPort filter is valid only with ALL, ALLConn, COnn, SOCKets, VCRT, and VDPT.
6. The APPLD filter is valid only with ALL, ALLConn, and COnn.
7. The SMCID filter is valid only with ALL, ALLConn, COnn, and DEvlinks.
8. The CONNType filter is valid only with ALLConn and COnn.
9. The INTFName filter is valid only with DEvlinks and H0me.
10. The valid protocol values are TCP and UDP.
11. The DNSAddr select string is valid only with RESCache.
12. The HOSTName select string is valid only with RESCache.
13. The valid protocol values are IP, ICMP, TCP, and UDP.
14. If the MAX parameter is not specified on the command, the default value for the MAX parameter is the value of the MAXRECS parameter on the GLOBALCONFIG profile statement.

Parameters

Note: The minimum abbreviation for each parameter is shown in uppercase letters.

Netstat
Request NETSTAT information.

ACCess,NETWork
Displays information about the network access tree in TCP/IP.

ALL
Displays detailed information about TCP connections and UDP sockets, including some that were recently closed.

SERVER
Provides detailed information only for TCP connections that are in the listen state.

ALLConn
Displays information for all TCP/IP connections, including recently closed ones.
**APPLDATA**
Displays application data in the output report.

**ARp**
Displays ARP cache information.

**netaddr**
This field has a maximum length of 15. Format is nnn.nnn.nnn.nnn where nnn is in the range 0 - 255. You must code all the triplets. No wildcards are allowed.

**BYTEinfo**
Displays the byte-count information about each active TCP connection and UDP socket. At the end of the report, the number of records written and the total number of records are displayed. The total number of records represents all UDP sockets and all TCP connections, not just active TCP connections.

**IDLETIME**
Displays the idle time for each connection.

**CACHinfo**
Displays information about Fast Response Cache Accelerator statistics. Statistics are displayed for each listening socket configured for Fast Response Cache Accelerator support. There is one section displayed per socket.

**CONFIG**
Displays TCP/IP configuration data.

**COnn**
Displays information about each active TCP/IP connection. At the end of the report, the number of records written and the total number of records are displayed. The total number of records represents all UDP sockets and all TCP connections, not just active TCP connections.

**APPLDATA**
Displays application data in the output report.

**SERVER**
Displays detailed information about TCP connections in the listen state.

**DEFADDRT**
Displays the policy table for IPv6 default address selection.

**DEvlinks**
Displays information about interfaces in the TCP/IP address space.

**PNETID=pnetid**
Displays information about interfaces for the specified physical network ID (pnetid). If an asterisk (*) is specified for the PNETID value, all interfaces with a PNETID are displayed. This modifier is mutually exclusive with the SMC modifier.

**SMC**
Displays only Shared Memory Communications (SMC) information.
- For Shared Memory Communications over Remote Direct Memory Access (SMC-R), displays information only about RDMA network interface card (RNIC) interfaces and their associated SMC-R link groups and SMC-R links.
- For Shared Memory Communications - Direct Memory Access (SMC-D), displays information only about internal shared memory (ISM) interfaces and their associated SMC-D links.

This modifier is mutually exclusive with the PNETID modifier.

**Tip:** If the INTFName/-K filter is specified with the SMC modifier, the SMC-R link group information is not displayed.

**HOme**
Displays the home list.

**IDS**
Displays information about intrusion detection services.
**SUMmary**
Displays summary information about intrusion detection services.

**PROTocol=**protocol
Displays information about intrusion detection services for the specified protocol. The valid protocols are TCP and UDP.

**ND**
Displays IPv6 Neighbor Discovery cache information.

**PORTList**
Displays the list of reserved ports and the port access control configuration for unreserved ports. Configure port access control for unreserved ports by specifying PORT profile statements with the port number value replaced by the keyword UNRSV. For more information about port access control, see port access control information in z/OS Communications Server: IP Configuration Guide.

For ports that are reserved by the PORTRANGE profile statement, only one output line is displayed for each range.

**RESCache**
Displays information about the operation of the system-wide resolver cache. This information is not specific to the TCP/IP stack whose name was specified on the D TCPIP command. Statistical information, such as number of record entries or number of cache queries, can be retrieved, or detailed information about some or all of the cache entries can be retrieved. Resolver caching is configured using resolver configuration statements in the resolver setup file. For more information about resolver caching, see details about resolver caching in z/OS Communications Server: IP Configuration Guide.

**DETAIL**
Display detailed information for all unexpired entries that are currently in the resolver cache. This information can include the following contents:
- Host-name-to-IP address entries from resolver forward lookups
- IP-address-to-host-name entries from resolver reverse lookups
- Negative entries included in both forward and reverse lookup tables

**NEGative**
Display detailed information for all negative cache entries in the resolver cache.

**SUMmary**
Display general system statistics for resolver cache operations. This is the default report for the RESCACHE report option.

**DNS**
Display general system statistics for resolver cache operations, plus individual statistics for each DNS name server that has provided information that is currently stored in the cache.

**Result:** Using the DETAIL modifier might cause a large amount of data to be displayed from the MVS console. As an alternative, consider using either the z/OS UNIX shell or TSO version of the command when you have large amount of resolver cache information.

**ROUTE**
Displays routing information. For a complete description of ROUTe, see “Netstat ROUTe/-r report” on page 484.

**Note:** Static routes over deleted interfaces are removed from the main routing table and therefore do not appear in the reports generated for the main routing table. Loopback routes are displayed as well as implicit (HOME list) routes.

**ADDRTYPE**
Displays routing information.

**IPV4**
Displays IPv4 routing information. This parameter is mutually exclusive with the RADV parameter.
IPV6
Displays IPv6 routing information.

DETAIL
Displays the preceding information plus the metric or cost of use for the route, and displays the following MVS-specific configured parameters for each route:

- Maximum retransmit time
- Minimum retransmit time
- Round-trip gain
- Variance gain
- Variance multiplier

This parameter is mutually exclusive with the QDIOACCEL and IQDIO parameters.

PR
Displays policy-based routing tables. This parameter is mutually exclusive with the QDIOACCEL and IQDIO parameters.

ALL
Displays all policy-based routing tables.

prname
Displays the policy-based routing table that has the name prname.

Restriction: Only active policy-based routing tables can be displayed with the Netstat ROUTe command. A policy-based routing table is active if an active routing rule and its associated action reference the policy-based routing table. You can display both active and inactive policy-based routing tables by using the pasearch command. For more information, see “The z/OS UNIX pasearch command: Display policies” on page 749.

QDIOACCEL
Displays routes that are eligible for accelerated routing by using the QDIO Accelerator or HiperSockets Accelerator. See information about QDIO Accelerator and efficient routing using HiperSockets Accelerator in z/OS Communications Server: IP Configuration Guide for more details. This parameter is mutually exclusive with the DETAIL, PR, RADV, and RSTAT parameters.

IQDIO
Displays routes that are eligible for accelerated routing by using the QDIO Accelerator or HiperSockets Accelerator. See information about QDIO Accelerator and efficient routing using HiperSockets Accelerator in z/OS Communications Server: IP Configuration Guide for more details. This parameter is mutually exclusive with the DETAIL, PR, RADV, and RSTAT parameters.

RADV
Displays all of the IPv6 routes that are added based on information received in router advertisement messages. All IPv6 router advertisement routes are displayed regardless of whether they are currently used for routing. The flags and reference count are not displayed on the report. This parameter is mutually exclusive with the RSTAT, QDIOACCEL, IQDIO, and ADDRTYPE=IPV4 parameters.

RSTAT
Displays all of the static routes that are defined as replaceable. All defined replaceable static routes are displayed without regard to whether they are currently being used for routing. The flags and reference count are not displayed on the report. The MTU value that is displayed in this report is the value that was defined by using the MTU parameter in the ROUTE statement, or the default value for the specified interface type. This parameter is mutually exclusive with the RADV, QDIOACCEL, and IQDIO parameters.

SOCKets
Displays information for open TCP or UDP sockets that are associated with a client name.

SRCIP
Displays information for all job-specific and destination-specific source IP address associations on the TCP/IP address space.

STATS
Displays TCP/IP statistics for each protocol.

PROTOCOL=protocol
Displays statistics for the specified protocol. The valid protocols are IP, ICMP, TCP, and UDP.
Result: If you specify TCP, you get TCP, SMC-R, and SMC-D statistics.

TTLS
Displays Application Transparent Transport Layer Security (AT-TLS) information for TCP protocol connections.

COnn=connid
Displays the name of the AT-TLS policy rule and the names of the associated actions for the specified connection. The specified connid is a number assigned by the TCP/IP stack to uniquely identify a socket entity. You can determine the connid from the Conn column in the “Netstat ALLConn/-a report” on page 334.

DETAIL
Displays the AT-TLS policy rule and the associated actions for the specified connection.

GRoup
Displays summary information for AT-TLS groups. AT-TLS groups are defined using the TTLSGroupAction policy statement. The AT-TLS group exists as long as the TTLSGroupAction statement is current or as long as there are active connections using the group.

DETAIL
Displays detailed information for AT-TLS groups.

VCRT
Displays the dynamic VIPA Connection Routing Table information.

DETAIL
For each entry that represents an established dynamic VIPA connection or an affinity created by the passive-mode FTP, displays the preceding information plus the policy rule, action information, routing information, and acceleration information.

For each entry that represents an affinity created by the TIMEDAFFINITY parameter on the VIPADISTRIBUTE profile statement, displays the preceding information plus the affinity related information.

VDPT
Displays the dynamic VIPA Destination Port Table information.

DETAIL
If this optional keyword is specified, when the table for TCP/IP stacks is displayed, the output contains policy action information, target responsiveness values, and a Workload Manager weight value (W/Q), on a separate line. If the DETAIL keyword is not specified, the output does not contain this information.

When the table for non-z/OS targets is displayed, the output contains the weight of the non-z/OS target. If the DETAIL keyword is not specified, the output does not contain this information.

VIPADCFG
Displays the current dynamic VIPA configuration information for a host.

VIPADyn
Displays the current dynamic VIPA and VIPAROUTE information for a local host.

DVIPA
Displays the current dynamic VIPA information only.

VIPAROUTE
Displays the current VIPAROUTE information only.

APPLD=appldata
Filter the output of the ALL, ALLConn, and COnn reports by using the specified application data appldata. The maximum size for this field is 40 alphanumeric characters.

CLIent=client
Specifies a client name that is used to limit the ALL, ALLConn, BYTEinfo, COnn, and SOCKets responses. Maximum size for this field is 8 alphanumeric characters (plus special characters #, $, and @). Wildcards (*) and (?) can appear in any position.
**CONNType**
Specifies a connection type to limit the ALLConn and COnn responses.

**NOTTLSPolicy**
Displays only those connections that have not been matched to an Application Transparent Transport Layer Security (AT-TLS) rule. This includes connections that were established while the AT-TLS function was disabled (NOTTLS is specified or in effect by default on the TCPCONFIG statement) and all connections that are not using the TCP protocol. For TCP connections that were established while the AT-TLS function was enabled, this includes the following connections:
- Connections for which AT-TLS policy lookup has not yet occurred (typically the first send or receive has not yet been issued).
- Connections for which AT-TLS policy lookup has occurred but for which no matching rule was found.

**TTLSPolicy**
Displays only connections that match an Application Transparent Transport Layer Security (AT-TLS) rule. This includes only connections that were established while the AT-TLS function was enabled, for which an AT-TLS policy rule was found with the value TTLSEnabled ON or TTLSEnabled OFF specified in the TTLSGroupAction. Responses can be further limited on AT-TLS connection type. AT-TLS connection type has the following values:

- **CURRENT**
  Displays only connections that are using AT-TLS where the rule and all actions are still available to be used for new connections.

- **GROUP=groupid**
  Displays only connections that are using the AT-TLS group specified by the groupid value. The specified groupid value is a number assigned by the TCP/IP stack to uniquely identify an AT-TLS group. You can determine the groupid value from the GroupID field in the Netstat TTLS GROUP report.

- **STALE**
  Displays only connections that are using AT-TLS where the rule or at least one action is no longer available to be used for new connections.

**DNSAddr=dnsipaddr**
Filter the output of the RESCache report using the specified DNS IP address dnsipaddr.

**HOSTName=hostname**
Filter the output of the RESCache report using the specified host name value hostname.

**INTFName=intfname**
Specifies a name that you can use to limit the DEvlinks and HOme report options to a single interface or to a group of interfaces.

For the DEvlinks and HOme report options, the INTFName filter can be one of the following values:
- The link name of a network interface that was configured on a LINK profile statement (this option selects one interface).
- The interface name of a network interface that was configured on an INTERFACE profile statement (this option selects one interface).
- The port name of an OSA-Express feature in QDIO mode. This is the name that is specified on the PORTNAME keyword in the TRLE (this option selects all interfaces that are associated with the OSA-Express port, including an OSAENTA trace interface).
- The name of a HiperSockets TRLE (this option selects all interfaces that are associated with the HiperSockets TRLE).

Additionally, for the DEvlinks report option, the INTFName filter can also be the interface name of an OSAENTA trace interface, which is EZANTAportname, where the portname value is the name that is specified on the PORTNAME keyword in the TRLE for the OSA-Express port that is being traced (this option selects one interface). The INTFName filter is not supported for the DEvlinks report if the PNETID modifier is specified.
IPAddr
Provides the option response on specified ipaddr, ipaddr/subnetmask or ipaddr/prefixlength

ipaddr
Provides the response for ALL, ALLConn, BYTEinfo, CONn, ND, RESCache, ROUTe, SOCKets, VCRT, and VDPT on the specified IP address (ipaddr). Except for the RESCache option, with IPv4 addresses, the default subnet mask 255.255.255.255 is used; for IPv6 addresses, the default prefix length 128 is used. The RECache option does not support any default subnet mask or default prefix length.

ipaddr/subnetmask
Provides the response for ALL, ALLConn, BYTEinfo, CONn, ROUTe, SOCKets, VCRT, and VDPT on the specified IP address with specified subnet mask (ipaddr/subnetmask). The IP address (ipaddr) in this format must be an IPv4 IP address.

ipaddr/prefixlength
Provides the response for ALL, ALLConn, BYTEinfo, CONn, ND, ROUTe, SOCKets, VCRT, and VDPT on the specified IP address and prefix length. For IPv4 addresses, the prefix length range is 1 - 32. For IPv6 addresses, the prefix length range is 1 - 128.

IPPort=ipaddr+portnum
Specifies the IP address and port that are used to limit the ALL, ALLConn, CONn, SOCKets, VCRT, and VDPT report options to the TCP local endpoints, TCP remote endpoints, or the UDP local endpoint. The specified IPv4 ipaddr value can be up to 15 characters in length, denoting a single IPv4 IP address; the specified IPv6 ipaddr value can be up to 45 characters in length, denoting a single IPv6 IP address. For TCP, the filter values ipaddr and portnum match any combination of the local and remote IP address and local and remote port.

NOTN3270
Provides the response of ALL, ALLConn, BYTEinfo, CONn, and SOCKets, excluding TN3270E Telnet server connections.

Port=portnum
Specifies a port that is used to limit the ALL, ALLConn, CONn, PORTList, SOCKets, VCRT, and VDPT options. The port value range, for all options except the PORTLIST option, is 0 - 65535. No wildcards are allowed. For the PORTList option only, the port value range is 1 - 65535 and you can also filter on the keyword UNRSV.

SMCID=smcid
Specifies a Shared Memory Communications identifier that is used to limit the ALL, ALLConn, CONn, and DEvlinks report options. The identifier can represent an SMC-R link, SMC-R link group, or SMC-D link. If an asterisk (*) is specified for the filter value, Netstat provides output only for entries that are associated with SMC-R links, SMC-R link groups, and SMC-D links. The SMCID filter is not supported for the DEvlinks report if the PNETID modifier is specified.

MAX=recs
The maximum number of records for which Netstat displays information on the console. The value recs indicates the number of records that are displayed on each report. For example, for the connection-related reports, a record is a TCP connection or listener, or a UDP endpoint. Valid recs values are in the range 1 - 65535. Specify an asterisk (*) to display information for all records on the console. If the number of output lines exceeds the maximum number of lines for a multi-line WTO (Write to Operator) message, the report output is truncated.

This parameter applies to the ACCess, ALL, ALLConn, ARP, BYTEinfo, CACHinfo, CONn, DEFADDRT, DEvlinks, HOMe, IDS, ND, PORTList, RESCache, ROUTe, SOCKets, SRCIP, VCRT, VDPT, VIPADCFG, and VIPADyn reports. The following list shows the descriptions of variations in support for the parameter for specific reports:

- DEvlinks report - The parameter and the values in the n OF m RECORDS DISPLAYED output line apply only to network interfaces that are defined with DEVICE or INTERFACE profile statements. These parameters and values do not apply to the LAN group or to the OSA-Express network traffic analyzer information.
• HOME - The parameter and the values in the $n$ OF $m$ RECORDS DISPLAYED output line apply to the IP addresses that are displayed by the report.

If this parameter is specified, it overrides the MAXRECS parameter value on the GLOBALCONFIG profile statement. If this parameter is not specified, the number of records value used for the report is one of the following values:

• The MAXRECS parameter value that is specified on the GLOBALCONFIG TCP/IP profile statement.
• If the MAXRECS parameter is not specified, the MAXRECS parameter default value of 100 records.

The number of records that are displayed and the total number of records that could have been displayed are listed at the end of the report in the following output line, where $n$ is the number of records that are displayed and $m$ is the total number of records that could be displayed.

$n$ OF $m$ RECORDS DISPLAYED

If the report output is truncated, the $n$ value specifies the number of records for which all output lines are successfully displayed.

Examples

DISPLAY TCPIP,,NETSTAT,ACCESS,NETWORK report

Use the DISPLAY TCPIP,,NETSTAT,ACCESS,NETWORK[,ipaddr] command to display the current NETACCESS profile statement configuration and associated security product information. When you specify the optional ipaddr value, the report is limited to the single NETACCESS entry, if any, that is currently being used by the stack for the specified IP address.

Parameters

ipaddr
A fully qualified IPv4 or IPv6 IP address. Wildcard IP address values are not supported. This value is used to display the NETACCESS profile statement entry that governs the specified ipaddr value.

Examples

Not IPv6 enabled (SHORT format):

<table>
<thead>
<tr>
<th>NETWORK ACCESS INFORMATION</th>
<th>INBOUND: YES OUTBOUND: YES</th>
<th>CACHE: ALL</th>
</tr>
</thead>

Report field descriptions

For a SHORT format report

**INBOUND**
Indicates whether Network Access Control is active for socket commands associated with inbound processing (accept, bind, and all variants of receive).

- **Yes**
  - Indicates that INBOUND is in effect (the INBOUND parameter was defined in the NETACCESS profile statement).

- **No**
  - Indicates that INBOUND is not in effect (the NOINBOUND parameter was defined or is in effect by default in the NETACCESS profile statement).

**OUTBOUND**
Indicates whether Network Access Control is active for socket commands associated with outbound processing (connect and all variants of send).

- **Yes**
  - Indicates that OUTBOUND is in effect (the OUTBOUND parameter was defined or is in effect by default in the NETACCESS profile statement).

- **No**
  - Indicates that OUTBOUND is not in effect (the NOOUTBOUND parameter was defined in the NETACCESS profile statement).

**CACHE**
Indicates the level of caching that is in effect for the Network Access Control access checking.

- **ALL**
  - Indicates that when a SAF call is made to check a user's access to a security zone, the result is cached regardless of whether access is permitted or denied.

- **PERMIT**
  - Indicates that when a SAF call is made to check a user's access to a security zone, the result is cached when access is permitted, but not when access is denied.

- **SAME**
  - Indicates that when a SAF call is made to check a user's access to a security zone, the result is cached when access is permitted, but not when access is denied. In addition, if the user associated with the socket changes or if the IP address being accessed changes from the previous packet received or sent over the socket, a new SAF call is made for a previously permitted security zone.

**SAF NAME**
The final qualifier of a security product resource name. The maximum length is eight characters.

**PRFNM**
The security product profile covering this network security zone resource name. If no profile name covers this resource name or the SERVAUTH resource class is not active, the value NONE is displayed.
SECLABEL
The security label configured for the security product profile. If none is configured or the SECLABEL resource class is not active, the value NONE is displayed.

NETWORK PREFIX AND ADDRESS MASK
Can be one of the following case:

- The IPv4 IP address configured on a NETACCESS statement entry. It is logically ANDed with the ADDRESS MASK value to create the network address for which access control is required.
- The DEFAULTHOME entry configured on a NETACCESS statement entry. This entry is used for all IP addresses local to this stack that are not covered by a specific entry. This entry does not have an ADDRESS MASK.
- The DEFAULT entry configured on a NETACCESS statement entry. This entry is used for all IP addresses that are not covered by any other entry. This entry does not have an ADDRESS MASK.

For a LONG format report
INBOUND
Indicates whether Network Access Control is active for socket commands associated with inbound processing (accept, bind, and all variants of receive).

Yes
Indicates that INBOUND is in effect (the INBOUND parameter was defined in the NETACCESS profile statement).

No
Indicates that INBOUND is not in effect (the NOINBOUND parameter was defined or is in effect by default in the NETACCESS profile statement).

OUTBOUND
Indicates whether Network Access Control is active for socket commands associated with outbound processing (connect and all variants of send).

Yes
Indicates that OUTBOUND is in effect (the OUTBOUND parameter was defined or is in effect by default in the NETACCESS profile statement).

No
Indicates that OUTBOUND is not in effect (the NOOUTBOUND parameter was defined in the NETACCESS profile statement).

CACHE
Indicates the level of caching that is in effect for the Network Access Control access checking.

ALL
Indicates that when a SAF call is made to check a user's access to a security zone, the result is cached regardless of whether access is permitted or denied.

PERMIT
Indicates that when a SAF call is made to check a user's access to a security zone, the result is cached when access is permitted, but not when access is denied.

SAME
Indicates that when a SAF call is made to check a user's access to a security zone, the result is cached when access is permitted, but not when access is denied. In addition, if the user associated with the socket changes or if the IP address being accessed changes from the previous packet received or sent over the socket, a new SAF call is made for a previously permitted security zone.

SAF NAME
The final qualifier of a security product resource name. The maximum length is eight characters.

NETWORK PREFIX AND PREFIX LENGTH
Can be one of the following case:
• The IPv4 or IPv6 IP address and prefix length configured on a NETACCESS statement entry. (If an IPv4 network mask was configured, the prefix length is derived from it.) The prefix length specifies the left-most number of bits of the IP address to use to create the network address for which access control is required.

• The DEFAULTHOME entry configured on a NETACCESS statement entry. This entry is used for all IP addresses local to this stack that are not covered by a specific entry. This entry does not have a PREFIX LENGTH.

• The DEFAULT entry configured on a NETACCESS statement entry. This entry is used for all IP addresses that are not covered by any other entry. This entry does not have a PREFIX LENGTH.

PRFNM
The security product profile covering this network security zone resource name. If no profile name covers this resource name or the SERVAUTH resource class is not active, the value NONE is displayed.

SECLABEL
The security label configured for the security product profile. If none is configured or the SECLABEL resource class is not active, the value NONE is displayed.

DISPLAY TCPIP,,OMPROUTE
Use the DISPLAY TCPIP,,OMPROUTE command to display OMPROUTE configuration and state information.

**Format**

```
Display TCPIP,,OMProute

**Parameters**

*proname*

The name of the member in a procedure library that was used to start the associated TCP/IP stack.

**OPTIONS**

Specifies that the global configuration options information is to be displayed.

**OSPF**

Specifies that OSPF information is to be displayed.
LIST
Specifies that OSPF information is to be displayed as defined in the OMPROUTE configuration file.

ALL
Displays a comprehensive list of all configuration information.

AREAS
Displays all information concerning configured OSPF areas and their associated ranges.

Interfaces
Displays, for each OSPF interface, the IP address and configured parameters as coded in the OMPROUTE configuration file.

NBMA
Displays the interface address and polling interval related to interfaces connected to non-broadcast multiaccess networks.

NeighBoRS
Displays the configured neighbors on non-broadcast networks.

VLINKS
Displays all virtual links that have been configured with this router as an endpoint.

LSA
Displays the contents of a single link state advertisement contained in the OSPF database.
A link state advertisement is defined by its
• Link state type (LSTYPE=ls_type)
• Link state ID (LSID=lsid)
• Advertising router (ORIGINator=ad_router)
There is also a separate link state database for each OSPF area. AREAID=area_id on the command line tells the software which database you want to search. If you do not specify which area to search, the backbone (0.0.0.0) area is searched. The different kinds of advertisements, which depend on the value given for link-state-type, are:
Router links (LSTYPE=1)
Describe the set of interfaces attached to a router.

Network links (LSTYPE=2)
Describe the set of routers attached to a network.

Summary link, IP network (LSTYPE=3)
Describe interarea routes to networks.

Summary link, ASBR (LSTYPE=4)
Describe interarea routes to AS boundary routers.

AS external link (LSTYPE=5)
Describe routes to destinations external to the Autonomous System.

Note: The ORIGINATOR value must be specified only for link-state-types 3, 4, and 5. An AREAID value must be specified for link-state-types 1-4.

Link State IDs, originators (specified by their router IDs), and area IDs take the same format as IP addresses. For example, the backbone area would be entered as 0.0.0.0.

AREASUM
Displays the statistics and parameters for all OSPF areas that are attached to the router.

EXTERNAL
Displays the AS external advertisements belonging to the OSPF routing domain. One line is printed for each advertisement.

DATABASE,AREAID=area_id
Displays a description of the contents of a particular OSPF area link state database. AS external advertisements are omitted from the display. A single line is printed for each advertisement. If an AREAID value is not specified, the database from area 0.0.0.0 is displayed.
DBSIZE
Displays the number of link state advertisements that are currently in the link state database, categorized by type.

InterFace,NAME=if_name
Displays current run-time statistics and parameters related to OSPF interfaces. If a NAME= parameter is omitted, a single line is printed that summarizes each interface. If a NAME= parameter is specified, detailed statistics for that interface are displayed.

Neighbor,IPADDR=ip_addr
Displays the statistics and parameters that are related to OSPF neighbors. If an IPADDR= parameter is omitted, a single line is printed that summarizes each neighbor. If an IPADDR= parameter is given, detailed statistics for that neighbor are displayed.

Routers
Displays all routes to area-border routers and autonomous system boundary routers that have been calculated by OSPF and are currently present in the routing table.

Statistics
Displays statistics generated by the OSPF routing protocol. The statistics indicate how well the implementation is performing, including its memory and network utilization. Many of the displayed fields are confirmation of the OSPF configuration.

RIP
Specifies that RIP information is to be displayed.

LIST
Specifies that RIP information is to be displayed as defined in the OMPROUTE configuration file.

ALL
Display all RIP-related configuration information.

InterFaceS
Display IP addresses and configured parameters for each RIP interface.

ACCEPTED
Displays the routes to be unconditionally accepted, as configured with the ACCEPT_RIP_ROUTE statement.

InterFace,NAME=if_name
Displays statistics and parameters related to RIP interfaces. If a NAME= parameter is omitted, a single line is printed that summarizes each interface. If a NAME= parameter is given, detailed statistics for the specified interface (if_name) are displayed.

FILTERS
Displays the global RIP filters.

GENERIC
Specifies that IPv4 information not related to a specific routing protocol is to be displayed.

LIST
Specifies that information is to be displayed as defined in the OMPROUTE configuration file.

ALL
Displays all IPv4 information that is not related to a specific routing protocol.

InterFaceS
Lists all generic IPv4 interfaces that are defined to OMPROUTE using INTERFACE statements.

InterFace
Displays statistics and parameters related to IPv4 generic interfaces that are known to TCP/IP.

RTTABLE
Displays routes in an OMPROUTE IPv4 routing table. If the DISPLAY TCPIP,,OMPROUTE command is issued without the PRtable option, routes from the main routing table are displayed.
DEST=ip_addr
Displays the routes to a particular destination. When multiple equal-cost routes exist, use this option to obtain a list of the next hops. You cannot use this option with the DELETED option.

PRtable=ALL
Displays routes in all of the OMPROUTE IPv4 policy-based routing tables. The dynamic routing parameters configured to the Policy Agent for a table are displayed following the routes for the table.

PRtable=prname
Displays routes in the specified OMPROUTE IPv4 policy-based routing table. The dynamic routing parameters that are configured to the Policy Agent for the table are displayed following the routes for the table.

DELETED
Displays information about routes that have been deleted from the OMPROUTE routing table and that have not been replaced. You cannot use this option with the DEST=ip_addr option.

Results:

• If the RIP protocol is running, deleted routes are displayable for only 3 minutes after deletion. After 3 minutes have elapsed, they become undisplayable.
• If a policy-based routing table is configured to the Policy Agent with no dynamic routing parameters, OMPROUTE has no knowledge of that route table. The route table does not appear in the display of OMPROUTE route tables.
• Only active policy-based routing tables appear in the display of OMPROUTE route tables. A policy-based routing table is active if it is referenced by an active routing rule and its associated action.
• The RTTABLE parameter displays the contents of the working tables that are used by OMPROUTE; it does not display the TCP/IP routing tables. The OMPROUTE routing tables might contain information that is different from the information in the TCP/IP routing tables. For more information about displaying the contents of the TCP/IP routing tables, see “DISPLAY TCPIP, NETSTAT” on page 9.

IPV6OSPF
Specifies that IPv6 OSPF information is to be displayed.

 ALL
Displays a comprehensive list of IPv6 OSPF information.

 AREASUM
Displays the statistics and parameters for all IPv6 OSPF areas attached to the router.

 InterFace,NAME=if_name or InterFace,ID=if_id
Displays current run-time statistics and parameters related to IPv6 OSPF interfaces. If the NAME= and ID= parameters are omitted, a single line is printed that summarizes each interface. If the NAME= or ID= parameter is specified, detailed statistics for that interface are displayed.

 VLINK,ENDPT=router-id
Displays current run-time statistics and parameters related to IPv6 OSPF virtual links. If the ENDPT= parameter is omitted, a single line is printed that summarizes each virtual link. If the ENDPT= parameter is specified, detailed statistics for that virtual link are displayed.

 NeighBoR,ID=router-id,IFNAME=if_name
Displays the statistics and parameters related to IPv6 OSPF neighbors.

 • If the ID= parameter is omitted, a single line is printed that summarizes each neighbor.
 • If the ID= parameter is given, detailed statistics for that neighbor are displayed.
 • If the neighbor specified by the ID= parameter has more than one neighbor relationship with OMPROUTE (for example if there are multiple IPv6 OSPF links connecting them), the IFNAME= parameter can be used to specify which link’s adjacency to examine (for an adjacency over a virtual link, specify IFNAME=*).

 DBSIZE
Displays the number of link state advertisements that are currently in the IPv6 OSPF link state database, categorized by type.
LSA
Displays the contents of a single link state advertisement contained in the IPv6 OSPF database. A link state advertisement is defined by the following information:

- Link state type (LSTYPE=ls_type, where ls_type is one of the listed hexadecimal link state type values)
- Link state ID (LSID=lsid)
- Advertising router (ORIGinator=ad_router)

Each interface has its own set of link LSAs (LSTYPE=0008). IFNAME=interface_name on the command line indicates which link's LSA you want to display.

There is also a separate link state database for each IPv6 OSPF area. AREAID=area_id on the command line indicates which database you want to search. If you do not specify which area to search, the backbone (0.0.0.0) area is searched. The following list shows different kinds of advertisements, which depend on the value given for link state type:

**Router LSA (LSTYPE=2001)**
The complete collection describes the state and cost of the router's interfaces to the area. Each router in an area originates one or more Router LSAs.

**Network LSA (LSTYPE=2002)**
Originated by the designated router of each multiaccess link (for example, LAN) in the area which supports two or more routers. Describes the set of routers that are attached to the link, including the designated router.

**Inter-Area Prefix LSA (LSTYPE=2003)**
Originated by an area border router. Describes the route to an IPv6 address prefix that belongs to another area.

**Inter-Area Router LSA (LSTYPE=2004)**
Originated by an area border router. Describes the route to an AS boundary router that belongs to another area.

**AS External LSA (LSTYPE=4005)**
Originated by an AS boundary router. Describes the route to a destination that is external to the IPv6 OSPF autonomous system.

**Link LSA (LSTYPE=0008)**
Originated by routers for each link to which they are attached. Provides the router's link-local address, provides a list of IPv6 address prefixes for the link, and asserts a set of options for the network LSA that are originated for the link.

**Intra-Area Prefix LSA (LSTYPE=2009)**
Originated by routers to advertise one or more IPv6 address prefixes that are associated with the router itself, an attached stub network segment, or an attached transit network segment.

**Requirements:**

- Specify the AREAILD for all link state types except AS External LSA.

  **Note:** If an AREAILD value is not specified, the backbone area default value (0.0.0.0) is used.

- Specify the IFNAME value for Link LSAs (LSTYPE=0008).

- Originators (specified by their router IDs) and area IDs are specified in dotted-decimal format. For example, the backbone area is entered as 0.0.0.0.

EXTERNAL
Displays the AS external LSAs belonging to the IPv6 OSPF routing domain. One line is printed for each advertisement.

DATABASE, AREAILD=area_id
Displays the contents of a particular IPv6 OSPF area link state database. AS external advertisements are omitted from the display. A single line is printed for each advertisement. If an AREAILD value is not specified, the database from area 0.0.0.0 is displayed.
ROUTERS
Displays all routes to other routers that have been calculated by IPv6 OSPF and are currently present in the routing table.

STATISTICS
Displays statistics that are generated by the IPv6 OSPF routing protocol. The statistics indicate how well the implementation is performing, including its memory and network utilization.

IPV6RIP
Specifies that IPv6 RIP information is to be displayed.

ALL
Displays all IPv6 RIP-related information.

ACCEPTED
Displays the routes that are to be unconditionally accepted, as configured with the IPV6_ACCEPT_RIP_ROUTE statement.

Interface,NAME=if_name
Displays statistics and parameters that are related to IPv6 RIP interfaces. If the NAME=if_name parameter is omitted, a single line is printed that summarizes each interface. If the NAME=if_name parameter is given, detailed statistics for the specified interface (if_name) are displayed.

FILTERS
Displays the global IPv6 RIP filters.

GENERIC6
Specifies that IPv6 information not related to a specific dynamic routing protocol is to be displayed.

ALL
Displays all IPv6 information that is not related to a specific routing protocol.

Interface,NAME=if_name
Displays statistics and parameters related to IPv6 generic interfaces that are known to TCP/IP or defined to OMPROUTE with IPV6_INTERFACE statements. If the NAME=if_name parameter is omitted, a single line is printed that summarizes each interface. If the NAME=if_name parameter is given, detailed statistics for the specified interface (if_name) are displayed.

RT6TABLE
Displays all the routes in an OMPROUTE IPv6 routing table. If the DISPLAY TCPIP,,OMPROUTE command is issued without the PRtable option, routes from the main routing table are displayed.

DEST=ip_addr/prefixlen
Displays information about a particular route. When multiple equal-cost routes exist, use this option to obtain a list of the next hops. You cannot use this option with the DELETED option.

PRtable=ALL
Displays routes in all of the OMPROUTE IPv6 policy-based routing tables. The dynamic routing parameters that are configured to the policy agent for a table are displayed following the routes for the table.

PRtable=prname
Displays routes in the specified OMPROUTE IPv6 policy-based routing table. The dynamic routing parameters that are configured to the policy agent for the table are displayed following the routes for the table.

DELETED
Displays information about IPv6 routes that have been deleted from the OMPROUTE routing table and that have not been replaced. You cannot use this option with the DEST=ip_addr/prefixlen option.

Results:
• If the IPv6 RIP protocol is running, deleted routes are displayable for only 3 minutes after deletion. After 3 minutes have elapsed, they become undisplayable.
• If a policy-based routing table is configured to the policy agent with no dynamic routing parameters, OMPROUTE has no knowledge of that route table. The routing table is not included in the display of OMPROUTE route tables.

• Only the active policy-based routing tables are included in the display of OMPROUTE route tables. A policy-based routing table is active if an active routing rule and its associated action reference the policy-based routing table.

• The RT6TABLE parameter displays the contents of the working tables that are used by OMPROUTE; it does not display the TCP/IP routing tables. The OMPROUTE routing tables might contain information that is different from the information in the TCP/IP routing tables. For more information about displaying the contents of the TCP/IP routing tables, see "DISPLAY TCPIP,,NETSTAT" on page 9.

**Examples**

The following information provides details on the types of data that can be displayed as well as examples of the generated output.

**Note:** All commands that include the LIST subparameter indicate that the information being displayed is configured information only and does not necessarily mean that the information is actually currently being used by OMPROUTE. To display actual information in current use, use related commands to display current, run-time statistics, and parameters. There are cases when the configured information does not match the actual information that is in use as a result of some undefined or unresolved information in OMPROUTE configuration.

For example, undefined interfaces or parameters in OMPROUTE configuration or incorrect sequence of dynamic reconfiguration using the MODIFY OMPROUTE,RECONFIG command might result in no update of the actual information. Information that is defined on wildcard interfaces is not displayed in the LIST commands; it is displayed in the corresponding nonLIST commands only when wildcard information is resolved to actual physical interfaces.

**Examples using the OPTIONS command**

The DISPLAY TCPIP,,tcpipjobname,OPTIONS command lists all OMPROUTE global configuration options information. The following contents show a sample output with an explanation of entries:

<table>
<thead>
<tr>
<th>EZZ8172I GLOBAL OPTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGNORE UNDEFINED INTERFACES: YES</td>
</tr>
</tbody>
</table>

**IGNORE UNDEFINED INTERFACES**

Indicates whether the processing of undefined interfaces is ignored.

**Examples using the OSPF command**

The following sections show the examples of using the OSPF command.

**All OSPF configuration information**

The DISPLAY TCPIP,,tcpipjobname,OMPROUTE,OSPF,LIST,ALL command lists all OSPF-related configuration information. A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>EZZ7832I GLOBAL CONFIGURATION 967</th>

---

**TRACE**

Displays the level of tracing that is currently in use by OMPROUTE for initialization and IPv4 routing protocols.

**DEBUG**

Displays the level of debugging that is currently in use by OMPROUTE for initialization and IPv4 routing protocols.

**SADEBUG LEVEL**

Displays the level of debugging that is currently in use by OMPROUTE OSPF SNMP subagent.

**STACK AFFINITY**

Displays the name of the stack on which OMPROUTE is running.

**OSPF PROTOCOL**

Indicates whether OSPF is enabled or disabled.

**EXTERNAL COMPARISON**

Displays the external route type that is used by OSPF when importing external information into the OSPF domain and when comparing OSPF external routes to RIP routes.

**AS BOUNDARY CAPABILITY**

Indicates whether the router will import external routes into the OSPF domain.

**IMPORT EXTERNAL ROUTES**

Indicates the types of external routes that are imported into the OSPF domain. Displayed only when AS Boundary Capability is enabled.

**ORIG DEFAULT ROUTE**

Indicates whether the router will originate a default route into the OSPF domain. The Originate Default Route is displayed only when AS Boundary Capability is enabled.

**DEFAULT ROUTE COST**

Displays the cost and type of the default route (if advertised). The Default Route Cost is displayed only when AS Boundary Capability is enabled and Orig Default Route value is Always.
DEFAULT FORWARD ADDR
Displays the forwarding address that is specified in the default route (if advertised). The Default Forwarding Address is displayed only when AS Boundary Capability is enabled and Orig Default Route value is Always.

LEARN HIGHER COST DFLT
Indicates the value of the LEARN_DEFAULT_ROUTE parameter of the AS_BOUNDARY_ROUTING configuration statement. This parameter is displayed only when AS Boundary Capability is enabled and Orig Default Route is Always.

DEMAND CIRCUITS
Indicates whether demand circuit support is available for OSPF interfaces.

DR MAX ADJ ATTEMPT
Specifies a threshold value for maximum number of adjacency attempts to a neighboring designated router. This value is used for reporting and controlling futile neighbor state loops. See the information about futile neighbor state loops in z/OS Communications Server: IP Configuration Guide.

The remainder of the DISPLAY TCPIP, tcpipjobname, OMPROUTE, OSPF, LIST, ALL output is described as follows:

Configured OSPF areas and ranges
The DISPLAY TCPIP, tcpipjobname, OMPROUTE, OSPF, LIST, AREAS command lists all information concerning configured OSPF areas and their associated ranges. A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>AREA ID</th>
<th>AUTYPE</th>
<th>STUB?</th>
<th>DEFAULT-COST</th>
<th>IMPORT-SUMMARIES?</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0.0.0</td>
<td>0=None</td>
<td>NO</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>2.2.2.2</td>
<td>0=None</td>
<td>NO</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

--AREA RANGES--
<table>
<thead>
<tr>
<th>AREA ID</th>
<th>ADDRESS</th>
<th>MASK</th>
<th>ADVERTISE?</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.2.2.2</td>
<td>9.167.200.0</td>
<td>255.255.255.0</td>

<tr>
<td>2.2.2.2</td>
<td>9.167.100.0</td>
<td>255.255.255.0</td>
<td>YES</td>
</tr>
</tbody>
</table>

AREA ID
Displays the area ID.

AUTYPE
Displays the method used for area authentication. The method Simple-pass means that a simple password scheme is being used for the area authentication. The method MD5 means that MD5 hash is being used for authentication.

STUB?
Indicates whether the area is a stub area.

DEFAULT COST
Displays the cost of the default route that is configured for the stub area.

IMPORT SUMMARIES?
Indicates whether summary advertisements are to be imported into the stub area.

Note: A stub area that does not allow summaries to be imported is sometimes referred to as a totally stubby area.

ADDRESS
Displays the network address for a given range within an area.

MASK
Displays the subnet mask for a given range within an area.

ADVERTISE?
Indicates whether a given range within an area is to be advertised into other areas.
Configured OSPF interfaces

The DISPLAY TCPIP, tcpipjobname, OMPROUTE, OSPF, LIST, INTERFACES command lists, for each OSPF interface, the IP address and configured parameters as coded in the OMPROUTE configuration file. (The keyword IFS can be substituted for INTERFACES.) A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>EZZ7833I INTERFACE CONFIGURATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP ADDRESS</td>
</tr>
<tr>
<td>9.168.100.3</td>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>DEMAND CIRCUIT PARAMETERS</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP ADDRESS</td>
</tr>
<tr>
<td>9.168.100.3</td>
</tr>
<tr>
<td>9.167.100.13</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>SUBNET ADVERTISEMENT PARAMETERS</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.168.100.3</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ADVERTISED VIPA ROUTES</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.169.100.0</td>
</tr>
</tbody>
</table>

**IP ADDRESS**
- Indicates the IP address of the interface.

**AREA**
- Indicates the OSPF area to which the interface attaches.

**COST**
- Indicates the ToS 0 cost (or metric) associated with the interface.

**RTRNS**
- Indicates the retransmission interval, which is the number of seconds between retransmissions of unacknowledged routing information.

**TRDLY**
- Indicates the transmission delay, which is an estimate of the number of seconds required to transmit routing information over the interface.

**PRI**
- Indicates the interface router priority, which is used when selecting the designated router.

**HELLO**
- Indicates the number of seconds between Hello packets sent from the interface.

**DEAD**
- Indicates the number of seconds after not having received an OSPF Hello packet, that a neighbor is declared to be down.

**DB_EX**
- Indicates the number of seconds to allow the database exchange to complete.

**DONOTAGE**
- Indicates whether the interface is configured as a demand circuit.

**HELLO SUPPRESSION**
- Indicates whether the interface is configured for hello suppression.

**POLL INTERVAL**
- Indicates the interval (in seconds) to be used when attempting to contact a neighbor when a neighbor relationship has failed, but the interface is available.

**SUBNET ADVERTISEMENT PARAMETERS**
- Lists the interfaces that are configured with the Subnet parameter containing a value other than NO. For VIPA interfaces this indicates advertisement of subnet or host routes that are being controlled. For real interfaces this indicates that SUBNET=YES has been coded.
**ADVERTISED VIPA ROUTES**
Lists the route destinations that OMPROUTE will advertise for locally owned VIPAs. These advertisements are controlled by the Advertise_VIPA_Routes or Subnet parameter on the OSPF_INTERFACE statement.

**Configured OSPF nonbroadcast, multiaccess networks**
The DISPLAY TCPIP, tcpipjobname, OMPROUTE, OSPF, LIST, NBMA command lists the interface address and polling interval related to interfaces connected to non-broadcast multi-access networks. A sample output follows:

<table>
<thead>
<tr>
<th>INTERFACE ADDR</th>
<th>POLL INTERVAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.168.100.3</td>
<td>120</td>
</tr>
</tbody>
</table>

**INTERFACE ADDR**
Interface IP address.

**POLL INTERVAL**
Displays the current poll interval value.

**Configured OSPF neighbors**
The DISPLAY TCPIP, tcpipjobname, OMPROUTE, OSPF, LIST, NEIGHBORS command lists the configured neighbors on non-broadcast networks. (The keyword NBRS can be substituted for NEIGHBORS.) A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>NEIGHBOR ADDR</th>
<th>INTERFACE ADDRESS</th>
<th>DR ELIGIBLE?</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.168.100.56</td>
<td>9.168.100.3</td>
<td>YES</td>
</tr>
<tr>
<td>9.168.100.70</td>
<td>9.168.100.3</td>
<td>NO</td>
</tr>
</tbody>
</table>

**NEIGHBOR ADDR**
Indicates the IP address of the neighbor.

**INTERFACE ADDRESS**
Indicates the IP address of the interface on which the neighbor is configured.

**DR ELIGIBLE?**
Indicates whether the neighbor is eligible to become the designated router on the link.

**Configured OSPF virtual links**
The DISPLAY TCPIP, tcpipjobname, OMPROUTE, OSPF, LIST, VLINKS command lists all virtual links that have been configured with this router as an endpoint. A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>VIRTUAL ENDPOINT</th>
<th>TRANSIT AREA</th>
<th>RTRNS</th>
<th>TRNSDLY</th>
<th>HELLO</th>
<th>DEAD</th>
<th>DB_EX</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.67.100.8</td>
<td>2.2.2.2</td>
<td>20</td>
<td>5</td>
<td>40</td>
<td>160</td>
<td>480</td>
</tr>
</tbody>
</table>

**VIRTUAL ENDPOINT**
Indicates the OSPF router ID of the other endpoint.

**TRANSIT AREA**
Indicates the non-backbone area through which the virtual link is configured. Virtual links are treated by the OSPF protocol similarly to point-to-point networks.

**RTRNS**
Indicates the retransmission interval, which is the number of seconds between retransmissions of unacknowledged routing information.

**TRNSDLY**
Indicates the transmission delay, which is an estimate of the number of seconds required to transmit routing information over the interface.
HELLO
Indicates the number of seconds between Hello packets sent from the interface.

DEAD
Indicates the number of seconds after not having received an OSPF Hello packet, that a neighbor is declared to be down.

DB_EX
Indicates the number of seconds to allow the database exchange to complete.

OSPF link state advertisement
The following command displays the contents of a single link state advertisement contained in the OSPF database:

```
DISPLAY TCPIP,tcpipjobname,OMPROUTE,OSPF,LSA,LSTYPE=ls-type,LSID=lsid,ORIG=ad-router,AREAID =area-id
```

Tips:
1. For a summary of all the non-external advertisements in the OSPF database, use the following command:

```
DISPLAY TCPIP,tcpipjobname,OMPROUTE,OSPF,DATABASE,AREAID=area-id
```

2. For a summary of all the external advertisements in the OSPF database, use the following command:

```
DISPLAY TCPIP,tcpipjobname,OMPROUTE,OSPF,EXTERNAL
```

The following example shows an output sample with an explanation of entries:

```
EZZ7880I LSA DETAILS 220
LS AGE:          292
LS OPTIONS:      E,DC (0X22)
LS TYPE:         1
LS DESTINATION (ID): 9.167.100.13
LS ORIGINATOR:   9.167.100.13
LS SEQUENCE NO:  0X80000009
LS CHECKSUM:     0X8F78
LS LENGTH:       36
ROUTER TYPE:  ABR,V (0X05)
# ROUTER IFCS:   1
  LINK ID:          9.67.100.8
  LINK DATA:        9.167.100.13
  INTERFACE TYPE:   4
          NO. OF METRICS: 0
          TOS 0 METRIC:   2 (2)
```

**LS AGE**
Indicates the age of the advertisement in seconds. An asterisk (*) displayed beside the age value indicates that the originator is supporting demand circuits and has indicated that the LSA should not be aged.

**LS OPTIONS**
Indicates the optional OSPF capabilities supported by the router that originated the advertisement. (The value displayed in parentheses is the hexadecimal options value received in the LSA.) These capabilities are denoted by:

<table>
<thead>
<tr>
<th>LS OPTION</th>
<th>OSPF capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>E</td>
<td>Processes type 5 externals; when this is not set, the area to which the advertisement belongs has been configured as a stub.</td>
</tr>
<tr>
<td>T</td>
<td>Can route based on ToS.</td>
</tr>
<tr>
<td>MC</td>
<td>RFC 1584 (Multicast Extensions to OSPF) is supported. This value is never set by OMPROUTE but can be received from other routers.</td>
</tr>
<tr>
<td>DC</td>
<td>RFC 1793 (Extending OSPF to Support Demand Circuits) is supported.</td>
</tr>
</tbody>
</table>
LS TYPE
Classifies the advertisement and dictates its contents:

<table>
<thead>
<tr>
<th>LS TYPE</th>
<th>Advertisement</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Router links advertisement</td>
</tr>
<tr>
<td>2</td>
<td>Network link advertisement</td>
</tr>
<tr>
<td>3</td>
<td>Summary link advertisement</td>
</tr>
<tr>
<td>4</td>
<td>Summary ASBR advertisement</td>
</tr>
<tr>
<td>5</td>
<td>AS external link</td>
</tr>
</tbody>
</table>

LS DESTINATION
Identifies what is being described by the advertisement. It depends on the advertisement type. For router links and ASBR summaries, it is the OSPF router ID. For network links, it is the IP address of the network designated router. For summary links and AS external links, it is a network or subnet number.

LS ORIGINATOR
OSPF router ID of the originating router.

LS SEQUENCE NUMBER
Used to distinguish separate instances of the same advertisement. Should be looked at as a signed 32-bit integer. Starts at 0x80000001, and increments by 1 each time the advertisement is updated.

LS CHECKSUM
A checksum of advertisement contents, used to detect data corruption.

LS LENGTH
The size of the advertisement in bytes.

ROUTER TYPE
Indicates the level of function of the advertising router. (The value displayed in parentheses is the hexadecimal router type value received in the LSA).

<table>
<thead>
<tr>
<th>ROUTER TYPE</th>
<th>Function level</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASBR</td>
<td>The router is an AS boundary router.</td>
</tr>
<tr>
<td>ABR</td>
<td>The router is an area border router.</td>
</tr>
<tr>
<td>V</td>
<td>The router is an endpoint of an active virtual link that is using the described area as a transit area.</td>
</tr>
</tbody>
</table>

# ROUTER IFCS
The number of router interfaces described in the advertisement.

LINK ID
Indicates what the interface connects to. Depends on interface type. For interfaces to routers (that is, point-to-point links), the Link ID is the neighbor router ID. For interfaces to transit networks, it is the IP address of the network designated router. For interfaces to stub networks, it is the network or subnet number.

LINK DATA
Four bytes of extra information concerning the link; it is either the IP address of the interface (for interfaces to point-to-point networks and transit networks), or the subnet mask (for interfaces to stub networks).

INTERFACE TYPE
One of the following value:

<table>
<thead>
<tr>
<th>INTERFACE TYPE</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Point-to-point connection to another router</td>
</tr>
<tr>
<td>INTERFACE TYPE</td>
<td>Details</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>2</td>
<td>Connection to transit network</td>
</tr>
<tr>
<td>3</td>
<td>Connection to stub network</td>
</tr>
<tr>
<td>4</td>
<td>Virtual link</td>
</tr>
</tbody>
</table>

**NO. OF METRICS**

The number of nonzero ToS values for which metrics are provided for this interface. For the z/OS implementation, this value will always be 0.

**TOS 0 METRIC**

The cost of the interface.

The LS age, LS options, LS type, LS destination, LS originator, LS sequence no, LS checksum and LS length fields are common to all advertisements. The Router type and # router ifcs are seen only in router links advertisements. Each link in the router advertisement is described by the Link ID, Link Data, and Interface type fields.

**OSPF area statistics and parameters**

The DISPLAY TCPIP, tcpipjobname, OMPROUTE, OSPF, AREASUM command displays the statistics and parameters for all OSPF areas attached to the router. A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>AREA ID</th>
<th>AUTHENTICATION</th>
<th>#IFCS</th>
<th>#NETS</th>
<th>#RTRS</th>
<th>#BRDRS</th>
<th>DEMAND</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0.0.0</td>
<td>NONE</td>
<td>2</td>
<td>0</td>
<td>2</td>
<td>2</td>
<td>ON</td>
</tr>
<tr>
<td>2.2.2.2</td>
<td>NONE</td>
<td>1</td>
<td>0</td>
<td>3</td>
<td>2</td>
<td>ON</td>
</tr>
</tbody>
</table>

**AREA ID**

Indicates the ID of the area.

**AUTHENTICATION**

Indicates the default authentication method for the area.

**# IFCS**

Indicates the number of router interfaces attached to the particular area. These interfaces are not necessarily functional.

**# NETS**

Indicates the number of transit networks that have been found while doing the SPF tree calculation for this area.

**# RTRS**

Indicates the number of routers that have been found when doing the SPF tree calculation for this area.

**# BRDRS**

Indicates the number of area border routers that have been found when doing the SPF tree calculation for this area.

**DEMAND**

Indicates whether demand circuits are supported in this area.

**OSPF external advertisements**

The DISPLAY TCPIP, tcpipjobname, OMPROUTE, OSPF, EXTERNAL command lists the AS external advertisements belonging to the OSPF routing domain. One line is printed for each advertisement. Each advertisement is defined by the following three parameters:

- Its link state type (always 5 for AS external advertisements)
- Its link state ID (called the LS destination)
- The advertising router (called the LS originator)
A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>TYPE</th>
<th>LS DESTINATION</th>
<th>LS ORIGINATOR</th>
<th>SEQNO</th>
<th>AGE</th>
<th>XSUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>9.67.100.0</td>
<td>9.67.100.8</td>
<td>0X80000001</td>
<td>4</td>
<td>0X408</td>
</tr>
<tr>
<td>5</td>
<td>9.167.100.0</td>
<td>9.67.100.8</td>
<td>0X80000001</td>
<td>4</td>
<td>0X73E</td>
</tr>
<tr>
<td>5</td>
<td>9.167.100.14</td>
<td>9.67.100.8</td>
<td>0X80000001</td>
<td>4</td>
<td>0X66</td>
</tr>
<tr>
<td>5</td>
<td>192.8.8.0</td>
<td>9.67.100.8</td>
<td>0X80000001</td>
<td>4</td>
<td>0XAA</td>
</tr>
</tbody>
</table>

# ADVERTISEMENTS: 5
CHECKSUM TOTAL: 0X2A026

**TYPE**

Always 5 for AS external advertisements. An asterisk (*) following the type value indicates that the MC option is on in the advertisement. The MC option indicates that the originating router has implemented RFC 1584 (Multicast Extensions to OSPF). An at sign (@) following the type value indicates that the DC option is on in the advertisement. The DC option indicates that the originating router has implemented RFC 1793 (Extending OSPF to Support Demand Circuits).

**LS DESTINATION**

Indicates an IP destination (network, subnet, or host). This destination belongs to another Autonomous System.

**LS ORIGINATOR**

Indicates the router that originated the advertisement.

**SEQNO, AGE, and XSUM**

It is possible for several instances of an advertisement to be present in the OSPF routing domain at any one time. However, only the most recent instance is kept in the OSPF link state database (and printed by this command). The LS sequence number (Seqno), LS age (Age), and LS checksum (Xsum) fields are compared to see which instance is most recent. The LS age field is expressed in seconds. Its maximum value is 3600. An asterisk (*) displayed beside an age value indicates that the DONOTAGE bit is on.

At the end of the display, the total number of AS external advertisements is printed, along with a checksum total over all of their contents. The checksum total is simply the 32-bit sum (carries discarded) of the individual advertisement LS checksum fields. This information can be used to quickly determine whether two OSPF routers have synchronized databases.

**OSPF area link state database**

The DISPLAY TCP, tcpipjobname, OMPROUTE, OSPF, DATABASE, AREAILD=area-id command displays a description of the contents of a particular OSPF area link state database. AS external advertisements are omitted from the display. A single line is printed for each advertisement. Each advertisement is defined by the following three parameters:

- Its link state type (called Type)
- Its link state ID (called the LS destination)
- The advertising router (called the LS originator)

A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>TYPE</th>
<th>LS DESTINATION</th>
<th>LS ORIGINATOR</th>

# ADVERTISEMENTS: 4
CHECKSUM TOTAL: 0X253C1

**TYPE**

Separate LS types are numerically displayed:

<table>
<thead>
<tr>
<th>TYPE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type 1</td>
<td>Router links advertisements</td>
</tr>
<tr>
<td>TYPE</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>----------------------------------</td>
</tr>
<tr>
<td>Type 2</td>
<td>Network links advertisements</td>
</tr>
<tr>
<td>Type 3</td>
<td>Network summaries</td>
</tr>
<tr>
<td>Type 4</td>
<td>AS boundary router summaries</td>
</tr>
</tbody>
</table>

An asterisk (*) following the type value indicates that the MC option is on in the advertisement. The MC option indicates that the originating router has implemented RFC 1584 (Multicast Extensions to OSPF). An at sign (@) following the type value indicates that the DC option is on in the advertisement. The DC option indicates that the originating router has implemented RFC 1793 (Extending OSPF to Support Demand Circuits).

**LS DESTINATION**
Indicates what is being described by the advertisement.

**LS ORIGINATOR**
Indicates the router that originated the advertisement.

**SEQNO, AGE, and XSUM**
It is possible for several instances of an advertisement to be present in the OSPF routing domain at any one time. However, only the most recent instance is kept in the OSPF link state database (and printed by this command). The LS sequence number (Seqno), LS age (Age) and LS checksum (Xsum) fields are compared to see which instance is most recent. The LS age field is expressed in seconds. Its maximum value is 3600. An asterisk (*) displayed beside an age value indicates that the DONOTAGE bit is on.

At the end of the display, the total number of advertisements in the area database is printed, along with a checksum total over all of their contents. The checksum total is simply the 32-bit sum (carries discarded) of the individual advertisement LS checksum fields. This information can be used to quickly determine whether two OSPF routers have synchronized databases.

**OSPF link state database statistics**
The DISPLAY TCPIP, tcpipjobname, OMPROUTE, OSPF, DBSIZE command displays the number of LSAs currently in the link state database, categorized by type. The following example is a sample output:

```
EZ7754I LINK STATE DATABASE SIZE 364
 # ROUTER-LSAS: 5
 # NETWORK-LSAS: 0
 # SUMMARY-LSAS: 7
 # SUMMARY ROUTER-LSAS: 1
 # AS EXTERNAL-LSAS: 5
 # INTRA-AREA ROUTES: 4
 # INTER-AREA ROUTES: 0
 # TYPE 1 EXTERNAL ROUTES: 5
 # TYPE 2 EXTERNAL ROUTES: 0
```

**OSPF interface statistics and parameters**
The DISPLAY TCPIP, tcpipjobname, OMPROUTE, OSPF, INTERFACE, NAME=if-name command displays current, run-time statistics and parameters related to OSPF interfaces. (The keyword IF can be substituted for INTERFACE.) If no NAME= parameter is given (see Example 1), a single line is printed summarizing each interface. If a NAME= parameter is given (see Example 2), detailed statistics for that interface are displayed. Sample outputs with an explanation of entries follow:

```
--- Example 1 ---
EZ7754I INTERFACES 354
 IFC ADDRESS PHYS ASSOC. AREA TYPE STATE #NBRS #ADJS
 9.168.100.3 CTC1 0.0.0.0 P-P 16 0 0
 9.167.100.13 CTC2 2.2.2.2 P-P 16 1 1
 10.1.1.1 0SAEGBE1 3.3.3.3 BRDCST 32 4 2
 10.1.1.2 0SAEGBE2 3.3.3.3 BRDCST 2 0 0
 0.0.0.0 VL/0 0.0.0.0 VLINK 16 1 1
```
**IFC ADDRESS**
Interface IP address.

**PHYS**
Displays the interface name.

**ASSOC AREA**
Attached area ID.

**TYPE**
Interface type. Can be BRDCST (a broadcast interface), P-P (a point-to-point interface), P-2-MP (a point-to-multipoint interface), MULTI (a non-broadcast, multiaccess interface such as ATM), VLINK (an OSPF virtual link), or VIPA (a Virtual IP Address link).

**STATE**
Can be one of the following value:

<table>
<thead>
<tr>
<th>STATE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Down</td>
</tr>
<tr>
<td>1*</td>
<td>Suspend</td>
</tr>
<tr>
<td></td>
<td>This state is not described in RFC 2328. The interface is suspended because a MODIFY command was issued or because it was unable to establish an adjacency with a neighboring designated router after it exceeded the futile neighbor state loop threshold (DR_Max_Adj_Attempt). For information about futile neighbor state loops, see the futile neighbor state loops information in the z/OS Communications Server: IP Configuration Guide.</td>
</tr>
<tr>
<td>2</td>
<td>Backup</td>
</tr>
<tr>
<td>4</td>
<td>Looped back</td>
</tr>
<tr>
<td>8</td>
<td>Waiting</td>
</tr>
<tr>
<td>16</td>
<td>Point-to-point</td>
</tr>
<tr>
<td>32</td>
<td>DR other</td>
</tr>
<tr>
<td>64</td>
<td>Backup DR</td>
</tr>
<tr>
<td>128</td>
<td>Designated router</td>
</tr>
</tbody>
</table>

For more information about these values, see RFC 1583 (OSPF Version 2).

**#NBRS**
Number of neighbors. This is the number of routers whose hellos have been received, plus those that have been configured.

**#ADJS**
Number of adjacencies. This is the number of neighbors in state Exchange or greater. These are the neighbors with whom the router has synchronized or is in the process of synchronization.

--- Example 2 ---
non-VIPA interface:
EZ278501 INTERFACE DETAILS 356
INTERFACE ADDRESS: 9.168.100.3
ATTACHED AREA: 0.0.0.0
PHYSICAL INTERFACE: CTC1
INTERFACE MASK: 255.255.255.0
INTERFACE TYPE: P-P
STATE: 16
DESIGNATED ROUTER: N/A

DEMAND CIRCUIT: OFF HELLO SUPPRESS: OFF SUPPRESS REQ: OFF
MAX PKT SIZE: 556 TOS 0 COST: 1 DB_EX INTERVAL: 256
AUTH TYPE: CRYPTO-MD5
INTERFACE ADDRESS
Interface IP address.

ATTACHED AREA
Attached area ID.

PHYSICAL INTERFACE
Displays interface name.

INTERFACE MASK
Displays interface subnet mask.

INTERFACE TYPE
Can be BRDCST (a broadcast interface), P-P (a point-to-point interface), P-2-MP (a point-to-multipoint interface), MULTI (a non-broadcast, multiaccess interface such as ATM), VLINK (an OSPF virtual link), or VIPA (a Virtual IP Address link).

STATE
Can be one of the following value:

<table>
<thead>
<tr>
<th>STATE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Down</td>
</tr>
<tr>
<td>1*</td>

<tr>
<td>32</td>
<td>DR other</td>
</tr>
<tr>
<td>64</td>
<td>Backup DR</td>
</tr>
<tr>
<td>128</td>
<td>Designated router</td>
</tr>
</tbody>
</table>

For more information about these values, see RFC 1583 (OSPF Version 2).

DESIGNATED ROUTER
IP address of the designated router.

BACKUP DR
IP address of the backup designated router.
**DR PRIORITY**
Displays the interface router priority used when selecting the designated router. A higher value indicates that this OMPROUTE is more likely to become the designated router. A value of 0 indicates that OMPROUTE will never become the designated router.

**HELLO INTERVAL**
Displays the current hello interval value.

**RXMT INTERVAL**
Displays the current retransmission interval value.

**DEAD INTERVAL**
Displays the current dead interval value.

**TX DELAY**
Displays the current transmission delay value.

**POLL INTERVAL**
Displays the current poll interval value.

**DEMAND CIRCUIT**
Displays the current demand circuit status.

**HELLO SUPPRESS**
Displays whether Hello Suppression is currently on or off.

**Tip:** When a point-to-multipoint interface (displayed Interface type is P-2-MP) on which hello suppression is allowed, an asterisk (*) might be displayed. If an asterisk (*) is displayed, consult the neighbor display for each OSPF neighbor associated with the interface to determine what state of Hello Suppression negotiated with that neighbor.

**SUPPRESS REQ**
Displays whether Hello Suppression was requested.

**MAX PKT SIZE**
Displays the maximum size for an OSPF packet sent out this interface.

**TOS 0 COST**
Displays the interface ToS 0 cost.

**DB_EX INTERVAL**
Indicates the number of seconds to allow the database exchange to complete.

**AUTH TYPE**
Authentication type is one of the following values:

- **NONE**
  - No authentication is used.

- **Password**
  - Simple password authentication.

- **MD5**
  - Crypto-MD5 type authentication.

**# NEIGHBORS**
Number of neighbors. This is the number of routers whose hellos have been received, plus those that have been configured.

**# ADJACENCIES**
Number of adjacencies. This is the number of neighbors in state Exchange or greater.

**# FULL ADJS**
Number of full adjacencies. This is the number of neighbors whose state is Full (and therefore with which the router has synchronized databases).

**# MAX ADJ. RESETS**
Total number of times the maximum threshold value for attempting an adjacency (see the DR MAX ADJ ATTEMPT field) with a neighboring designated router has been reset. The value N/A indicates that the field is not applicable for that interface, based on the interface type that is used to reach a
neighbor. See futile neighbor state loops information in z/OS Communications Server: IP Configuration Reference for details about the types of interfaces that support futile neighbor state loop detection for OSPF.

# MCAST FLOODS
Number of link state updates that flooded the interface (not counting retransmissions).

# MCAST ACKS
Number of link state acknowledgments that flooded the interface (not counting retransmissions).

# ERR PKTS RCVD
Number of the packets received on the interface that contained errors. These errors include bad packet type, bad length, bad checksum, or other errors.

NETWORK CAPABILITIES
Displays the capabilities of the interface.

OSPF neighbor statistics and parameters
The DISPLAY TCPIP, tcpipjobname, OMPROUTE, OSPF, NEIGHBOR, IPADDR=ip-addr command displays the statistics and parameters related to OSPF neighbors. (The keyword NBR can be substituted for NEIGHBOR.) If no IPADDR= parameter is given (see Example 1), a single line is printed summarizing each neighbor. If an IPADDR= parameter is given (see Example 2), detailed statistics for that neighbor are displayed. Following are sample outputs with an explanation of entries:

```
----  Example 1  ----
EZ27851I NEIGHBOR SUMMARY 358
NEIGHBOR ADDR   NEIGHBOR ID     STATE  LSRXL DBSUM LSREQ HSUP IFC
 9.167.100.17    9.67.100.7         128     0     0     0  OFF CTC2
VL/0            9.67.100.8         128     0     0     0  OFF *
```

NEIGHBOR ADDR
Displays the neighbor interface IP address.

NEIGHBOR ID
Displays the neighbor OSPF router ID.

STATE
Can be one of the following value:

<table>
<thead>
<tr>
<th>STATE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Down</td>
</tr>
<tr>
<td>2</td>
<td>Attempt</td>
</tr>
<tr>
<td>4</td>
<td>Init</td>
</tr>
<tr>
<td>8</td>
<td>2-Way</td>
</tr>
<tr>
<td>16</td>
<td>ExStart</td>
</tr>
<tr>
<td>32</td>
<td>Exchange</td>
</tr>
<tr>
<td>64</td>
<td>Loading</td>
</tr>
<tr>
<td>128</td>
<td>Full</td>
</tr>
</tbody>
</table>

For more information about these values, see RFC 1583 (OSPF Version 2).

LSRXL
Displays the size of the current link state retransmission list for this neighbor.

DBSUM
Displays the size of the database summary list waiting to be sent to the neighbor.

LSREQ
Displays the number of link state advertisements that are being requested from the neighbor.
HSUP
Displays whether Hello Suppression is active with the neighbor.

IFC
Displays the name of the interface over which a relationship has been established with this neighbor.

---- Example 2 ----

</tbody>
</table>

NEIGHBOR IP ADDRESS
Displays the neighbor interface IP address.

OSPF ROUTER ID
Neighbor OSPF router ID.

NEIGHBOR STATE
Can be one of the following value:
• 1 (Down)
• 2 (Attempt)
• 4 (Init)
• 8 (2-Way)
• 16 (ExStart)
• 32 (Exchange)
• 64 (Loading)
• 128 (Full)

PHYSICAL INTERFACE
Displays the name of the interface over which a relationship has been established with this neighbor.

DR CHOICE, BACKUP CHOICE, DR PRIORITY
Indicates the values seen in the last hello message received from the neighbor.

NBR OPTIONS
Indicates the optional OSPF capabilities supported by the neighbor. (The value displayed in parentheses is the hexadecimal options value received from the neighbor). These capabilities are denoted by:
• E (processes type 5 externals; when this is not set, the area to which the common network belongs has been configured as a stub)
• T (can route based on ToS)
• MC (can forward IP multicast datagrams)
• DC (can support demand circuits)
This field is valid only for those neighbors in state Exchange or greater.

DB SUMM QLEN
Indicates the number of advertisements waiting to be summarized in Database Description packets. It must be 0 except when the neighbor is in state Exchange.
**LS RXMT QLEN**
Indicates the number of advertisements that have been flooded to the neighbor, but not yet acknowledged.

**LS REQ QLEN**
Indicates the number of advertisements that are being requested from the neighbor in state Loading.

**LAST HELLO**
Indicates the number of seconds since a hello message has been received from the neighbor. If the TCP/IP stack enters a storage shortage condition, this value is reset to 0 when the shortage condition is relieved.

**NO HELLO**
Indicates whether Hello Suppression is active with the neighbor.

**# LS RXMITS**
Indicates the number of retransmissions that have occurred during flooding.

**# DIRECT ACKS**
Indicates responses to duplicate link state advertisements.

**# DUP LS RCVD**
Indicates the number of duplicate retransmissions that have occurred during flooding.

**# OLD LS RCVD**
Indicates the number of old advertisements received during flooding.

**# DUP ACKS RCVD**
Indicates the number of duplicate acknowledgments received.

**# NBR LOSSES**
Indicates the number of times the neighbor has transitioned to Down state.

**# ADJ. RESETS**
Counts transitions to state ExStart from a higher state.

**ERR LS RCVD**
Number of the link state advertisements received from the neighbor that are unexpected or that contain errors. These errors include bad advertisement type, bad length, bad checksum, or other errors.

**OSPF router routes**
The DISPLAY TCPIP, *tcpipjobname*, OMPROUTE, OSPF, ROUTERS command displays all routes to other area-border or autonomous system boundary routers that have been calculated by OSPF and are now present in the routing table. A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>DTYPE</th>
<th>RTYPE</th>
<th>DESTINATION</th>
<th>AREA</th>
<th>COST</th>
<th>NEXT HOP(S)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BR</td>
<td>SPF</td>
<td>9.67.100.8</td>
<td>2.2.2</td>
<td>2</td>
<td>9.167.100.17</td>
</tr>
<tr>
<td>BR</td>
<td>SPF</td>
<td>9.67.100.8</td>
<td>6.6.6.6</td>
<td>2</td>
<td>9.67.100.6</td>
</tr>
<tr>
<td>ASBR</td>
<td>SPF</td>
<td>9.67.100.8</td>
<td>2.2.2</td>
<td>2</td>
<td>9.167.100.17</td>
</tr>
</tbody>
</table>

**DTYPE**
Indicates the destination type:

**ASBR**
Indicates that the destination is an AS boundary router.

**ABR**
Indicates that the destination is an area border router.

**FADD**
Indicates a forwarding address (for external routes).

**RTYPE**
Indicates the route type and how the route was derived:

**SPF**
Indicates that the route is an intra-area route (comes from the Dijkstra calculation).
**SPIA**
Indicates that it is an inter-area route (comes from considering summary link advertisements).

**DESTINATION**
Indicates the destination router OSPF router ID.

**AREA**
Displays the OSPF area to which the destination router belongs.

**COST**
Displays the cost to reach the router.

**NEXT HOP(S)**
Indicates the address of the next router on the path toward the destination host. A number in parentheses at the end of the column indicates the number of equal-cost routes to the destination.

**OSPF routing protocol statistics**
The DISPLAY TCPIP, tcpipjobname, OMPROUTE, OSPF, STATISTICS command displays statistics generated by the OSPF routing protocol. (The keyword STATS can be substituted for STATISTICS.) The statistics indicate how well the implementation is performing, including its memory and network utilization. Many of the fields displayed are confirmation of the OSPF configuration. The following example shows a sample output with an explanation of entries:

```
EZZ7856I OSPF STATISTICS 380
OSPF ROUTER ID:         9.167.100.13  (ETH1)
EXTERNAL COMPARISON:    TYPE 1
AS BOUNDARY CAPABILITY: YES
IMPORT EXTERNAL ROUTES: RIP SUB

INCREMENTAL EXT. UPDATES:        19

**OSPF ROUTER ID**
Displays the router OSPF router ID and its configuration source. Possible sources are:

- OMPROUTE configuration statement (denoted by a prefixed asterisk "*") that has the RouterID parameter specified:
  1. ROUTERID
  2. OSPF

- The name of the IPv4 interface that was used by OMPROUTE to set the router ID. This information is displayed when you do not configure a router ID on an OMPROUTE configuration statement. In this case, the router ID was set by OMPROUTE using the IP address assigned to an IPv4 interface.

For more information about assigned and configured router IDs, see Steps for configuring OSPF and RIP (IPv4 and IPv6) in the z/OS Communications Server: IP Configuration Guide.

**EXTERNAL COMPARISON**
Displays the external route type used by OSPF when importing external information into the OSPF domain and when comparing OSPF external routes to RIP routes.

**AS BOUNDARY CAPABILITY**
Displays whether external routes are imported.

**IMPORT EXTERNAL ROUTES**
Displays the external routes that are imported. Displayed only when AS Boundary Capability is enabled.
**ORIG. DEFAULT ROUTE**
Displays whether the router will advertise an OSPF default route. Displayed only when AS Boundary Capability is enabled.

**DEFAULT ROUTE COST**
Displays the cost and type of the default route (if advertised). Displayed only when AS Boundary Capability is enabled and Orig Default Route is ALWAYS.

**DEFAULT FORWARD ADDR**
Displays the forwarding address specified in the default route (if advertised). Displayed only when AS Boundary Capability is enabled and Orig Default Route is ALWAYS.

**LEARN HIGHER COST DFLT**
Indicates the value of the LEARN_DEFAULT_ROUTE parameter of the AS_BOUNDARY_ROUTING configuration statement. Displayed only when AS Boundary Capability is enabled and Orig Default Route is ALWAYS.

**ATTACHED AREAS**
Indicates the number of areas that the router has active interfaces to.

**OSPF PACKETS RCVD**
Covers all types of OSPF protocol packets.

**OSPF PACKETS RCVD W/ERRS**
Indicates the number of OSPF packets that have been received that were determined to contain errors.

**TRANSIT NODES**
Allocated to store router links and network links advertisements.

**LS ADV**
Allocated to store summary link and AS external link advertisements.

**QUEUE HEADERS**
Form lists of link state advertisements. These lists are used in the flooding and database exchange processes; if the number of queue headers allocated is not equal to the number available, database synchronization with a neighbor is in progress.

**MAXIMUM LSA SIZE**
The size of the largest link state advertisement that can be sent.

**# DIJKSTRA RUNS**
Indicates how many times the OSPF routing table has been calculated from scratch.

**INCREMENTAL SUMM UPDATES, INCREMENTAL VL UPDATES**
Indicates that new summary link advertisements have caused the routing table to be partially rebuilt.

**MULTICAST PKTS SENT**
Covers OSPF hello packets and packets sent during the flooding procedure.

**UNICAST PKTS SENT**
Covers OSPF packet retransmissions and the Database Exchange procedure.

**LS ADV. AGED OUT**
Indicates the number of advertisements that have hit 60 minutes. Link state advertisements are aged out after 60 minutes. Usually they are refreshed before this time.

**LS ADV. FLUSHED**
Indicates the number of advertisements removed (and not replaced) from the link state database.

**INCREMENTAL EXT. UPDATES**
Displays the number of changes to external destinations that are incrementally installed in the routing table.

*Examples using the RIP command*
RIP configuration information

The DISPLAY TCPIP, tcpipjobname, OMPROUTE, RIP, LIST, ALL command lists all RIP-related configuration information. A sample output with an explanation of entries follows:

```
EZ7843I RIP CONFIGURATION 447
TRACE: 1, DEBUG: 0, SADEBUG LEVEL: 0
STACK AFFINITY: TCPCS6
RIP: ENABLED
RIP DEFAULT ORIGINATION: ALWAYS, COST = 1
PER-INTERFACE ADDRESS FLAGS:
   CTC2     9.167.100.13   RIP VERSION 1
             SEND NET AND SUBNET ROUTES

             RIP INTERFACE OUTPUT METRIC: 0
             RIP RECEIVE CONTROL: ANY
   CTC1     9.168.100.3    RIP VERSION 1
             SEND NET AND SUBNET ROUTES
             RECEIVE NO DYNAMIC HOST ROUTES
             RIP INTERFACE INPUT METRIC: 1
             RIP INTERFACE OUTPUT METRIC: 0
             RIP RECEIVE CONTROL: ANY

EZ7844I RIP ROUTE ACCEPTANCE
ACCEPT RIP UPDATES ALWAYS FOR:
   9.167.100.79   9.167.100.59
IGNORE RIP UPDATES FROM:
   NONE
```

**TRACE**
Displays the level of tracing currently in use by OMPROUTE for initialization and IPv4 routing protocols.

**DEBUG**
Displays the level of debugging currently in use by OMPROUTE for initialization and IPv4 routing protocols.

**SADEBUG LEVEL**
Displays the level of debugging currently in use by OMPROUTE OSPF SNMP subagent.

**STACK AFFINITY**
Displays the name of the stack on which OMPROUTE is running.

The remainder of the DISPLAY TCPIP, tcpipjobname, OMPROUTE, RIP, LIST, ALL output is described in the following sections.

Configured RIP interfaces

The DISPLAY TCPIP, tcpipjobname, OMPROUTE, RIP, LIST, INTERFACES command lists IP addresses and configured parameters for each RIP interface. (The keyword IFS can be substituted for INTERFACES.) A sample output with an explanation of entries follows:

```
EZ7843I RIP CONFIGURATION 447
TRACE: 1, DEBUG: 0, SADEBUG LEVEL: 0
STACK AFFINITY: TCPCS6
RIP: ENABLED
RIP DEFAULT ORIGINATION: ALWAYS, COST = 1
PER-INTERFACE ADDRESS FLAGS:
   CTC2     9.167.100.13   RIP VERSION 1
             SEND NET AND SUBNET ROUTES
             RECEIVE NO DYNAMIC HOST ROUTES
             RIP INTERFACE INPUT METRIC: 1
             RIP INTERFACE OUTPUT METRIC: 0
             RIP RECEIVE CONTROL: ANY
   CTC1     9.168.100.3    RIP VERSION 1
             SEND NET AND SUBNET ROUTES
             RECEIVE NO DYNAMIC HOST ROUTES

             RIP INTERFACE OUTPUT METRIC: 0
             RIP RECEIVE CONTROL: ANY
```
RIP
Indicates whether RIP communication is enabled.

RIP DEFAULT ORIGINATION
Indicates the conditions under which RIP supports default route generation and the advertised cost for the default route.

PER-INTERFACE ADDRESS FLAGS
Specifies information about an interface:

RIP VERSION
Specifies whether RIP Version 1 or RIP Version 2 packets are being sent over this interface.

SEND
Specifies which types of routes are included in RIP responses sent out on this interface.

RECEIVE
Specifies which types of routes are accepted in RIP responses received on this interface.

RIP INTERFACE INPUT METRIC
Specifies the value of the metric to be added to RIP routes received over this interface.

RIP INTERFACE OUTPUT METRIC
Specifies the value of the metric to be added to RIP routes advertised over this interface.

RIP RECEIVE CONTROL
Indicates what level of RIP updates can be received over the interface. Values are:

ANY
RIP1 and RIP2 updates can be received.

NO
No RIP updates can be received.

RIP1
Only RIP1 updates can be received.

RIP2
Only RIP2 updates can be received.

RIP routes to be accepted
The DISPLAY TCPIP, tcpipjobname, OMPROUTE, RIP, LIST, ACCEPTED command lists the routes to be unconditionally accepted, as configured with the ACCEPT_RIP_ROUTE statement. A sample output follows:

EZZ7844I RIP ROUTE ACCEPTANCE
ACCEPT RIP UPDATES ALWAYS FOR:
   9.167.100.79       9.167.100.59

ACCEPT RIP UPDATES ALWAYS FOR
Indicates the networks, subnets, and hosts for which updates are always accepted.

RIP interface statistics and parameters
The DISPLAY TCPIP, tcpipjobname, OMPROUTE, RIP, INTERFACE, NAME=if-name command displays statistics and parameters related to RIP interfaces. (The keyword IF can be substituted for INTERFACE.) If no NAME= parameter is given (DISPLAY TCPIP, tcpipjobname, OMPROUTE, RIP, INTERFACE), a single line is printed summarizing each interface. (See Example 1.) If a NAME= parameter is given, detailed statistics for that interface are displayed. (See Example 2.)

---- Example 1 ----
EZZ78591 RIP INTERFACES 464
IFC ADDRESS     IFC NAME      SUBNET MASK     MTU    DESTINATION
 9.167.100.13    CTC2          255.255.0.0     576    9.167.100.17
**IFC ADDRESS**
Indicates the interface IP address.

**IFC NAME**
Indicates the interface name.

**SUBNET MASK**
Indicates the subnet mask.

**MTU**
Indicates the value of the maximum transmission unit.

**DESTINATION**
Indicates the RIP identification for the destination router when the interface is point-to-point.

--- Example 2 ---
EZz786oi RIP INTERFACE DETAILS 066

<table>

| RECEIVE       | 9.67.101.0 | 255.255.255.0 |

| RIP RECEIVE CONTROL: | ANY |

**INTERFACE ADDRESS**
Indicates the interface IP address.

**INTERFACE NAME**
Indicates the interface name.

**SUBNET MASK**
Indicates the subnet mask.

**MTU**
Indicates the value of the maximum transmission unit.

**DESTINATION ADDRESS**
Indicates the RIP identification for the destination router when the interface is point-to-point.

**RIP VERSION**
Indicates whether RIP Version 1 or RIP Version 2 packets are sent over this interface.

**SEND POIS. REV. ROUTES**
Indicates whether poisoned reverse routes are advertised in RIP responses sent over this interface. A poisoned reverse route is one with an infinite metric (a metric of 16).

**IN METRIC**
Specifies the value of the metric to be added to RIP routes received over this interface.

**OUT METRIC**
Specifies the value of the metric to be added to RIP routes advertised over this interface.

**RECEIVE NET ROUTES**
Indicates whether network routes are accepted in RIP responses received over this interface.

**RECEIVE SUBNET ROUTES**
Indicates whether subnet routes are accepted in RIP responses received over this interface.

**RECEIVE HOST ROUTES**
Indicates whether host routes are accepted in RIP responses received over this interface.
SEND DEFAULT ROUTES
Indicates whether the default route, if available, is advertised in RIP responses sent over this interface.

SEND NET ROUTES
Indicates whether network routes are advertised in RIP responses sent over this interface.

SEND SUBNET ROUTES
Indicates whether subnet routes are advertised in RIP responses sent over this interface.

SEND STATIC ROUTES
Indicates whether static routes are advertised in RIP responses sent over this interface.

SEND HOST ROUTES
Indicates whether host routes are advertised in RIP responses sent over this interface.

SEND ONLY
Indicates the route-type restrictions on RIP broadcasts for this interface.

FILTERS
Indicates the send and receive filters for this interface.

RIP RECEIVE CONTROL
Indicates the type of RIP packets that are received over this interface: RIP1, RIP2, ANY (both RIP1 and RIP2), or NONE.

Global RIP filters
The DISPLAY TCPIP,tcpipjobname,OMPROUTE,RIP,FILTERS command displays the Global RIP filters. A sample output with an explanation of entries follows.

```
EZZ8016I GLOBAL RIP FILTERS
SEND ONLY: VIRTUAL, DEFAULT
IGNORE RIP UPDATES FROM:
   9.67.103.10   9.67.103.9
FILTERS: NOSEND          10.1.1.0            255.255.255.0
               NORECEIVE 9.67.101.0          255.255.255.0
```

SEND ONLY
Indicates the global route-type restrictions on RIP broadcasts that apply to all RIP interfaces.

IGNORE RIP UPDATES FROM
Specifies that RIP routing table broadcasts from this gateway are to be ignored. This option serves as a RIP input filter.

FILTERS
Indicates the global send and receive filters that apply to all RIP interfaces.

Examples using the GENERIC command

All IPv4 generic information
The DISPLAY TCPIP,tcpipjobname,OMPROUTE,GENERIC,LIST,ALL command lists all IPv4 configuration information that is not related to a specific routing protocol. A sample output with an explanation of the entries follows:

```
EZZ8053I IPV4 GENERIC CONFIGURATION
TRACE: 2, DEBUG: 3, SADEBUG LEVEL: 0
IPV4 TRACE DESTINATION: /TMP/AMPROUT3.DBG
STACK AFFINITY: TCPCS3
EZZ8056I IPV4 GEN INT CONFIGURATION
IFC NAME         IFC ADDRESS     SUBNET MASK       MTU DESTADDR
NSQDIO3L         9.67.120.3      255.255.255.0     576  N/A
CTC3TO4          9.67.101.3      255.255.255.0   10000  9.67.101.4
```
TRACE
Displays the level of tracing currently in use by OMPROUTE initialization and IPv4 routing protocols.

DEBUG
Displays the level of debugging currently in use by OMPROUTE initialization and IPv4 routing protocols.

SADEBUG LEVEL
Displays the level of debugging currently in use by OMPROUTE OSPF SNMP subagent.

IPV4 TRACE DESTINATION
Indicates the file name of the destination for IPv4 trace, or OMPCTRC if the destination is the OMPROUTE CTRACE.

Restriction: On the console, the file name is shown in upper case, regardless of the case of the actual file name.

STACK AFFINITY
Displays the name of the stack on which OMPROUTE is running.

IPV4 GENERIC INTERFACES
Displays the same output as DISPLAY TCPIP, tcpipjobname, OMPROUTE, GENERIC, LIST, INTERFACES described in “Configured IPv4 generic interfaces” on page 51.

Configured IPv4 generic interfaces
The DISPLAY TCPIP, tcpipjobname, OMPROUTE, GENERIC, LIST, INTERFACES command lists, for each IPv4 generic interface, the IP address and configured parameters that are defined to OMPROUTE using the INTERFACE statement. IFS can be used in place of INTERFACES. A sample output with an explanation of the entries follows:

<table>
<thead>
<tr>
<th>IFC NAME</th>
<th>IFC ADDRESS</th>
<th>SUBNET MASK</th>
<th>MTU</th>
<th>DESTADDR</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSQDIO3L</td>
<td>9.67.120.3</td>
<td>255.255.255.0</td>
<td>576</td>
<td>N/A</td>
</tr>
<tr>
<td>CTC3T04</td>
<td>9.67.161.3</td>
<td>255.255.255.0</td>
<td>10000</td>
<td>9.67.101.4</td>
</tr>
</tbody>
</table>

**IFC NAME**
The interface link name, as defined using the NAME parameter on the INTERFACE statement.

**IFC ADDRESS**
The interface home address, as defined using the IP_ADDRESS parameter on the INTERFACE statement.

**SUBNET MASK**
The interface subnet mask, as defined using the SUBNET_MASK parameter on the INTERFACE statement.

**MTU**
The interface MTU size, as defined using the MTU parameter on the INTERFACE statement.

**DESTADDR**
If the interface is known to be a point-to-point interface and the DESTINATION_ADDR parameter was coded in the OMPROUTE configuration file, DESTADDR is the value of the interface DESTINATION_ADDR parameter. Otherwise, N/A is displayed.

**IPv4 generic interfaces**
The DISPLAY TCPIP, tcpname, OMPROUTE, GENERIC, INTERFACE command displays current, run-time statistics and parameters related to IPv4 generic interfaces that are known to TCP/IP. The keyword IF can be used instead of INTERFACE. A sample output with an explanation of the entries follows:

<table>
<thead>
<tr>
<th>IFC NAME</th>
<th>IFC ADDRESS</th>
<th>SUBNET MASK</th>
<th>MTU</th>
<th>CFG</th>
<th>IGN</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSQDIO3L</td>
<td>9.67.120.3</td>
<td>255.255.255.0</td>
<td>576</td>
<td>YES</td>
<td>NO</td>
</tr>
<tr>
<td>CTC3T01</td>
<td>130.200.1.3</td>
<td>N/A</td>
<td>N/A</td>
<td>NO</td>
<td>YES</td>
</tr>
<tr>
<td>VIPA03</td>
<td>3.3.3.103</td>
<td>N/A</td>
<td>N/A</td>
<td>NO</td>
<td>YES</td>
</tr>
<tr>
<td>CTC3T04</td>
<td>9.67.161.3</td>
<td>255.255.255.0</td>
<td>10000</td>
<td>YES</td>
<td>NO</td>
</tr>
</tbody>
</table>
**IFC NAME**
The interface link name.

**IFC ADDRESS**
The interface home address.

**SUBNET MASK**
The interface subnet mask. If the interface is being ignored by OMPROUTE, N/A is displayed.

**MTU**
The interface MTU size. If the interface is being ignored by OMPROUTE, N/A is displayed.

**CFG**
Indicates whether or not the interface was configured to OMPROUTE.

**IGN**
Indicates whether or not the interface is being ignored by OMPROUTE (the value of this field can be YES only if CFG=NO, and the value of GLOBAL_OPTIONS IGNORE_UNDEFINED_INTERFACES is configured to be YES.)

**Examples using the RTTABLE command**

**OMPROUTE IPv4 main routing table**

The DISPLAY TCPIP, tcpipjobname, OMPROUTE, RTTABLE command displays all of the routes in the OMPROUTE IPv4 main routing table. A sample output with an explanation of the entries follows.

**Result:** This command displays the contents of the working table that is used by OMPROUTE; it does not display the TCP/IP routing table. The OMPROUTE routing table might contain information that is different from the information in the TCP/IP routing table. For more information about displaying the contents of the TCP/IP routing tables, see “DISPLAY TCPIP, NETSTAT” on page 9.

<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPF</td>
<td>Indicates that the route is an OSPF intra-area route.</td>
</tr>
<tr>
<td>SBNT</td>
<td>Indicates that the network is subnetted; such an entry is a placeholder only.</td>
</tr>
<tr>
<td>DIR</td>
<td>Indicates a directly connected network, subnet, or host.</td>
</tr>
<tr>
<td>RIP</td>
<td>Indicates a route that was learned through the RIP protocol.</td>
</tr>
<tr>
<td>DEL</td>
<td>Indicates the route has been deleted. <strong>Restriction:</strong> Deleted routes are shown in this display only if RIP is active and only as long as RIP needs to advertise to neighboring routers that they have been deleted. Deleted routes cannot be displayed in the detailed routes display.</td>
</tr>
<tr>
<td>STAT</td>
<td>Indicates a nonreplaceable statically configured route.</td>
</tr>
<tr>
<td>SPE1</td>
<td>Indicates OSPF external routes (type 1).</td>
</tr>
<tr>
<td>SPE2</td>
<td>Indicates OSPF external routes (type 2)</td>
</tr>
<tr>
<td>RNGE</td>
<td>Indicates a route type that is an active OSPF area address range and is not used in forwarding packets.</td>
</tr>
<tr>
<td>RSTA</td>
<td>Indicates a static route that is defined as replaceable. An asterisk (*) after the route type indicates that the route has a directly connected backup. A percent sign (%) after the route type indicates that RIP updates are always accepted for this destination.</td>
</tr>
</tbody>
</table>

**DEST NET**  
Indicates the IP destination.

**MASK**  
Indicates the IP destination subnet mask.
**COST**
Indicates the route cost.

<table>
<thead>
<tr>
<th>Route Type</th>
<th>COST Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPF or SPIA</td>
<td>The OSPF cost of the route.</td>
</tr>
<tr>

<td>The OSPF cost to get to the AS boundary router or forwarding address that is used to reach the destination, plus the external cost.</td>
</tr>
<tr>
<td>SPE2</td>
<td>The external cost.</td>
</tr>
<tr>
<td>RIP</td>
<td>The RIP metric.</td>
</tr>
<tr>
<td>STAT or RSTA</td>
<td>• 0 when the route is direct.</td>
</tr>
<tr>
<td></td>
<td>• 1 when the route is indirect.</td>
</tr>
<tr>
<td>DIR or SBNT</td>
<td>1</td>
</tr>
<tr>
<td>RNGE</td>
<td>The OSPF cost of the range.</td>
</tr>
<tr>
<td>DFLT</td>
<td>0</td>
</tr>
</tbody>
</table>

**AGE**
Indicates the time that has elapsed since the routing table entry was last refreshed. For routes that have the route type DEL or RIP, this value increments by a factor of 10 for each 10-second increase in age. If the TCP/IP stack enters a storage shortage condition, all routes that have the route type DEL or RIP are refreshed when the shortage condition is relieved.

**NEXT HOP(S)**
Indicates the IP address of the next router on the path toward the destination. A number in parentheses at the end of the column indicates the number of equal-cost routes to the destination. Use the DISPLAY TCPIP, tcpipjobname, OMPROUTE, RTTABLE, DEST=ip-addr command to obtain a list of the next hops.

**NETS DELETED**
Indicates the number of routes that have been deleted from the OMPROUTE routing table and not replaced. Use the D TCPIP, OMPROUTE, RTTABLE, DELETED command to list these routes.

**NETS INACTIVE**
Used for internal debugging purposes only.

*Route expansion information for the OMPROUTE IPv4 main routing table*
Use the DISPLAY TCPIP, tcpipjobname, OMPROUTE, RTTABLE, DEST=ip-addr command to obtain information about a particular route in the OMPROUTE IPv4 main routing table. When multiple equal-cost routes exist, use this command to obtain a list of the next hops. A sample output with an explanation of the entries follows:

**Result:** This command displays information from the working table that is used by OMPROUTE; it does not display the TCP/IP routing table. The OMPROUTE routing table might contain information that is different from the information in the TCP/IP routing table. For more information about displaying the contents of the TCP/IP routing tables, see “DISPLAY TCPIP,.NETSTAT” on page 9.

```
EZZ7874I ROUTE EXPANSION 370
DESTINATION: 9.68.101.0
MASK: 255.255.255.0
ROUTE TYPE: SPF
DISTANCE: 6
AGE: 1344
NEXT HOP(S): 9.167.100.17 (CTC2)
            9.168.100.4  (CTC1)
```
DESTINATION
Indicates the IP destination.

MASK
Indicates the IP destination subnet mask.

ROUTE TYPE
Indicates how the route was derived:

DFLT
Indicates a route defined using the DEFAULT_ROUTE configuration statement in the OMPROUTE configuration file.

SBNT
Indicates that the network is subnetted; such an entry is a placeholder only.

DIR
Indicates a directly connected network, subnet, or host.

RIP
Indicates a route that was learned through the RIP protocol.

STAT
Indicates a nonreplaceable statically configured route.

SPF
Indicates that the route is an OSPF intra-area route.

SPIA
Indicates that the route is an OSPF interarea route.

SPE1
Indicates OSPF external routes (type 1).

SPE2
Indicates OSPF external routes (type 2).

RNGE
Indicates a route type that is an active OSPF area address range and is not used in forwarding packets.

RSTA
Indicates a static route that is defined as replaceable.

An asterisk (*) after the route type indicates that the route has a directly connected backup. A percent sign (%) after the route type indicates that RIP updates are always accepted for this destination.

DISTANCE
Indicates the route cost.

### Table 4. OMPROUTE IPv4 Route Type and DISTANCE Value mapping

<table>

</tr>
</tbody>
</table>
Table 4. OMPROUTE IPv4 Route Type and DISTANCE Value mapping (continued)

<table>
<thead>
<tr>
<th>Route Type</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFLT</td>
<td>0</td>
</tr>
</tbody>
</table>

**AGE**
Indicates the time that has elapsed since the routing table entry was last refreshed. For routes that have the route type DEL or RIP, this value increments by a factor of 10 for each 10-second increase in age. If the TCP/IP stack enters a storage shortage condition, all routes that have the route type DEL or RIP are refreshed when the shortage condition is relieved.

**NEXT HOP(S)**
Indicates the IP address of the next router and the interface used to reach that router for each of the paths toward the destination.

*All OMPROUTE IPv4 policy-based routing tables*
The DISPLAY TCPIP,<tcpipjobname>,OMPROUTE,RTTABLE,PRTABLE=ALL command displays all of the routes in all of the OMPROUTE IPv4 policy-based routing tables. The dynamic routing parameters configured to the Policy Agent for each table are displayed following the routes for that table. A sample output with an explanation of the entries follows.

**Results:**
- This command displays the contents of the working tables that are used by OMPROUTE; it does not display the TCP/IP routing tables. The OMPROUTE routing tables might contain information that is different from the information in the TCP/IP routing tables. For more information about displaying the contents of the TCP/IP routing tables, see “DISPLAY TCPIP,,NETSTAT” on page 9.
- If a policy-based routing table is configured with no IPv4 dynamic routing parameters, OMPROUTE has no knowledge of that routing table for IPv4. The routing table is not included in the display of OMPROUTE IPv4 policy-based routing tables.
TABLE NAME
Indicates the name of the policy-based routing table.

INTERFACE
Indicates the name of an interface that is specified in a dynamic routing parameter for the policy-based routing table. If the interface is not currently defined to the TCP/IP stack as an IPv4 interface or the interface is inactive on the TCP/IP stack, the name is preceded by an asterisk (*).

NEXT HOP
Indicates the next hop router IP address that is specified in a dynamic routing parameter for the policy-based routing table. The value ANY is displayed when no next-hop router IP address is specified for the dynamic routing parameter.

See “OMPROUTE IPv4 main routing table” on page 52 for additional field descriptions.

OMPROUTE IPv4 policy-based routing table
The DISPLAY TCPIP(tcpipjobname),OMPROUTE,RTTABLE,PRTABLE=prname command displays all of the routes in a single OMPROUTE IPv4 policy-based routing table. The dynamic routing parameters configured to the Policy Agent for the table are displayed following the routes for the table. A sample output with explanation of entries follows.

Results:
• This command displays the contents of the working table that is used by OMPROUTE; it does not display the TCP/IP routing table. The OMPROUTE routing table might contain information that is different from the information in the TCP/IP routing table. For more information about displaying the contents of the TCP/IP routing tables, see “DISPLAY TCPPIP,,NETSTAT” on page 9.
• If a policy-based route table is configured with no IPv4 dynamic routing parameters, OMPROUTE has no knowledge of that route table for IPv4. You cannot use that route table with this command.

 Route expansion information for OMPROUTE IPv4 policy-based routing table
Use the DISPLAY TCPIP(tcpipjobname),OMPROUTE,RTTABLE,PRTABLE=prname,DEST=ip-addr command to obtain information about a particular route in an OMPROUTE IPv4 policy-based routing table. When multiple equal-cost routes exist, use this command to obtain a list of the next hops. A sample output with explanation of entries follows.

Results:
• This command displays information from the working table that is used by OMPROUTE; it does not display the TCP/IP routing table. The OMPROUTE routing table might contain information that is different from the information in the TCP/IP routing table. For more information about displaying the contents of the TCP/IP routing tables, see “DISPLAY TCPPIP,,NETSTAT” on page 9.
If a policy-based route table is configured with no IPv4 dynamic routing parameters, OMPROUTE has no knowledge of that route table for IPv4. You cannot use that route table with this command.

</tr>
</tbody>
</table>

**TABLE NAME**

Indicates the name of the policy-based routing table.

See “Route expansion information for the OMPROUTE IPv4 main routing table” on page 54 for additional field descriptions.

**Route expansion information for all OMPROUTE IPv4 policy-based routing tables**

Use the DISPLAY TCPIP,tcpipjobname,OMPROUTE,RTTABLE,PRTABLE=ALL,DEST=ip-addr command to obtain information from all of the OMPROUTE IPv4 policy-based routing tables about a particular route. When multiple equal-cost routes exist in a table, use this command to obtain a list of the next hops. A sample output with explanation of entries follows.

**Results:**

- This command displays information from the working tables that are used by OMPROUTE; it does not display the TCP/IP routing tables. The OMPROUTE routing tables might contain information that is different from the information in the TCP/IP routing tables. For more information about displaying the contents of the TCP/IP routing tables, see “DISPLAY TCPIP,,NETSTAT” on page 9.

- If a policy-based route table is configured with no IPv4 dynamic routing parameters, OMPROUTE has no knowledge of that route table for IPv4. The route table does not appear in the display of OMPROUTE IPv4 route tables.

**TABLE NAME**

Indicates the name of the policy-based routing table.

See “Route expansion information for the OMPROUTE IPv4 main routing table” on page 54 for additional field descriptions.

**Deleted OMPROUTE IPv4 routes**

The DISPLAY TCPIP,tcpipjobname,OMPROUTE,RTTABLE,DELETED command displays the routes that have been deleted from the OMPROUTE IPv4 main routing table and that have not been replaced or recycled through garbage collection (garbage collection occurs only when RIP is running). A sample output follows. Explanation of entries is the same as for the DISPLAY TCPIP,tcpipjobname,OMPROUTE,RTTABLE command (see “OMPROUTE IPv4 main routing table” on page 52).
The DISPLAY TCPIP, tcpipjobname, OMPROUTE, RTTABLE, PRTABLE=prname, DELETED command displays the routes that have been deleted from an OMPROUTE IPv4 policy-based routing table and that have not been replaced or recycled through garbage collection.

```

```

**TRACE6**

Displays the level of tracing currently in use by OMPROUTE IPv6 routing protocols.

**DEBUG6**

Displays the level of debugging currently in use by OMPROUTE IPv6 routing protocols.

**STACK AFFINITY**

Displays the name of the stack on which OMPROUTE is running.

**IPV6 OSPF PROTOCOL**

Displays whether IPv6 OSPF is enabled or disabled.

**IPV6 OSPF ROUTER ID**

Displays the IPv6 OSPF Router ID and its configuration source. Possible sources are:
• OMPROUTE configuration statement (denoted by a prefixed asterisk "*") that has the RouterID parameter specified:

1. IPV6_OSPF
2. ROUTERID (if the IPv6 router ID was inherited from the router ID specified for IPv4)
3. OSPF (if the IPv6 router ID was inherited from the router ID specified for IPv4)

• The name of the IPv4 interface that was used by OMPROUTE to set the router ID. This indicates that you did not specify an IPv6 router ID, so the IPv6 router ID was inherited from the IPv4 router ID, which had been defaulted by OMPROUTE to the IP address assigned to an IPv4 interface.

For more information about assigned and configured router IDs, see Steps for configuring OSPF and RIP (IPv4 and IPv6) in the z/OS Communications Server: IP Configuration Guide.

DFLT IPV6 OSPF INST ID
Displays the default value for the OSPF protocol instance identifier for IPV6_OSPF_INTERFACES.

EXTERNAL COMPARISON
Displays the external route type used by IPv6 OSPF when importing external information into the IPv6 OSPF domain and when comparing IPv6 OSPF external routes to IPv6 RIP routes.

AS BOUNDARY CAPABILITY
Indicates whether external routes are imported into the IPv6 OSPF domain.

IMPORT EXTERNAL ROUTES
Indicates the types of external routes that are imported into the IPv6 OSPF domain. Displayed only when AS Boundary Capability is enabled.

ORIG DEFAULT ROUTE
Indicates whether a default route is originated into the IPv6 OSPF domain. Orig Default Route is displayed only when AS Boundary Capability is enabled.

DEFAULT ROUTE COST
Displays the cost and type of the default route (if originated). Default Route Cost is displayed only when AS Boundary Capability is enabled and Orig Default Route is Always.

DEFAULT FORWARD ADDR
Displays the forwarding address specified in the default route (if originated). Default Forwarding Address is displayed only when AS Boundary Capability is enabled and Orig Default Route is Always.

LEARN HIGHER COST DFLT
Indicates whether IPv6 OSPF will learn default routes from inbound packets when their cost is higher than the default route originated by this host. This parameter is displayed only when AS Boundary Capability is enabled and Orig Default Route is Always.

DEMAND CIRCUITS
Indicates whether demand circuit support is available for IPv6 OSPF interfaces.

DR MAX ADJ ATTEMPT
Establishes a threshold value for maximum number of adjacency attempts to a neighboring designated router. It is used for reporting and controlling futile neighbor state loops. For information about futile neighbor state loops, see the futile neighbor state loops information in the z/OS Communications Server: IP Configuration Guide.

The remainder of the DISPLAY TCPIP, tcpipjobname,OMPROUTE,IPV6OSPF,ALL output is described in the following sections.

IPv6 OSPF area statistics and parameters

The DISPLAY TCPIP,tcipjobname,OMPROUTE,IPV6OSPF,AREASUM command displays the statistics and parameters for all IPv6 OSPF areas attached to the router. A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>AREA ID</th>
<th>STUB</th>
<th>DFLT-COST</th>
<th>IMPORT-PREF</th>
<th>DEMAND</th>
<th>IFCS</th>
<th>NETS</th>
<th>RTRS</th>
<th>ABRs</th>
</tr>

<th>ADVERTISE</th>
<th>PREFIX</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.6.6.6</td>
<td>NO</td>
<td>2001:DB8:0:101::/64</td>
</tr>
</tbody>
</table>

**AREA ID**
Indicates the ID of the area.

**STUB**
Indicates whether the area is a stub area.

**DFLT-COST**
Displays the cost of the default route configured for the stub area.

**IMPORT-PREF**
Indicates whether Inter-Area Prefix LSAs are to be imported into the stub area.

**DEMAND**
Indicates whether demand circuits are supported in this area. This is ON when every router in the area supports demand circuits, otherwise it is OFF.

**IFCS**
Indicates the number of router interfaces attached to the particular area. These interfaces are not necessarily functional.

**NETS**
Indicates the number of transit networks that have been found while doing the SPF tree calculation for this area.

**RTRS**
Indicates the number of routers that have been found when doing the SPF tree calculation for this area.

**ABRS**
Indicates the number of area border routers that have been found when doing the SPF tree calculation for this area.

**AREA RANGES**
Indicates that information about ranges configured for this area follows.

**ADVERTISE**
Indicates whether a given range within an area is to be advertised into other areas.

**PREFIX**
Displays the prefix and prefix length for a given range within an area.

---IPv6 OSPF interface statistics and parameters---

The DISPLAY TCPIP, tcpijobname, OMPROUTE, IPV6OSPF, INTERFACE, NAME=if-name, ID=if-id command displays current, run-time statistics and parameters related to IPv6 OSPF interfaces. (The keyword IF can be substituted for INTERFACE.) Either the NAME= parameter or the ID= parameter can be specified, but not both. If no NAME= or ID= parameter is given (see Example 1), a single line is printed summarizing each interface. If NAME= or ID= parameter is given (see Example 2), detailed statistics for that interface are displayed. Sample outputs with an explanation of entries follow:

---Example 1----

<tr>
<td>64</td>
<td>Backup DR</td>
</tr>
<tr>
<td>128</td>
<td>Designated router</td>
</tr>
</tbody>
</table>

For more information about these values, see RFC 1583 (OSPF Version 2).

**COST**

Indicates the cost (or metric) associated with the interface.

**HELLO**

Indicates the number of seconds between Hello packets sent from the interface.

**DEAD**

Indicates the number of seconds after not having received an OSPF Hello packet, that a neighbor is declared to be down.

**NBRS**

Number of neighbors. This is the number of routers whose hellos have been received.

**ADJS**

Number of adjacencies. This is the number of neighbors in state Exchange or greater. These are the neighbors with whom the router has synchronized or is in the process of synchronization.

INTERFACE NAME
Displays the interface name.

INTERFACE ID
Number that uniquely identifies the interface among the collection of all OSPF interfaces on this TCP/IP stack.

INSTANCE ID
The IPv6 OSPF Instance ID for this interface.

INTERFACE ADDRESS
Indicates the IP addresses that have been learned from the TCP/IP stack for the interface.

INTERFACE PREFIX
Lists the prefixes of the interface. RADV indicates the prefix was learned through IPv6 Router Discovery. STAT indicates it was statically defined to this interface using the PREFIX parameter of the IPv6_OSPF_INTERFACE statement. OSPF indicates it was learned using the OSPF protocol.

ATTACHED AREA
Attached area ID.

INTERFACE TYPE
Can be one of the following value:

<table>
<thead>
<tr>
<th>INTERFACE TYPE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BRDCST</td>
<td>Broadcast interface</td>
</tr>
<tr>
<td>P-2-MP</td>

</tr>
<tr>
<td>64</td>
<td>Backup DR</td>
</tr>
<tr>
<td>128</td>
<td>Designated router</td>
</tr>
</tbody>
</table>

For more information about these values, see RFC 1583 (OSPF Version 2).

**DESIGNATED ROUTER**
Router ID of the designated router.

**BACKUP DR**
Router ID of the backup designated router.

**DR PRIORITY**
Displays the interface router priority used when selecting the designated router. A higher value indicates that this OMPROUTE is more likely to become the designated router. A value of 0 indicates that OMPROUTE never becomes the designated router.

**HELLO INTERVAL**
Indicates the number of seconds between Hello packets sent from the interface.

**RXMT INTERVAL**
Displays the frequency (in seconds) of retransmitting link state update packets, link state request packets, and database description packets.

**DEAD INTERVAL**
Indicates the number of seconds after not having received an OSPF Hello packet, that a neighbor is declared to be down.

**TX DELAY**
Displays the transmission delay value (in seconds). As each link state advertisement is sent out through this interface, it is aged by this value.

**POLL INTERVAL**
Displays the poll interval value.

**DEMAND CIRCUIT**
Displays the current demand circuit status.

**HELLO SUPPRESS**
Displays whether Hello Suppression is currently on or off.

**SUPPRESS REQ**
Displays whether Hello Suppression was requested for this interface.

**MTU**
Indicates the value of the Maximum Transmission Unit.

**COST**
Indicates the cost (or metric) associated with the interface.

**DB_EX INTERVAL**
Indicates the number of seconds to allow the database exchange to complete.

**# NEIGHBORS**
Number of neighbors. This is the number of routers whose hellos have been received.

**# ADJACENCIES**
Number of adjacencies. This is the number of neighbors in state Exchange or greater. These are the neighbors with whom the router has synchronized or is in the process of synchronization.

**# FULL ADJS**
Number of full adjacencies. This is the number of neighbors whose state is Full (and therefore with which the router has synchronized databases).
# MAX ADJ. RESETS
The total number of times that the maximum threshold value for adjacency attempts (see the DR MAX ADJ ATTEMPT field) with a neighboring designated router has been reset. A value of N/A indicates that the field is not applicable for that interface, based on the interface type that is used to reach a neighbor. See the types of interfaces supported by OMPROUTE information in z/OS Communications Server: IP Configuration Reference for the types of interfaces that support the futile neighbor state loop detection for OSPF.

# MCAST FLOODS
Number of link state updates that flooded the interface (not counting retransmissions).

# MCAST ACKS
Number of link state acknowledgments that flooded the interface (not counting retransmissions).

# ERR PKTS RCVD
Number of the packets received on the interface that contain errors. These errors include bad packet type, bad length, bad checksum, or other errors.

NETWORK CAPABILITIES
Displays the capabilities of the interface.

IPv6 OSPF virtual link statistics and parameters
The DISPLAY TCPIP,tcipjobname,OMPROUTE,IPV6OSPF,VLINK,ENDPT=router-id command displays current, run-time statistics and parameters related to IPv6 OSPF virtual links. If no ENDPT= parameter is given (see Example 1), a single line is printed summarizing each virtual link. If ENDPT= parameter is given (see Example 2), detailed statistics for that virtual link is displayed. Sample outputs with an explanation of entries follow:

<table>
<thead>
<tr>
<th>ENDPOINT</th>
<th>TRANSIT AREA</th>
<th>STATE</th>
<th>COST</th>
<th>HELLO</th>
<th>DEAD</th>
<th>NBRS</th>
<th>ADJS</th>
</tr>
</thead>
<tbody>
<tr>
<td>64.64.64.64</td>
<td>6.6.6.6</td>
<td>16</td>
<td>1</td>
<td>30</td>
<td>180</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

ENDPOINT
Indicates the router ID of the virtual neighbor (other endpoint).

TRANSIT AREA
Indicates the non-backbone, non-stub area through which the virtual link is configured.

STATE
Can be one of the following value:

<table>
<thead>
<tr>
<th>STATE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Down</td>
</tr>
<tr>
<td>16</td>
<td>Point-to-point</td>
</tr>
</tbody>
</table>

For more information about these values, see RFC 1583 (OSPF Version 2).

COST
Indicates the cost (or metric) associated with the virtual link.

HELLO
Indicates the number of seconds between Hello packets sent from the virtual link.

DEAD
Indicates the number of seconds after not having received an OSPF Hello packet, that a neighbor is declared to be down.

NBRS
Number of neighbors. This is the number of routers whose hellos have been received.
ADJS

Number of adjacencies. This is the number of neighbors in state Exchange or greater. These are the neighbors with whom the router has synchronized or is in the process of synchronization.

---Example 2----

```

VIRTUAL LINK ENDPOINT

Indicates the router ID of the virtual neighbor (other endpoint).

PHYSICAL INTERFACE NAME

Indicates the name of the physical interface being used by the virtual link.

VL TRANSIT AREA

Indicates the non-backbone, non-stub area through which the virtual link is configured.

STATE

Can be one of the following value:

<table>
<thead>
<tr>
<th>STATE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Down</td>
</tr>
<tr>
<td>16</td>
<td>Point-to-point</td>
</tr>
</tbody>
</table>

For more information about these values, see RFC 1583 (OSPF Version 2).

HELLO INTERVAL

Indicates the number of seconds between Hello packets sent from the virtual link.

DEAD INTERVAL

Indicates the number of seconds after not having received an OSPF Hello packet, that a neighbor is declared to be down.

DB_EX INTERVAL

Indicates the number of seconds to allow the database exchange to complete.

RXMT INTERVAL

Displays the frequency (in seconds) of retransmitting link state update packets, link state request packets, and database description packets.

TX DELAY

Displays the transmission delay value (in seconds). As each link state advertisement is sent out through this interface, it is aged by this value.

COST

Indicates the cost (or metric) associated with the virtual link.

DEMAND CIRCUIT

Displays the current demand circuit status.

HELLO SUPPRESS

Displays whether Hello Suppression is currently on or off.

SUPPRESS REQ

Displays whether Hello Suppression was requested for this interface.

# NEIGHBORS

Number of neighbors. This is the number of routers whose hellos have been received.
# ADJACENCIES
Number of adjacencies. This is the number of neighbors in state Exchange or greater. These are the
eighbors with whom the router has synchronized or is in the process of synchronization.

# FULL ADJS
Number of full adjacencies. This is the number of neighbors whose state is Full (and therefore with
which the router has synchronized databases).

IPv6 OSPF neighbor statistics and parameters
The DISPLAY TCPIP,tcpipjobname,OMPROUTE,IPV6OSPF,NEIGHBOR,ID=router-id,IFNAME=if_name
command displays the statistics and parameters related to IPv6 OSPF neighbors. (The keyword NBR can
be substituted for NEIGHBOR.)

• If no ID= parameter is given (see Example 1), a single line is printed summarizing each neighbor.
• If an ID= parameter is given (see Example 2), detailed statistics for that neighbor are displayed.
• If the neighbor specified by the ID= parameter has more than one neighbor relationship with
  OMPROUTE (for example if there are multiple IPv6 OSPF links connecting them), the IFNAME=
  parameter can be used to specify which link’s adjacency to examine (for an adjacency over a virtual link,
  specify IFNAME=*).

See the following sample outputs with an explanation of entries:

----Example 1 ----
EZZ8129I IPV6 OSPF NEIGHBORS 715
ROUTER ID STATE LSRXL DBSUM LSREQ HSUP RTR-PRI IFC
65.65.65.65 128 0 0 0 OFF 1 MPCPTP7T05
63.63.63.63 8 0 0 0 OFF 1 NSQDIO1L6
64.64.64.64 128 0 0 0 OFF 1 NSQDIO1L6
68.68.68.68 128 0 0 0 OFF 1 NSQDIO1L6
64.64.64.64 128 0 0 0 OFF 1 *

ROUTER ID
Displays the neighbor's OSPF router ID.

STATE
Can be one of the following value:

<table>
<thead>
<tr>
<th>STATE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Down</td>
</tr>
<tr>
<td>2</td>
<td>Attempt</td>
</tr>
<tr>
<td>4</td>
<td>Init</td>
</tr>
<tr>
<td>8</td>
<td>2-Way</td>
</tr>
<tr>
<td>16</td>
<td>ExStart</td>
</tr>
<tr>
<td>32</td>
<td>Exchange</td>
</tr>
<tr>
<td>64</td>
<td>Loading</td>
</tr>
<tr>
<td>128</td>
<td>Full</td>
</tr>
</tbody>
</table>

For more information about these values, see RFC 1583 (OSPF Version 2).

LSRXL
Displays the size of the current link state retransmission list for this neighbor.

DBSUM
Displays the size of the database summary list waiting to be sent to the neighbor.

LSREQ
Displays the number of link state advertisements that are being requested from the neighbor.
**HSUP**
Displays whether hello suppression is active with the neighbor.

**RTR-PRI**
Displays the neighbor's router priority. Higher router priority indicates that it is more likely to become a designated router. A router priority of 0 indicates that the neighbor is not eligible to become designated router. N/A indicates the neighbor is not on a multi-access link; therefore, no designated router is required.

**IFC**
Displays the name of the interface over which a relationship has been established with this neighbor. An asterisk (*) displayed in this column indicates that the neighbor relationship has been established over a virtual link.

---Example 2---

**NEIGHBOR IP ADDRESS:** FE80::4
**OSPF ROUTER ID:** 64.64.64.64
**NEIGHBOR STATE:** 128
**PHYSICAL INTERFACE:** NSQDIOL6
**DR CHOICE:** 68.68.68.68
**BACKUP CHOICE:** 64.64.64.64
**DR PRIORITY:** 1
**NBR OPTIONS:** V6,E,R (0X0013)

**NEIGHBOR IP ADDRESS**
Displays the link-local IP address of the neighbor's interface to the common link.

**OSPF ROUTER ID**
Displays the neighbor's OSPF router ID.

**NEIGHBOR STATE**
Can be one of the following values:

<table>
<thead>
<tr>
<th>NEIGHBOR STATE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Down</td>
</tr>
<tr>
<td>2</td>
<td>Attempt</td>
</tr>
<tr>
<td>4</td>
<td>Init</td>
</tr>
<tr>
<td>8</td>
<td>2-Way</td>
</tr>
<tr>
<td>16</td>
<td>ExStart</td>
</tr>
<tr>
<td>32</td>
<td>Exchange</td>
</tr>
<tr>
<td>64</td>
<td>Loading</td>
</tr>
<tr>
<td>128</td>
<td>Full</td>
</tr>
</tbody>
</table>

For more information about these values, see RFC 1583 (OSPF Version 2).

**PHYSICAL INTERFACE**
Displays the name of the interface over which a relationship has been established with this neighbor.

**DR CHOICE, BACKUP CHOICE, DR PRIORITY**
Indicate the values seen in the last hello message received from the neighbor. N/A indicates that the neighbor is not on a multiaccess link; therefore, no designated router is required.

**NBR OPTIONS**
Indicates the optional OSPF capabilities supported by the neighbor. These capabilities are denoted by:
<table>
<thead>
<tr>
<th>NBR OPTIONS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V6</td>
<td>The router can be used in IPv6 routing calculations.</td>
</tr>
<tr>
<td>E</td>
<td>Processes AS External LSAs. When this is not set, the area to which the common network belongs has been configured as a stub.</td>
</tr>
<tr>
<td>MC</td>
<td>RFC 1584 (Multicast Extensions to OSPF) is supported. This value is never set by OMPROUTE but can be received from other routers.</td>
</tr>
<tr>
<td>N</td>
<td>Describes the handling of Type-7 LSAs - Multicast OSPF. This value is never set by OMPROUTE but might be received from other routers.</td>
</tr>
<tr>
<td>R</td>
<td>Is an active router. Routes that transit the neighbor can be computed.</td>
</tr>
<tr>
<td>DC</td>
<td>RFC 1793 (Extending OSPF to Support Demand Circuits) is supported.</td>
</tr>
</tbody>
</table>

This field is valid only for those neighbors in state Exchange or greater.

**DB SUMM QLEN**
Indicates the number of advertisements waiting to be summarized in Database Description packets. It must be 0 except when the neighbor is in state Exchange.

**LS RXMT QLEN**
Indicates the number of advertisements that have been flooded to the neighbor, but not yet acknowledged.

**LS REQ QLEN**
Indicates the number of advertisements that are being requested from the neighbor in state Loading.

**LAST HELLO**
Indicates the number of seconds since a hello message has been received from the neighbor. If the TCP/IP stack enters a storage shortage condition, this value is reset to 0 when the shortage condition is relieved.

**NO HELLO**
Indicates whether Hello Suppression is active with the neighbor.

**# LS RXMITS**
Indicates the number of retransmissions that have occurred during flooding.

**# DIRECT ACKS**
Indicates the number of acknowledgements sent in response to duplicate link state advertisements.

**# DUP LS RCVD**
Indicates the number of duplicate retransmissions that have occurred during flooding.

**# OLD LS RCVD**
Indicates the number of old advertisements received during flooding.

**# DUP ACKS RCVD**
Indicates the number of duplicate acknowledgments received.

**# ADJ. RESETS**
Indicates the number of times the neighbor has transitioned down to ExStart state.

**# ERR LS RVCD**
Number of the link state advertisements received from the neighbor that are unexpected or that contain errors. These errors include bad advertisement type, bad length, bad checksum, or other errors.

**IPv6 OSPF link state database statistics**

The DISPLAY TCPIP,tcpipjobname,OMPROUTE,IPV6OSPF,DSBSIZE command displays the number of LSAs currently in the link state database, categorized by type. The following example is a sample output:

```
EZS8128I IPV6 OSPF LS DATABASE SIZE 841
# ROUTER-LSAS: 8
# NETWORK-LSAS: 1
# INTER-AREA PREFIX LSAS: 50
```
IPv6 OSPF link state advertisement

The following command displays the contents of a single link state advertisement contained in the IPv6 OSPF database:

```
DISPLAY TCPIP,tcpipjobname,OMPROUTE,IPV6OSPF,LSA,LSTYPE=ls-type,LSID=lsid,ORIG=ad-router,AREAID=area-id,IFNAME=if_name
```

For a summary of all non-external advertisements in the IPv6 OSPF database, use the following command: DISPLAY TCPIP,tcpipjobname,OMPROUTE,IPV6OSPF,DATABASE,AREAID=area-id

For a summary of all external advertisements in the IPv6 OSPF database, use the following command: DISPLAY TCPIP,tcpipjobname,OMPROUTE,IPV6OSPF,EXTERNAL

The following example shows a sample output of a Router LSA with an explanation of entries:

```
EZZ7880I LSA DETAILS 834
LS AGE:          61
LS TYPE:         0X2001 (ROUTER LSA)
LS ID:           0
LS ORIGINATOR:   64.64.64.64
LS SEQUENCE NO:  0X8000000F
LS CHECKSUM:     0X3886
LS LENGTH:       40
ROUTER TYPE:     (0X01) ABR
LS OPTIONS:      (0X000033) V6,E,R,DC
INTERFACES:
  TYPE  METRIC  INTERFACE ID   NBR INTERFACE ID   NBR ROUTER ID
    2       1            16                 14     68.68.68.68
```

**LS AGE**

The time, in seconds, since the LSA was originated. An asterisk (*) displayed beside the age value indicates that the originator is supporting demand circuits and has indicated that this LSA should not be aged.

**LS TYPE**

Classifies the advertisement and dictates its contents. LS Type values are hexadecimal values.

<table>
<thead>
<tr>
<th>LS TYPE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x2001</td>
<td>Router LSA, has area scope.</td>
</tr>
<tr>
<td>0x2002</td>
<td>Network LSA, has area scope.</td>
</tr>
<tr>
<td>0x2003</td>
<td>Inter-Area Prefix LSA, has area scope.</td>
</tr>
<tr>
<td>0x2004</td>
<td>Inter-Area Router LSA, has area scope.</td>
</tr>
<tr>
<td>0x4005</td>
<td>AS External LSA, has global scope throughout the IPv6 OSPF autonomous sytem.</td>
</tr>
<tr>
<td>0x0008</td>
<td>Link LSA, has link scope.</td>
</tr>
<tr>
<td>0x2009</td>
<td>Intra-Area Prefix LSA, has area scope.</td>
</tr>
</tbody>
</table>

**LS ID**

Together with LS Type and LS Originator, uniquely identifies the LSA in the link state database.

**LS ORIGINATOR**

The Router ID of the router that originated the LSA.
LS SEQUENCE NO
Used to detect old or duplicate LSAs. Successive instances of an LSA are given successive LS sequence numbers.

LS CHECKSUM
The Fletcher checksum of the complete contents of the LSA, including the LSA header but excluding the LS age field.

LS LENGTH
The length in bytes of the LSA, including the 20-byte LSA header.

ROUTER TYPE
Indicates the level of function of the advertising router and can be one of the following type:

<table>
<thead>
<tr>
<th>ROUTER TYPE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASBR</td>
<td>The router is an AS boundary router.</td>
</tr>
<tr>
<td>ABR</td>
<td>The router is an area border router.</td>
</tr>
<tr>
<td>V</td>
<td>The router is an endpoint of one of more fully adjacent virtual links having the described area as transit area.</td>
</tr>
<tr>
<td>W</td>
<td>The router is a wildcard multicast receiver (OMPROUTE will never set the W option on its own Router LSAs).</td>
</tr>
</tbody>
</table>

LS OPTIONS
Indicates the optional OSPF capabilities supported by the piece of the routing domain described by the advertisement, denoted by:

<table>
<thead>
<tr>
<th>LS OPTIONS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V6</td>
<td>The information in the LSA can be used in IPv6 routing calculations.</td>
</tr>
<tr>
<td>E</td>
<td>Processes AS External LSAs. When this is not set, the area to which the advertisement belongs has been configured as a stub.</td>
</tr>
<tr>
<td>MC</td>
<td>RFC 1584 (Multicast Extensions to OSPF) is supported. This value is never set by OMPROUTE but can be received from other routers.</td>
</tr>
<tr>
<td>N</td>
<td>Describes the handling of Type-7 LSAs - Multicast OSPF. This value is never set by OMPROUTE but can be received from other routers.</td>
</tr>
<tr>
<td>R</td>
<td>Routes can be computed which transit the advertising node.</td>
</tr>
<tr>
<td>DC</td>
<td>RFC 1793 (Extending OSPF to Support Demand Circuits) is supported.</td>
</tr>
</tbody>
</table>

INTERFACES
Subheader indicating that information about interfaces advertised on this Router LSA follows.

TYPE
The kind of interface being described:

<table>
<thead>
<tr>
<th>TYPE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Point-to-point connection to another router</td>
</tr>
<tr>
<td>2</td>
<td>Connection to a transit network</td>
</tr>
<tr>
<td>4</td>
<td>Virtual link</td>
</tr>
</tbody>
</table>

METRIC
The cost of using this router interface, for outbound traffic.
**INTERFACE ID**
The interface ID assigned to the interface being described.

**NBR INTERFACE ID**
The interface ID that the neighbor router (or, for Type 2 interfaces, the link's designated router) has been advertising in hello packets sent on the link.

**NBR ROUTER ID**
The Router ID of the neighbor router, or, for Type 2 interfaces, the link's designated router.

The following example shows a sample output of a Network LSA with an explanation of entries:

```
EZZ7880I LSA DETAILS 877
  LS AGE:          268
  LS TYPE:         0X2002 (NETWORK LSA)
  LS ID:           14
  LS ORIGINATOR:   68.68.68.68
  LS SEQUENCE NO:  0X80000003
  LS CHECKSUM:     0X774C
  LS LENGTH:       40
  LS OPTIONS:      (0X000033) V6,E,R,DC
  ATTACHED ROUTERS:
                              68.68.68.68  67.67.67.67  64.64.64.64  63.63.63.63
```

**LS AGE, LS TYPE, LS ID, LS ORIGINATOR, LS SEQUENCE NO, LS CHECKSUM, LS LENGTH, LS OPTIONS**

See descriptions for these values in the Router LSA sample in “IPv6 OSPF link state advertisement” on page 70.

**ATTACHED ROUTERS**
The Router IDs of each of the routers attached to the link. This includes the Designated Router and all routers that are fully adjacent to the Designated Router.

The following example shows a sample output of an Inter-Area Prefix LSA with an explanation of entries:

```
EZZ7880I LSA DETAILS 881
  LS AGE:          58
  LS TYPE:         0X2003 (INTER-AREA PREFIX LSA)
  LS ID:           23
  LS ORIGINATOR:   64.64.64.64
  LS SEQUENCE NO:  0X80000002
  LS CHECKSUM:     0X1C69
  LS LENGTH:       44
  PREFIX:          2001:DB8:0:120::7/128
  PREFIX-OPTIONS:  (0X00)
  METRIC:          1
```

**LS AGE, LS TYPE, LS ID, LS ORIGINATOR, LS SEQUENCE NO, LS CHECKSUM, LS LENGTH**
See descriptions for these values in the Router LSA sample in “IPv6 OSPF link state advertisement” on page 70.

**PREFIX**
The prefix being described by the LSA.

**PREFIX OPTIONS**
The optional capabilities of the prefix including the following values:

<table>
<thead>
<tr>
<th>PREFIX OPTIONS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NU</td>
<td>The prefix should be excluded from IPv6 unicast calculations.</td>
</tr>
<tr>
<td>LA</td>
<td>The prefix is actually an IPv6 interface address of the advertising router.</td>
</tr>
<tr>
<td>MC</td>
<td>The prefix should be included in IPv6 multicast routing calculations.</td>
</tr>
<tr>
<td>P</td>
<td>On NSSA area prefixes, the prefix should be readvertised at the NSSA area border. OMPROUTE cannot be an NSSA area router.</td>
</tr>
</tbody>
</table>

**METRIC**
The cost of the route from the LSA originator to the prefix being described by the LSA.
The following example shows a sample output of an Inter-Area Router LSA with an explanation of entries:

| LS AGE: | 8          |
| LS TYPE: | 0x2004 (INTER-AREA ROUTER LSA) |
| LS ID:   | 2          |
| LS ORIGINATOR: | 64.64.64.64 |
| LS SEQUENCE NO: | 0x80000001 |
| LS CHECKSUM: | 0x9859 |
| LS LENGTH: | 32         |
| LS OPTIONS: | (0x000033) V6,E,R,DC |
| ROUTER ID: | 68.68.68.68 |
| METRIC: | 1          |

**LS AGE, LS TYPE, LS ID, LS ORIGINATOR, LS SEQUENCE NO, LS CHECKSUM, LS LENGTH, LS OPTIONS**

See descriptions for these values in the Router LSA sample in “IPv6 OSPF link state advertisement” on page 70.

**ROUTER ID**

The Router ID of the router being described by the LSA.

**METRIC**

The cost of the route from the LSA originator to the router being described by the LSA.

The following example shows a sample output of an AS External LSA with an explanation of entries:

| LS AGE: | 33          |
| LS TYPE: | 0x4005 (AS EXTERNAL LSA) |
| LS ID:   | 4          |
| LS ORIGINATOR: | 67.67.67.67 |
| LS SEQUENCE NO: | 0x80000001 |
| LS CHECKSUM: | 0x4d64 |
| LS LENGTH: | 36         |
| METRIC: | 2          |
| METRIC TYPE: | 2 |
| PREFIX-OPTIONS: | (0x00) |
| PREFIX: | 2001:DB8:0:A1B::/64 |

**LS AGE, LS TYPE, LS ID, LS ORIGINATOR, LS SEQUENCE NO, LS CHECKSUM, LS LENGTH**

See descriptions for these values in the Router LSA sample in “IPv6 OSPF link state advertisement” on page 70.

**METRIC**

The cost of the route from the LSA originator to the prefix being described by the LSA.

**METRIC TYPE**

Whether the specified metric is a Type 1 or Type 2 external metric.

**PREFIX OPTIONS**

The optional capabilities of the prefix including the following values:

<table>
<thead>
<tr>
<th>PREFIX OPTIONS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NU</td>
<td>The prefix should be excluded from IPv6 unicast calculations.</td>
</tr>
<tr>
<td>LA</td>
<td>The prefix is actually an IPv6 interface address of the advertising router.</td>
</tr>
<tr>
<td>MC</td>
<td>The prefix should be included in IPv6 multicast routing calculations.</td>
</tr>
<tr>
<td>P</td>
<td>On NSSA area prefixes, the prefix should be readvertised at the NSSA area border. OMPROUTE cannot be an NSSA area router.</td>
</tr>
</tbody>
</table>

**PREFIX**

The prefix being described by the LSA.

**FORWARD ADDR**

Optional field. If included, data traffic for the advertised destination should be forwarded to this address.
**ROUTE TAG**
Optional field. If included, communicates additional information between AS boundary routers.

**REF TYPE, REF LS ID**
Optional fields. If included, additional information concerning the advertised external route can be found in the LSA having LS type of REF TYPE, Link State ID of REF LS ID, and LS Originator the same as specified in this LSA.

The following example shows a sample output of a Link LSA with an explanation of entries:

```
EZZ7880I LSA DETAILS 911
  LS AGE:          2
  LS TYPE:         0X0008 (LINK LSA)
  LS ID:           34
  LS ORIGINATOR:   63.63.63.63
  LS SEQUENCE NO:  0X80000003
  LS CHECKSUM:     0X34E8
  LS LENGTH:       56
  LS OPTIONS:      (0X000033) V6,E,R,DC
  LINK LOCAL ADDR: FE80::3
  ROUTER PRIORITY: 1
  # PREFIXES:      1
  PREFIX-OPTIONS   PREFIX
                   (0X00)  2001:DB8:0:120::/64
```

**LS AGE, LS TYPE, LS ID, LS ORIGINATOR, LS SEQUENCE NO, LS CHECKSUM, LS LENGTH, LS OPTIONS**
See descriptions for these values in the Router LSA sample in “IPv6 OSPF link state advertisement” on page 70.

**LINK LOCAL ADDR**
The originating router's link-local address on the link.

**ROUTER PRIORITY**
The router priority of the interface attaching the originating router to the link. Used in electing Designated Router.

**# PREFIXES**
The number of IPv6 address prefixes contained in the LSA.

**PREFIX OPTIONS**
The optional capabilities of the prefix:

<table>
<thead>
<tr>
<th>PREFIX OPTIONS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NU</td>
<td>The prefix should be excluded from IPv6 unicast calculations.</td>
</tr>
<tr>
<td>LA</td>
<td>The prefix is actually an IPv6 interface address of the advertising router.</td>
</tr>
<tr>
<td>MC</td>
<td>The prefix should be included in IPv6 multicast routing calculations.</td>
</tr>
<tr>
<td>P</td>
<td>On NSSA area prefixes, the prefix should be readvertised at the NSSA area border. OMPROUTE cannot be an NSSA area router.</td>
</tr>
</tbody>
</table>

**PREFIX**
An IPv6 prefix to be associated with the link.

The following example shows a sample output of an Intra-Area Prefix LSA with an explanation of entries:

```
EZZ7880I LSA DETAILS 913
  LS AGE:          32
  LS TYPE:         0X2009 (INTRA-AREA PREFIX LSA)
  LS ID:           14
  LS ORIGINATOR:   68.68.68.68
  LS SEQUENCE NO:  0X80000004
  LS CHECKSUM:     0X6EC8
  LS LENGTH:       52
  # PREFIXES:      1
  REF LS TYPE:     0X2001
  REF LS ID:       0
  REF ORIG:        68.68.68.68
```

---

74 z/OS Communications Server: IP System Administrator's Commands
**METRIC**

The cost of the route from the LSA originator to each of the prefixes being described.

**PREFIX OPTIONS**

The optional capabilities of each of the prefixes being described:

<table>
<thead>
<tr>
<th>PREFIX OPTIONS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NU</td>
<td>The prefix should be excluded from IPv6 unicast calculations.</td>
</tr>
<tr>
<td>LA</td>
<td>The prefix is actually an IPv6 interface address of the advertising router.</td>
</tr>
<tr>
<td>MC</td>
<td>The prefix should be included in IPv6 multicast routing calculations.</td>
</tr>
<tr>
<td>P</td>
<td>On NSSA area prefixes, the prefix should be readvertised at the NSSA area border. OMPROUTE cannot be an NSSA area router.</td>
</tr>
</tbody>
</table>

**PREFIX**

The list of prefixes being described.

**IPv6 OSPF external advertisements**

The DISPLAY TCPIP/tcpipjobname,OMPROUTE,IPv6OSPF,EXTERNAL command lists the AS external advertisements belonging to the IPv6 OSPF routing domain. One line is printed for each advertisement. Each advertisement is defined by the following three parameters:

- Its link state type (always 4005 for AS external advertisements)
- Its link state ID
- The advertising router (called the LS originator)

A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>LS ORIGINATOR</th>
<th>LS ID</th>
<th>SEQNO</th>
<th>AGE</th>
<th>PREFIX</th>
</tr>
</thead>
<tbody>
<tr>
<td>67.67.67.67</td>
<td>6</td>
<td>0X80000001</td>
<td>561</td>
<td>2001:DB8:0:A1C::6/128</td>
</tr>
<tr>
<td>67.67.67.67</td>
<td>7</td>
<td>0X80000001</td>
<td>558</td>
<td>2001:DB8:0:103::6/128</td>
</tr>
<tr>
<td>67.67.67.67</td>
<td>8</td>
<td>0X80000001</td>
<td>222</td>
<td>2001:DB8:0:A10::/60</td>
</tr>
<tr>
<td>67.67.67.67</td>
<td>9</td>
<td>0X80000001</td>
<td>222</td>
<td>2001:DB8:0:A18::/64</td>
</tr>
<tr>
<td>67.67.67.67</td>
<td>10</td>
<td>0X80000001</td>
<td>222</td>
<td>2001:DB8:0:A1C::/64</td>
</tr>
</tbody>
</table>

# ADSvertisements: 6  CHECKSUM TOTAL: 0X000271C6

**LS ORIGINATOR**

The Router ID of the router that originated the advertisement.

**LS ID**

Uniquely identifies multiple external LSAs originated by the same router.

**SEQNO, AGE**

It is possible for several instances of an advertisement to be present in the IPv6 OSPF routing domain at any one time. However, only the most recent instance is kept in the IPv6 OSPF link state database (and printed by this command). The LS sequence number (Seqno) and LS age (Age) fields are
compared to see which instance is most recent. The LS age field is expressed in seconds. Its maximum value is 3600. An asterisk (*) displayed beside an age value indicates that the DONOTAGE bit is on.

**PREFIX**

The prefix being described by the LSA.

At the end of the display, the total number of AS external advertisements is printed, along with a checksum total over all of their contents. The checksum total is simply the 32-bit sum (carries discarded) of the individual advertisement LS checksum fields. This information can be used to quickly determine whether two IPv6 OSPF routers have synchronized databases.

**IPv6 OSPF area link state database**

The `DISPLAY TCPIP,tcpipjobname,OMPROUTE,IPV6OSPF,DATABASE,AREAID=area-id` command displays the contents of a particular IPv6 OSPF area link state database. AS external advertisements are omitted from the display. A single line is printed for each advertisement. Each advertisement is defined by the following three parameters:

- Its link state type (called Type)
- The advertising router (called the LS originator)
- Its link state ID

A sample output with an explanation of entries follows:

```
<table>
<thead>
<tr>

</tr>
</tbody>
</table>
```
LS ORIGINATOR
The Router ID of the router that originated the advertisement.

LS ID
Uniquely identifies multiple LSAs of the same type originated by the same router.

SEQNO, AGE
It is possible for several instances of an advertisement to be present in the IPv6 OSPF routing domain at any one time. However, only the most recent instance is kept in the IPv6 OSPF link state database (and printed by this command). The LS sequence number (Seqno) and LS age (Age) fields are compared to see which instance is most recent. The LS age field is expressed in seconds. Its maximum value is 3600. An asterisk (*) displayed beside an age value indicates that the DONOTAGE bit is on.

LINKS
Number of links described by the LSA.

ROUTER TYPE
Indicates the level of function of the advertising router.

<table>
<thead>
<tr>
<th>ROUTER TYPE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASBR</td>
<td>The router is an AS boundary router.</td>
</tr>
<tr>
<td>ABR</td>
<td>The router is an area border router.</td>
</tr>
<tr>
<td>V</td>
<td>The router is an endpoint of one of more fully adjacent virtual links having the described area as transit area.</td>
</tr>
<tr>
<td>W</td>
<td>The router is a wildcard multicast receiver (OMPROUTE will never set the W option on its own Router LSAs).</td>
</tr>
</tbody>
</table>

ROUTERS
The number of routers attached to the link described by the LSA.

PREFIX
The prefix being described by the LSA.

INTERFACE
Associated interface.

REF LS-TYPE,REF-LS ID
Identifies the referenced Router LSA or Network LSA.

At the end of each type of LSA in the display, the total number of advertisements of that type in the area database is printed, along with a checksum total over all of their contents. The checksum total is simply the 32-bit sum (carries discarded) of the individual advertisement LS checksum fields. This information can be used to quickly determine whether two IPv6 OSPF routers have synchronized databases.
IPv6 OSPF router routes

The DISPLAY TCPIP.tcpipjobname,OMPROUTE,IPV6OSPF,RUTERS command displays all routes to other routers that have been calculated by IPv6 OSPF and are now present in the routing table. A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>DEST</th>
<th>NEXT HOP</th>
<th>DTYPE</th>
<th>RTYPE</th>
<th>COST</th>
<th>AREA</th>
</tr>
</thead>
<tbody>
<tr>
<td>68.68.68.68</td>
<td>FE80::8</td>
<td>RTR</td>
<td>SPF</td>
<td>1</td>
<td>6.6.6.6</td>
</tr>
<tr>
<td>64.64.64.64</td>
<td>FE80::4</td>
<td>BR</td>
<td>SPF</td>
<td>1</td>
<td>6.6.6.6</td>
</tr>
<tr>
<td>65.65.65.65</td>
<td>FE80::5:7</td>
<td>RTR</td>
<td>SPF</td>
<td>1</td>
<td>0.0.0.0</td>
</tr>
<tr>
<td>63.63.63.63</td>
<td>FE80::3</td>
<td>RTR</td>
<td>SPF</td>
<td>1</td>
<td>6.6.6.6</td>
</tr>
<tr>
<td>62.62.62.62</td>
<td>FE80::4</td>
<td>RTR</td>
<td>SPF</td>
<td>2</td>
<td>0.0.0.0</td>
</tr>
<tr>
<td>64.64.64.64</td>
<td>FE80::4</td>
<td>BR</td>
<td>SPF</td>
<td>1</td>
<td>0.0.0.0</td>
</tr>
</tbody>
</table>

DEST      Indicates the destination router’s OSPF router ID.

NEXT HOP   Indicates the address of the next router on the path toward the destination host. A number in parentheses at the end of the address indicates the number of equal-cost routes to the destination.

DTYPE     Indicates the destination type:

- ASBR     Indicates that the destination is an AS boundary router.
- BR       Indicates that the destination is an area border router.
- FADD     Indicates a forwarding address (for external routes).
- RTR      Indicates that the destination is a router.

RTYPE     Indicates the route type and how the route was derived:

- SPF      Indicates that the route is an intra-area route (comes from the Dijkstra calculation).
- SPIA     Indicates that it is an inter-area route (comes from considering Inter-Area Router advertisements).

COST      Displays the cost to reach the router.

AREA      Displays the OSPF area to which the destination router belongs.

IPv6 OSPF routing protocol statistics

The DISPLAY TCPIP.tcpipjobname,OMPROUTE,IPV6OSPF,STATISTICS command displays statistics generated by the IPv6 OSPF routing protocol. (The keyword STATS can be substituted for STATISTICS.)
The statistics indicate how well the implementation is performing, including its memory and network utilization. A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTACHED AREAS</td>
<td>2</td>
</tr>
<tr>
<td># DIJKSTRA RUNS</td>
<td>12</td>

</tr>
<tr>
<td>MULTICAST PKTS SENT</td>
<td>40</td>
</tr>
<tr>
<td>LS ADV. AGED OUT</td>
<td>0</td>
</tr>
<tr>
<td>LS ADV. FLUSHED</td>
<td>41</td>
</tr>
</tbody>
</table>

**ATTACHED AREAS**
Indicates the number of areas to which the router has active interfaces.

**# DIJKSTRA RUNS**
Indicates how many times the IPv6 OSPF routing table has been calculated from scratch.

**OSPF PACKETS RCVD**
Covers all types of IPv6 OSPF protocol packets.

**OSPF PACKETS RCVD W/ERRS**
Indicates the number of IPv6 OSPF packets that have been received that were determined to contain errors.

**TRANSIT NODES**
Allocated to store Router LSAs and Network LSAs.

**LS ADV**
Allocated to store Inter-Area Prefix, Inter-Area Router, AS External, Link, and Intra-Area prefix LSAs.

**QUEUE HEADERS**
Form lists of link state advertisements. These lists are used in the flooding and database exchange processes. If the number of queue headers allocated is not equal to the number available, database synchronization with a neighbor is in progress.

**INCREMENTAL SUMM. UPDATES, INCREMENTAL VL UPDATES**
Indicates how many times new Inter-Area Prefix or Inter-Area Router LSAs have caused the routing table to be partially rebuilt.

**INCREMENTAL EXT. UPDATES**
Displays the number of changes to external destinations that are incrementally installed in the routing table.

**MULTICAST PKTS SENT**
Covers IPv6 OSPF hello packets and packets sent during the flooding procedure.

**UNICAST PKTS SENT**
Covers IPv6 OSPF packet retransmissions and the Database Exchange procedure.

**LS ADV. AGED OUT**
Indicates the number of advertisements that have hit 60 minutes. Link state advertisements are aged out after 60 minutes. Usually they are refreshed before this time.

**LS ADV. FLUSHED**
Indicates the number of advertisements removed (and not replaced) from the link state database.

*Examples using the IPV6RIP command*

*All IPv6 RIP information*
The DISPLAY TCPIP, tcpipjobname, OMPROUTE, IPV6RIP, ALL command lists all IPv6 RIP-related information. A sample output with an explanation of entries follows:

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRACE6:</td>
<td>1</td>
</tr>
<tr>
<td>DEBUG6:</td>
<td>0</td>
</tr>
<tr>
<td>STACK AFFINITY:</td>
<td>TCPCS6</td>
</tr>
<tr>
<td>IPV6 RIP:</td>
<td>ENABLED</td>
</tr>
<tr>
<td>IPV6 RIP DEFAULT ORIGINATION:</td>
<td>ALWAYS, COST = 1</td>
</tr>
</tbody>
</table>
TRACE6
Displays the level of tracing currently in use by OMPROUTE IPv6 routing protocols.

DEBUG6
Displays the level of debugging currently in use by OMPROUTE IPv6 routing protocols.

STACK AFFINITY
Displays the name of the stack on which OMPROUTE is running.

IPV6 RIP DEFAULT ORIGINATION
Indicates the conditions under which IPv6 RIP supports default route generation and the advertised cost for the default route.

The remainder of the TCPIP, tcpipjobname,OMPROUTE,IPV6RIP,ALL output is described in the following sections.

IPv6 RIP routes to be accepted
The DISPLAY TCPIP,tcpipjobname,OMPROUTE,IPV6RIP,ACCEPTED command lists the routes to be unconditionally accepted, as configured with the IPV6_ACCEPT_RIP_ROUTE statement. A sample output follows:

<table>
<thead>
<tr>
<th>NAME</th>
<th>MTU</th>
<th>STATE</th>
<th>IN</th>
<th>OUT</th>
<th>PRF</th>
<th>HST</th>
<th>STA</th>
<th>DEF</th>
<th>RADV</th>
<th>PSN</th>
<th>PRF</th>
<th>HST</th>
</tr>
</thead>
<tbody>
<tr>

<td>0</td>
<td>NO</td>
<td>YES</td>
<td>YES</td>
<td>NO</td>
<td>YES</td>
<td>YES</td>
<td>YES</td>
<td>YES</td>
</tr>
</tbody>
</table>

ACCEPT IPV6 RIP UPDATES ALWAYS FOR
Indicates the prefixes and hosts for which updates are always accepted.

IPv6 RIP interface statistics and parameters
The DISPLAY TCPIP,tcpipjobname,OMPROUTE,IPV6RIP,INTERFACE,NAME=if_name command displays statistics and parameters related to IPv6 RIP interfaces. (The keyword IF can be substituted for INTERFACE.) If no NAME= parameter is given (DISPLAY TCPIP,tcpipjobname,OMPROUTE,IPV6RIP,INTERFACE), a single line is printed summarizing each interface. (See example 1.) If a NAME= parameter is given, detailed statistics for that interface are displayed. (See example 2.)
**MTU**
Indicates the value of the maximum transmission unit learned from the TCP/IP stack for the interface.

**STATE**
Indicates the status of the interface. Values are:
- **UP**
  The interface is up.
- **DOWN**
  The interface is known to TCP/IP but is down.
- **N/A**
  The interface is defined to OMPROUTE, but the TCP/IP stack has not informed OMPROUTE that the interface is installed. For detailed interface status information, use the DISPLAY TCPIP,procname,NETSTAT,DEVLINKS command.

**IN**
Specifies the value of the metric to be added to IPv6 RIP routes received over this interface.

**OUT**
Specifies the value of the metric to be added to IPv6 RIP routes advertised over this interface.

**SEND**
- **PRF**
  Indicates whether prefix routes are advertised in IPv6 RIP responses sent over this interface.
- **HST**
  Indicates whether host routes are advertised in IPv6 RIP responses sent over this interface.
- **STA**
  Indicates whether static routes are advertised in IPv6 RIP responses sent over this interface.
- **DEF**
  Indicates whether the default route, if available, is advertised in IPv6 RIP responses sent over this interface.
- **RADV**
  Indicates whether router advertisement routes are advertised in IPv6 RIP responses sent over this interface.
- **PSN**
  Indicates whether poisoned reverse routes are advertised in IPv6 RIP responses sent over this interface. A poisoned reverse route is one with an infinite metric (a metric of 16).

**RECEIVE**
- **PRF**
  Indicates whether prefix routes are accepted in IPv6 RIP responses received over this interface.
- **HST**
  Indicates whether host routes are accepted in IPv6 RIP responses received over this interface.

--- Example 2 ---
EZZ8028I IPV6 RIP INTERFACE DETAILS
INTERFACE NAME: LOSAFE6
INTERFACE ADDRESS: FE80::1:2:3:1 2001:DB8::1:2:3:1
INTERFACE PREFIX: RADV 12AB::/16
MTU: 2000 STATE: UP
IN METRIC: 1 OUT METRIC: 0
SEND PREFIX ROUTES: YES SEND HOST ROUTES: NO
SEND STATIC ROUTES: NO SEND DEFAULT ROUTES: NO
SEND RTR. ADV. ROUTES: YES SEND POIS. REV. ROUTES: NO
RECEIVE PREFIX ROUTES: YES RECEIVE HOST ROUTES: YES
SEND ONLY: VIRTUAL, DEFAULT
NORECEIVE 2001:DB8::A1E::/64
INTERFACE NAME
  Indicates the interface name.

INTERFACE ADDRESS
  Indicates the IP addresses that have been learned from the TCP/IP stack for the interface.

INTERFACE PREFIX
  Lists the interface prefixes. RADV indicates the prefix was learned through IPv6 Router Discovery. STAT indicates it was statically defined to this interface using the PREFIX parameter of the IPV6_RIP_INTERFACE statement.

MTU
  Indicates the value of the maximum transmission unit learned from the TCP/IP stack for the interface.

STATE
  Indicates the status of the interface. Values are:
  UP
    The interface is up.
  DOWN
    The interface is known to TCP/IP but is down.
  N/A
    The interface is defined to OMPROUTE, but the TCP/IP stack has not informed OMPROUTE that the interface is installed. For detailed interface status information, use the DISPLAY TCPIP,procname,NETSTAT,DEVLINKS command.
  IGNORED
    The interface is known to TCP/IP but is being ignored by OMPROUTE.

IN METRIC
  Specifies the value of the metric to be added to IPv6 RIP routes received over this interface.

OUT METRIC
  Specifies the value of the metric to be added to IPv6 RIP routes advertised over this interface.

SEND PREFIX ROUTES
  Indicates whether prefix routes are advertised in IPv6 RIP responses sent over this interface.

SEND HOST ROUTES
  Indicates whether host routes are advertised in IPv6 RIP responses sent over this interface.

SEND STATIC ROUTES
  Indicates whether static routes are advertised in IPv6 RIP responses sent over this interface.

SEND DEFAULT ROUTES
  Indicates whether the default route, if available, is advertised in IPv6 RIP responses sent over this interface.

SEND RTR. ADV. ROUTES
  Indicates whether router advertisement routes are advertised in IPv6 RIP responses sent over this interface.

SEND POIS. REV. ROUTES
  Indicates whether poisoned reverse routes are advertised in IPv6 RIP responses sent over this interface. A poisoned reverse route is one with an infinite metric (a metric of 16).

RECEIVE PREFIX ROUTES
  Indicates whether prefix routes are accepted in IPv6 RIP responses received over this interface.

RECEIVE HOST ROUTES
  Indicates whether host routes are accepted in IPv6 RIP responses received over this interface.

SEND ONLY
  Indicates the route-type restrictions on IPv6 RIP sends for this interface.

FILTERS
  Indicates the send and receive filters for this interface.
Global IPv6 RIP filters

The DISPLAY TCPIP,tcipjobname,OMPROUTE,IPv6RIP,FILTERS command displays the Global IPv6 RIP filters. A sample output with an explanation of entries follows:

```
EZ8029I GLOBAL IPV6 RIP FILTERS
SEND ONLY: VIRTUAL, DEFAULT
IGNORE IPV6 RIP UPDATES FROM:
FE80::1:2:3:4
NORECEIVE 2001:DB8::A1E::/64
```

**SEND ONLY**
Indicates the global route-type restrictions on IPv6 RIP sends that apply to all IPv6 RIP interfaces.

**IGNORE IPV6 RIP UPDATES FROM**
Indicates the IPv6 RIP routers from which advertisements will not be accepted.

**FILTERS**
Indicates the global send and receive filters that apply to all IPv6 RIP interfaces.

*Examples using the GENERIC6 command*

All IPv6 generic information

The DISPLAY TCPIP,tcipjobname,OMPROUTE,GENERIC6,ALL command lists all IPv6 generic information, which is information that is not specific to a routing protocol. A sample output with an explanation of entries follows:

```
EZ8053I IPV6 GENERIC CONFIGURATION 067
TRACE6: 2, DEBUG6: 3
IPV6 TRACE DESTINATION: /TMP/6MPROUT3.DBG
STACK AFFINITY: TCPCS3
EZ8060I IPV6 GENERIC INTERFACES
NAME               MTU STATE CONFIGURED
MPCPTPV66        65535    UP      NO
GENERIC_INTF      1280   N/A     YES
```

**TRACE6**
Displays the level of tracing currently in use by OMPROUTE IPv6 routing protocols.

**DEBUG6**
Displays the level of debugging currently in use by OMPROUTE IPv6 routing protocols.

**IPV6 TRACE DESTINATION**
Displays the file name of the IPv6 trace destination, or OMPCTR if that destination is the OMPROUTE CTRACE.

Restriction: The trace destination is displayed in upper case on the console, regardless of the case of the actual case-sensitive file name, if the destination is a z/OS UNIX file.

**STACK AFFINITY**
Displays the name of the stack on which OMPROUTE is running.

The remainder of the DISPLAY TCPIP,tcipjobname,OMPROUTE,GENERIC6,ALL output is described in the following sections.

IPv6 generic interface statistics and parameters

The DISPLAY TCPIP,tcipjobname,OMPROUTE,GENERIC6,INTERFACE,NAME=if-name command displays statistics and parameters related to IPv6 generic interfaces. (The keyword IF can be substituted for INTERFACE.) If no NAME= parameter is given (DISPLAY TCPIP,tcipjobname,OMPROUTE,GENERIC6,INTERFACE), a single line is printed summarizing each
interface. (See Example 1.) If a NAME= parameter is given, detailed statistics for that interface are displayed. (See Example 2.)

### Example 1

<table>
<thead>
<tr>
<th>NAME</th>
<th>MTU</th>
<th>STATE</th>
<th>CONFIGURED</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPCPTPV66</td>
<td>65535</td>
<td>UP</td>
<td>NO</td>
</tr>
<tr>
<td>GENERIC_INTF</td>
<td>1280</td>
<td>N/A</td>
<td>YES</td>
</tr>
</tbody>
</table>

**NAME**

Indicates the name of the IPv6 generic interface.

**MTU**

Indicates the value of the maximum transmission unit learned from the TCP/IP stack for the interface.

**STATE**

Indicates the status of the interface. Values are:

- **UP**
  The interface is up.

- **DOWN**
  The interface is known to TCP/IP but is down.

- **N/A**
  The interface is defined to OMPROUTE, but the TCP/IP stack has not informed OMPROUTE that the interface is installed. For detailed interface status information, use the DISPLAY TCPIP,procname,NETSTAT,DEVLINKS command.

- **IGNR**
  The interface is known to TCP/IP but is being ignored by OMPROUTE.

**CONFIGURED**

Indicates whether or not the interface was configured to OMPROUTE.

### Example 2

<table>
<thead>
<tr>
<th>INTERFACE NAME:</th>
<th>LOSAFE6</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTERFACE ADDRESS:</td>
<td>FE80::9:9:9:8</td>
</tr>
<tr>
<td></td>

<td>STAT 9801:4321::/32</td>
</tr>
<tr>
<td>MTU:</td>
<td>2000</td>
</tr>
<tr>
<td>STATE:</td>
<td>UP</td>
</tr>
<tr>
<td>CONFIGURED:</td>
<td>YES</td>
</tr>
</tbody>
</table>

**INTERFACE NAME**

Indicates the interface name.

**INTERFACE ADDRESS**

Indicates the IP addresses that have been learned from the TCP/IP stack for the interface.

**INTERFACE PREFIX**

Lists the interface prefixes. RADV indicates the prefix was learned using IPv6 Router Discovery. STAT indicates it was statically defined to this interface using the PREFIX parameter of the IPV6_INTERFACE statement.

**MTU**

Indicates the value of the maximum transmission unit learned from the TCP/IP stack for the interface.

**STATE**

Indicates the status of the interface. Values are:

- **UP**
  The interface is up.

- **DOWN**
  The interface is known to TCP/IP but is down.
The interface is defined to OMPROUTE, but the TCP/IP stack has not informed OMPROUTE that
the interface is installed. For detailed interface status information use the DISPLAY
TCPIP,procname,NETSTAT,DEVLINKS command.

**IGNR**
The interface is known to TCP/IP but is being ignored by OMPROUTE.

**CONFIGURED**
Indicates whether or not the interface was configured to OMPROUTE.

*Examples using the RT6TABLE command*

The following sections show the examples of using the RT6TABLE command.

**OMPROUTE IPv6 main routing table**

The DISPLAY TCPIP,tcpipjobname,OMPROUTE,RT6TABLE command displays all of the routes in the
OMPROUTE IPv6 main routing table. A sample output with an explanation of entries follows.

**Result:** This command displays the contents of the working table that is used by OMPROUTE; it does not
display the TCP/IP routing table. The OMPROUTE routing table might contain information that is different
from the information in the TCP/IP routing table. For more information about displaying the contents of
the TCP/IP routing tables, see “DISPLAY TCPIP,,NETSTAT” on page 9.

```

DESTINATION: 2001:DB8:0:A1C::/64
  TYPE: RIP  COST: 2  AGE: 0
  0 NETS DELETED, 5 NETS INACTIVE
```

**DESTINATION**
Indicates the IP destination, along with its prefix length.
NEXT HOP
Indicates the IP address of the next router on the path toward the destination. A number in parentheses at the end of the column indicates the number of equal-cost routes to the destination. Use the DISPLAY TCPIP, tcpi JOBNAME, OMPROUTE, RT6TABLE, DEST=ip_addr command to obtain a list of the next hops.

TYPE
Indicates how the route was derived:

DFLT
Indicates a route defined using the IPV6_DEFAULT_ROUTE configuration statement in the OMPROUTE configuration file.

DIR
Indicates a directly connected prefix or host.

RIP
Indicates a route that was learned through the IPv6 RIP protocol.

DEL
Indicates the route has been deleted.

Restriction: Deleted routes are shown only when RIP is active and only as long as RIP needs to advertise to neighboring routers that they have been deleted.

STAT
Indicates a nonreplaceable statically configured route.

SPF
Indicates that the route is an IPv6 OSPF intra-area route.

SPIA
Indicates that the route is an IPv6 OSPF interarea route.

SPE1
Indicates IPv6 OSPF external routes (type 1).

SPE2
Indicates IPv6 OSPF external routes (type 2).

RANGE
Indicates a route type that is an active IPv6 OSPF area address range and is not used in forwarding packets.

RSTA
Indicates a static route that is defined as replaceable.

RADV
Indicates a route that was learned by the TCP/IP stack through the IPv6 Router Discovery protocol.

An asterisk (*) after the route type indicates that the route has a directly connected backup. A percent sign (%) after the route type indicates that IPv6 RIP updates are always accepted for this destination.

COST
Indicates the route cost.

<table>
<thead>
<tr>
<th>Route Type</th>

Table 5. OMPROUTE IPv6 Route Type and COST Value mapping (continued)

<table>
<thead>
<tr>
<th>Route Type</th>
<th>COST Value</th>
</tr>
</thead>
</table>
| STAT or RSTA | • 0 when the route is direct.  
| | • 1 when the route is indirect.  |
| DIR or SBNT | 1          |
| RNGE       | The OSPF cost of the range. |
| DFLT       | 0          |
| RADV       | • 1 when the router advertisement indicated a preference of high.  
| | • 2 when the router advertisement indicated a preference of medium.  
| | • 3 when the router advertisement indicated a preference of low.  |

AGE
Indicates the time that has elapsed since the routing table entry was last refreshed. For routes that have the route type DEL or RIP, this value increments by a factor of 10 for each 10-second increase in age. If the TCP/IP stack enters a storage shortage condition, all routes that have the route type DEL or RIP are refreshed when the shortage condition is relieved.

NETS_DELETED
Indicates the number of routes that have been deleted from the OMPROUTE routing table and not replaced. Use the DTCPIP,,OMPROUTE,RT6TABLE,DELETED command to list these routes.

NETS_INACTIVE
Used for internal debugging purposes only.

Route expansion information for the OMPROUTE IPv6 main routing table
Use the DISPLAY TCPIP,,tcpipjobname,,OMPROUTE,RT6TABLE,DEST=ip_addr command to obtain information about a particular route in the OMPROUTE IPv6 main routing table. When multiple equal-cost routes exist, use this command to obtain a list of the next hops. A sample output with an explanation of entries follows:

ROUTE TYPE: RIP
COST: 5
AGE: 233
NEXT HOP(S): FE80::7:7:7:7 (LOSAFE6)  
FE80::8:8:8:8 (LOSAFE6)  
FE80::9:9:9:9 (LOSAFE3)

DESTINATION
Indicates the IP destination, along with its prefix length.

ROUTE TYPE
Indicates how the route was derived:

DFLT
Indicates a route defined using the IPV6_DEFAULT_ROUTE configuration statement in the OMPROUTE configuration file.

DIR
Indicates a directly connected prefix or host.

RIP
Indicates a route that was learned through the IPv6 RIP protocol.

STAT
Indicates a nonreplaceable statically configured route.
SPF
Indicates that the route is an IPv6 OSPF intra-area route.

SPIA
Indicates that the route is an IPv6 OSPF interarea route.

SPE1
Indicates IPv6 OSPF external routes (type 1).

SPE2
Indicates IPv6 OSPF external routes (type 2).

RANGE
Indicates a route type that is an active IPv6 OSPF area address range and is not used in forwarding packets.

RSTA
Indicates a static route that is defined as replaceable.

RADV
Indicates a route that was learned by the TCP/IP stack through the IPv6 Router Discovery protocol.

An asterisk (*) after the route type indicates that the route has a directly connected backup. A percent sign (%) after the route type indicates that IPv6 RIP updates are always accepted for this destination.

COST
Indicates the route cost.

<table>
<thead>
<tr>
<th>Route Type</th>

<tr>
<td>RADV</td>
<td>• 1 when the router advertisement indicated a preference of high.&lt;br&gt;• 2 when the router advertisement indicated a preference of medium.&lt;br&gt;• 3 when the router advertisement indicated a preference of low.</td>
</tr>
</tbody>
</table>

AGE
Indicates the time that has elapsed since the routing table entry was last refreshed. For routes that have the route type DEL or RIP, this value increments by a factor of 10 for each 10 second increase in age. If the TCP/IP stack enters a storage shortage condition, all routes that have the route type DEL or RIP are refreshed when the shortage condition is relieved.

NEXT HOP(S)
Indicates the IP address of the next router and the interface used to reach that router for each of the paths toward the destination.
All OMPROUTE IPv6 policy-based routing tables

The DISPLAY TCPIP, tcpipjobname, OMPROUTE, RT6TABLE, PRTABLE=ALL command displays all of the routes in all of the OMPROUTE IPv6 policy-based routing tables. The dynamic routing parameters that are configured to the policy agent for each table are displayed following the routes for that table. A sample output with an explanation of the entries follows.

Results:

- This command displays the contents of the working tables that OMPROUTE uses; it does not display the TCP/IP routing tables. The OMPROUTE routing tables might contain information that is different from the information in the TCP/IP routing tables. For more information about displaying the contents of the TCP/IP routing tables, see “DISPLAY TCPIP,,NETSTAT” on page 9.
- If a policy-based routing table is configured with no IPv6 dynamic routing parameters, OMPROUTE has no knowledge of that routing table for IPv6. The routing table is not included in the display of OMPROUTE IPv6 policy-based routing tables.

```

DYNAMIC ROUTING PARAMETERS
  INTERFACE: NSQDIO1L6
  NEXT HOP: FEB0::4
```

**TABLE NAME**

Indicates the name of the policy-based routing table.
**INTERFACE**
Indicates the name of an interface that is specified in a dynamic routing parameter for the policy-based routing table. If the interface is not currently defined to the TCP/IP stack as an IPv6 interface or the interface is inactive on the TCP/IP stack, the name is preceded by an asterisk (*).

**NEXT HOP**
Indicates the next hop router IP address that is specified in a dynamic routing parameter for the policy-based routing table. The value ANY is displayed when no next-hop router IP address is specified for the dynamic routing parameter.

See “OMPROUTE IPv6 main routing table” on page 85 for additional field descriptions.

**OMPROUTE IPv6 policy-based routing table**
The DISPLAY TCPIP,tcpipjobname,OMPROUTE,RT6TABLE,PRTABLE=prname command displays all of the routes in a single OMPROUTE IPv6 policy-based routing table. The dynamic routing parameters that are configured to the policy agent for the table are displayed following the routes for the table. A sample output with explanation of entries follows.

Results:
- This command displays the contents of the working table that is used by OMPROUTE; it does not display the TCP/IP routing table. The OMPROUTE routing table might contain information that is different from the information in the TCP/IP routing table. For more information about displaying the contents of the TCP/IP routing tables, see “DISPLAY TCPIP,NETSTAT” on page 9.
- If a policy-based route table is configured with no IPv6 dynamic routing parameters, OMPROUTE has no knowledge of that route table for IPv6. You cannot use that route table with this command.

---

**Route expansion information for OMPROUTE IPv6 policy-based routing table**
Use the DISPLAY TCPIP,tcpipjobname,OMPROUTE,RT6TABLE,PRTABLE=prname,DEST=ip-addr command to obtain information about a particular route in an OMPROUTE IPv6 policy-based routing table. When multiple equal-cost routes exist, use this command to obtain a list of the next hops. A sample output with explanation of entries follows.

Results:
- This command displays information from the working table that is used by OMPROUTE; it does not display the TCP/IP routing table. The OMPROUTE routing table might contain information that is
different from the information in the TCP/IP routing table. For more information about displaying the contents of the TCP/IP routing tables, see “DISPLAY TCPIP,,NETSTAT” on page 9.

• If a policy-based route table is configured with no IPv6 dynamic routing parameters, OMPROUTE has no knowledge of that route table for IPv6. You cannot use that route table with this command.

</tr>
</tbody>
</table>

**TABLE NAME**
- Indicates the name of the policy-based routing table.

See “Route expansion information for the OMPROUTE IPv6 main routing table” on page 87 for additional field descriptions.

**Route expansion information for all OMPROUTE IPv6 policy-based routing tables**

Use the `DISPLAY TCPIP,tcpipjobname,OMPROUTE,RT6TABLE,PRTABLE=ALL,DEST=ip-addr` command to obtain information from all of the OMPROUTE IPv6 policy-based routing tables about a particular route. When multiple equal-cost routes exist in a table, use this command to obtain a list of the next hops. A sample output with explanation of entries follows.

**Results:**

- This command displays information from the working tables that are used by OMPROUTE; it does not display the TCP/IP routing tables. The OMPROUTE routing tables might contain information that is different from the information in the TCP/IP routing tables. For more information about displaying the contents of the TCP/IP routing tables, see “DISPLAY TCPIP,,NETSTAT” on page 9.

- If a policy-based route table is configured with no IPv6 dynamic routing parameters, OMPROUTE has no knowledge of that route table for IPv6. The route table does not appear in the display of OMPROUTE IPv6 route tables.

</table>

**TABLE NAME**
- Indicates the name of the policy-based routing table.

See “Route expansion information for the OMPROUTE IPv6 main routing table” on page 87 for additional field descriptions.

**Deleted OMPROUTE IPv6 routes**

The DISPLAY TCPIP,tcpipjobname,OMPROUTE,RT6TABLE,DELETED command displays the routes that have been deleted from the OMPROUTE IPv6 routing table and that have not been replaced or recycled through garbage collection (garbage collection occurs only when IPv6 RIP is running). A sample output follows. The explanation for the entries is the same as for the Display TCPIP,tcpipjobname,OMPROUTE,RT6TABLE command (see “OMPROUTE IPv6 main routing table” on page 85).

Operator commands and system administration 91
DISPLAY TCPIP,,OSAINFO

Use the DISPLAY TCPIP,,OSAINFO command to retrieve information for active IPAQENET and IPAQENET6 interfaces. An interface represents a single datapath device of an OSA-Express feature. The information is retrieved directly from the OSA-Express feature.

Tips:
• If you have an INTERFACE and a DEVICE or LINK definition with the same port name and both are active, specifying either the INTERFACE or link name on the command will generate a report with both IPv4 and IPv6 information.
• You can use the DISPLAY TCPIP,,OSAINFO command to retrieve information for an active OSAENTA interface although only the base portion of the report is pertinent.

The command output provides the following sections of information:

Base
   Contains physical characteristics and attributes for the interface and OSA-Express feature.

Registered addresses
   Contains the Layer 2 MAC addresses or Layer 3 unicast and multicast IPv4 and IPv6 addresses registered to the OSA-Express feature.

QDIO inbound workload queueing routing variables
   If QDIO inbound workload queueing is in effect for the interface, this section contains the routing variables for the ancillary input queues. Routing variables identify which inbound packets are to be presented on an ancillary input queue. For more information about ancillary input queues, see QDIO inbound workload queueing in z/OS Communications Server: IP Configuration Guide.

Both the modifiers and the MAX parameters can be used to limit the number of output lines.

Format

Display TCPIP,, procname, OSAINfo, INTFName= intf_name

Notes:
1 If no modifiers are specified, all sections for which information exists are displayed.

Rule: You must specify the parameters in the order that the syntax diagram shows.
Parameters

OSAINFO
Requests OSA information.

INTFNAME = intf_name
Specifies the name of the OSA-Express QDIO interface whose datapath device information is requested. The intf_name value can be one of the following names:

- The name that was configured on a LINK IPAQENET profile statement.
- The name that was configured on an INTERFACE IPAQENET or IPAQENET6 profile statement.
- The name of an OSAENTA trace interface, which is EZANTAportname, where the portname value is the name that is specified on the PORTNAME keyword in the TRLE for the OSA-Express port that is being traced.

Tip: To obtain a list of names to use as the value of the INTFNAME parameter, use the Netstat DEvlinks/-d command.

BASE
Indicates that the physical characteristics and attributes of the interface and OSA-Express feature are to be included in the report.

BULKDATA
Indicates that QDIO inbound workload queueing routing variables for the BULKDATA ancillary queue are to be included in the report. The BULKDATA routing variables are comprised of source and destination IP addresses, source and destination ports, and protocol. That combination uniquely identifies those packets that the OSA-Express will route to the BULKDATA ancillary queue.

EE
Indicates that QDIO inbound workload queueing routing variables for the Enterprise Extender (EE) ancillary queue are to be included in the report. The EE routing variables are comprised of destination IP addresses, destination ports, and protocol. That combination uniquely identifies those packets that the OSA-Express will route to the EE ancillary queue.

IPSEC
Indicates that QDIO inbound workload queueing routing variables for the IPSec ancillary queue are to be included in the report. The IPSec routing variables include IPSec protocols AH and ESP and a combination of protocol and port for UDP encapsulated ESP packets. These routing variables uniquely identify those packets that the OSA-Express will route to the IPSec ancillary queue.

REGADDRS
Indicates that registered Layer 2 MAC addresses or Layer 3 unicast and multicast addresses are to be included in the report.

SYSDIST
Indicates that QDIO inbound workload queueing routing variables for the SYSDIST ancillary queue are to be included in the report. The SYSDIST routing variables are comprised of destination IP addresses and protocol. That combination uniquely identifies those packets that the OSA-Express will route to the SYSDIST ancillary queue.

MAX = lines| *
The maximum number of lines to be displayed on the console. Valid lines values are in the range 4 - 65533. Specify an asterisk (*) to allow up to 65533 lines to be displayed.

- If MAX=* is specified and the report is truncated as the result of exceeding the multi-line WTO maximum, the following message is displayed:

  Report truncated due to greater than 65533 lines of output

- In all other cases, the total number of lines that is displayed and the total number of lines that could have been displayed are shown in the following output line, where n is the number of lines displayed and m is the total number of lines that could have been displayed.

  n of m lines displayed

Reply field descriptions

Interface
Interface name from the display command.

Base section:
The Base section of the report is displayed if the BASE modifier is specified or none of the modifiers are specified.
PortName
Portname specified on the INTERFACE definition, specified as the device name, or both when the datapath device is shared by both definitions. This name also matches portname on the VTAM TRLE definition.

PortNum
Physical port on the OSA-Express that is used for the interface.

Datapath
Hexadecimal datapath device address on the OSA-Express that is used for the interface.

RealAddr
Hexadecimal logical address and unit address of the interface.

PCHID
Physically installed channel path that is used by this QDIO datapath device.

CHPID
Channel path identifier that is used by this QDIO datapath device.

CHPID Type
The CHPID type of the interface, which can have the following values:
- OSD: External network
- OSM: Intra node management network
- OSX: Intra ensemble data network

OSA code level
OSA-Express processor code level of the QDIO datapath device.

Gen
Generation of the OSA-Express feature. The following values are supported:
- OSA-E3: OSA-Express3
- OSA-E4S: OSA-Express4S
- OSA-E5S: OSA-Express5S
- OSA-E6S: OSA-Express6S
- OSA-E7S: OSA-Express7S

Active speed/mode
Switch speed and duplex mode of the interface. The following values are supported:
- 10 mb/sec half duplex
- 10 mb/sec full duplex
- 100 mb/sec half duplex
- 100 mb/sec full duplex
- 1000 mb/sec half duplex
- 1000 mb/sec full duplex
- 10 gigabit/sec full duplex
- 25 gigabit/sec full duplex
- Unknown
Media
Transmission media (copper or fiber). If fiber is the transmission media, it can be single-mode fiber (LR/LX) or multimode (SR/SX). The following values are supported:

- Copper
- Multimode Fiber
- Single-mode Fiber

Jumbo frames
Indicates whether jumbo frames are supported.

Isolate
Indicates whether this TCP/IP stack is prohibited from communicating directly through the interface with other TCP/IP stacks that are sharing the OSA-Express feature.

PhysicalMACAddr
Physical Medium Access Control (MAC) LAN address for the interface.

LocallyCfgMACAddr
Local Medium Access Control (MAC) LAN address for the interface.

Queues defined

- **Out**
  Number of output priority queues that are defined for this interface.

- **In**
  Number of input queues that are defined for this interface. A value of 1 indicates only the primary queue is defined. A value larger than 1 indicates that QDIO inbound workload queueing ancillary queues are defined and the number of ancillary queues is 1 less than the value reported.

Ancillary queues in use
Number of QDIO inbound workload queueing ancillary input queues (SYSDIST, BULKDATA, and so on) in use by this interface.

Connection Mode
Connection mode of the interface. The following values are supported:

- Layer 2
- Layer 3

IPv4
Indicates whether an IPv4 interface is active for the datapath device.

IPv6
Indicates whether an IPv6 interface is active for the datapath device.

SAPSup
Information used for problem analysis by IBM support.

SAPEna
Information used for problem analysis by IBM support.

IPv4, IPv6, or Layer 2 attributes
This section displays the attributes for the interface.

- **VLAN ID**
  Decimal virtual LAN identification number that is defined on this interface.

- **VMAC Active**
  Indicates whether the interface is using a virtual MAC address.

Defined Router
The defined router attribute. This field is displayed for Layer 3 only when VMAC is not active. The following values are supported:

- **Pri**
  The interface is a primary router.
Sec
The interface is a secondary router.

Non
The interface is not a router.

Active Router
Indicates whether this interface is the active router for the OSA-Express feature. This field is displayed for Layer 3 only when VMAC is not active and is applicable only for PRIROUTER and SECROUTER interface configurations.

VMAC Addr
Displays the virtual MAC address in use for this interface. This field is displayed only when VMAC is active.

VMAC Origin
Indicates the origin of the virtual MAC address. This field is displayed only when VMAC is active. The following values are supported:

Cfg
The virtual MAC address was configured in the TCP/IP stack PROFILE

OSA
The virtual MAC address was assigned by the OSA-Express

VMAC Router
This field is displayed for Layer 3 only when VMAC is active. The following values are supported:

All
Indicates that the OSA-Express is routing everything that was received on the virtual MAC address to the interface without regard for registered addresses.

Local
Indicates that the OSA-Express is routing everything that is received on the virtual MAC address, and to a registered IP address, to the interface.

AsstParms
This field is displayed only for Layer 3. It is information used for problem analysis by IBM support.

OutCkSumEna
This field is displayed only for Layer 3. It is information used for problem analysis by IBM support.

InCkSumEna
This field is displayed only for Layer 3. It is information used for problem analysis by IBM support.

Registered Addresses
This is the registered addresses section of the report and is displayed if the REGADDRS modifier is specified or none of the modifiers are specified and only if there are registered addresses.

For Layer 3, there are four subsections that are included only if there are addresses to report:

• IPv4 Unicast Addresses
• IPv4 Multicast Addresses
• IPv6 Unicast Addresses
• IPv6 Multicast Addresses

For Layer 2, there is only one subsection which is included only if there are addresses to report:

• Layer 2 Multicast MAC Addresses

ARP
Indicates whether the OSA-Express is providing address resolution for the corresponding registered IPv4 address.
Addr
IPv4 or IPv6 address.

Total number of IPv4 addresses or Total number of IPv6 addresses
Shows the cumulative number of IPv4 or IPv6 addresses immediately preceding this message.

MAC
The Medium Access Control (MAC) LAN address corresponding to the Layer 2 or registered multicast IP address.

Total number of Layer 2 MAC addresses
Shows the cumulative number of MAC addresses immediately preceding this message.

Ancillary Input Queue Routing Variables
The Ancillary Input Queue Routing Variables section of the report is displayed if any of the following modifiers were specified, or none were specified:

- BULKDATA
- SYSDIST

Queue Type
Displays the workload name for an ancillary queue. The following values are supported:

  BULKDATA
  Specifies that the input queue is used for streaming workloads.

  EE
  Specifies that the input queue is used for enterprise extender workloads.

  IPSEC
  Specifies that the input queue is used for IP security workloads.

  SYSDIST
  Specifies that the input queue is used for sysplex distributor workloads.

Queue ID
Ancillary queue number.

Protocol
TCP

Src
Source address and port. This information is displayed only for the BULKDATA queue.

Dst
Destination address and port. This information is displayed only for the BULKDATA queue.

Total number of IPv4 connections or Total number of IPv6 connections
Displays the cumulative number of BULKDATA IPv4 or IPv6 Src/Dst combinations immediately preceding this message.

DISPLAY TCPIP,,STOR
Use the DISPLAY TCPIP,procname,STOR command to display TCP/IP storage usage information. You can use this command to verify the load module service level.

To verify load module service level, ensure that the eyecatcher for the module matches the latest PTF service for the module. When you contact IBM Service, you can use this command to verify that you are running on the correct TCP/IP service level.

Format

Display — TCPIP — , — procname — , — STOR —

, — MODule= — modname_name —
Parameters

STOR
Requests storage information.

If no other option is specified, the command displays the current and maximum storage usage for the TCP/IP stack and any TCP/IP storage limits. The maximum storage usage is the highest amount of storage TCP/IP has used since it started. See “Example” on page 100 for an example output, and see message EZZ8453I in z/OS Communications Server: IP Messages Volume 4 (EZZ, SNM) for a description of the output displayed.

MODULE
Displays the load module name that contains the module, module address and the first 48 bytes of storage.

This command displays modules within load modules EZBTIINI, EZBITCOM, EZBPFINI, EZBTLMST, EZBTLCMN, and EZBTLCLG. This command does not provide information for the FTP TCP/IP modules.

Load module
Storage Location
EZBTIINI
Common storage
EZBITCOM
Common storage
EZBPFINI
OMVS private storage
EZBTLMST
TCP/IP private storage
EZBTLCMN
TCP/IP private storage
EZBTLCLG
TCP/IP private storage

Example
To display TCP/IP storage usage, issue the following command:

```
d tcpip,tcpip2,stor
```

```
EZZ8453I  TCP/IP STORAGE
EZZ8454I  STORAGE  CURRENT   MAXIMUM     LIMIT
EZD2018I 31-BIT
EZZ8455I  ECSA                45654K    56823K   204800K
EZZ8455I  PRIVATE            124634K   143743K   524288K
EZZ8455I  ECSA MODULES         8702K     8702K   NOLIMIT
EZD2018I 64-BIT
EZZ8455I  HVCOMMON                3M        3M   NOLIMIT
EZZ8455I  HVPNPrivate            50M       50M   NOLIMIT
EZZ8455I  TRACE HVCOMMON          2578M     2578M     2578M
EZZ8455I  SMC-R FIXEDMEMORY         12M      16M      40M
EZZ8455I  SMC-R SEND MEMORY          4M        4M
EZZ8455I  SMC-R RECV MEMORY          8M       12M
EZZ8455I  SMC-D FIXEDMEMORY         12M      16M      40M
EZZ8459I DISPLAY TCP/IP STOR COMPLETED SUCCESSFULLY
```

Usage

• If a module is built into multiple load modules, each occurrence is displayed.
• The storage display command is used to verify the load module service level of the TCP/IP stack. The command supports several, but not all, modules within the product.
• SMC-R memory information (messages EZZ8455I and EZD2024I) is included only when the Shared Memory Communications over Remote Direct Memory Access (SMC-R) function is or was enabled on this TCP/IP stack. The SMC-R function is enabled by using the SMCR parameter of the GLOBALCONFIG statement.
SMC-D memory information (messages EZZ8455I) is included only when the Shared Memory Communications - Direct Memory Access (SMC-D) function is or was enabled on this TCP/IP stack. The SMC-D function is enabled by using the SMCD parameter of the GLOBALCONFIG statement.

**DISPLAY TCPIP,,SYSPLEX**

Use the DISPLAY TCPIP,,SYSPLEX command from an operator console to request SYSPLEX information.

**Format**

\[\text{Display TCPIP,,procname,,SYSplex,,VIPADyn,IPAddr=ipaddr,,INTFName=intfname,,MAX=100,,MAX=*,,MAX=recs}\]

1. **GROUP**
   - Displays the name of the TCP/IP sysplex group that the active stack has joined. If more than one stack is active, use the **procname** parameter to specify the particular TCP/IP stack for which you want to display information.

1. **PORTS**
   - Displays the configured EXPLICITBINDPORTRANGE port range (as specified on the GLOBALCONFIG EXPLICITBINDPORTRANGE statement) for this stack, and the currently active port range throughout the sysplex. If the stack is not configured for an explicit bind port range, a message is displayed to indicate that the range has not been configured on this stack. If this stack has not interrogated the

**Notes:**

1. MAX limits the number of records displayed to the MVS operator's console.

**Result:** If the stack is not a member of a sysplex group, the following message is displayed:

EZZ8269I tcpstackname mvsname IS NOT A MEMBER OF A SYSPLEX GROUP

**Parameters**

1. **SYSPLEX**
   - Request SYSPLEX information.

1. **VIPADYN**
   - Displays information about Dynamic VIPA for the active stack. If more than one stack is active, use **procname** to specify the particular TCP stack for which you want to display information.

The display contains a Distribute field. This field indicates whether the stack is a distributing stack, a destination stack, or both. For a description of all the fields displayed on the report, see the output examples for the “Netstat VIPADyn/-v report” on page 597.

1. **IPADDR=ipaddr**
   - Specifies a fully qualified IPv4 or IPv6 address that is used to limit the VIPADYN option. No wildcard characters (*) and ?) are allowed for this value.

1. **INTFName=intfname**
   - Specifies an IPv6 interface name that is used to limit the VIPADYN option.

1. **MAX=number of records**
   - Number of records to be written to the console. Valid values are in the range 1 - 65535. A wildcard (*) displays all records. The default value is 100.
active explicit bind port range, a message is displayed to indicate that the active range is not available from this stack.

**Result:** The range that was configured on this stack might not be the actual range that is in use throughout the sysplex at this time, because another stack that was started later with a different EXPLICITBINDPORTRANGE value configured (or a Vary Obey command specifying a file with a different EXPLICITBINDPORTRANGE value) can override the range that was configured by this stack.

**Examples**

**Not IPv6 enabled (SHORT format):**

DISPLAY TCPIP,,TRACE

Use the DISPLAY TCPIP,,TRACE command to display information about network management applications that use the real-time application-controlled TCP/IP trace network management interface (NMI) to obtain real-time network management data from the TCP/IP stack. See Real-time application-controlled TCP/IP trace NMI (EZBRCIFR) in z/OS Communications Server: IP Programmer's Guide and Reference for more information.

This command displays each application that currently uses the NMI, along with information about the storage that the TCP/IP stack uses to provide the real-time data. If neither the NAME parameter nor the TYPE parameter is specified, the command displays a statistics section that applies to all applications that currently use the NMI. Specify the DETAIL parameter of the command to display all the trace filters that have been specified by each application.
**Format**

```
Display     TCPIP , proname ,
TRACE , DETAIL ,
, NAME=jobname ,
, TYPE= DAT , PKT
 , MAX=200 ,
 , MAX=* ,
 , MAX= lines
```

**Rule:** The parameters must be specified in the order that is shown in the syntax diagram.

**Parameters**

**DETAIL**

Specifies that all the filter sets for each trace type will be displayed. If this parameter is not specified, none of the filter set information is displayed.

**NAME=jobname**

Specifies that only the information for the specified job name will be displayed. The `jobname` value can be one of the following MVS job names:

- The job name of the application that is using the real-time application-controlled TCP/IP trace NMI.
- The job name of the original application that created the application that is using the NMI. For example, if JOB1 forked JOB2 and JOB2 is using the NMI, you can specify either JOB1 or JOB2 as the job name. If fork or spawn services are not used, the JOB1 and JOB2 job names should be identical.

**Guideline:** If you specify the NAME parameter, only the information about the applications that are using the NMI is displayed. The NMI statistics section is not displayed.

**TYPE=DAT|PKT**

Specifies that only the information for jobs that use the NMI for the specified trace type will be displayed. If you specify both the DETAIL parameter and the TYPE parameter, all the filter sets for the specified trace type are displayed. The valid TYPE values currently supported are:

- **DAT**
  Specifies that only the information for jobs using the NMI data trace function will be displayed.

- **PKT**
  Specifies that only the information for jobs using the NMI packet trace function will be displayed.

**Guideline:** If you specify the TYPE parameter, only the information about the applications that are using the NMI is displayed. The NMI statistics section is not displayed.

**MAX=*|lines**

The maximum number of lines to be displayed on the console. Valid values are in the range 2 - 65533. Specify an asterisk (*) to display up to 65533 lines.

**MAX=***

If MAX=* is specified and the report is truncated because the multi-line WTO maximum was exceeded, the following message is displayed:

```
Report truncated due to greater than 65533 lines of output
```
**MAX=**

The total number of lines that are displayed and the total number of lines that could have been displayed are shown in the following output line:

\[
\text{n of m lines displayed}
\]

where \(n\) is the number of lines that are displayed and \(m\) is the total number of lines that could have been displayed.

**Examples**

1. Display the statistics section and summary information for all applications that are using the real-time application-controlled TCP/IP trace NMI.

### Report field descriptions

- **NMI Global information**
  - **TotStage**
    - The total amount of trace instance staging buffer storage that is currently allocated. Each trace instance specifies the amount of storage to be allocated on the RCCOpen request.

- **Collection buffer statistics section**
  - **TotalSize**
    - The size of the collection buffer in megabytes.
  - **InUse**
    - The number of kilobytes or megabytes currently in use in the collection buffer.
  - **HiWater**
    - The largest number of kilobytes, or megabytes that have been in use in the collection buffer since an application opened a trace instance.
  - **Lost**
    - The total number of trace records that could not be written to the collection buffer due to insufficient storage space.

- **Application information section**
  - **Name**
    - The job name of the application that opened an NMI trace instance. Applications invoke the RCCOpen NMI request to open a trace instance. If an application opens several trace instances, the same job name is displayed for all the trace instances.
**OrigName**
The job name of the originator of the application. For example, if JOB1 forked JOB2 and JOB2 is using the NMI, the job name JOB1 will be displayed in this field. If fork or spawn services are not being used, the value of this field is the same as the value of the Name field.

**ASID**
The hexadecimal address space identifier of the application that opened an NMI trace instance.

**UserID**
The user ID that is associated with the application that opened an NMI trace instance.

**Description**
The description that was supplied by the application on the RCCOpen NMI request when it opened an NMI trace instance.

**Active**
Indicates whether the application trace instance is currently active. If the trace instance is active, trace records are being created in the staging buffer for the application to retrieve.

  - **Yes**
    Indicates that the application trace instance is currently active.

  - **No**
    Indicates that the application trace instance is not currently active.

**Mode**
Indicates the mode that the application trace instance uses to access the trace records.

  - **Locate**
    The application uses locate mode. This option is specified on the RCCOpen NMI request.

  - **Move**
    The application uses move mode. This is the default mode if locate mode is not specified on the RCCOpen NMI request.

**Ecb**
Indicates whether the application trace instance uses an ECB that the application owns to be posted when trace records are written to the staging buffer.

  - **Yes**
    The application uses an ECB that the application owns. This option is specified on the RCCOpen NMI request.

  - **No**
    The application does not use an ECB that the application owns. This is the default option if an ECB address is not supplied on the RCCOpen NMI request.

**Staging buffer statistics section**

**TotalSize**
The size of the staging buffer in megabytes.

**InUse**
The number of kilobytes or megabytes currently in use in the staging buffer. This value is reset to zero each time the RCCStart request is processed for the trace instance.

**HiWater**
The largest number of kilobytes, or megabytes that have been in use in the staging buffer since the last RCCStart request was processed for the trace instance.

**Lost**
The total number of trace records and collection buffer lost records that could not be written to the staging buffer as the result of insufficient storage space. This value is reset to zero each time the RCCStart request is processed for the trace instance.

**PutRecs**
The total number of trace records that have been stored in the staging buffer since the last RCCStart request was processed for the trace instance.
GetRecs
The total number of trace records that the application has retrieved from the staging buffer since the last RCCStart request was processed for the trace instance.

Data trace filter control block section

Data trace
Indicates whether the application trace instance has set up filters for data trace.

Yes
Indicates that the application trace instance has set up filters for data trace. If the DETAIL parameter was specified on the command, the filter sets will be displayed under this field.

No
Indicates that the application trace instance has not set up filters for data trace.

FiltNum num
Indicates the total number of filters that are defined for the trace type.

ATTLSClr
Indicates whether AT-TLS cleartext data is requested in any of the data trace filters.

Yes
Indicates that AT-TLS cleartext data is requested in at least one of the filters.

No
Indicates that AT-TLS cleartext data is not requested in any of the filters.

Data trace filter set #num
Indicates that the filter set number num is displayed under this field. The filter set information is displayed only if filters have been set for the trace type and the DETAIL parameter was specified on the command.

Payload
The specified or default payload value from the RCDAPayload field in the RCCDat filter control block.

Portnum
The port number from the RCDAPortNum field in the RCCDat filter control block. The port number applies to the source or destination port. One of the following values is displayed:

Any
Indicates that no port number is specified for this filter set.

portnum
The port number.

ATTLS
The requested AT-TLS filter support from the RCDAFiltFlags field in the RCCDat filter control block. One or more of the following values can be displayed:

None
Indicates that no AT-TLS filter support is requested.

Clear
Indicates that AT-TLS cleartext data support is requested. Trace records will be created for AT-TLS before the data is encapsulated or encrypted.

Restriction: The data must match other filter criteria for a trace record to be created for it.

JobName
The job name from the RCDAJobName field in the RCCDat filter control block. One of the following values is displayed:

Any
Indicates that no job name is specified for this filter set.

jobname
The job name.
IpAddr
The job name from the RCDAJobName field in the RCCDat filter control block. One of the following values is displayed:

Any
Indicates that no job name is specified for this filter set.

jobname
The job name.

PfxLen
The prefix length from the RCDAPrefix field in the RCCDat filter control block. This value is used together with the IP address value to create an IP address mask that will be used in comparing the IP address to the source or destination IP addresses in a packet. One of the following values is displayed:

None
Indicates that no prefix length is specified for this filter set.

pfxlen
The prefix length in number of bits.

Packet trace filter control block section

Packet trace
Indicates whether the application trace instance has set up filters for the packet trace.

Yes
Indicates that the application trace instance has set up filters for the packet trace. If the DETAIL parameter was specified on the command, the filter sets are displayed under this field.

No
Indicates that the application trace instance has not set up filters for packet trace.

FiltNum num
Indicates the total number of filters that are defined for the trace type.

IPSecClr
Indicates whether IPSec cleartext data is requested in any of the data trace filters.

Yes
Indicates that IPSec cleartext data is requested in at least one of the filters.

No
Indicates that IPSec cleartext data is not requested in any of the filters.

Packet trace filter set #num
Indicates that filter set number num is displayed under this field. The filter set information is displayed only if filters have been set for the trace type and the DETAIL parameter was specified on the command.

Protocol
The protocol number from the RCPKProto field in the RCCPkt filter control block. One of the following values will be displayed:

Any
Indicates that no protocol was specified for this filter set.

protocol | TCP | UDP | ICMP | ICMPv6
The protocol number or the protocol name for the indicated well-known protocols.

Payload
The specified or default payload value from the RCPKPayload field in the RCCPkt filter control block.

Discard
The discarded packets value from the RCPKDiscard field in the RCCPkt filter control block. One of the following values will be displayed:
None
Indicates that trace records are not created for discarded packets.

Both
Indicates that trace records are created for both discarded packets and packets that were sent and delivered.

Only
Indicates that trace records are created only for discarded packets.

*reason_code*
Indicates that trace records are created only for packets with the specified discard reason code.

*Portnum*
The port number from the RCPKPortNum field in the RCCPkt filter control block. The port number applies to the source or destination port. One of the following values will be displayed:

*Any*
Indicates that no port number was specified for this filter set.

*portnum*
The port number.

*IPSec*
The requested IPSec filter support from the RCPKFiltFlags field in the RCCPkt filter control block. One or more of the following values can be displayed:

*None*
Indicates that no IPSec filter support is requested.

*Clear*
Indicates that IPSec cleartext data support is requested. Trace records will be created for IPSec packets before the packet is encapsulated or after the packet is decapsulated.

*Secure*
Indicates that IPSec secure data support is requested. Trace records will be created for encapsulated IPSec packets.

*Restriction:* The packet must match other filter criteria for a trace record to be created for it.

*IntfName*
The interface name from the RCPKIntfName field in the RCCPkt filter control block. One of the following values will be displayed:

*Any*
Indicates that no interface name was specified for this filter set.

*intfname*
The interface name.

*IpAddr*
The IPv4 or IPv6 address from the RCPKIpAddr field in the RCCPkt filter control block. The IP address applies to the source or destination address. If a packet contains GRE headers, the IP address also applies to the source or destination address in the GRE header. One of the following values will be displayed:

*Any*
Indicates that no IP address was specified for this filter set.

*ipaddr*
The IP address.

*PfxLen*
The prefix length from the RCPKPrefix field in the RCCPkt filter control block. The NMI uses the prefix length value and the IP address value to create an IP address mask. The IP address mask is used to compare the IP address to the source or destination IP addresses in a packet. One of the following values will be displayed:
None
Indicates that no prefix length was specified for this filter set.

\textit{pfxlen}
The prefix length in number of bits.

**Matches**
The number of trace records that matched the values in this filter set. This value includes normal trace records and discarded trace records.

**DISPLAY command: TN3270E Telnet server address space**

Use the \texttt{DISPLAY TCPIP,tnproc,<TELNET>} command from an operator console to request TN3270E Telnet server (Telnet) information. You must specify the Telnet procedure name. Because all commands are directed to the Telnet address space, the keyword TELNET can be omitted.

```
>>> Display TCPIP — ,tnproc — ,Telnet — ,ClientID —

,OBJect —

,PROFile —

,CONNection —

,INACTLUS —
```

The IPv6 address format is accepted wherever an IP address is specified. The result might be no matches, but the IPv6 address format is always accepted.

If the z/OS UNIX domain name is set to AF_INET6 for IPv6 or the FORMAT LONG configuration statement is specified, then tabular style displays that contain client identifier data use a second line to display data; otherwise, the data is displayed on a single line. To ensure uniformity in the displays, if the second line format is in effect, then any display that contains client identifier data uses the 2-line format even if the data would fit on a single line. The following tabular displays are affected:

- \texttt{D TCPIP,tnproc,<TELNET>,CLientID}
- \texttt{D TCPIP,tnproc,<TELNET>,OBJect}
- \texttt{D TCPIP,tnproc,<TELNET>,CONNection}

All commands that contain the \texttt{PROFILE=} parameter are considered to be part of the profile group because the commands categorize (and display) the information based on the profile in which it is contained. All of these commands search all profiles that match the \texttt{PROFILE=} search criteria. Once a match is found, the other parameters are used to determine what is displayed for the profile.

Profile, connection, and port-related displays contain a port description line that identifies the port for the preceding data.

Telnet Display commands provide the following summary or detailed information at all levels:

- Connection
  \texttt{D TCPIP,tnproc,<Telnet>,CONNection (Summary|Detail)}
- Profile
  - \texttt{D TCPIP,tnproc,<Telnet>,PROFile (Summary|Detail)}
  - \texttt{D TCPIP,tnproc,<Telnet>,OBJect (Summary|Detail)}
  - \texttt{D TCPIP,tnproc,<Telnet>,CLient ID (Summary|Detail)}
- Port
  - \texttt{D TCPIP,tnproc,<Telnet>,PROFile (Summary)}
- Server
  - \texttt{D TCPIP,tnproc,<Telnet>,PROFile (Summary)}
Telnet displays use multiple console support (MCS) display lines. In the examples, a C indicates a control line and an L indicates a label line. When MCS is being used, control and label lines do not scroll off the screen.

**Tip:** All parameters after the command can be in any order. All commands are directed to the Telnet address space, which makes the TELNET parameter redundant and optional.

When you specify a TN3270E Telnet server as the `tnproc` value on the command, you can display information about the TN3270E Telnet server or about functions that are associated with the server.

The functions listed in Table 7 on page 113 support the DISPLAY TCPIP command when it is directed to a TN3270E Telnet server.

**DISPLAY Telnet CLIENTID command**

Use the CLIENTID display command to display Client IDs that are defined in the profile and details about the Client ID.

**Format:**
Parameters:

**tnproc**
- The member name of the cataloged procedure that is used to start the Telnet address space.

**Telnet**
- Legacy parameter that directs the command to the Telnet component when Telnet could run in the TCP/IP stack.

**ClientID**
- The ClientID keyword.

**POrt=ALL|num|num1..num2|num,qual**
- Specifies that ALL ports, a specific port (num), port number range (num1..num2), qualified port (num,qual) be displayed. ALL is the default.

**PROFile=CURRent|prfid|ACTive|ALL|Basic|Pending|Secure**
- The type of profile to display.
  - CURRent is the name of the current profile. This is the default.
  - prfid is the profile ID.
  - ACTive is all the active profiles.
  - ALL is all profiles, both active and inactive.
  - Secure is the secure profiles.
  - Pending is the profile that is waiting for LUNS acknowledgement to become the active profile.
  - Basic is the basic profile.

**TYPE=clidtype**
- The type of client identifier to display. The client identifier values are:
  - USERID
  - HOSTNAME
  - IPADDR
  - USERGRP
• HNGRP
• IPGRP
• DESTIP
• LINKNAME
• DESTIPGRP
• LINKGRP
• USERS (USERID and USERGRP)
• HNS (HOSTNAME and HNGRP)
• IPS (IPADDR and IPGRP)
• DESTIPS (DESTIP and DESTIPGRP)
• LINKS (LINKNAME and LINKGRP)
• NULL
• WU (Determines all the places where a particular name or IPADDR was used and presents mapping information.)

**ID=clidname**
The client identifier name. If more than one client ID has the same name, one line mapping information is displayed for all, but only the first one found in a random search will have details presented. Use TYPE with ID to get the correct match.

**DETail|SUMmary**
Summary is the default when neither TYPE nor ID is specified. Detail is the default if either TYPE or ID are specified. The following describes the different conditions:

• Neither TYPE nor ID is specified

  **Summary**
  Using message EZZ6082I, produces a listing of client identifiers.

  **Detail**
  Using message EZZ6081I, produces a more detailed display showing all Client Identifiers and the objects that are mapped to them.

• TYPE is specified

  **Summary**
  Using message EZZ6082I, produces a list of all Client Identifiers for the specified Client Identifier type.

  **Detail**
  Using message EZZ6081I, produces a more detailed display showing all Client Identifiers and the objects mapped to them for the specified client identifier type.

• ID is specified with or without TYPE

  **Summary**
  Using message EZZ6081I, produces a detailed display showing all client identifiers and the objects mapped to them for the specified client identifier.

  **Detail**
  Using message EZZ6081I, produces a detailed display showing all client identifiers and the objects mapped to them for the specified client identifier. In addition, if the client identifier is a group, the individual client identifiers within the group are displayed. If a PARMGROUP group is mapped to the client identifier, a summary of the resulting parameters used by a connection are displayed.

**MAX=100|nn|*  
The number of output lines that are displayed. Valid values are in the range 2 - 65533. The default value is 100. An asterisk (*) means that all output lines are displayed. The command can display a maximum of 65533 output lines (control, label, and data lines). Therefore, if you specify an asterisk (*), a maximum of 65533 output lines is displayed.
Examples:
The following examples show what might be displayed with this command.

DISPLAY TELNET CONNECTION command

Use the CONNECTION DISPLAY command with the SUMmary parameter to view high-level information about multiple existing connections and their usage.

Use the CONNECTION DISPLAY command with the DETail parameter to view all available details about a single connection.

Use the LUName filter with the *LUNSREQ option to see the connections at a LUNR that are waiting for a reply from the LUNS.

Format:
Parameters:

**tnproc**
The member name of the cataloged procedure that is used to start the Telnet address space.

**Telnet**
Legacy parameter that directs the command to the Telnet component when Telnet could run in the TCP/IP stack.
CONNection
The connection keyword.

Port=ALL|num|num1..num2|num,qual
Specifies that ALL ports, a specific port (num), port number range (num1..num2), qualified port (num,qual) be displayed. ALL is the default.

PROFILE =ALL|prfid|ACTive|CURRent|Basic|Secure
The type of profile to display.
• ALL is all profiles, both active and inactive. This is the default.
• prfid is the profile ID.
• ACTive is all the active profiles.
• CURRent is the name of the current profile.
• Basic is the basic profile.
• Secure is the secure profiles.

CONn=connid
Displays detailed information about a specific TCP/IP connection ID.

IPPort=ipaddr..port
Displays detailed information about a specific IP port and address.

LUName=luname*
The name of the LU for which you are searching. The wildcard (*) is allowed only as the last character of the LUName. If no * is indicated, a detailed display will appear.

SUMmary|DETail
DETail displays all of the information about the requested connection.
SUMmary displays a subset of the information about the requested connection.

APPL=applname|applname*
The application name of the application for which you are searching. The wildcard (*) is allowed only as the last character.

TCPIPJOBNAME=tcpip
The TCPIP stack that supports the connection.

IPAddr=ipaddr|mask:subnet
The IP address of the connection for which you are searching. The mask : subnet designation is essentially allowing an IP wildcard.

LUGroup=lugroupname
The name of the LU group for which you are searching.

IPGroup=ipgroupname
The name of the IP group for which you are searching.

PROTOCOL=protocol mode
The protocol mode for which you are searching. Protocol choices are:
• BINARY
• LINEMODE
• TN3270
• TN3270E
• TRANSFORM

HName|NOHname
The summary display includes client host names when HNAME is specified. The summary display omits client host names when NOHNAME is specified.

HName=*hostname
The host name for which you are searching. Single or double asterisks are permitted as wildcards:
• Use a single asterisk (*) to indicate that any value is acceptable for a particular qualifier in a particular position within the host name. For example, *.IBM.COM matches USER1.RALEIGH.IBM.COM, but does not match USER1.TCP.RALEIGH.IBM.COM because this name includes an extra qualifier.

• Use a double asterisk (**) to indicate that any number of qualifiers are acceptable to the left of the asterisks. For example, **.IBM.COM matches USER1.IBM.COM, USER1.RALEIGH.IBM.COM, and USER1.TCP.RALEIGH.IBM.COM.

Both wildcard techniques require that the entire qualifier be wildcarded. For example, *USER.IBM.COM is not a valid use of a wildcard. In this case, use *.IBM.COM instead.

HNGroup=hn grouppname
The name of the HN group for which you are searching.

MAX=100|nn*|
The number of output lines that are displayed. Valid values are in the range 2–65533. The default value is 100. An asterisk (*) indicates that all output lines are displayed. The command can display a maximum of 65533 output lines (control, label, and data lines). Therefore, if you specify an asterisk (*), a maximum of 65533 output lines is displayed.

Examples:

```

120 z/OS Communications Server: IP System Administrator's Commands
Usage:

Only one connection at a time is displayed with parameters CONN=, IPPort=, and LUName= if no wildcard is on LUName.

DISPLAY TCPIP,tnproc,HELP

Use the DISPLAY TCPIP,tnproc,HELP command from the MVS operator console to display the syntax of MVS operator DISPLAY commands for the TN3270E Telnet server (Telnet).

Format

Display — TCPIP — , — tnproc — , Help

Parameters

STOR

Shows help on the Telnet variation of the Display STOR command.

Telnet

Shows the available options on the Display Telnet command.

ClientID

Shows help on the Display TELNET,ClientID command.

CONNection

Shows help on the Display TELNET,CONNection command.

INACTLUS

Shows help on the Display TELNET,INACTLUS command or the Display LUNS,INACTLUS command.
OBJ ect
    Shows help on the Display TELNET,OBJ ect command or the Display LUNS,OBJ ect command.
PRO file
    Shows help on the Display TELNET,PRO file command.
LUN S
    Shows help on the Display LUNS command.
XCF
    Shows help on the Display XCF command.

Examples
To view the available help for Telnet, issue the following information:

```
  d tcpip,TNSERV,help,Telnet
  EZZ6103I D TCPIP,TNPROC<,TELNET>,
  (CLIENTID|CONNECTION|INACTLUS|OBJECT|PROFILE)
```

To get more information about the syntax of a particular Telnet command (for example, CONnn), issue the following information:

```
  d tcpip,TNSERV,help,telnet,conn
  EZZ6107I D TCPIP,TNSERV<,TELNET>,CONNECTION
  (,CONN=XCONNID|IPPORT=XIPADDR .. XPORT|LUNAME=XLUNM)
  (,DETAIL|SUMMARY)>>|
  (,LUNAME=XLUNM|APPL=(XAPPLNM|XAPPLNM*)|TCPJOBNAME=XTCPJOBPNM|PROTOCOL=XPROTOCOL|LUGROUP=XLUGROUP|IPGROUP=XIPGROUP|IPADDR=(XIPADDR|XV4MASK:XV4SUBNET|XIPADDR/XPREFIXLEN))
  (,NOHNAME|HNAME)>>|
  (,(HNAME=X+HOSTNAME|HNGROUP=XHNGROUPNM)
  (,NOHNAME|HNAME)>>)
  ,PORT=(ALL|XNUM|XNUM1 .. XNUM2|XNUM,XQUAL)>
  ,PROF=(CURRENT|XPROFID|ACTIVE|ALL|BASIC|SECURE)>
  ,SUMMARY|DETAIL>
  ,MAX=(XNN|*)>
```

DISPLAY Telnet INACTLUS command

Use the INACTLUS DISPLAY command to see all of the LUs that have not been available to any users since the VARY INACT command was issued or since the OPEN ACB command failed and Telnet automatically set the LU state to inactive.

Format:

```
Display TCPIP ...,tnproc,,,Telnet,,INACTLUS
```

Parameters:

- `tnproc`
  The member name of the cataloged procedure that is used to start the Telnet address space.
- **INACTLUS**
  The inactive LUs keyword.
- **MAX=100**
  The number of output lines that are displayed. Valid values are in the range 2 - 65,533. The default value is 100. An asterisk (*) indicates that all output lines are displayed. The command can display a maximum of 65,533 output lines (control, label, and data lines). Therefore, if you specify an asterisk (*), a maximum of 65,533 output lines is displayed.
Examples:

D TCPIP, TELNET, INACTLUS
(C) EZZ6061I TELNET INACTLUS DISPLAY 771
(L) INACTIVE LUS

TCPM1003  TCPM1005  TCPM1004  TCPM1001  TCPPM1010
TCPM1015  TCPPM1012  TCPPM1008

5 OF 5 RECORDS DISPLAYED

DISPLAY TCPIP, tnproc, LUNS

Use the DISPLAY TCPIP, tnproc, LUNS command from an operator console to request TN3270E Telnet LU name server (LUNS) information. You must specify the Telnet procedure name.

Format:

```
DISPLAY TCPIP, tnproc, LUNS
```

The following descriptions provide details of the DISPLAY TCPIP, tnproc, LUNS commands that you can issue.

Display TCPIP, tnproc, LUNS, OBJect command

Use the Display TCPIP, tnproc, LUNS, OBJect command to display the shared LU group objects at the LU name server (LUNS). The shared LU group objects are defined in the LU name requester (LUNR) profile and sent to the LUNS.

Format:

```
Display TCPIP, tnproc, LUNS, OBJect
```

```
,PROFile=CURRent
,PROFile=prfid
,PROFile=ALL

,JObname=ALL
,JObname=jobname

,SYSname=ALL
,SYSname=sysname

,TYPE= objtype
,TYPE=WU

,ID=objname

,MAX=100
,MAX=nn|
```

**tnproc**

The member name of the cataloged procedure that is used to start the Telnet address space.

**LUNS**

The LUNS keyword.

**OBJect**

The OBJect keyword.
**POrt=ALL|num|num1..num2|num.qual**
Specifies that all ports, a specific port (num), a port number range (num1..num2), or a qualified port (num.qual) are to be displayed. The value ALL is the default.

**PROFILE = CURRENT|prfid|ALL**
The type of profile to display.
- CURRENT is the name of the most recent profile that was received from the LUNR. This is the default.
- prfid is the profile ID.
- ALL indicates active profiles.

**TYPE=objtype**
The type of object identifier to display. Possible values are:
- SLUGRP
- SPRTGRP
- LUS (SLUGRP and SPRTGRP)
- WU (determines all places where a particular name is defined, presents mapping information, and displays where the name has been assigned.)

**ID=objname**
The shared object name. If more than one shared object has the same name, the first object found in a random search is presented. Specify the TYPE parameter with the ID parameter to get the correct match.

**DETail|SUMmary**
Summary is the default when neither the TYPE nor the ID parameter is specified. Detail is the default if either the TYPE or the ID parameter is specified. Possible conditions are:
- Neither TYPE nor ID is specified.
  - Summary
    - Using message EZZ6086I, produces a list of shared objects.
  - Detail
    - Using message EZZ6085I, produces a more detailed display that shows all shared objects.
- TYPE is specified.
  - Summary
    - Using message EZZ6086I, produces a list of all objects for the specified object type. Types SLUGRP and SPRTGRP provide a summary of total LUs and in-use LUs by group. An LU is considered in-use if it is assigned to a connection, is being kept for possible reuse, or is inactive. When TYPE=WU is specified, one line that shows where the LU is being used is displayed.
  - Detail
    - Using message EZZ6085I, produces a more detailed display showing all shared objects for the specified object type.
- ID is specified with or without the TYPE parameter.
  - Summary
    - Using message EZZ6085I, produces a detailed display showing all objects for the specified objname object name.
  - Detail
    - Using message EZZ6085I, produces a detailed display showing all objects for the specified object. If the object is a group, the individual objects in the group are displayed.

**MAX=100|nn|**
The number of output lines that are displayed. Valid values are in the range 2 – 65 533. The default value is 100. An asterisk (*) indicates that all output lines are displayed. The command can display a maximum of 65 533 output lines (control, label, and data lines). Therefore, if you specify an asterisk (*), a maximum of 65 533 output lines is displayed.

**Examples:**

124 z/OS Communications Server: IP System Administrator's Commands
The following examples display possible output from this command.

```

**Display TCPIP,tnproc,LUNS,INACTLUS command**

Use the D TCPIP,tnproc,LUNS,INACTLUS display command to see all of the LUs that have not been available to any LU name requesters because the VARY INACT command was issued or because the OPEN ACB failed and Telnet automatically set the LU state to inactive.

**Format:**

```
Display TCPIP ,tnproc ,LUNS,INACTLUS
```

**Parameters:**

*tnproc*

The member name of the cataloged procedure that is used to start the Telnet address space.
INACTLUS
The inactive LUs keyword.

MAX=100|nn|*
The number of output lines that are displayed. Valid values are in the range 2 – 65 533. The default value is 100. An asterisk (*) indicates that all output lines are displayed. The command can display a maximum of 65 533 output lines (control, label, and data lines). Therefore, if you specify an asterisk (*), a maximum of 65 533 output lines is displayed.

Examples:

```
D TCPIP, TNLUNS, LUNS, INACTLUS
(C) EZ26062I TNLUNS LUNS INACTLUS
(L) INACTIVE LUS
TCPM1003 TCPM1005 TCPM1004 TCPM1001 TCPM1010
TCPM1015 TCPM1012 TCPM1008
5 OF 5 RECORDS DISPLAYED
```

DISPLAY Telnet OBJect command
Use the OBJECT DISPLAY command to display objects that are defined in the profile and details about the object.

**Format:**

```
Display TCPIP ,tnproc ,OBJect ,Telnet ,POrtnum2 ,POrtnum ,POrtnum1..num2 ,POrtnum,qual ,PROFile=CURRent ,PROFile=prfid ,PROFile=ACTive ,PROFile=ALL ,PROFile=Basic ,PROFile=Pending ,PROFile=Secure ,TYPE=obtype ,ID=objname ,DETail ,SUMmary ,MAX=100 ,MAX=nn*
```

**Parameters:**

*tnproc*
The member name of the cataloged procedure used to start the Telnet address space.

*Telnet*
Legacy parameter that directs the command to the Telnet component when Telnet could run in the TCP/IP stack.

*OBJect*
The OBJect keyword.

*PORT=ALL|num1..num2|num,qual*
Specifies that ALL ports, a specific port (num), port number range (num1..num2), qualified port (num,qual) be displayed. ALL is the default.
PROFile = Current|prfid|Active|All|Basic|Pending|Secure

The type of profile to display.

- Current is the name of the current profile. This is the default.
- prfid is the profile ID.
- Active is all the active profiles.
- All is all profiles, both active and inactive.
- Secure is the secure profiles.
- Pending is the profile waiting for LUNS acknowledgement to become the active profile.
- Basic is the basic profile.

TYPE= objtype

The type of object identifier to display. The object identifier values are:

- ARAPPL
- DEFAPPL
- INT
- LINEAPPL
- LU
- LUGRP
- SLUGRP
- MAPAPPL
- MONGRP
- PARMSGRP
- PRT
- PRTAPPL
- PRTGRP
- SPRTGRP
- USS
- APPLS (ARAPPL, DEFAPPL, PRTAPPL, LINEAPPL, MAPAPPL)
- DEFAULTS (DEFAPPL, PRTAPPL, LINEAPPL, MAPAPPL, USS, INT)
- LUS (LU, LUGRP, SLUGRP, APPLLUG, PRT, PRTGRP, SPRTGRP)
- WU (Determines all of the places where a particular name was used and presents mapping information.)

ID= objname

The object name. If more than one object has the same name, the first one found in a random search is presented. Use TYPE with ID to get the correct match.

DETail|SUMmmary

Summary is the default when neither TYPE nor ID is specified. Detail is the default if either TYPE or ID are specified. The following describes the different conditions:

- Neither TYPE nor ID is specified

  Summary
  Using message EZZ6084I, produces a list of objects.

  Detail
  Using message EZZ6083I, produces a more detailed display showing all objects and the client identifiers to which they are mapped.

- TYPE is specified
Summary
Using message EZZ6084I, produces a list of all objects for the specified object type. Types LUGRP, PRTGRP, SLUGRP, and SPRTGRP provide a summary of total LUs and in-use LUs by group. An LU is considered to be in-use if it is assigned to a connection, is being kept for possible reuse, or is deactivated.

Detail
Using message EZZ6083I, produces a more detailed display showing all objects and the Client Identifiers to which they are mapped for the specified object type.

• ID is specified with or without TYPE

Summary
Using message EZZ6083I, produces a detailed display showing all objects and the Client Identifiers to which they are mapped for the specified object.

Detail
Using message EZZ6083I, produces a detailed display showing all objects and the Client Identifiers to which they are mapped for the specified object. In addition, if the object is a group, the individual objects within the group are displayed.

MAX=100|nn|*

The number of output lines that are displayed. Valid values are in the range 2 - 65 533. The default value is 100. An asterisk (*) indicates that all output lines are displayed. The command can display a maximum of 65 533 output lines (control, label, and data lines). Therefore, if you specify an asterisk (*), a maximum of 65 533 output lines is displayed.

Examples:
The following examples show what might be displayed with this command.

```
D TCPIP,TELNET,OBJECT,PORT=23,SUMMARY

```
**DISPLAY Telnet PROFILE command**

Use the PROFILE DISPLAY command to determine:

- Which profile-wide options are in effect for each profile
- Which profiles are still being used
- How many users are on each profile

**Format:**

```
Display TCPIP .tnproc .Telnet .PROFile .POrt=ALL .POrt=num .POrt=num1..num2 .PROFile=CURR .PROFile=ALL .PROFile=Active .PROFile=Pending .PROFile=Secure .SUMmary .MAX=100 .MAX=nn
```

**Parameters:**

- **tnproc**
  - The member name of the cataloged procedure that is used to start the Telnet address space.

- **Telnet**
  - Legacy parameter that directs the command to the Telnet component when Telnet could run in the TCP/IP stack.

- **PROFile**
  - The profile keyword.

- **POrt=ALL|num|num1..num2|num,qual**
  - Specifies that ALL ports, a specific port (num), port number range (num1..num2), qualified port (num,qual) be displayed. **ALL** is the default.
PROFile = **CURRent | prfid | ACTive | ALL | Basic | Pending | Secure**

The type of profile to display.

- **CURRent** is the name of the current profile. This is the default.
- **prfid** is the profile ID.
- **ACTive** is all the active profiles.
- **ALL** is all profiles, both active and inactive.
- **Secure** is the secure profiles.
- **Pending** is the profile waiting for LUNS acknowledgement to become the active profile.
- **Basic** is the basic profile.

**SUMmary | DETail**

**SUMmary** indicates which parameters are set and the total number of users that are associated with the profile. **DETail** indicates whether the default value or a configured value is used and the value of each parameter.

**MAX=100 | nl | * **

The number of output lines that are displayed. Valid values are in the range 2-65533. The default value is 100. An asterisk (*) indicates that all output lines are displayed. The command can display a maximum of 65533 output lines (control, label, and data lines). Therefore, if you specify an asterisk (*), a maximum of 65533 output lines is displayed.

**Examples:**

To display Telnet summary or detailed profile information, issue the following commands:

```
D TCPIP,TELNET,PROF,PORT=23

DISPLAY TCPIP,tnproc,STOR

Use the DISPLAY TCPIP,tnproc,STOR command to display TN3270E Telnet server (Telnet) storage usage information. You can use this command to verify the load module service level.

To verify load module service level, ensure that the eyecatcher for the module matches the latest PTF service for the module. When you contact IBM Service, you can use this command to verify that you are running on the correct Telnet service level.

Format

Display — TCPIP, — tnproc — ,STOR

Parameters

STOR
Requests storage information.

If no other option is specified, the command displays the current and maximum storage usage for Telnet and any Telnet storage limits. The maximum storage usage is the highest amount of storage that Telnet has used since it started. See message EZZ8453I in z/OS Communications Server: IP Messages Volume 4 (EZZ, SNM) for a description of the output displayed.

MODULE
Displays the load module name that contains the module, module address and the first 48 bytes of storage.

This command displays modules within load modules EZBTNINI, EZBTMCTL, EZBTPGUE, EZBTTMST, and EZBTZMST for Telnet.

Examples

To display Telnet storage usage, issue the following command:

d tcpip,tn3270,stor
EZZ8453I TELNET STORAGE
EZZ8464I TN3270 STORAGE CURRENT MAXIMUM LIMIT
EZZD2818I 31-BIT
EZZ8455I ECSA 85K 137K NOLIMIT
EZZ8455I PRIVATE 6810K 7241K NOLIMIT
EZZD2818I 64-BIT
EZZ8455I TRACE HVPRIVATE 1025M 1025M 1025M
EZZ8459I DISPLAY TELNET STOR COMPLETED SUCCESSFULLY

DISPLAY TCPIP,TELNET

Use the DISPLAY TCPIP,TELNET command from the MVS operator console to display the name, version, and status of the TN3270E Telnet servers (Telnet) that are or were running.

Format

Display TCPIP — ,TELNET

Parameters

There are no parameters.

Examples

To view the name, version, and status of Telnet servers, issue the following command:

d tcpip,telnet
EZA0P60I TELNET STATUS REPORT
TELNET NAME VERSION STATUS
DISPLAY TCPIP,tnproc,XCF

Use the DISPLAY TCPIP,tnproc,XCF command from an operator console to request TN3270E Telnet server XCF information. You must specify the Telnet procedure name.

**Format:**

```
DISPLAY TCPIP ,tnproc ,XCF
```

The following descriptions provide details of the DISPLAY TCPIP,tnproc,XCF commands that you can use.

**DISPLAY TCPIP,tnproc,XCF<,GRoup> command**

Use the Display TCPIP,tnproc,XCF<,GRoup> command to see the state and status of all the Telnet members of the XCF group.

**Format:**

```
Display TCPIP ,tnproc ,XCF
```

**Parameters:**

- **tnproc**
  The member name of the cataloged procedure that is used to start the Telnet address space.

- **XCF**
  The XCF keyword.

- **GROUP**
  The type of XCF information to display. Use the GROUP parameter to display status information for all XCF Telnets in the XCF group.

- **MAX=100|nn|**
  The number of output lines that are displayed. Valid values are in the range 2 - 65533. The default value is 100. An asterisk (*) indicates that all output lines are displayed. The command can display a maximum of 65533 output lines (control, label, and data lines). Therefore, if you specify an asterisk (*), a maximum of 65533 output lines is displayed.

**Example:**

```
D TCPIP,TLUNS1,XCF
EZ660091 TLUNS1 XCF GROUP DISPLAY
GROUP NAME: EZ6TLUNS CONNECTTIMEOUT: 90
XCFMONITOR: 10 RECOVERYTIMEOUT: 80
LUNS LISTENER: 192.168.17.2..8000
---------------------------
MVSNAM | TNNAM | PDMON | CTR | RANK | STATE | STATUS | LUNR | STATE | STATUS
-------- | ------ | ------ | --- | ----- | ------ | ------- | ------ | ------- | -------
RANS17  | TLNR1  | 12     |   |     | ACTIVE | L       |        |        |        |
RANS17  | TLNR2  | 12     |   |     | ACTIVE | CP      |        |        |        |
RANS17  | TLNR3  | 12     |   |     | ACTIVE | R       |        |        |        |
RANS17  | TLNS1  | 12     | P101 | STANDBY | STANDBY |        |        |        |
RANS17  | TLNS2  | 12     | P100 | STANDBY | STANDBY |        |        |        |
RANS18  | TLNR1  | 12     |   |     | ACTIVE | L       |        |        |        |
RANS18  | TLNR2  | 12     |   |     | ACTIVE | L       |        |        |        |
RANS18  | TLNR3  | 12     |   |     | ACTIVE |         |        |        |        |
```
Display TCPIP,tnproc,XCF,STats command

Use the Display TCPIP,tnproc,XCF,STats command to see the performance statistics of the LUNR and LUNS.

Format:

Display TCPIP "tnproc" XCF "STats"

Parameters:

tnproc
The member name of the cataloged procedure that is used to start the Telnet address space.

XCF
The XCF keyword.

STats
The type of XCF information to display. The STats parameter displays performance statistics for all XCF Telnets in the XCF group.

MAX=100|nn|*
The number of output lines that are displayed. Valid values are in the range 2 - 65 533. The default value is 100. An asterisk (*) indicates that all output lines are displayed. The command can display a maximum of 65 533 output lines (control, label, and data lines). Therefore, if you specify an asterisk (*), a maximum of 65 533 output lines is displayed.

Example:
The following example displays possible output from this command.
MODIFY command

The MODIFY command allows you to dynamically change the characteristics of an active task. The abbreviated version of the command is the letter F.

This is the general format of MODIFY:

```
MODIFY  F  procname , parameter
```

*procname*

The name of the member in a procedure library that was used to start the server or address space.

*parameter*

Any of the parameters that are valid for the server.

The following servers or address spaces support the MVS MODIFY command. Not all servers support the same parameters. For further descriptions of the supported parameters, see Table 8 on page 135.

</table>

**MODIFY command: Automated domain name registration application (EZBADNR)**

Use the MODIFY command to control the automated domain name registration (ADNR) application from the operator’s console.

**Format:**
Parameters:

**proname**

The member name of the cataloged procedure that is used to start the automated domain name registration application.

**DEBug,Level=debug_level**

Changes the automated domain name registration application debug level. See Automated domain name registration application (EZBADNR) configuration file in the z/OS Communications Server: IP Configuration Reference for details on valid automated domain name registration application debug levels.

**DISplay,DEBug**

Displays the automated domain name registration application debug level including the active individual logging levels.

**DISplay,DNS[,DNSID=dns_label][,SUMMARY][,MAX=recs]**

Displays a summary of Domain Name System (DNS) information for the name server specified by the *dns_label* value or for all configured name servers. All configured name servers are displayed if the DNSID parameter is not specified. If the DNSID parameter is specified, the *dns_label* value must match the *dns_label* value used on one of the dns statements in the automated domain name registration application configuration file. See the following summary DNS information:

- DNS label
- DNS status

The number of name servers displayed is limited by the MAX=recs parameter. The default value is 100. If MAX=* is specified, then all name servers are displayed.

**DISplay,DNS[DNSID=dns_label],DETAIL[,MAX=recs]**

Displays detailed DNS information for the name server specified by the *dns_label* value or for all configured name servers. All configured name servers are displayed if the DNSID parameter is not specified. If the DNSID parameter is specified, the *dns_label* value must match the *dns_label* value used on one of the dns statements in the automated domain name registration application configuration file. See the following detailed DNS information:

- DNS label
- DNS status
- DNS IP address and port
- Number of zones defined
- Number of zones active

The number of name servers displayed is limited by the MAX=recs parameter. The default value is 100. If MAX=* is specified, then all name servers are displayed.

**DISplay,DNS[DNSID=dns_label],ZONES,ZONEID=zone_label][,SUMMARY][,MAX=recs]**
Displays a summary of zone information for the zone specified by the zone_label value or for all zones.

- All zones are displayed if DNSID and ZONEID parameters are not specified.
- All zones under a specific configured name server are displayed if the DNSID parameter is specified and the ZONEID parameter is not specified.
- If the DNSID parameter is specified, the dns_label value must match the dns_label value used on one of the dns statements in the automated domain name registration application configuration file.
- If ZONEID and DNSID parameters are specified, the zone_label value must match the zone_label value on one of the zone parameters on the dns statement with label dns_label in the automated domain name registration application configuration file.
- If the ZONEID parameter is specified and the DNSID parameter is not specified, the zone_label value must match the zone_label value on one of the zone parameters that is on one of the dns statements in the automated domain name registration configuration file. Only information about the zone specified by the ZONEID parameter and the name server that contains the zone is displayed.

See the following summary zone information:

- DNS label
- DNS status
- Zone information

For each zone the following information is displayed:

- Zone label
- Zone status

The number of zones displayed is limited by the MAX=recs parameter. When this maximum is reached, no more zones or name servers are displayed. The default value is 100. If MAX=* is specified, then all zones are displayed.

`DISPLAY,DNS[,DNSID=dns_label],ZONES[,ZONEID=zone_label],DETAIL[,MAX=recs]`

Displays detailed zone information for the zone specified by the zone_label value or for all zones.

- All zones are displayed if DNSID and ZONEID parameters are not specified.
- All zones under a specific configured name server are displayed if the DNSID parameter is specified and the ZONEID parameter is not specified.
- If the DNSID parameter is specified, the dns_label value must match the dns_label value on one of the dns statements in the automated domain name registration application configuration file.
- If the ZONEID and DNSID parameters are specified, the zone_label value must match the zone_label value on one of the zone parameters on the dns statement with label dns_label in the automated domain name registration application configuration file.
- If the ZONEID parameter is specified and the DNSID parameter is not specified, the zone_label value must match the zone_label value on one of the zone parameters that is on one of the dns statements in the automated domain name registration application configuration file. Only information about the zone specified by the ZONEID parameter and the name server that contains the zone is displayed.

See the following detailed zone information:

- DNS label
- DNS status
- DNS IP address and port
- Number of zones defined
- Number of zones active
- Zone information

For each zone, the following information is displayed:
• Zone label
• Zone status
• Status timestamp
• Domain suffix
• TSIG flags
• DNS resource record information

For each DNS resource record, the following information is displayed:
• Label
• Status
• TTL
• Class
• Type
• IP address
• GWM label
• Group label
• Last update timestamp

The number of zones displayed is limited by the MAX=recs parameter. The default value is 100. If MAX=* is specified, then all zones are displayed.

DISPLAY,GWM[,SUMMARY]
Displays a summary of the Global Workload Manager (GWM) information. See the following summary GWM information:
• GWM label
• GWM status

DISPLAY,GWM,DETAIL
Displays detailed GWM information. See the following detailed GWM information:
• GWM label
• GWM status
• Status timestamp
• GWM IP address and port
• Host (local) IP address
• Universally unique identifier (UUID)
• Update interval
• Last update timestamp

DISPLAY,GWM,GROUPS[,GROUPID=group_label][,SUMMARY][,MAX=recs]
Displays a summary of group information for the group specified by the group_label value or for all groups. All groups are displayed if the GROUPID parameter is not specified. If the GROUPID parameter is specified, the group_label value must match the host_group_label value on one of the host_group statements or the server_group_label value on one of the server_group statements in the automated domain name registration application configuration file. See the following summary group information:
• GWM label
• GWM status
• Group information

For each group, the following information is displayed:
• Group label
• Group name

The number of groups displayed is limited by the MAX=recs parameter. The default value is 100. If MAX=* is specified, then all groups are displayed.

**Display,GWM,GROUPS[,GROUPID=group_label],DETAIL[,MAX=recs]**

Displays detailed group information for the group specified by the group_label value or for all groups. All groups are displayed if the GROUPID parameter is not specified. If the GROUPID parameter is specified, the group_label value must match the host_group_label value on one of the host_group statements or the server_group_label value on one of the server_group statements in the automated domain name registration application configuration file.

See the following detailed group information:

• GWM label
• GWM status
• Status timestamp
• GWM IP address and port
• Host (local) IP address
• Universally unique identifier (UUID)
• Update interval
• Last update timestamp
• Group information

For each group, the following information is displayed:

• Group label
• Group name
• Group type
• DNS label
• Zone label
• Member information

For each member, the following information is displayed:

• Member hostname (if available)
• IP address information

For each member IP address, the following information is displayed:

• IP address and port
• Protocol, if the member is part of a server group. Protocol is not displayed if the member is part of a host group.
• Status
• Flags
• Update count

The number of groups displayed is limited by the MAX=recs parameter. The default value is 100. If MAX=* is specified, all groups are displayed.

**REFRESH**

Initiates a dynamic reconfiguration using the configuration file defined in the cataloged procedure that is used to start the automated domain name registration application. This causes the automated domain name registration application to resynchronize all dynamic DNS zones with the modified configuration. DNS records representing prior configuration elements existing in the previous configuration are removed.
While the new configuration file is being processed, the existing debug level is used, regardless of how it was set (using the last configuration file or with the MODIFY DEBUG command). After the new configuration file has been successfully processed, the value specified on the debug_level statement of the new configuration file takes effect. If the debug_level statement is not specified in the new configuration file, the debug level defaults to a level of 7 (ERROR, WARNING, EVENT). If the new configuration file contains errors that cause it to be rejected, the debug level that was in effect prior to the dynamic reconfiguration is used.

Rule: When you update the arm_element_suffix statement, perform the following steps to ensure that the ADNR application is able to automatically restart:
1. Add the new element name to the ARM policy and add or change the arm_element_suffix value in the ADNR configuration file.
2. Refresh the ADNR application.
3. Optionally, remove the old element name from the ARM policy.

Example 1: The MODIFY DISPLAY DNS command summarizes all name servers that are managed by the automated domain name registration application.

<table>
<thead>
<tr>
<th>F ADNR,DIS,DNS</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2012541 DNS SUMMARY</td>

<tr>
<td>DNS STATUS : DELETING</td>
</tr>
<tr>
<td>2 of 2 RECORDS DISPLAYED</td>
</tr>
</tbody>
</table>

DNS LABEL
The DNS label configured in the automated domain name registration application configuration file on the dns statement.

DNS STATUS
The status of the DNS server. The following list shows the possible values:

ACTIVE
The automated domain name registration application is operating under normal conditions.

DELETED
The automated domain name registration application has successfully deleted the name server and its subordinate zones from its configuration following a MODIFY REFRESH command. The automated domain name registration application is waiting for zones under other name servers to be deleted.

DELETING
The automated domain name registration application is in the process of deleting the subordinate zones and resource records.

INITIAL
The automated domain name registration application has not yet started managing data for the name server. This occurs while the automated domain name registration application is initializing or shortly after dynamic reconfiguration has begun.

SHUTTING_DOWN
The automated domain name registration application is terminating.

Example 2: The MODIFY DISPLAY DNS DETAIL command provides details for all name servers that are managed by the automated domain name registration application.

<table>
<thead>
<tr>
<th>F ADNR,DIS,DNS,DETAIL</th>

<tr>
<td>DNS IPADDR..PORT: 10.81.7.7..53</td>
</tr>
</tbody>
</table>
ZONES DEFINED : 1
ZONES ACTIVE : 0
2 of 2 RECORDS DISPLAYED

DNS LABEL
The DNS label configured in the automated domain name registration application configuration file on the dns statement.

DNS STATUS
The DNS server status.

DNS IPADDR..PORT
The remote IP address and port of the name server.

ZONES DEFINED
The number of zones defined using the zone parameter on the dns statement.

ZONES ACTIVE
The number of active zones.

Example 3: The MODIFY DISPLAY DNS ZONES command supplies zone summary information for all name servers that are managed by the automated domain name registration application.

<table>
<thead>
<tr>
<th>DNS LABEL</th>
<th>DNS STATUS</th>
<th>ZONE LABEL</th>
<th>ZONE STATUS</th>

</table>

3 of 3 RECORDS DISPLAYED

DNS LABEL
The DNS label configured in the automated domain name registration application configuration file on the dns statement.

DNS STATUS
The DNS server status.

ZONE LABEL
The zone label configured in the automated domain name registration application configuration file using the zone parameter on the dns statement.

ZONE STATUS
The status of the zone. The following list shows the possible values:

- **DELETED**
  The zone managed by the automated domain name registration application has been terminated.

- **DELETING**
  The zone managed by the automated domain name registration application is being terminated. A zone delete is in progress.

- **INITIAL**
  The automated domain name registration application has not yet started managing data for the zone. This occurs while the automated domain name registration application is initializing, or shortly after dynamic reconfiguration has begun.

- **NOT_RESPONSIVE_ZONE_UPDATE_PENDING**
  The zone managed by the automated domain name registration application is not responsive. Dynamic update probes are periodically sent to the zone in this state until one is successful.

- **NOT_RESPONSIVE_ZONE_XFER_PENDING**
  The zone managed by the automated domain name registration application is not responsive. A zone transfer is in progress.
**RESYNCH_ZONE_UPDATE_PENDING**

The zone managed by the automated domain name registration application is being resynchronized. A zone update is in progress. Resynchronization occurs during initialization or dynamic reconfiguration of the automated domain name registration application.

**RESYNCH_RECONCILE_PENDING**

The zone managed by the automated domain name registration application is being resynchronized. A reconcile of the zone is in progress. Resynchronization occurs during initialization or dynamic reconfiguration of the automated domain name registration application. A zone can remain in this state indefinitely if one of the following condition is true:

- The GWM is not active
- No groups are defined to the automated domain name registration application
- No groups reference the zone

**RESYNCH_ZONE_XFER_PENDING**

The zone managed by the automated domain name registration application is being resynchronized. A zone transfer is in progress. Resynchronization occurs during initialization or dynamic reconfiguration of the automated domain name registration application.

**SHUTTING_DOWN**

The automated domain name registration application is terminating.

**SYNCHRONIZED**

The automated domain name registration application is in synch with the name server and is able to update the zone.

**Example 4**: The MODIFY DISPLAY DNS ZONES DETAIL command supplies zone detail information about all name servers that are managed by the automated domain name registration application.

```
DNS LABEL
The DNS label configured in the automated domain name registration application configuration file on the dns statement.

DNS STATUS
The DNS server status.

DNS IPADDR..PORT
The remote IP address and port of the name server.

ZONES DEFINED
The number of zones defined using the zone parameter on the dns statement.

ZONES ACTIVE
The number of active zones.

ZONE LABEL
The zone label configured in the automated domain name registration application configuration file using the zone parameter on the dns statement.

ZONE STATUS
The status of the zone. The following list shows the possible values:

DELETED
The zone managed by the automated domain name registration application has been terminated.

DELETING
The zone managed by the automated domain name registration application is being terminated. A zone delete is in progress.

INITIAL
The automated domain name registration application has not yet started managing data for the zone. This occurs while the automated domain name registration application is initializing, or shortly after dynamic reconfiguration has begun.

NOT_RESPONSIVE_ZONE_UPDATE_PENDING
The zone managed by the automated domain name registration application is not responsive. A zone update is in progress.

NOT_RESPONSIVE_ZONE_XFER_PENDING
The zone managed by the automated domain name registration application is not responsive. A zone transfer is in progress.

RESYNCH_ZONE_UPDATE_PENDING
The zone managed by the automated domain name registration application is being resynchronized. A zone update is in progress. Resynchronization occurs during initialization or dynamic reconfiguration of the automated domain name registration application.
RESYNCH_RECONCILE_PENDING
The zone managed by the automated domain name registration application is being resynchronized. A reconcile of the zone is in progress. Resynchronization occurs during initialization or dynamic reconfiguration of the automated domain name registration application. A zone can remain in this state indefinitely if one of the following condition is true:

- The GWM is not active
- No groups are defined to ADNR
- No groups reference the zone

RESYNCH_ZONE_XFER_PENDING
The zone managed by the automated domain name registration application is being resynchronized. A zone transfer is in progress. Resynchronization occurs during initialization or dynamic reconfiguration of the automated domain name registration application.

SHUTTING_DOWN
The automated domain name registration application is terminating.

SYNCHRONIZED
The automated domain name registration application is synchronized with the name server and is able to update the zone.

DOMAIN SUFFIX
The domain suffix of the zone for which the name server is authoritative.

ZONE TIMESTAMP
The timestamp in UTC format specifying when the DNS server reached the status indicated by the ZONE STATUS value.

TSIG FLAGS
An indication of whether DNS transactions are signed. The following list shows the possible flag values:

TRANSFER
DNS transfers are signed.

UPDATE
DNS updates are signed.

If no flags are displayed, then DNS transactions are not signed.

DNS RR LABEL
The DNS resource record label.

DNS RR STATUS
The DNS resource record status. The following list shows the possible status values:

NOT_PRESENT
The DNS resource record is not currently present in the name server. This indicates that the host or application is not available for one of the following reasons:

- The IP address was not found by the GWM.
- The IP address was found by the GWM but an application was not found to be listening on the specific port.
- The host or application has been quiesced.

PRESENT
The DNS resource record is currently present in the name server. This indicates that the host or application is available.

UPDATE-ADD_IN_PROGRESS
The DNS resource record is being added to the name server.

UPDATE-DEL_IN_PROGRESS
The DNS resource record is being deleted from the name server.
The DNS resource record is being replaced as a result of a TTL change.

**TTL**
The time to live value in seconds associated with this DNS record in the name server.

**CLASS**
The DNS record class always has the value INTERNET, which is abbreviated as IN.

**TYPE**
The DNS record type. Possible values are:

- **A**
  Designates IPv4.

- **AAAA**
  Designates IPv6.

**RDATA**
The DNS record data.

- RDATA is an IPv4 address when TYPE is A.
- RDATA is an IPv6 address when TYPE is AAAA.

**GWM LABEL**
The GWM label configured in the automated domain name registration application configuration file on the gwm statement.

**GROUP LABEL**
The group label configured in the automated domain name registration application configuration file on the host_group statement or the server_group statement.

**LAST UPDATE**
The timestamp, in UTC format, specifying the most recent update by ADNR for this DNS record; N/A is displayed if ADNR has never sent an update for this record to the name server.

**Example 5**
The MODIFY DISPLAY GWM command summarizes the state of the GWM.

```
F ADNR,DIS,GWM
E2D12541  GWM SUMMARY
GWM_LABEL           : GWM1
GWM_STATUS           : GWM_ACTIVE
1 of 1 RECORDS DISPLAYED
```

**GWM LABEL**
The GWM label configured in the automated domain name registration application configuration file on the gwm statement.

**GWM STATUS**
The status of the GWM advising the automated domain name registration application. Possible values are:

- **CONNECTED**
  The automated domain name registration application is connected to the GWM.

- **CONVERGENCE_PENDING**
  The automated domain name registration application is waiting a fixed period of time for information about all configured groups to be returned from the GWM.

- **DISCONNECTED**
  The automated domain name registration application is not connected to the GWM.

- **GETWEIGHTS_RSP_PENDING**
  The automated domain name registration application is waiting for a SASP GetWeights response message from the GWM.

- **GWM_ACTIVE**
  The state of the GWM after it has exited the CONVERGENCE_PENDING state. This is the normal steady state of the GWM. When the GWM is in this state, all changes in the status of any
configured group are received by the automated domain name registration application and forwarded to the appropriate name servers. The GWM remains in this state until there is a configuration change or until either the GWM or the ADNR application is stopped.

**PRE_REG_DEREGISTRATION_RSP_PENDING**
The automated domain name registration application is waiting for a SASP DeRegistration response message from the GWM as a result of GWM communication initialization.

**REGISTRATION_RSP_PENDING**
The automated domain name registration application is waiting for a SASP Registration response message from the GWM.

**SETLBSTATE_RSP_PENDING**
The automated domain name registration application is waiting for a SASP SetLoadBalancerState response message from the GWM.

**SHUTTING_DOWN**
The automated domain name registration application is terminating.

**Example 6**
The MODIFY DISPLAY GWM DETAIL command provides details about the GWM.

```
F ADNR,DIS,GWM,DETAIL
EZD1254I GWM DETAIL
GWM LABEL : GWM1
GWM STATUS : GWM_ACTIVE
GWM TIMESTAMP : 04/27/2005 12:32:01
GWM IPADDR..PORT: 10.81.1.1..3860
LOCAL IPADDR : 10.81.4.4
UUID : UUID1
UPDATE INTERVAL : 60
LAST UPDATE : 04/27/2005 01:05:03
1 of 1 RECORDS DISPLAYED
```

**GWM LABEL**
The GWM label configured in the automated domain name registration application configuration file on the gwm statement.

**GWM STATUS**
The status of the GWM advising the automated domain name registration application. Possible values are:

- **CONNECTED**
The automated domain name registration application is connected to the GWM.

- **CONVERGENCE_PENDING**
The automated domain name registration application is waiting a fixed period of time for information about all configured groups to be returned from the GWM.

- **DISCONNECTED**
The automated domain name registration application is not connected to the GWM.

- **GETWEIGHTS_RSP_PENDING**
The automated domain name registration application is waiting for a SASP GetWeights response message from the GWM.

- **GWM_ACTIVE**
The state of the GWM after it has exited the CONVERGENCE_PENDING state. This is the normal steady state of the GWM. When the GWM is in this state, all changes in the status of any configured group are received by the automated domain name registration application and forwarded to the appropriate name servers. The GWM remains in this state until there is a configuration change or until either the GWM or the automated domain name registration application is stopped.

- **PRE_REG_DEREGISTRATION_RSP_PENDING**
The automated domain name registration application is waiting for a SASP DeRegistration response message from the GWM as a result of GWM communication initialization.
REGISTRATION_RSP_PENDING
The automated domain name registration application is waiting for a SASP Registration response message from the GWM.

SETLBSTATE_RSP_PENDING
The automated domain name registration application is waiting for a SASP SetLoadBalancerState response message from the GWM.

SHUTTING_DOWN
The automated domain name registration application is terminating.

GWM_TIMESTAMP
The timestamp in UTC format specifying when the GWM reached the status indicated by the GWM STATUS value.

GWM_IPADDR..PORT
The remote IP address and port of the GWM.

LOCAL_IPADDR
The local IP address that the automated domain name registration application used to connect to the GWM.

UUID
The universally unique identifier that the automated domain name registration application used to connect to the GWM.

UPDATE_INTERVAL
The GWM’s update interval in seconds. See the appropriate GWM documentation for more information.

LAST_UPDATE
The timestamp, in UTC format, specifying the most recent update (SASP SendWeights message) received from the GWM; N/A is displayed if the GWM has not sent the automated domain name registration application an update since the connection to the GWM became active.

Example 7: The MODIFY DISPLAY GWM GROUPS command supplies group summary information about the GWM.

```
F ADNR,DIS,GWM,GROUPS
EZD1254I GWM GROUP SUMMARY
GWM_LABEL : GWM1
GWM_STATUS : GWM_ACTIVE
GROUP_LABEL : FTP_GROUP
GROUP_NAME : FTP.ZONE2.MYCORP.COM
GROUP_LABEL : HOST_GROUP
GROUP_NAME : HOST7.ZONE7.MYCORP.COM
2 of 2 RECORDS DISPLAYED
```

GWM_LABEL
The GWM label configured in the automated domain name registration application configuration file on the gwm statement.

GWM_STATUS
The status of the GWM advising the automated domain name registration application. Possible values are:

CONNECTED
The automated domain name registration application is connected to the GWM.

CONVERGENCE_PENDING
The automated domain name registration application is waiting a fixed period of time for information about all configured groups to be returned from the GWM.

DISCONNECTED
The automated domain name registration application is not connected to the GWM.

GETWEIGHTS_RSP_PENDING
The automated domain name registration application is waiting for a SASP GetWeights response message from the GWM.
**GWM_ACTIVE**
The state of the GWM after it has exited the CONVERGENCE_PENDING state. This is the normal steady state of the GWM. When the GWM is in this state, all changes in the status of any configured group are received by the automated domain name registration application and forwarded to the appropriate name servers. The GWM remains in this state until there is a configuration change or until either the GWM or the automated domain name registration application is stopped.

**PRE_REG_DEREGISTRATION_RSP_PENDING**
The automated domain name registration application is waiting for a SASP DeRegistration response message from the GWM as a result of GWM communication initialization.

**REGISTRATION_RSP_PENDING**
The automated domain name registration application is waiting for a SASP Registration response message from the GWM.

**SETLBSTATE_RSP_PENDING**
The automated domain name registration application is waiting for a SASP SetLoadBalancerState response message from the GWM.

**SHUTTING_DOWN**
The automated domain name registration application is terminating.

**GROUP LABEL**
The group label configured in the automated domain name registration application configuration file on the host_group statement or on the server_group statement.

**GROUP NAME**
The group name registered with the GWM. The group name is defined in the automated domain name registration application configuration file using the host_group_name parameter on the host_group statement or the server_group_name parameter on the server_group statement concatenated to the domain_suffix of the zone identified by the dns and zone parameters on the host_group statement or the server_group statement.

**Example 8:** The MODIFY DISPLAY GWM GROUPS DETAIL command supplies group detail information about the GWM.

```
F ADNR,DIS,GWM,GROUPS,DETAIL
EZD1254I GWM GROUP DETAIL

```
GWM LABEL
The GWM label configured in the automated domain name registration application configuration file on the gwm statement.

GWM STATUS
The status of the GWM advising the automated domain name registration application. Possible values are:

CONNECTED
The automated domain name registration application is connected to the GWM specified.

CONVERGENCE_PENDING
The automated domain name registration application is waiting a fixed period of time for information about all configured groups to be returned from the GWM.

DISCONNECTED
The automated domain name registration application is not connected to the GWM.

GETWEIGHTS_RSP_PENDING
The automated domain name registration application is waiting for a SASP GetWeights response message from the GWM.

GWM_ACTIVE
The state of the GWM after it has exited the CONVERGENCE_PENDING state. This is the normal steady state of the GWM. When the GWM is in this state, all changes in the status of any configured group are received by the automated domain name registration application and forwarded to the appropriate name servers. The GWM remains in this state until there is a configuration change or until either the GWM or the automated domain name registration application is stopped.

PRE_REG_DEREGISTRATION_RSP_PENDING
The automated domain name registration application is waiting for a SASP DeRegistration response message from the GWM as a result of GWM communication initialization.

REGISTRATION_RSP_PENDING
The automated domain name registration application is waiting for a SASP Registration response message from the GWM.

SETLBSTATE_RSP_PENDING
The automated domain name registration application is waiting for a SASP SetLoadBalancerState response message from the GWM.

SHUTTING_DOWN
The automated domain name registration application is terminating.

GWM TIMESTAMP
The timestamp in UTC format specifying when the GWM reached the status indicated by GWM STATUS.

GWM IPADDR..PORT
The remote IP address and port of the GWM.

LOCAL IPADDR
The local IP address that the automated domain name registration application used to connect to the GWM.
**UUID**

The universally unique identifier that the automated domain name registration application used to connect to the GWM.

**UPDATE INTERVAL**

The GWM’s update interval in seconds. See the appropriate GWM documentation for more information.

**LAST UPDATE**

The timestamp in UTC format specifying the most recent update (SASP SendWeights message) received from the GWM.

**GROUP LABEL**

The group label configured in the automated domain name registration application configuration file on the host_group statement or on the server_group statement.

**GROUP NAME**

The group name registered with the GWM. The group name is defined in the automated domain name registration application configuration file using the host_group_name parameter on the host_group statement or the server_group_name parameter on the server_group statement concatenated to the domain_suffix of the zone identified by the dns and zone parameters on the host_group statement or the server_group statement.

**GROUP TYPE**

The group type. Possible values are:

- **HOST**
  
  Indicates a host group.

- **SERVER**
  
  Indicates a server group.

**DNS LABEL**

The DNS label configured in the automated domain name registration application configuration file on the dns statement.

**ZONE LABEL**

The zone label configured in the automated domain name registration application configuration file using the zone parameter on the dns statement.

**MEMBER HOSTNAME**

The optional member hostname is defined in the automated domain name registration application configuration file using the member host_name parameter on the host_group statement or the server_name parameter on the server_group statement.

**IPADDR[..PORT]**

The IP address and port on which the application can be reached. The port is not displayed when the GROUP TYPE value is HOST.

**PROTOCOL**

The protocol the application is using. The protocol value is either TCP or UDP. The protocol is not displayed when GROUP TYPE is HOST.

**AVAIL**

Indicates whether or not the member is available in the sysplex.

**FLAGS**

Indicates which flags are currently set. Flag values are:

- **NOTARGETAPP**
  
  The GWM found the IP address but did not find an available server application using the IP address, port, and protocol. When the GWM is the z/OS Load Balancing Advisor, this can indicate that the application member has been quiesced by the Agent.

- **NOTARGETHOST**
  
  The GWM found the IP address but the host is not available. When the GWM is the z/OS Load Balancing Advisor, this indicates that the system member has been quiesced by the Agent.
NOTARGETSYS
The GWM did not find the IP address.

No flags are displayed when the AVAIL value is YES.

UPDATE COUNT
The number of times the availability of this IP address, which is associated with the preceding MEMBER HOSTNAME value, has changed.

MODIFY command: Communications Server SMTP application (CSSMTP)

Use the MODIFY command to control the Communications Server SMTP (CSSMTP) application from the operator console. For descriptions of terms that are used in this section, see the CSSMTP information in z/OS Communications Server: IP Configuration Guide.

Format:

```
MODIFY procname, Display, CONFig
            IPlist, LOGlevel
            SPoolistatus, Summary
            Summary, ALL
            Summary, ALL, TKID= tkid
            TARgets, ADDR= ipAddress
            FLUSHretry, AGE= days
            TKID= tkid
            LOGlevel, LEVEL= logLevel
            REFRESH
            REFRESHIPlist
            REFRESHTargets
            RESume
            SUSpend, Immediate
            ,Delay
            ,Immediate
            USERexit, LEVEL= NONE
            VERSION2, VERSION3
```
**procname**
The member name of the cataloged procedure that is used to start the CSSMTP application.

**Display,CONFIG**
Display the CSSMTP application configuration and global values that are used for processing mail.

**Display,IPlist**
Display all target server IP addresses and their preferences that are used by CSSMTP. A target server is the resolved or configured IP addresses from TargetServer statements. See the TargetServer statement information in z/OS Communications Server: IP Configuration Reference for details about how the target server addresses are obtained.

**DISplay,LOGlevel**
Display CSSMTP active log levels.

**Display,SPoolstatus**
Display summary information for all tasks that are processing spool files for CSSMTP. You can use this display to determine the number of mail messages that are pending or you can use it on the long-retry queue for each spool file that is being processed. The summary option is the default for the MODIFY DISPLAY,SPoolstatus command.

**Tip:** Use this command to obtain the task ID to use on other modify commands that use task ID values as options.

**Display,SPoolstatus,Detail**
Display detailed information for all tasks that are not idle. The ALL option is the default for the MODIFY DISPLAY,SPoolstatus,Detail command.

**Display,SPoolstatus,Detail,TKID=tkid**
Display detailed information for this specific task that processes spool files for CSSMTP.

**Tip:** You can use the MODIFY DISPLAY,SPoolstatus,Detail command to obtain a valid TKID value.

**Display,TARgets[,ADDR=ipAddress]**
Display global and specific information about target servers. If the ADDR parameter is not specified, all configured target servers are displayed. If the ADDR parameter is specified, then the IP address value must match the IP address of an existing target server that is in use by CSSMTP.

**Tip:** You can use the MODIFY DISPLAY IPLIST command to obtain IP addresses for the list of target servers that are being used by CSSMTP.

**FLUSHRetry,TKID=tkid**
Initiate a request for the CSSMTP application to remove mail messages from the long retry queue, and send those mail messages to the list of target servers. If CSSMTP cannot send a mail message, that mail message becomes subject to long-term retry processing; if any mail message is not defined, it becomes an undeliverable mail message. For more information about undeliverable mail, see z/OS Communications Server: IP Configuration Guide.

A nonzero TKID (task ID) value requests that only the mail messages for the specified TKID value is flushed. A TKID value 0 requests that all mail messages in the long-retry queue be flushed.

**Tip:** You can use the MODIFY DISPLAY,SPoolstatus command to obtain a valid TKID value.

**FLUSHRetry,AGE=days**
Initiate a request for the CSSMTP application to remove the mail messages that are older than days days from the extended retry queue, and send those mail messages to the list of target servers. If CSSMTP cannot send a mail message, that message becomes an undeliverable mail message. To make this command effective, the target servers must be available. For details, see the information about extended retry mail in z/OS Communications Server: IP Configuration Reference and the information about undeliverable mail in z/OS Communications Server: IP Configuration Guide.

A days value of 0 specifies that all messages in the extended retry list are to be processed.

**Tip:** You can use the command to monitor the number of the mail messages in the extended retry list and the state of the target servers used by CSSMTP.
LOGlevel,LEVEL=logLevel
Change the CSSMTP application log level. The logLevel value specifies the log level. If a logLevel value is not specified, then the current log level remains in effect. See the LogLevel statement information in z/OS Communications Server: IP Configuration Reference for details about defining the CSSMTP application log level.

REFRESH
Initiate a dynamic reconfiguration using the configuration file that is defined at initialization. If a configuration error is detected during a dynamic refresh, the entire refresh is rejected, the error message is written to the log and console, and the CSSMTP application continues to run with the old configuration values.

Results:

• While the new configuration file is being processed, the existing log level is used, regardless of how it was set (using the last configuration file or with the MODIFY LOGLEVEL command). After the new configuration file has been successfully processed, the value that is specified on the LogLevel statement of the new configuration file takes effect. If the LogLevel statement is not specified in the new configuration file, the log level defaults to level 7 (ERROR, WARNING, and EVENT). If the new configuration file contains errors that cause it to be rejected, the log level that was in effect prior to the dynamic reconfiguration is used.

• If an update to the ExtWrtName statement is detected during a dynamic refresh, then the CSSMTP application continues to run with the old external writer name and a warning message is written to the log and console.

• If an update to the Translate statement is detected during a dynamic refresh, then the CSSMTP application continues to run with the old translate value and a warning message is written to the log and console.

• If an update to the ChkPointSizeLimit statement is detected during a dynamic refresh, then the CSSMTP application continues to run with the old ChkPointSizeLimit value and a warning message is written to the log and console.

• While the new configuration file is being processed, the existing UserExit value is used, regardless of how it was set (using the last configuration file or with the MODIFY USEREXIT command). After the new configuration file has been successfully processed, the value that is specified on the UserExit statement of the new configuration file takes effect when the next JES spool file is opened. If the new configuration file contains errors that cause it to be rejected, the UserExit value that was in effect prior to the dynamic reconfiguration is used.

• An update to the TargetServer statement can force CSSMTP to stop and restart connections on the affected IP addresses. If CSSMTP is in the process of sending a mail message on the affected IP address, the mail message is retried at another IP address or placed in the long retry queue. For more information about the TargetServer statement, see the TargetServer statement information in z/OS Communications Server: IP Configuration Reference.

REFRESHIPlist
Initiates a dynamic DNS refresh of the target that is identified by the configured TargetName or TargetMx parameter value. This parameter does not cause the configuration file to be reprocessed.

Result: If a TargetServer statement has TargetName or TargetMx parameters configured, new IP addresses might be resolved. If the IP address list is changed, CSSMTP might be forced to stop and restart connections on the affected IP addresses. If CSSMTP is in the process of sending a mail message on the affected IP address, the mail message is retried at another IP address or placed in the long retry queue.

REFRESHTargets
Reinitiates a connection to all target servers. The CSSMTP application can learn about any capability changes from the target servers.

Tip: This command causes all active connections to all target servers to be stopped and restarted; therefore, use this command only when there is a change in the network topology and no work is being done by the CSSMTP application because the command interrupts all active connections.
**Result:** If you issue this command while CSSMTP is in the process of sending a mail message on the connection, the mail message is retried at another IP address or placed in the long retry queue.

**RESume**
Resumes processing of any JES spool files whose processing was suspended with the MODIFY SUSPEND operator command.

**SUSpend,Immediate**
Suspends the reading of mail messages immediately for all active spool files. To resume this processing, issue the MODIFY RESUME operator command. The IMMediate option is the default for the MODIFY SUSPEND command.

**SUSpend,Delay**
Suspends the reading of any new spool files immediately but completes reading any spool files that are already in process. To resume reading of spool files, issue the MODIFY RESUME operator command.

**USERexit,LEVEL=userExitValue**
Change the CSSMTP application user exit value. The USERexit keyword can be set to NONE, VERSION2, or VERSION3. If a userExitValue parameter value is not specified, then the current user exit value remains in effect. See the USEREXIT statement information in z/OS Communications Server: IP Configuration Reference for details about how to define the CSSMTP application user exit value.

**Result:** The user exit value does not change until the next JES spool file is opened.

**Examples:**

**Example 1:** The MODIFY DISPLAY,LOGLEVEL command displays the current logging level that is being used by CSSMTP.

```
F CSSMTP,DISPLAY,LOGLEVEL
EZD1828I CSSMTP DISPLAY LOGLEVEL = 15
```

**Example 2:** The MODIFY DISPLAY,CONFIG command displays the current configuration that is being used by CSSMTP.

```

For definitions of statements and parameters that are obtained from configuration file, see the CSSMTP information in z/OS Communications Server: IP Configuration Reference.

CONFIGFILENAME
The configuration name from the CONFIG DD statement in the started procedure.

LOGFILENAME
The configured log file name from LOGFILE DD statement in the started procedure.

PID
The process ID.

LOGLEVEL
The logging level.

chkpoint
Indicates whether checkpointing is active.

WARM
Checkpointing was initiated using the CHKPOINT DD statement.

COLD
Checkpointing was initiated using the -f start option.

NONE
There was no CHKPOINT DD statement.

CONFIG CODEPAGE
The code page value specified on the CSSMTP_CODEPAGE_CONFIG statement or the default value.

TRANSLATE
The code page value that is configured on the Translate statement.

CHKPOINT FILENAME
The name of the configured checkpoint file, if a CHKPOINT DD statement is configured in the started procedure.

START OPTION TCPNAME
The TCP name that is passed on the -p start option or the value N/A if the -p start option is not used.

IPV6 ENABLED
Indicates whether IPV6 is supported.

EXTENDEDRETRY
Indicates whether extended retry processing is ACTIVE or INACTIVE.

ATSIGN
The hex value of the configured AtSign symbol.

Result: Code page IBM-1047 is always used for the CSSMTP display. The CSSMTP_CODEPAGE_CONFIG environment variable is not used for the display. The value displayed is the hex value that is defined in the IBM-1047 code page for the configured symbol.
The remaining values that are displayed are the values for the matching statement or parameter from the configuration file.

**Example 3:** The MODIFY DISPLAY,IPLIST command displays the IP address of the configured target servers from the TargetServer statement and TargetIp parameter, or it displays the resolved target server addresses from the TargetServer statement and TargetName parameter, that are being used by CSSMTP.

</table>

For definitions of terms that relate to this information, see the CSSMTP common terms information in z/OS Communications Server: IP Configuration Guide.

W
A writer JES task, if the JES spool file was generated by the IEBGENER utility.

D
A dest JES task, if the JES spool file was generated by the SMTPNOTE command or by the TSO Transmit (XMIT) command.

TKID
The task ID, which can be used to identify a specific task.

Tip: You can use the task ID in the MODIFY FLUSHRetry command and the MODIFY DISPLAY,SPOOLSTATUS,DETAIL,TKID=tkid command.

JOBNAME
The JES job name for this task. If the task is in the IDLE state, this is the name of the previous job.

STATE
This parameter can have one of the following values:

WAITS
The task is waiting because virtual storage is constrained.

READ
The task is reading a spool file.

IDLE
The task is waiting for a JES spool file to process.

ACTIVE
The task is actively waiting for all mail in the spool file to be processed.

WAIT
The task is waiting because no target server is active to receive mail.

SUPND
The task was suspended by the MODIFY SUSPEND command.

PEND
The number of mail messages that are waiting to be sent to target server.

LRT
The number of mail messages that are currently queued in the long-retry queue.

The MODIFY DISPLAY SPOOLSTATUS,DETAIL command displays detailed information for all tasks that are not in the IDLE state that are processing JES spool files.

<table>
<thead>
<tr>
<th>TKID</th>

158 z/OS Communications Server: IP System Administrator's Commands
The MODIFY DISPLAY SPOOLSTATUS,DETAIL command displays detailed information for all tasks that are not in the IDLE state that are processing JES spool files; in this example all state tasks are idle.

F CSSMTP,Display,Spoolstatus,detail
EZD1833I CSSMTP SPOOLSTATUS:
No non-idle TKIDs to display

The MODIFY DISPLAY SPOOLSTATUS,DETAIL,TKID=11 command displays detailed information for a specific TKID 11 task that is processing a spool file for the CSSMTP application.

F CSSMTP,DISPLAY,SPOOLSTATUS,DETAIL,TKID=11
EZD1833I CSSMTP SPOOLSTATUS:
TASK ACTVE    : WRITER     TKID    : 11
JOBNAME      : JOBNM532   JOBID    : STC00532
PEND         : 0          LRT      : 0
MAIL READ    : 25         UNDELIVERABLE: 0

The MODIFY DISPLAY SPOOLSTATUS,DETAIL,TKID=3 command displays detailed information for a specific TKID 3 task that is currently idle.

F CSSMTP,DISPLAY,SPOOLSTATUS,DETAIL,TKID=2
EZD1833I CSSMTP SPOOLSTATUS:
TASK IDLE     : WRITER     TKID    : 2
JOBNAME      : JOBNM32    JOBID    : STC00055
PEND         : 0          LRT      : 0
MAIL READ    : 2          UNDELIVERABLE: 1

TASK
The TASK parameter has the following fields:

state
Possible values are:

WAITS
The task is waiting because virtual storage is constrained.

READ
The task is reading a spool file.

IDLE
The task is waiting for a JES spool file to process.

ACTIVE
The task is actively waiting for all mail in the spool file to be processed.

WAIT
The task is waiting because no target server is active to receive mail.

SUPND
The task was suspended by the MODIFY SUSPEND command.

type task
Possible type task values are:

WRITER
This is a writer JES task if the JES spool file was generated by the IEBGENER utility.
DEST
This is a DEST JES task if the JES spool file was generated by the SMTPNOTE command or by the TSO Transmit (XMIT) command.

TKID
The task ID, which can be used to identify a specific task.

Tips:
• You can use the task ID in the MODIFY FLUSHRetry command and the MODIFY DISPLAY,SPOOLSTATUS,DETAIL,TKID=tkid command.
• You can use the task ID to identify log information that is in the log file. If the tkid value is 2, that TKID value is represented in the following example by the value :002.

08/01 07:10:20  CSSMTP  DEBUG  :002:mlJESThread:Message(0): ...

JOBNAME
The JES job name for this task. If the task is in the IDLE state, then this is the previous job name.

JOBID
This is the JES job ID for this task. If the task is in the IDLE state, then this is the previous job ID.

PEND
The number of mail messages that are waiting to be sent to a target server. If the task is in the IDLE state, then this value is always 0.

LRT
The number of mail messages that are currently in the long-retry queue. If the task is in the IDLE state, then this value is always 0.

MAIL READ
The total number of mail messages that have been read for the job. If the task is in the IDLE state, then this is the mail for the previous job.

UNDELIVERABLE
The total number of undeliverable mail messages for this job name. If the task is in IDLE state, then this value is the undeliverable count of the previous job.

Example 6: The MODIFY DISPLAY,TARGETS command displays the global and specific information that is related to sending email to target servers. For definitions of statements and parameters that are obtained from the configuration file, see the CSSMTP information in z/OS Communications Server: IP Configuration Reference.

F CSSMTP,DIS,TARGETS
EZD1831I CSSMTP TARGETS:
GLOBAL INFORMATION:
  MAIL SENT : 0  TOTAL RETRY : 0
  DEADLETTER: 0  CURRENT RETRY: 0
  UNDELIVER : 0
EXTENDED RETRY:
  CURRENT : 0  TOTAL : 0
TARGET SERVER 1.1.1.1
  STATE : ACTIVE
  ESMTP : YES  MESSAGE SIZE : 20000000
  STARTTLS : NO  MAIL ATTEMPTS: 24
  MAIL SENT : 24  CONNECT FAIL : 0
TARGET SERVER ::6
  STATE : ACTIVE
  ESMTP : YES  MESSAGE SIZE : 20000000
  STARTTLS : YES  MAIL ATTEMPTS: 30
  MAIL SENT : 30  CONNECT FAIL : 0

The following global target server information for this application is displayed:

MAIL SENT
Count of all mail messages that were processed successfully after all mail messages were sent.

TOTAL RETRY
Cumulative count of mail messages that have been in the long-retry state.
DEADLETTER
Cumulative count of all mail messages that were classified as dead letters.

CURRENT RETRY
Count of mail messages that are currently in the long-retry queue.

UNDELIVER
Count of all mail messages that were undeliverable.

EXTENDED RETRY
  CURRENT
  Count of mail messages currently in the extended retry directory while extended retry is active.
  TOTAL
  Cumulative count of mail messages that have been in the extended retry directory.

The following fields are displayed for each target server:

STATE
State of the target server.
  ACTIVE
  The target server is active.
  NOT USABLE
  This target server is not usable. For example, CSSMTP has lost connectivity to this target server.
  UNKNOWN
  This target server is new and its capabilities have not been learned at this time.

ESMTP
Type of target server. If the ESMTP value is YES, the target server type is ESMTP. If the ESMTP value is NO, the target server type is SMTP.

MESSAGE SIZE
The actual message size.
  • For ESMTP this value was obtained from the SIZE extension when the connection was made. The value 0 indicates that there is no predefined message size limit.
  • For SMTP, this value is the value that is configured for the MessageSize parameter of the TargetServer statement. For details, see the TargetServer statement information in z/OS Communications Server: IP Configuration Reference.

STARTTLS
Indicates that the target server has acknowledged that it is capable of establishing secure connections.
  • For ESMTP see the information that describes using Transport Layer Security TLS in z/OS Communications Server: IP Configuration Guide for details.
  • For SMTP this is always set to NO.

MAIL ATTEMPTS
The total number of mail messages that CSSMTP has sent or has attempted to send to the target server.

Tip: A single mail message operation can be attempted on multiple target servers.

MAIL SENT
The number of mail messages that were sent successfully for this target server.

Tip: A single mail message that contains multiple recipients can be sent successfully on multiple target servers.

CONNECT FAIL
Count of the number of SMTP connections that the application was unable to establish when it attempted to send mail to a target server.
Example 7: The MODIFY DISPLAY, TARGETS, ADDR=x.x.x.x command displays the global and specific information related to sending e-mail to a specific target server.

<table>
<thead>
<tr>
<th>F CSSMTP,DIS, TARGETS, ADDR=1.1.1.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>EZD1831I CSSMTP TARGETS:</td>
</tr>
<tr>
<td>GLOBAL INFORMATION:</td>
</tr>
<tr>
<td>MAIL SENT : 24</td>
</tr>
<tr>
<td>LONG RETRY : 0</td>
</tr>
<tr>
<td>DEADLETTER: 0</td>
</tr>
<tr>
<td>UNDELIVERABLE: 0</td>
</tr>
<tr>
<td>TARGET SERVER: 1.1.1.1</td>
</tr>
<tr>
<td>STATE : ACTIVE</td>
</tr>
<tr>
<td>ESMTP : YES</td>
</tr>
<tr>
<td>MESSAGE SIZE : 200000000</td>
</tr>
<tr>
<td>STARTTLS : NO</td>
</tr>
<tr>
<td>MAIL ATTEMPTS: 24</td>
</tr>
<tr>
<td>CONNECT FAIL : 0</td>
</tr>
</tbody>
</table>

Example 8: The MODIFY LOGLEVEL, LEVEL=15 command requests the CSSMTP application to change the logging level to 15. The EZD1809I message indicates that the logging level was updated successfully.

<table>
<thead>
<tr>
<th>F CSSMTP, LOGLEVEL, LEVEL=15</th>
</tr>
</thead>
<tbody>
<tr>
<td>EZD1809I CSSMTP1 MODIFY LOGLEVEL COMMAND COMPLETED : UPDATED</td>
</tr>
</tbody>
</table>

Example 9: The MODIFY REFRESH command requests that the CSSMTP application reprocess the configuration file. The following messages indicate that the configuration was updated successfully with no errors.

<table>
<thead>
<tr>
<th>F CSSMTP, REFRESH</th>
</tr>
</thead>
<tbody>
<tr>
<td>EZD1834I CSSMTP MODIFY COMMAND ACCEPTED</td>
</tr>
<tr>
<td>EZD1840I CSSMTP UPDATED CONFIGURATION</td>
</tr>
<tr>
<td>EZD1846I CSSMTP UPDATED TARGET SERVERS</td>
</tr>
<tr>
<td>EZD1848I CSSMTP MODIFY REFRESH COMMAND COMPLETED</td>
</tr>
</tbody>
</table>

Result: If an update to the TestMode value is detected during a dynamic refresh, the CSSMTP application continues to run with the old TestMode value and a warning message is written to the log and console.

Example 10: The MODIFY REFRESHIPLIST command requests that the CSSMTP application perform a dynamic DNS refresh of the TargetName or TargetMx field. The following messages indicate that the target server addresses were successfully updated.

<table>
<thead>
<tr>
<th>F CSSMTP, REFRESHIPLIST</th>
</tr>
</thead>
<tbody>
<tr>
<td>EZD1834I CSSMTP MODIFY COMMAND ACCEPTED</td>
</tr>
<tr>
<td>EZD1845I CSSMTP UPDATED TARGET SERVERS</td>
</tr>
<tr>
<td>EZD1842I CSSMTP MODIFY REFRESHIPLIST COMMAND COMPLETED</td>
</tr>
</tbody>
</table>

Example 11: The MODIFY FLUSHRETRY, TKID=0 command initiates a request to move all mail that is in the long-retry queue to the send queue.

The following messages indicate that all mail messages have been moved from the long-retry queue to the send queue.

<table>
<thead>
<tr>
<th>F CSSMTP, FLUSHRETRY, TKID=0</th>
</tr>
</thead>
<tbody>
<tr>
<td>EZD1834I CSSMTP MODIFY COMMAND ACCEPTED</td>
</tr>
<tr>
<td>EZD1810I CSSMTP MODIFY FLUSHRETRY, TKID=0 COMMAND COMPLETED</td>
</tr>
</tbody>
</table>

Example 12: The MODIFY FLUSHRETRY command initiates a request to move all mail for TKID 2 from the long-retry queue to the send queue.

The following messages indicate that all mail messages for TKID 2 have been moved from the long-retry queue to the send queue.

<table>
<thead>
<tr>
<th>F CSSMTP, FLUSHRETRY, TKID=2</th>
</tr>
</thead>
<tbody>
<tr>
<td>EZD1834I CSSMTP MODIFY COMMAND ACCEPTED</td>
</tr>
<tr>
<td>EZD1810I CSSMTP MODIFY FLUSHRETRY, TKID=2 COMMAND COMPLETED</td>
</tr>
</tbody>
</table>

Example 13: The MODIFY REFRESHTARGETS command reinitiates a connection to all target servers.

The following messages indicate that the CSSMTP application completed this request.

<table>
<thead>
<tr>
<th>F CSSMTP, REFRESHTARGETS</th>
</tr>
</thead>
<tbody>
<tr>
<td>EZD1834I CSSMTP MODIFY COMMAND ACCEPTED</td>
</tr>
<tr>
<td>EZD1821I CSSMTP ABLE TO USE TARGET SERVER 9.1.1.1</td>
</tr>
</tbody>
</table>
Example 14: The MODIFY RESUME command resumes processing of any JES spool files when processing was suspended using the MODIFY SUSPEND operator command.

The following messages indicate that the CSSMTP application will start processing any JES spool files.

```
F CSSMTP,RESUME
  EZD1834I CSSMTP MODIFY COMMAND ACCEPTED
  EZD1814I CSSMTP MODIFY RESUME COMMAND COMPLETED
```

Example 15: The MODIFY SUSPEND command suspends the reading of mail messages immediately for all JES spool files.

The following messages indicate that the CSSMTP application has suspended the processing of mail messages for all JES spool files.

```
F CSSMTP,SUSPEND
  EZD1834I CSSMTP MODIFY COMMAND ACCEPTED
  EZD1822I CSSMTP MODIFY SUSPEND IMMEDIATE COMMAND COMPLETED
```

Example 16: The MODIFY FLUSHRETRY,AGE=0 command initiates a request to move all the mails that are in the extended retry queue to the send queue.

The following messages indicate that all mail messages have been moved from the extended retry queue to the send queue.

```
F CSSMTP,FLUSHRETRY,AGE=0
  EZD1834I CSSMTP MODIFY COMMAND ACCEPTED
  EZD1823I CSSMTP MODIFY FLUSHRETRY,AGE=0 COMMAND COMPLETED
```

Example 17: The MODIFY FLUSHRETRY,AGE=2 command initiates a request to move all mail messages that have been in the extended retry queue for more than two days from the extended retry queue to the send queue.

The following messages indicate that all the extended retry mail messages that are older than two days have been moved from the extended retry queue to the send queue.

```
F CSSMTP,FLUSHRETRY,AGE=2
  EZD1834I CSSMTP MODIFY COMMAND ACCEPTED
  EZD1823I CSSMTP MODIFY FLUSHRETRY,AGE=2 COMMAND COMPLETED
```

MODIFY command: DCAS

Use the MODIFY command to control tracing after initialization is complete.

Format:

```
MODIFY F jobname,, DEBUG=debug_level
```

Parameters:

DEBUG

`debug_level`

Controls digital certificate access server (DCAS) general tracing. The `debug_level` value must be one of the following values:

0

Disables logging.

1

Specifies log error and warning messages.

2

Specifies log error, warning, and informational messages.
Specifies log error, warning, informational, and debug messages.

**MODIFY command: Defense Manager daemon**

Use the MODIFY command to control the Defense Manager (DM) functions from the operator console.

**Format:**

```
MODIFY procname,DISPLAY
```

```
MODIFY procname,REFRESH
```

```
MODIFY procname,FORCE_INACTIVE, stackname
```

**Parameters:**

**procname**
The member name of the cataloged procedure that is used to start the Defense Manager daemon (DMD).

**DISPLAY**
Displays configuration values that are currently being used by the DMD.

**REFRESH**
Indicates that the DMD configuration file should be reread. The file is treated as a complete replacement, so it must contain all necessary DMD configuration information. You cannot update all DMD parameters using this command. See the description for the parameters in the configuration file to find out which ones can be dynamically changed. You must include parameters that cannot be dynamically changed in the REFRESH configuration file if the daemon was started with a value for the parameter that was not the default value. See the Defense Manager daemon information in the z/OS Communications Server: IP Configuration Reference.

**FILE**
Indicates the name and location of the DMD configuration file that is to be read. The file is treated as a complete replacement so it must contain all necessary DMD configuration information. The file name must be a fully qualified z/OS UNIX file name or MVS data set name. A z/OS UNIX file name must be enclosed by single quotation marks ('). MVS data set names must begin with two forward slashes (//) and the data set name must be enclosed by single quotation marks ('). This option is valid only when specified with REFRESH.

**FORCE_INACTIVE ,stackname**
Forces the TCP/IP stack named stackname to become inactive with respect to defensive filters. All defensive filters for the stack are removed from DMD persistent memory and also from the stack itself. No additional defensive filters are added to the stack while it is in inactive mode. The stack does not have to be configured in the DMD configuration file in order for the FORCE_INACTIVE option to operate. If the stack is active and IP security is enabled, then any defensive filters in the stack are removed regardless of the DMD configuration status of the stack. Changes to the mode of the stack persist until the next time the MODIFY procname,REFRESH command is successfully issued. See the Defense Manager daemon information in the z/OS Communications Server: IP Configuration Reference.

**Examples:**
The following example displays the command and current configuration values.

```
f dmd,display
EZD1733I DISPLAY DMD CONFIGURATION
Defense Manager Configuration Settings
SyslogLevel = 7
DefensiveFilterDirectory = /var/dm/filters
DM Config for TCP/IP stack TCPCS
  Mode = Simulate
  MaxLifetime = 1440
  DefaultLogLimit = 100
  Exclude 192.168.1.3
  Exclude 192.168.1.10
```

The following example is the command output used to forcibly deactivate a stack with respect to the Defense Manager daemon (DMD).

```
F DMD,FORCE_INACTIVE,TCPCS
EZD1643I THE DEFENSIVE FILTER MODE FOR STACK TCPCS WAS SUCCESSFULLY FORCED TO INACTIVE
```

**MODIFY command: FTP**

Use the MODIFY command to start and stop tracing after initialization is complete. The MODIFY command for z/OS FTP has two keywords: one for general tracing (DEBug) and one for extended tracing (DUMP).

Only FTP sessions established after trace is active can be traced. When tracing is stopped, sessions currently connected to the server will continue to be traced; new FTP sessions will not be traced.

**Format:**
MODIFY jobname, DEBug = ( F

Parameters:

DEBug

Subcommand to begin general tracing. General tracing includes the following options:

?          Displays the status of the general traces.

Notes:

1 Prepend any option $yyy$ with X to turn off that trace.

Parameters:

DEBug

Subcommand to begin general tracing. General tracing includes the following options:

?          Displays the status of the general traces.
**Note:** The status of the trace is displayed as a response to all uses of the MODIFY DEBUG command. The ? allows you to obtain the status without making a change.

**ACC**
Displays the details of the login process.

**ALL**
Sets all of the trace points.

**Note:** Both the FSC and the SOC trace are set to level 1 when the ALL parameter is processed.

**BAS**
Sets a select group of traces that offer the best overall details without the intense tracing of some of the traces. This is equivalent to:

```
MODIFY jobname,DEBUG=(CMD,INT,FSC,SOC)
```

**CMD**
Shows each command and the parsing of the parameters for the command.

**FLO**
Shows the flow of control within FTP. It is useful to show which services of FTP are used for an FTP request.

**FSC(n)**
Shows details of the processing of the file services commands APPE, STOR, STOU, RETR, DELE, RNFR, and RNTO. This trace can be very intense and therefore it allows you to specify levels of granularity for the trace points. The level 1 tracing that is specified by entering FSC or FSC(1) is the level that is normally used unless more data is requested by TCP/IP service group. The variable n can be a number in the range 1 – 8.

**INT**
Shows the details of the initialization and termination of the FTP session.

**JES**
Shows details of the processing for JES requests, such as when SITE FILETYPE=JES is in effect.

**NONE**
Turn off all of the traces.

**PAR**
Shows details of the FTP command parser. It is useful for debugging problems in the handling of the command parameters.

**SEC**
The SEC trace shows the processing of security functions such as TLS and GSSAPI negotiations.

**SOC(n)**
Shows details of the processing during the setup of the interface between the FTP application and the network as well as details of the actual amounts of data that is processed. This trace can be very intense and therefore it allows you to specify levels of granularity for the trace points. The level 1 tracing that is specified by entering SOC or SOC(1) is the level normally used unless more data is requested by the TCP/IP service group. The variable n can be a number in the range 1 – 8.

**SQL**
Shows details of the processing for SQL requests, such as when SITE FILETYPE=SQL is in effect.

**UTL**
Shows the processing of utility functions such as CD and SITE.

**Xyyy**
Turns off an active option, where yyy is the option. For example: XUTL turns off the UTL option.

**DUMp**
Subcommand to begin extended tracing. Extended tracing includes the following options:

- ?
  Displays the status of the extended traces.
Specifies the number of a specific extended trace point that is to be activated in the FTP code. The number has a range of 1 – 99.

**ALL**
Activates all of the trace points.

**FSC**
Activates all of the extended trace points in the file services code. The numbers activated are 20 – 49.

**JES**
Activates all of the extended trace points in the JES services code. The numbers activated are 60–69.

**NONE**
Turns off all extended traces.

**SOC**
Activates all of the extended trace points in the network services code. The numbers activated are 50–59.

**SQL**
Activates all of the extended trace points in the SQL services code. The numbers activated are 70–79.

**Xyyy**
Turns off an active option, where yyy is the option. For example: XUTL turns off the UTL option.

**USERID(filter_name)**
Filter the trace for user IDs matching the filter_name pattern.

If the user ID matches the filter at the time the client logs in, then tracing options are set to the current value of the options. Otherwise, there are no tracing options set. The client might use the SITE command to set options after login if the initial ones are not appropriate. An example for the USERID filter is `MODIFY jobname,DUMP=(21,USERID(USER33))` which activates the dumpID 21 trace for a user if the user ID is USER33.

**IPADDR(filter)**
Filter the trace for IP addresses matching the filter pattern.

If the IP address matches the filter at the time the client connects, then tracing options will be set to the current value of the options. Otherwise, no tracing options will be set. The client might use the SITE command to set options after connect if the initial ones are not appropriate. An example of the IPADDR filter is `MODIFY jobname,DEBUG=(JES,IPADDR(9.67.113.57))` which will activate the JES trace for a client whose IP address is 9.67.113.57. Specify the filter address in dotted decimal format if the IP address is an IPv4 address. Indicate submasking by using a slash followed by a dotted decimal submask. For example, 192.48.32/255.255.255.0 will allow addresses from 192.48.32.00 to 192.48.32.255.

Specify the filter address for an IPv6 address as x:x:x:x:x:x:x:x, where the x's are the hexadecimal values of the eight 16-bit pieces of the address. Alternate notations described in RFC 2373 (IP Version 6 Addressing Architecture) are acceptable.

For example,

```
MODIFY jobname,DUMP=(FSC,IPADDR(:1))
```

Indicate IPv6 network prefixing using a slash followed by the number of prefix bits. For example, use 12AB:0:0:CD30::/60 to indicate the prefix 12AB00000000CD3 (hexadecimal).

```
MODIFY JOBNAME,DEBUG=(JES,IPADDR(12AB:0:0:CD30::/60))
```
• The specification of the trace on the MODIFY command is not additive. That is, the trace setting will be that of the last MODIFY command as shown in the following examples.

  - Using DEBug:

```
MODIFY FTPDJG1,DEBUG=(NONE)
+EZYFT82I Active traces: NONE
MODIFY FTPDJG1,DEBUG=(CMD)
+EZYFT82I Active traces: CMD
MODIFY FTPDJG1,DEBUG=(FSC,USERID(USER33))
+EZYFT82I Active traces: FSC(1)
+EZYFT89I Userid filter: USER33
MODIFY FTPDJG1,DEBUG=(SOC)
+EZYFT82I Active traces: SOC(1)
```

  - Using DUMP:

```
MODIFY FTPDJG1,DUMP=(NONE)
+EZYFT83I Active dumpIDs: NONE
MODIFY FTPDJG1,DUMP=(21)
+EZYFT83I Active dumpIDs: 21
MODIFY FTPDJG1,DUMP=(22)
+EZYFT83I Active dumpIDs: 22
```

• The DUMP keyword can be used as shown in the following example:

```
modify jobname,DUMP=(SQL,SOC) ;sets all SQL and SOC DUMP ID's
modify jobname,DUMP=(NONE) ;resets all DUMP ID's
modify jobname,DUMP=(Xnn) ;resets DUMP ID nn where nn is ;a number between 1 and 99
modify jobname,DUMP=(XFSC) ;resets all DUMP ID's 20 to 49
modify jobname,DUMP=(XSOC) ;resets all DUMP ID's 50 to 59
modify jobname,DUMP=(XJES) ;resets all DUMP ID's 60 to 69
modify jobname,DUMP=(XSQL) ;resets all DUMP ID's 70 to 79
modify jobname,DUMP=(NONE,JES,X61) ;resets all ID's and ;then sets all JES DUMP ID's ;except number 61
```

• The modify jobname, UTRACE command that was supported in releases prior to z/OS V1R2 is not supported in this release. However, its function can be replaced with the following pair of commands:

```
MODIFY jobname,DEBUG=(ALL,USERID(USER33))
MODIFY jobname,DUMP=(ALL,USERID(USER33))
```

Do not specify the ALL parameter on a routine basis, because it can produce an extensive amount of trace data.

• The modify jobname, NOTRACE command that was supported in releases prior to z/OS V1R2 is not supported in this release. If complete tracing was activated as suggested above, then the tracing can be stopped using the following pair of commands:

```
MODIFY jobname,DEBUG=(NONE)
MODIFY jobname,DUMP=(NONE)
```

**Context:**

For additional information see z/OS Communications Server: IP Diagnosis Guide.

**MODIFY command: IKE server**

You can use the operator console and the MODIFY command to control IKE server functions.

**Format:**
MODIFY procnamedisplay F

MODIFY procrefresh F 'FILE=filename'

Parameters:

procname
The member name of the cataloged procedure that is used to start the IKE server (IKED).

DISPLAY
Displays the configuration values that are currently being used by the IKE server.

REFRESH
Indicates that the IKE server configuration file should be reread. Not all IkeConfig parameters can be updated using this command. See the individual IkeConfig statement parameter descriptions for information about which parameters can be dynamically changed. See IkeConfig statement information in the z/OS Communications Server: IP Configuration Reference for details.

FILE
Indicates the name and location of the IKE server configuration file that is to be read. The filename value must be a fully qualified z/OS UNIX file name or an MVS data set name. You must enclose a z/OS UNIX file name in single quotation marks ('). MVS data set names must begin with two forward slashes (/) and you must enclose the data set name in single quotation marks ('). If the FILE parameter is omitted, the normal search order for locating the configuration data set or file applies. See the steps for configuring the IKE daemon in the z/OS Communications Server: IP Configuration Guide for information about the search order. This option is valid only when it is specified with the REFRESH parameter. If you omit this option, the IKE server rereads the configuration file with which it was started.

Examples:
The following example displays the configuration values that are currently being used by the IKE server.

f iked,display
EZD1158I DISPLAY IKE CONFIGURATION
DISPLAY IKE configuration parameters:
   Values loaded from /etc/security/iked.conf
   IkeSyslogLevel = 1
   PagentSyslogLevel = 0
   SMF119 = NONE
   Keyring = iked/keyring
   IkeRetries = 6
   IkeInitWait = 2
   FIPS140 = no
   Echo = no
   PagentWait = 0
   NssWaitLimit = 5
   NssWaitRetries = 3
   IKE configuration contains no SupportedCertAuth labels.
   NetworkSecurityServer = 10.81.5.5
   Port = 4159
   Identity = 10.81.5.5
   IKE configuration contains no NetworkSecurityServerBackup info.
   NssStackConfig 1: Stack = TPCCS2
      Client name = CLIENT2
      Userid name = USER1
      AuthBy = Password
      Cert Service: Enabled
      RemoteMgmtService: Enabled
MODIFY command: Network security services server

You can use the operator console and the MODIFY command to control the network security services (NSS) server functions.

**Format:**

```
MODIFY procname,DISPLAY
'-.URLCACHE-

MODIFY procname,REFRESH
',FILE= 'filename'
',FILE=/'filename'
```

**Parameters:**

**procname**

The member name of the cataloged procedure that is used to start the network security services daemon (NSSD).

**DISPLAY**

Displays configuration values that are currently being used by the NSS server.

**URLCACHE**

Displays the current contents of the URL cache instead of displaying the configuration information. For each URL that has data cached, this command displays the type of data (Cert, Bundle, or CRL), the expiration date and time of the cache entry, and the URL for which data is cached.

**REFRESH**

Indicates that the NSS server configuration file should be reread and any cached certificate URL data should be flushed. See the Network security services server information in z/OS Communications Server: IP Configuration Reference for more information.

**FILE**

Indicates the name and location of the network security services (NSS) server configuration file that is to be read. The `filename` value must be a fully qualified z/OS UNIX file name or an MVS data set name. You must enclose a z/OS UNIX file name in single quotation marks ('). MVS data set names must begin with two forward slashes (//) and you must enclose the data set name in single quotation marks ('). If the FILE parameter is omitted, the normal search order for locating the configuration data set or file applies. See the steps for configuring the NSS server in the z/OS Communications Server: IP Configuration Guide for information about the search order. This option is valid only when it is specified with the REFRESH parameter. If you omit this option, the NSS server rereads the configuration file with which it was started.

**Examples:**

The following example displays the configuration values that are currently being used by the NSS server.

```
f nssd,display
EZD1386I DISPLAY NSS CONFIGURATION
DISPLAY Network Security Server Configuration Parameters:
   Port     = 4159
   SyslogLevel = 255     (0x00ff)
   KeyRing   = "nssd/keyring"
   Discipline IPSec = Enabled
   Discipline XMLAppliance = Enabled
   IPSec Discipline Configuration Parameters:
      FIPS140   = No
      URLCacheInterval = 10080
   There are 2 CertificateURL and CertificateBundleURL entries:
      Type             Label                            URL
.....................................................................
```

Operator commands and system administration  171
The following example displays the current URL cache information.

```
f nssd,display,urlcache

EZD1389I DISPLAY NSS URLCACHE:
URL Cache:
Type   Expiration          URL
------ ------------------- -------------------------
CRL    2010/02/04 12:48:12 HTTP://EXAMPLE.COM:80/crl.der
Cert   2010/02/04 12:50:36 HTTP://EXAMPLE.COM:80/cert2.der
2 URL Cache entries displayed.
```

**MODIFY command: OMPROUTE**

You can control OMPROUTE from the operator console using the MODIFY command.

**Format:**

```
MODIFY procname -> KILL, RECONFIG

ROUTE-SA= ENABLE, DISABLE

TRACE= trace_level
DEBUG= debug_level
TRACE6= trace6_level
DEBUG6= debug6_level
SADEBUG= sdebug_level

OSPF options
```
LSA command

[].LSA — LSTYPE= ls_type — LSID=lsid — ORIGINator=ad_router — ,AREAS

RIP options

%.LIST — ,ALL

.INTERFACE

.INTERFACE

.INTERFACE

.GENERIC options

%.LIST — ,ALL

.INTERFACE

.IPv6 OSPF options

%.LIST — ,ALL

.INTERFACE

.INTERFACE
The name of the member in a procedure library that was used to start OMPROUTE.

Parameters:

**procname**

The name of the member in a procedure library that was used to start OMPROUTE.
OPTIONS
Specifies that the global configuration options information is to be displayed.

KILL
Stop the OMPROUTE function.

RECONFIG
Reread the OMPROUTE configuration file. This command ignores all statements in the configuration file except new OSPF_Interface, RIP_Interface, Interface, IPv6_RIP_Interface, and IPv6_Interface statements.

Rule: If you do not have GLOBAL_OPTIONS IGNORE_UNDEFINED_INTERFACES=YES coded in your OMPROUTE configuration, these new configuration statements must be reread from the configuration file by using this command before the interface is first configured to the TCP/IP stack. If you have coded GLOBAL_OPTIONS IGNORE_UNDEFINED_INTERFACES=YES in your OMPROUTE configuration file, you can use OMPROUTE reconfiguration to add a definition for an interface that has been defined to the stack but that is ignored by OMPROUTE. However, OMPROUTE does not associate the interface with the new definition until the interface has been deleted from the stack and then re-added.

ROUTESA=ENABLE|DISABLE
Enable or disable the OMPROUTE subagent.

Note: To change any other value on the ROUTESA_CONFIG statement, the OMPROUTE application must be recycled.

TRACE=trace_level
Start, stop, or change the level of OMPROUTE tracing for initialization and IPv4 routing protocols. The different trace levels available and their descriptions are as follows:

TRACE=0
Turns off OMPROUTE tracing.

TRACE=1
Gives all the informational messages.

TRACE=2
Gives the informational messages plus formatted packet tracing.

Attention: OMPROUTE tracing affects OMPROUTE performance and might require increasing the Dead_Router_Interval on OSPF interfaces to keep neighbor adjacencies from collapsing.

DEBUG=debug_level
Level of debugging for OMPROUTE to use for initialization and IPv4 routing protocols. The following values are valid:

• DEBUG=0 turns off OMPROUTE IPv4 and initialization debugging.
• DEBUG=1 provides internal debug messages.
• DEBUG=2 provides the same information as DEBUG=1 plus hexadecimal packet tracing.
• DEBUG=3 provides the same information as DEBUG=2 plus module entry and exit.
• DEBUG=4 provides the same information as DEBUG=3 plus task add and run.

TRACE6=trace6_level
Start, stop, or change the level of OMPROUTE tracing for IPv6 routing protocols. The different trace levels available and their descriptions are as follows:

TRACE6=0
Turns off OMPROUTE tracing.

TRACE6=1
Gives all the informational messages.

TRACE6=2
Gives the informational messages plus formatted packet tracing.
Attention: OMPROUTE tracing affects OMPROUTE performance and might require increasing the Dead_Router_Interval on OSPF interfaces to keep neighbor adjacencies from collapsing.

**DEBUG6=debug6_level**
Level of debugging for OMPROUTE to use for IPv6 routing protocols. The following values are valid:
- DEBUG=0 turns off OMPROUTE IPv4 and initialization debugging.
- DEBUG=1 provides internal debug messages.
- DEBUG=2 provides the same information as DEBUG=1 plus hexadecimal packet tracing.
- DEBUG=3 provides the same information as DEBUG=2 plus module entry and exit.
- DEBUG=4 provides the same information as DEBUG=3 plus task add and run.

**SADEBUG=saddebug_level**
Level of debugging for OMPROUTE subagent to use.

**OSPF**
Specifies that OSPF information is to be displayed.

**LIST**
Specifies that OSPF information is to be displayed as defined in the OMPROUTE configuration file.

- **ALL**
  Displays a comprehensive list of all configuration information.

- **AREAS**
  Displays all information concerning configured OSPF areas and their associated ranges.

- **Interface**
  Displays, for each OSPF interface, the IP address and configured parameters as coded in the OMPROUTE configuration file.

- **NBMA**
  Displays the interface address and polling interval related to interfaces connected to non-broadcast multi-access networks.

- **NeighBoRS**
  Displays the configured neighbors on non-broadcast networks.

- **VLINKS**
  Displays all virtual links that have been configured with this router as the endpoint.

**LSA**
Displays the contents of a single link state advertisement contained in the OSPF database.

- A link state advertisement is defined by its
  - Link state type (**LTYPE=ls_type**)
  - Link state ID (**LSID=lsid**)
  - Advertising router (**ORIGINator=ad_router**).

There is a separate link state database for each OSPF area. **AREAID=area_id** on the command line tells the software which database you want to search. The different kinds of advertisements, which depend on the value given for link-state-type, are:

- **Router links (LTYPE=1)**
  Describe the collected states of a router interface attached to a router.

- **Network links (LTYPE=2)**
  Describe the set of routers attached to a network.

- **Summary link, IP network (LTYPE=3)**
  Describe interarea routes to networks.

- **Summary link, ASBR (LTYPE=4)**
  Describe interarea routes to AS boundary routers.

- **AS external link (LTYPE=5)**
  Describe routes to destinations external to the Autonomous System.
Note: The ORIGINATOR needs to be specified only for link-state-types three, four, and five. The AREAID value needs to be specified for all link-state-types except five.

Link State IDs, originators (specified by their router IDs), and area IDs take the same format as IP addresses. For example, the backbone area can be entered as 0.0.0.0

AREASUM
Displays the statistics and parameters for all OSPF areas attached to the router.

EXTERNAL
Displays the AS external advertisements belonging to the OSPF routing domain. One line is printed for each advertisement.

DATABASE,AREAID=area_id
Displays a description of the contents of a particular OSPF area link state database. AS external advertisements are omitted from the display. A single line is printed for each advertisement. If AREAID is not specified, the database from area 0.0.0.0 will be displayed.

DBSIZE
Displays the number of LSAs currently in the link state database, categorized by type

Interface,NAME=if_name
Displays current, run-time statistics and parameters related to OSPF interfaces. If a NAME=if_name parameter is omitted, a single line is printed summarizing each interface. If a NAME=if_name parameter is specified, detailed statistics for that interface will be displayed.

ACTIVATE
Activate an OSPF interface that is in suspend state to allow adjacency formations with neighbors over this interface. This parameter is not applicable for static and dynamic VIPA interfaces. If this is a LAN interface and there is another alternate redundant interface on this same LAN segment that is the primary OSPF interface, this interface becomes a backup interface. This command does not force the activated interface to take over or resume the primary OSPF interface role for the LAN segment.

SUSPEND
Suspend an active OSPF interface that is not in DOWN or SUSPEND state so that adjacency formations with neighbors over this interface are stopped or not allowed. This forces adjacency attempts with neighbors over an alternate redundant interface if this is a LAN interface and an alternate interface is available. Existing connections that use static routes over the suspended interface are not disrupted. This parameter is not applicable for static and dynamic VIPA interfaces. If a TCP/IP stack is recycled while an interface is in suspended state, the interface state is reset after the recycle.

NeighBoR,IPADDR=ip_addr
Displays the statistics and parameters related to OSPF neighbors. If an IPADDR=ip_addr parameter is omitted, a single line is printed summarizing each neighbor. If an IPADDR=ip_addr parameter is given, detailed statistics for that neighbor are displayed.

ROUTERS
Displays all routes to other routers that have been calculated by OSPF and are currently present in the routing table.

STATiStics
Displays statistics generated by the OSPF routing protocol. The statistics indicate how well the implementation is performing, including its memory and network utilization. Many of the fields displayed are confirmation of the OSPF configuration.

WEIGHT
Dynamically change the cost of an OSPF interface. This new cost is flooded quickly throughout the OSPF routing domain, and modifies the routing immediately.

The cost of the interface reverts to its configured value whenever OMPROUTE is restarted. To make the cost change permanent, you must reconfigure the appropriate OSPF interface in the configuration file. This command can be issued only for an OSPF interface that is active in the TCP/IP stack.
NAME=name
   Name of the OSPF interface the new cost affects.

COST=cost
   New cost value for the OSPF interface.

RIP
   Specifies that RIP information is to be displayed.

LIST
   Specifies that RIP information is to be displayed as defined in the OMPROUTE configuration file.

   ALL
   Display all RIP-related configuration information.

InterFaceS
   Display IP addresses and configured parameters for each RIP interface.

ACCEPTED
   Displays the routes to be unconditionally accepted, as configured with the ACCEPT_RIP_ROUTE statement.

InterFace,NAME=if_name
   Displays statistics and parameters related to RIP interfaces. If a NAME=if_name parameter is omitted, a single line is printed summarizing each interface. If a NAME=if_name parameter is given, detailed statistics for the specified interface (if_name) are displayed.

FILTERS
   Displays the Global RIP filters.

GENERIC
   Specifies that IPv4 information not related to a specific routing protocol is to be displayed.

LIST
   Specifies that information is to be displayed as defined in the OMPROUTE configuration file.

   ALL
   Displays all IPv4 information that is not related to a specific routing protocol.

InterFaceS
   Lists all generic IPv4 interfaces that are defined to OMPROUTE using INTERFACE statements.

InterFace
   Displays statistics and parameters related to IPv4 generic interfaces that are known to TCP/IP.

RTTABLE
   Displays routes in an OMPROUTE IPv4 routing table. If this option is used without the PRtable option, the routes that are displayed are from the main routing table.

   DEST=ip_addr
   Displays the routes to a particular destination. When multiple equal-cost routes exist, use this option to obtain a list of the next hops. You cannot use this option with the DELETED option.

PRtable=ALL
   Displays routes in all of the OMPROUTE IPv4 policy-based routing tables. The dynamic routing parameters configured to the Policy Agent for a table are displayed following the routes for the table.

PRtable=prname
   Displays routes in the specified OMPROUTE IPv4 policy-based routing table. The dynamic routing parameters configured to the Policy Agent for the table are displayed following the routes for the table.

DELETED
   Displays information about routes that have been deleted from the OMPROUTE routing table and that have not been replaced. You cannot use this option with the DEST=ip_addr option.

Results:
• If the RIP protocol is running, deleted routes are displayable for only 3 minutes after deletion. After 3 minutes have elapsed they are garbage collected by RIP and are no longer displayable.
• If a policy-based routing table is configured to the Policy Agent with no IPv4 dynamic routing parameters, OMPROUTE has no knowledge of that routing table for IPv4. The routing table does not appear in the display of OMPROUTE IPv4 routing tables. The routing table does not appear in the display of OMPROUTE routing tables.
• Only active policy-based routing tables appear in the display of OMPROUTE routing tables. A policy-based routing table is active if it is referenced by an active routing rule and its associated action.
• This option displays the contents of the working tables that are used by OMPROUTE; it does not display the TCP/IP routing tables. The OMPROUTE routing tables might contain information that is different from the information in the TCP/IP routing tables. For more information about displaying the contents of the TCP/IP routing tables, see “DISPLAY TCPIP,.NETSTAT” on page 9.

IPV6OSPF
Specifies that IPv6 OSPF information is to be displayed.

ALL
Displays a comprehensive list of IPv6 OSPF information.

AREASUM
Displays the statistics and parameters for all IPv6 OSPF areas attached to the router.

InterFace,NAME=if_name or InterFace,ID=if_id
Displays current, run-time statistics and parameters related to IPv6 OSPF interfaces. If the NAME= and ID= parameters are omitted, a single line is printed summarizing each interface. If the NAME= or ID= parameter is specified, detailed statistics for that interface will be displayed.

VLINK,ENDPT=router-id
Displays current, run-time statistics and parameters related to IPv6 OSPF virtual links. If the ENDPT= parameter is omitted, a single line is printed summarizing each virtual link. If the ENDPT= parameter is specified, detailed statistics for that virtual link will be displayed.

NeighBoR,ID=router-id,IFNAME=if_name
Displays the statistics and parameters related to IPv6 OSPF neighbors.

• If the ID= parameter is omitted, a single line is printed summarizing each neighbor.
• If the ID= parameter is given, detailed statistics for that neighbor are displayed.
• If the neighbor specified by the ID= parameter has more than one neighbor relationship with OMPROUTE (for example if there are multiple IPv6 OSPF links connecting them), the IFNAME= parameter can be used to specify which link’s adjacency to examine (for an adjacency over a virtual link, specify IFNAME=*).

DBSIZE
Displays the number of LSAs currently in the IPv6 OSPF link state database, categorized by type.

LSA
Displays the contents of a single link state advertisement contained in the IPv6 OSPF database. A link state advertisement is defined by its:

• Link state type (LSTYPE=ls_type, where ls_type is one of the hexadecimal link state type values listed below).
• Link state ID (LSID=lsid).
• Advertising router (ORIGINator=ad_router).

Each interface has its own set of link LSAs (LSTYPE=0008). IFNAME=interface_name on the command line indicates which link's LSA you want to display.

There is also a separate link state database for each IPv6 OSPF area. AREAID=area_id on the command line indicates which database you want to search. If you do not specify which area to search, the backbone (0.0.0.0) area will be searched. The different kinds of advertisements, which depend on the value given for link state type, are:
Router LSA (LSTYPE=2001)
The complete collection describes the state and cost of the router's interfaces to the area. Each router in an area originates one or more Router LSAs.

Network LSA (LSTYPE=2002)
Originated by the Designated Router of each multiaccess link (i.e., LAN) in the area which supports two or more routers. Describes the set of routers attached to the link, including the Designated Router.

Inter-Area Prefix LSA (LSTYPE=2003)
Originated by an area border router. Describes the route to an IPv6 address prefix that belongs to another area.

Inter-Area Router LSA (LSTYPE=2004)
Originated by an area border router. Describes the route to an AS boundary router that belongs to another area.

AS External LSA (LSTYPE=4005)
Originated by an AS boundary router. Describes the route to a destination external to the IPv6 OSPF Autonomous System.

Link LSA (LSTYPE=0008)
Originated by routers for each link to which they are attached. Provides the router's link-local address, provides a list of IPv6 address prefixes for the link, and asserts a set of options for the Network LSA that will be originated for the link.

Intra-Area Prefix LSA (LSTYPE=2009)
Originated by routers to advertise one or more IPv6 address prefixes that are associated with the router itself, an attached stub network segment, or an attached transit network segment.

Requirements:
1. Specify the AREAID value for all link state types except AS External LSA.
   Note: The AREAID value defaults to the backbone (0.0.0.0) area if not specified.
2. Specify the IFNAME value for Link LSAs (LSTYPE=0008).
3. Originators (specified by their router IDs) and area IDs are specified in dotted-decimal format. For example, the backbone area is entered as 0.0.0.0.

EXTERNAL
Displays the AS external LSAs belonging to the IPv6 OSPF routing domain. One line is printed for each advertisement.

DATABASE,AREAID=area_id
Displays the contents of a particular IPv6 OSPF area link state database. AS external advertisements are omitted from the display. A single line is printed for each advertisement. If AREAID is not specified, the database from area 0.0.0.0 will be displayed.

ROUTERS
Displays all routes to other routers that have been calculated by IPv6 OSPF and are currently present in the routing table.

STATISTICS
Displays statistics generated by the IPv6 OSPF routing protocol. The statistics indicate how well the implementation is performing, including its memory and network utilization.

WEIGHT
Dynamically change the cost of an IPv6 OSPF interface. This new cost is flooded quickly throughout the IPv6 OSPF routing domain, and modifies the routing immediately. The cost of the interface reverts to its configured value whenever OMPROUTE is restarted. To make the cost change permanent, you must reconfigure the appropriate IPv6 OSPF interface in the OMPROUTE configuration file.

NAME=name
Name of the IPv6 OSPF interface the new cost affects.
COST=\texttt{cost}  
New cost value for the IPv6 OSPF interface.

\texttt{IPV6RIP}  
Specifies the IPv6 RIP information.

\texttt{ALL}  
Displays all IPv6 RIP-related information.

\texttt{ACCEPTED}  
Displays the routes to be unconditionally accepted, as configured with the \texttt{IPV6_ACCEPT_RIP\_ROUTE} statement.

\texttt{InterFace,NAME=if\_name}  
Displays statistics and parameters related to IPv6 RIP interfaces. If the \texttt{NAME=if\_name} parameter is omitted, a single line is printed summarizing each interface. If the \texttt{NAME=if\_name} parameter is given, detailed statistics for the specified interface (\texttt{if\_name}) are displayed.

\texttt{FILTERS}  
Displays the Global IPv6 RIP filters.

\texttt{GENERIC6}  
Specifies IPv6 information not related to a specific dynamic routing protocol.

\texttt{ALL}  
Displays all IPv6 information not related to a specific routing protocol.

\texttt{InterFace,NAME=if\_name}  
Displays statistics and parameters related to IPv6 generic interfaces that are known to TCP/IP or defined to OMPROUTE with IPv6\_INTERFACE statements. If the \texttt{NAME=if\_name} parameter is omitted, a single line is printed summarizing each interface. If the \texttt{NAME=if\_name} parameter is given, detailed statistics for the specified interface (\texttt{if\_name}) is displayed.

\texttt{RT6TABLE}  
Displays routes in an OMPROUTE IPv6 routing table. If this option is used without the PRtable option, the routes that are displayed are from the main routing table.

\texttt{DEST=ip\_addr/prefixlen}  
Displays information about a particular route. When multiple equal-cost routes exist, use this option to obtain a list of the next hops. You cannot use this option with the \texttt{DELETED} option.

\texttt{PRtable=ALL}  
Displays routes in all of the OMPROUTE IPv6 policy-based routing tables. The dynamic routing parameters that are configured to the policy agent for a table are displayed following the routes for the table.

\texttt{PRtable=prname}  
Displays routes in the specified OMPROUTE IPv6 policy-based routing table. The dynamic routing parameters that are configured to the policy agent for the table are displayed following the routes for the table.

\texttt{DELETED}  
Displays information about IPv6 routes that have been deleted from the OMPROUTE routing table and that have not been replaced. You cannot use this option with the \texttt{DEST=ip\_addr/prefixlen} option.

**Results:**

- If the RIP protocol is running, deleted routes are displayable for only 3 minutes after they are deleted. After 3 minutes have elapsed they are garbage collected by RIP and are no longer displayable.

- If a policy-based routing table is configured to the policy agent with no IPv6 dynamic routing parameters, OMPROUTE has no knowledge of that routing table for IPv6. The routing table is not included in the display of OMPROUTE IPv6 routing tables.
Only active policy-based routing tables are included in the display of OMPROUTE routing tables. A policy-based routing table is active if an active routing rule and its associated action reference the routing table.

This option displays the contents of the working tables that are used by OMPROUTE; it does not display the TCP/IP routing tables. The OMPROUTE routing tables might contain information that is different from the information in the TCP/IP routing tables. For more information about displaying the contents of the TCP/IP routing tables, see “DISPLAY TCPIP,,NETSTAT” on page 9.

Examples:
You can use MODIFY OMPROUTE commands to perform the following functions:

- “Displaying OMPROUTE information” on page 182
- “Stopping OMPROUTE” on page 182
- “Rereading the configuration file” on page 182
- “Enabling or disabling the OMPROUTE subagent” on page 183
- “Changing the cost of OSPF links” on page 183

Displaying OMPROUTE information
You can use the MODIFY command to display information for OMPROUTE. For example, assume you have a procname of OMPROUTE2 running on stack TCPCS2.

- To display the OMPROUTE IPv4 main routing table you can use:
  ```
  f omprout2,rttable
  ```

- To display ospf neighbors you can use:
  ```
  f omprout2,ospf,nbrs
  ```

See “DISPLAY TCPIP,,OMPROUTE” on page 21 for information about parameter descriptions and use.

Stopping OMPROUTE
OMPROUTE can be stopped in several ways:

- From MVS, issue P procname or MODIFY procname,KILL.

  If OMPROUTE was started from a cataloged procedure, procname is the member name of that procedure. If OMPROUTE was started from the z/OS shell, procname is based on the userid. If the userid is 8 characters long, the procname is the userid. If the userid is less than 8 characters long, the procname is useridX, where X is the sequence number set by the system. To determine the sequence number, from the SDSF LOG window on TSO, issue /d omvs,u=userid. This will show the programs running under the user ID userid. The procname value can also be set using the environment variable_BPX_JOBNAME and then starting OMPROUTE in the shell background.

- From a z/OS shell superuser ID, issue the kill command to the process ID (PID) associated with OMPROUTE. To find the PID, use one of the following methods:
  - From the MVS console, issue D OMVS,U=userid, or issue /D OMVS,U=userid at the SDSF LOG window on TSO (where userid is the user ID that started omproute from the shell).
  - Issue the ps -ef command from the z/OS shell.
  - Write down the PID when you start OMPROUTE.

For information about the environment variable_BPX_JOBNAME, see z/OS UNIX System Services Planning. For information about the D OMVS,U=userid command, see z/OS MVS System Commands.

Rereading the configuration file
The MODIFY procname,RECONFIG command is used to reread the OMPROUTE configuration file. This command ignores all statements in the configuration file except new OSPF_Interface, RIP_Interface,
Interface, IPv6_RIP_Interface, IPv6_Interface, IPv6_OSPF_Interface, and IPv6_OSPF (ROUTERID parameter only) statements.

**Rule:** These new configuration statements must be reread from the configuration file through this command prior to any new interfaces referred to by new OMPROUTE configuration statements being configured to the TCP/IP stack.

**Enabling or disabling the OMPROUTE subagent**

Use the MODIFY procname,ROUTESA=ENABLE command or the MODIFY procname,ROUTESA=DISABLE command to enable or disable the OMPROUTE subagent.

**Note:** To change any other value on the ROUTESA_CONFIG statement, the OMPROUTE application must be recycled.

The OMPROUTE subagent implements RFC 1850 (OSPF Version 2 Management Information Base) for the OSPF (Open Shortest Path First) Protocol. The ROUTESA_CONFIG statement is used in the OMPROUTE configuration file to configure the OMPROUTE subagent. For details about the ROUTESA_CONFIG statement, see ROUTESA_CONFIG statement information in the z/OS Communications Server: IP Configuration Reference.

**Changing the cost of OSPF links**

The cost of an OSPF interface can be dynamically changed using the MODIFY procname,OSPF,WEIGHT,NAME=\textit{name},COST=\textit{cost} command for an IPv4 OSPF interface or the MODIFY procname,IPV6OSPF,WEIGHT,NAME=\textit{name},COST=\textit{cost} command for an IPv6 OSPF interface. This new cost is flooded quickly throughout the OSPF routing domain, and modifies the routing immediately.

The cost of the interface reverts to its configured value whenever OMPROUTE is restarted. To make the cost change permanent, you must reconfigure the appropriate OSPF interface in the configuration file.

**MODIFY command: Policy Agent**

You can use the operator console and the MODIFY command to control the Policy Agent functions.

**Format:**
Parameters:

**procname**
The member name of the cataloged procedure used to start the Policy Agent.

**LOGLEVEL,** **LEVEL=n**
Changes the Policy Agent LogLevel. The required log level is \( n \). If \( n \) is not specified, then the current LogLevel remains the same. See LogLevel statement information in the z/OS Communications Server: IP Configuration Reference for details on how to define the Policy Agent LogLevel.

**TRACE,** **LEVEL=t**
Changes the Policy Agent start option trace level. The required trace level is \( t \). If \( t \) is not specified, then the current trace level remains the same. See the Starting Policy Agent from the z/OS shell information in the z/OS Communications Server: IP Configuration Reference for details on valid Policy Agent trace levels.

**Note:** If Policy Agent was started with the trace option disabled, then the output destination of stderr will be closed. This option cannot later be enabled by using the MODIFY command.

**DEBUG,** **LEVEL=d**
Changes the Policy Agent start option debug level. The required debug level is \( d \). If \( d \) is not specified, then the current debug level remains the same. See the Starting Policy Agent from the z/OS shell information in the z/OS Communications Server: IP Configuration Reference for details on valid Policy Agent debug levels.

**MEMTRC**
Causes the Policy Agent to dump the contents of the memory request buffer to the log file. This buffer is used when the -m startup option is specified, so if this option is not specified, the MEMTRC parameter has no effect.

**QUERY**
Displays the current LogLevel, debug level, and trace level in effect for the Policy Agent.

**REFRESH**
Triggers the Policy Agent to reread the configuration files, and, if requested, download objects from the LDAP server. Basically you download objects from the LDAP server only if a ReadFromDirectory
statement is included in the configuration file. Note that policies are also refreshed if the SIGHUP signal is received by the Policy Agent. This signal can be sent using the UNIX kill command. If the FLUSH parameter was specified on the TcpImage or discipline configuration statement, the REFRESH command triggers FLUSH processing. One consequence of this is that policy statistics being collected in the TCP/IP stack are reset, because FLUSH deletes and reinstalls all policies.

See FLUSH and PURGE considerations details in z/OS Communications Server: IP Configuration Guide for more information concerning the FLUSH/NOFLUSH and PURGE/NOPURGE parameters.

**Tip:** If you specify the Security Secure value on the ServicesConnection statement and the generated AT-TLS policy is installed successfully, then the MODIFY REFRESH command removes all AT-TLS policies, including the generated AT-TLS policy, if FLUSH is specified for AT-TLS. The AT-TLS policies, including the generated AT-TLS policy, are then reinstalled. The services connection might be unavailable until the generated AT-TLS policy is reinstalled.

**SRVLSTN**
Triggers the Policy Agent to restart the listen for services requestor connections and if required, to reinstall the generated AT-TLS policy. See ServicesConnection statement information in z/OS Communications Server: IP Configuration Reference for more details about configuring the ServicesConnection statement.

**Tips:**
- If you specify the Security Secure value on the ServicesConnection statement and the generated AT-TLS policy is installed successfully, use the MODIFY command with the SRVLSTN parameter to trigger the Policy Agent to reinstall the generated AT-TLS policy. Use this command when the contents of the key ring have changed, but the key ring name is unchanged.
- If you specify the Security Secure value on the ServicesConnection statement and the configured local or remote AT-TLS policies did not install successfully, use the MODIFY command with the SRVLSTN parameter to force the generated AT-TLS policy to be installed before the local or remote AT-TLS policies are installed. See the AT-TLS TCP/IP stack initialization access control information in z/OS Communications Server: IP Configuration Guide for more details about stack initialization access control.
- If the ImageName value that is configured on the ServicesConnection statement is not active when the ServicesConnection statement is processed, issue the MODIFY command with the SRVLSTN parameter after the TCP/IP image becomes active.

**UPDATE**
Triggers the Policy Agent to reread configuration files and, if requested, download objects from the LDAP server. Basically you download objects from the LDAP server only if a ReadFromDirectory statement is included in the configuration file. This command is different from the REFRESH command because Pagent only installs or removes from the stack as appropriate any new, changed, or deleted policies.

See FLUSH and PURGE considerations information in the in the z/OS Communications Server: IP Configuration Guide for more information concerning the FLUSH/NOFLUSH and PURGE/NOPURGE parameters.

**MON**
Send a command to an application that is being monitored by the Policy Agent.

**DISPLAY**
Display information about the set of applications, including whether or not they are being monitored, their status, and the associated TCP/IP stack name, if any.

**START**
Start a specified application or start all applications that are configured on the AutoMonitorApps statement to be started and stopped. Policy Agent starts the applications using the cataloged procedure and other parameters that are configured on the AutoMonitorApps statement.

**Result:** If the Policy Agent has stopped monitoring the applications because the applications failed to successfully start within the retry period that was specified on the AutoMonitorParms statement, Policy Agent resumes monitoring the running status of the applications.
ALL
Start all applications that are configured on the AutoMonitorApps statement.

DMD
Start the Defense Manager daemon (DMD).

IKED
Start the IKE daemon (IKED).

NSSD
Start the network security services daemon (NSSD).

SYSLOGD
Start the syslog daemon (syslogd).

TRMD
Start the traffic regulation management daemon (TRMD).

P=image
Specifies the name of the TCP/IP stack on which the TRMD application is running. If only one instance of TRMD is configured on the AutoMonitorApps statement, this parameter is optional.

RESTART
Stop and restart a specified application or stop and restart all applications that are configured on the AutoMonitorApps statement to be started and stopped. Policy Agent restarts the applications using the cataloged procedure and other parameters that are configured on the AutoMonitorApps statement.

ALL
Restart all applications that are configured on the AutoMonitorApps statement.

DMD
Restart the Defense Manager daemon (DMD).

IKED
Restart the IKE daemon (IKED).

NSSD
Restart the network security services daemon (NSSD).

SYSLOGD
Restart the syslog daemon (syslogd).

TRMD
Restart the traffic regulation management daemon (TRMD).

P=image
Specifies the name of the TCP/IP stack on which the TRMD application is running. If only one instance of TRMD is configured on the AutoMonitorApps statement, this parameter is optional.

STOP
Stop a specified application or stop all applications that are configured on the AutoMonitorApps statement to be started and stopped.

Result: Policy Agent stops monitoring the running status of the applications.

ALL
Stop all applications that are configured on the AutoMonitorApps statement.

DMD
Stop the Defense Manager daemon (DMD).

IKED
Stop the IKE daemon (IKED).

NSSD
Stop the network security services daemon (NSSD).
SYSLOGD
Stop the syslog daemon (SYSLOGD).

TRMD
Stop the traffic regulation management daemon (TRMD).

P=\textit{image}
Specifies the name of the TCP/IP stack on which the TRMD application is running. If only one instance of TRMD is configured on the AutoMonitorApps statement, this parameter is optional.

Examples:
The following example displays the status of applications that are monitored by the Policy Agent.

\begin{verbatim}
F PAGENT,MON,DISPLAY
EZD1587I PAGENT MONITOR INFORMATION
APPLICATION  MONITORED  JOBNAME  STATUS      TCP/IP STACK
DMD          NO         N/A      N/A         N/A
IKEO         YES        IKED     ACTIVE      N/A
NSSD         YES        NSSD     RESTARTING  N/A
SYSLOGD      YES        SYSLOGD  ACTIVE      N/A
TRMD         YES        TRMD2    ACTIVE      TCPIP2
TRMD         YES        TRMD3    INACTIVE    TCPIP3
\end{verbatim}

\section*{MODIFY command: Resolver address space}
You can refresh the resolver address space from the operator console using the MODIFY command. Issue the REFRESH command to refresh the resolver address space and the DISPLAY command to display the current values of the resolver setup statements. Issue the FLUSH command to delete the contents of the resolver cache. You can also reset the current z/OS knowledge of name server capabilities by issuing the REFRESH command.

For a description of the resolver setup statements, see Resolver setup statements in z/OS Communications Server: IP Configuration Reference.

\section*{Format:}

\begin{itemize}
\item \texttt{MODIFY proname}, \texttt{Display}
\item \texttt{REFRESH}, \texttt{SETUP=xxx(yyy)}
\item \texttt{FLUSH ,ALL}
\end{itemize}

\section*{Parameters:}

\texttt{proname}
The member name of the cataloged procedure used to start the resolver.

You can use the Display OMVS,0 command to determine the \texttt{proname} value. The output displayed includes a line as follows:

\begin{verbatim}
RESOLVER PROC = DEFAULT
\end{verbatim}

If DEFAULT is displayed, then the \texttt{proname} value is RESOLVER. Any other value must be used as the \texttt{proname}.

Display
Displays the current resolver setup statement values, including the name of the most recently used resolver setup file. If the autonomic quiescing of unresponsive name server function is active, the
resolver also displays the status of the name servers specified on NSINTERADDR statements in the global TCPIP.DATA file.

**FLUSH**
Deletes the contents of the resolver cache.

**ALL**
All resolver cache entries are deleted.

**REFRESH**
Causes applications to have their TCPIP.DATA information updated on their next resolver request after the refresh occurs, including local host tables (for example, etc/hosts, etc/ipnodes, HOSTS.SITEINFO, HOSTS.ADDRINFO, or ETC.IPNODES information). For more information about what TCPIP.DATA information can be updated, see Dynamically changing TCPIP.DATA statements in z/OS Communications Server: IP Configuration Reference.

Resets information about name server capabilities that was dynamically acquired. For example, a name server has been upgraded to support extension mechanisms for DNS (EDNS0). Issue the REFRESH command to reset the current information about the capability of the name server, forcing the z/OS resolver to dynamically determine the new capability.

Clears message EZD2037E from the network operator console. Issue the REFRESH command to restart the resolver unresponsive name server monitoring functions after the resolver had stopped them as a result of a system error.

**Restriction:** The REFRESH command resets information about all name servers.

The z/OS resolver uses EDNS0 to accept DNS UDP messages that have a length greater than 512 bytes when the name server also supports EDNS0. Using the less costly UDP protocol, EDNS0 results in improved DNS and resolver performance. See the information about Extension Mechanisms for DNS standards and the resolver in z/OS Communications Server: IP Configuration Guide for more details.

In some cases, the resolver statistics regarding name server responsiveness for all name servers are affected by a REFRESH command. This situation occurs when the REFRESH command is used to stop the name server monitoring functions or when the REFRESH command is used to switch between the autonomic quiescing of unresponsive name server function and the network operator notification function. In these situations, the resolver statistics are set to the value of 0 and the current unresponsive name server notification messages EZZ9308E or EZZ9311E are cleared from the operator console. If the REFRESH command does not result in any changes to the unresponsive name server monitoring function, the resolver statistics are not affected and the current unresponsive name server notification messages remain on the operator console. For information about when the statistics and messages are affected, see UNRESPONSIVETHRESHOLD statement in z/OS Communications Server: IP Configuration Reference.

If the REFRESH command is used to change the NSINTERADDR statement values coded in the TCPIP.DATA file specified on the GLOBALTCPIPDATA resolver setup statement, the resolver statistics regarding name server responsiveness for a single name server might be affected. If the REFRESH command is used to remove an unresponsive name server from the NSINTERADDR statements, the resolver will zero the resolver statistics for this name server, will stop sending resolver DNS polling queries to the name server, and will clear the EZZ9311E unresponsive name server notification message from the operator console. For information on the NSINTERADDR statement, see NSINTERADDR statement in z/OS Communications Server: IP Configuration Reference.

**SETUP=**
The contents of the specified resolver setup file are processed. Processing TCPIP.DATA statements and local host tables are updated at the next resolver request.

**Result:** If the resolver setup file contains unrecognized resolver setup statements, or setup statements with syntax errors, the MODIFY command fails. The resolver configuration is unchanged.

**xxx**
Identifies a specific MVS sequential data set. The data set must have an LRECL in the range 56–256. The record format can be either RECFM=F or RECFM=FB.
xxx(yyy)
Identifies a specific MVS PDS member. The PDS must have an LRECL in the range 56–256. The record format can be either RECFM=F or RECFM=FB.

'/xxx'
The full path name of the file must be specified and must begin with a slash (/) character. The single quotation marks (') are required around the complete z/OS UNIX file system name so that z/OS command processing passes the file name without changing it to uppercase.

**Rule:** If the single quotation mark notation is used to specify an MVS data set name, the data set name must be entered in uppercase.

**Examples:**
The following example is the command and messages returned to display the current values. In this example, the AUTOQUIESCE operand on the UNRESPONSIVETHRESHOLD resolver setup statement was not specified:

```
f resolver,display
```
```
EZZ9298I RESOLVERSETUP - SYS1.TCPPARMS(RESSETUP)
EZZ9298I DEFAULTTCPIPDATA - None
EZZ9298I GLOBALTCPIPDATA - SYS1.TCPPARMS(TCPDATA)
EZZ9298I DEFAULTIPNODES - USER55.ETC.IPNODES
EZZ9298I GLOBALIPNODES - None
EZZ9304I NOCOMMONSEARCH
EZZ9304I CACHE
EZZ9298I CACHESIZE - 200M
EZZ9298I MAXTTL - 2147483647
EZZ9298I MAXNEGTTL - 2147483647
EZZ9304I NOCACHEREORDER
EZZ9298I UNRESPONSIVETHRESHOLD - 25
EZZ9293I DISPLAY COMMAND PROCESSED
```

The following example is the command and messages returned to display the current values. In this example, errors have been detected during initialization of the resolver address space.

```
f resolver,display
```
```
EZZ9298I RESOLVERSETUP - SYS1.TCPPARMS(RESSETUP)
EZZ9298I DEFAULTTCPIPDATA - None
EZZ9298I GLOBALTCPIPDATA - SYS1.TCPPARMS(TCPDATA)
EZZ9298I DEFAULTIPNODES - USER55.ETC.IPNODES
EZZ9298I GLOBALIPNODES - None
EZZ9304I NOCOMMONSEARCH
EZZ9304I CACHE
EZZ9298I CACHESIZE - 200M
EZZ9298I MAXTTL - 2147483647
EZZ9298I MAXNEGTTL - 2147483647
EZZ9304I NOCACHEREORDER
EZZ9298I UNRESPONSIVETHRESHOLD - 25
EZZ9293I DISPLAY COMMAND PROCESSED
```

In the following example, the AUTOQUIESCE operand on the UNRESPONSIVETHRESHOLD resolver setup statement is coded:

```
f resolver,display
```
```
EZZ9298I RESOLVERSETUP - SYS1.TCPPARMS(RESSETUP)
EZZ9298I DEFAULTTCPIPDATA - None
EZZ9298I GLOBALTCPIPDATA - SYS1.TCPPARMS(TCPDATA)
EZZ9298I DEFAULTIPNODES - USER55.ETC.IPNODES
EZZ9298I GLOBALIPNODES - None
EZZ9304I NOCOMMONSEARCH
EZZ9304I CACHE
EZZ9298I CACHESIZE - 200M
EZZ9298I MAXTTL - 2147483647
EZZ9298I MAXNEGTTL - 2147483647
EZZ394I NOCACHEREORDER
EZZ9298I UNRESPONSIVETHRESHOLD - 25
EZZ9293I WARNING ISSUED DURING RESOLVER INITIALIZATION
EZZ9293I DISPLAY COMMAND PROCESSED
```

```
The following example shows how to change some current resolver settings by using values in the user55.ressetup setup file, such as changing NOCOMMONSEARCH to be COMMONSEARCH, changing the file name of DEFAULTIPNODES to be USER1.ETC.IPNODES, and changing MAXNEGTTL to a different value (300) than what is used for MAXTTL. Note that the display indicates that user55.ressetup is now the most recently used resolver setup file.

```
f resolver,refresh,setup=user55.ressetup
```

The following example contains the command and messages that are returned to delete all of the entries in the resolver cache.

```
f resolver,flush,all
```

**Usage:**

See the resolver setup statements in the resolver setup file topic in z/OS Communications Server: IP Configuration Guide for an explanation of the fields on the report.

**MODIFY command: REXEC**

Use the MODIFY command to change the parameters on the Remote Execution server.

**Format:**

```
MODIFY procname , EXIT=exitmod , TSOPROC=proc
 , MSGCLASS=c , PURGE=Yes ,
 , TSCLASS=c , TRACE=LOG
```

190  z/OS Communications Server: IP System Administrator's Commands
**Parameters:**
For a description of the valid resolver setup statements parameters, see Remote execution server parameters in the z/OS Communications Server: IP Configuration Reference.

**Examples:**
To change the user exit and TSO batch procedure, you might enter:

```
F RXSERVE,EXIT=USERX22,TSOPROC=KHFLACCN
```

**Usage:**
You cannot use the MODIFY command to change the MAXCONN parameter.

**MODIFY command: RPCBIND**
Use the MODIFY command to start and stop tracing after the rpcbind address space initialization is complete.

**Format**
```
MODIFY  jobname  ,  TRACE  =  FLOW  NOFLOW  LOG  NOLOG  ON  OFF  XDR  NOXDR  ?
```

**Parameters**

**TRACE**
Subcommand to begin general tracing. Tracing options include the following values:

- **FLOW**
  Enable tracing for entry and exit of modules.

- **NOFLOW**
  Disable tracing for entry and exit of modules.

- **LOG**
  Enable activity tracing for each RPC procedure on the server that was invoked by an RPC client.

- **NOLOG**
  Disable activity tracing for each RPC procedure on the server that was invoked by an RPC client.

- **ON**
  Enable all tracing.

- **OFF**
  Disable all tracing.

- **XDR**
  Enable tracing of XDR procedures.

- **NOXDR**
  Disable tracing of XDR procedures.

- **?**
  Display the trace status.
**Result:** Specifying TRACE on the MODIFY command is additive. Enabling tracing with the values FLOW and then XDR results in tracing for both. Specifying ON or OFF sets or resets all trace types.

**MODIFY command: SNALINK LU0**

Use the MODIFY command to halt the SNALINK LU0 interface.

**Format:**

```
MODIFY procname , HALT
```

**Parameters:**

- **procname**
  The member name of the cataloged procedure used to start the SNALINK LU0 interface.

- **HALT**
  Shuts down the SNALINK interface.

**MODIFY command: SNALINK LU 6.2**

You can stop or restart the SNALINK LU6.2 interface and control tracing with the MODIFY command. Use the MODIFY command to:

- Stop or restart the SNALINK LU6.2 interface
- Alter the level of tracing

**Format:**

```
MODIFY procname ,
```

- **CANCEL**
- **DROP**
  - **IP=** dest_ip
  - **LU=** dest_lu
  - **ALL**
- **HALT**
- **LIST**
  - **ACTIVE**
  - **IP=** dest_ip
  - **LU=** dest_lu
  - **ALL**
- **RESTART**
  - **INIT**
  - **IP=** dest_ip
  - **LU=** dest_lu
  - **ALL**
- **TRACE**
  - **ON**
  - **OFF**
  - **DETAIL**
  - **IP=** dest_ip
  - **ALL**

**Parameters:**

---

192 z/OS Communications Server: IP System Administrator's Commands
**proname**
The member name of the cataloged procedure used to start the SNALINK LU6.2 interface.

**CANCEL**
Cancels the SNALINK LU6.2 interface by a user abend. The system produces a dump and writes it to the data set defined by the //SYSUDUMP DD statement in the cataloged procedure.

**DROP**
Ends the connection with the destination nodes as specified.

**IP=dest_ip**
The destination IP address of the connection to end.

**LU=dest_lu**
The destination LU name of the connection to end. For dependent LU connections, either the sending or receiving remote LU name can be supplied and both sessions are ended.

**ALL**
Drops all connections defined in SNALINK LU6.2 configuration data set.

**HALT**
Shuts down the SNALINK LU6.2 interface.

**LIST**
Displays status and traffic information for the range of connections specified.

**ACTIVE**
The range of destinations to be listed. Information is displayed for all currently established connections handled by the specified address space. This is the default.

**IP=dest_ip**
The destination IP address of the connection to be listed.

**LU=dest_lu**
The destination LU name of the connection to be listed. For dependent LU connections, you can supply either the remote sending or receiving LU name.

**ALL**
Displays information for all destinations defined in the SNALINK LU6.2 configuration data set.

**RESTART**
Establishes one or more connections to destination nodes. Any destinations in the specified range that are already connected are skipped.

**INIT**
The range of connections to be established. If the INIT parameter is specified, connections are established with all destinations defined with the INIT parameter in the SNALINK LU6.2 configuration data set. If the RESTART subcommand is entered without parameters, the INIT option is the default.

**IP=dest_ip**
The destination IP address of the connection to be established.

**LU=dest_lu**
The destination LU name of the connection to be established. For dependent LU connections, either the remote sending or receiving LU name can be supplied and both sessions are established.

**ALL**
The range of connections to be established. If the ALL parameter is specified, connections are established with all destinations defined in the SNALINK LU6.2 configuration data set.

**TRACE**
Alters the levels of trace defined in the SNALINK LU6.2 configuration data set while the address space is active.

**ON**
Enables a basic level of tracing for all connection in the specified range. The default is ON.
OFF
If the OFF parameter is specified, tracing is disabled for all connections in the specified range.

DETAIL
Enables a detailed level of tracing for all connections in the specified range.

IP=dest_ip
The destination IP address associated with the connection for which tracing will be enabled or disabled.

ALL
If the ALL parameter is specified, tracing for all destinations (either currently or subsequently connected) is set to the requested level.

Examples:
To enable tracing for the procedure LU62PROD on connection associated with 9.163.37.12, enter

F LU62PROD, TRACE IP=9.163.37.112

The following example illustrates the output you might get if you issued the MODIFY command with the LIST parameter:

```
MODIFY TCPIPL62, LIST ALL
TCPL62217I LIST Accepted; Range = All Connections
TCPL62212I  192.9.207.39 (Connected on 92.013 at 09:52:11)
TCPL62213I Connected by:  DATA  Trace Level: OFF
TCPL62214I SEND:  Status: Not Allocated  Packets Out: 0
TCPL62215I RECV:  Status: Allocated  Packets In:  0
TCPL62211I  192.9.207.40 (Disconnected on 92.013 at 08:30:10)
TCPL62210I  192.9.207.41 (Disconnected)
TCPL62219I LIST Completed
```
Will retry connect
Either a previously connected DLC connection has been severed, or the previous connection request was not accepted within the timeout period. In either case, the TCP/IP address space attempts to resend another connection request within 30 seconds.

Status Reported
Explanation

Issued connect
Passive side: SNALINK is waiting for a remote LU to establish a session.
Active side: SNALINK is trying to establish a session with a remote LU.

Will retry connect
The last session was ended, or the last session attempt failed. SNAIUCV driver tries the connection again within 30 seconds.

Connected
An SNA send session is established. Under normal conditions this also means a receive session is established or will be established soon, and communication between the two LUs is possible.

Sending message
An SNA send session is established, and there is a DLC SEND currently outstanding.

MODIFY command: SNMP agent
Some SNMP agent initialization parameters can be modified while the agent is executing using the MVS MODIFY command. The MODIFY command can also be used to display the current level of SNMP agent tracing.

Format:
```
MODIFY snmp_agent_jobname, INTERVAL=n, TRACE, LEVEL=n, QUERY
```

Parameters:

INTERVAL
Specifies an integer in the range 0 – 10, which indicates the maximum number of minutes before committed configuration changes to the SNMPD.CONF file will be written out. A value of 0 means that the changes will be written out at the time the SET is committed.

TRACE
Indicates SNMP agent tracing is to be queried or changed.

LEVEL
Specifies an integer in the range 0 – 255, which indicates the level of agent tracing. This corresponds to the -d parameter at agent initialization. See OSNMPD parameters in the z/OS Communications Server: IP Configuration Reference for additional guidance on setting the trace level.

QUERY
Requests that the current level of SNMP agent tracing be displayed.

MODIFY command: SNMP Network SLAPM2 subagent
You can control the Network SLAPM2 subagent (nslapm2) functions from the operator console using the MODIFY command. The following list shows the syntax and valid parameters.

Format:
Parameters:

**Debug,Level**
Changes the Network SLAPM2 subagent start option debug level. \( n \) is the required debug level. Specifying a level of 0 disables debug tracing. If \( n \) is not specified, then the current debug level remains the same. See the Starting the network SLAPM2 subagent from the z/OS shell information in the z/OS Communications Server: IP Configuration Reference and the Problems connecting subagents to the SNMP agent information in the z/OS Communications Server: IP Diagnosis Guide for details about valid Network SLAPM2 subagent debug levels.

**Cache,Time**
Changes the Network SLAPM2 subagent start option cache time. \( t \) is the required cache time in seconds. If \( t \) is not specified, then the current cache time remains the same. See the Starting the network SLAPM2 subagent from the z/OS shell information in the z/OS Communications Server: IP Configuration Reference for details about valid Network SLAPM2 subagent cache times.

**Query**
Displays the current Network SLAPM2 subagent debug level, subagent cacheTime and actual cache time in effect.

**MODIFY command: Syslog Daemon**
Use the MODIFY command to control the syslog daemon functions from the operator console.

**Format:**

```
MODIFY F procname, Debug,Level= n, Cache,Time= t, Query
```

**Parameters:**

**procname**
The member name of the cataloged procedure that is used to start the syslog daemon.

**ARCHIVE**
Perform an immediate archive of UNIX file-system files that are defined by syslogd configuration rules. When the rule for the destination file includes the -N parameter and is preceded by the BeginArchiveParms statement, that file is archived. When the rule for the destination file includes the -X parameter, the contents of that file are deleted.

If a previously initiated archive is already in progress, an additional archive does not occur, and message FSUM1256 is issued to the console. The previously initiated archive might have been initiated by an ARCHIVE command, a time-of-day-based archive, or a file-system threshold-based archive.

**DISPLAY,ARCHIVE**
Display UNIX file-system use data for file systems that have output destination files defined by syslogd configuration rules. Capacity percentages are displayed for each file system. If you specify the DETAIL parameter, the largest files for that file system are displayed. The MAX parameter controls the
number of files that are displayed for the detail report. The default value for MAX is 5; the maximum value is 65 535. If you specify an asterisk (*) then all files are displayed.

**RESTART**

Indicates that the syslogd configuration file should be reread. The result is similar to sending a SIGHUP signal to syslogd. Syslogd attempts to finish writing all pending output to the appropriate destinations before rereading the configuration file. If any output cannot be written within 30 seconds, the appropriate destination is marked as unreachable and any output pending for that destination is discarded.

If a previously initiated restart is already in progress, an additional restart is not performed, and message FSUM1256 is issued to the console. The previously initiated restart might have been initiated by a RESTART command or a SIGHUP signal.

**Examples:**

The following command causes syslogd to reread its configuration file.

```
F SYSLOGD,RESTART
FSUM1254 SYSLOGD MODIFY COMMAND ACCEPTED
FSUM1252 SYSLOGD RECONFIGURATION COMPLETE
```

The following command causes syslogd to archive all UNIX file-system files that are defined by syslogd configuration rules.

```
F SYSLOGD,ARCHIVE
FSUM1254 SYSLOGD MODIFY COMMAND ACCEPTED
FSUM1268 SYSLOGD ARCHIVE COMPLETE FOR 2 FILES
```

The following commands cause syslogd to display UNIX file system utilization data.

```
F SYSLOGD,DISPLAY,ARCHIVE
FSUM1277 FILE SYSTEM SUMMARY 387
 NAME=OMVS.VAR.HFS
 PATH=/SYSTEM/var
 512-BLOCKS= 177120 USED= 108592 AVAIL= 68528 USAGE= 61%

```
**ARCHIVE column values:**

The values displayed in the ARCHIVE column in the output of the `F procname,DISPLAY,ARCHIVE,DETAIL` commands above, indicate the following information for the file name displayed in the PATH column:

- **CLEAR:** The -X archive parameter was specified for the file.
- **FILE:** The file name was specified by using the field descriptors for year, month, or day (for example, %Y, %m, or %d).
- **GDG:** The -N archive parameter specified a GDG archive file.
- **NONE:** No archive parameters were specified for the file.
- **SEQ:** The -N archive parameter specified a sequential archive file.

**MODIFY command: Trap forwarder daemon (TRAPFWD)**

You can control the TRAPFWD daemon from the operations console using the MODIFY command. The following list shows the syntax and valid parameters.

**Format:**

```
MODIFY F trap_daemon_jobname, REFRESH TRACE, QUERY LEVEL=n
```

**Parameters:**

- **REFRESH**
  Dynamically refreshes the configuration information. When this is done, the old configuration information is discarded, the configuration file is read again, and the daemon is initialized.

- **TRACE**
  Indicates TRAPFWD tracing is to be queried or changed.

- **QUERY**
  Requests that the current level or TRAPFWD daemon tracing be displayed.

- **LEVEL**
  Valid values are:
  - 0—No tracing.
  - 1—Minimal tracing. Trace address from which the trap is received.
  - 2—In addition to 1, trace addresses to which the trap packet is forwarded.

**MODIFY command: VMCF and TNF**

Display the names of current users of VMCF and TNF and remove names from the name list.

**Format:**

```
MODIFY F VMCF, TNF, DISPLAY, REMOVE, NAME= name
```

**Parameters:**

- **VMCF**
  Communicates with the VMCF address space.

- **TNF**
  Communicates with the TNF address space.

- **Display**
  Displays the current users of TNF/VMCF.
REMOVE
Terminates the current users of TNF/VMCF.

NAME
Named users or * = all users of the TNF/VMCF.

MODIFY command: X.25 NPSI server
Use the MODIFY command to pass parameters to the X.25 NPSI server.

Format:

MODIFY procname, CANCEL
DEBUG digits
EVENTS id
HALT
LIST
RESTART mchlu
SNAP id
TRACE id * DATA OFF
TRAFFIC

Parameters:

procname
The member name of the cataloged procedure used to start this server.

CANCEL
Cancels the X.25 NPSI server task and produces a dump.

DEBUG digits
Alters debug settings, where digits is a string of debug levels corresponding to those in the configuration data set for X.25 NPSI server.

EVENTS id
Displays event handler names for debugging, where id is an optional LU name or logon ID.

HALT
Shuts down the X.25 NPSI task, closing all connections.

LIST
Displays a list of the status of the virtual circuit.

RESTART mchlu
Attempts to reacquire failed links (MCHs), after reactivating them through VTAM. mchlu is an optional LU name from a link definition. If omitted, all inactive MCHs are restarted.

SNAP id
Displays program data areas for debugging, where id is an optional LU name or logon ID.

TRACE
Alters the trace level, where id is an optional LU name, logon ID, or an asterisk (*). TRACE can be one of two levels: DATA or OFF.

TRAFFIC
Displays traffic counts.

Examples:
To halt an X.25 NPSI server whose procedure started with the following statements in the hlq.PROFILE.TCPIP you could issue either of the commands that follow at the operator console:

<table>
<thead>
<tr>
<th>AUTOLOG</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCPIX25</td>
</tr>
</tbody>
</table>

Issue one of the following commands:

| MODIFY    |
| TCPIX25,HALT |
| F TCPIX25,HALT |

**MODIFY command: z/OS Load Balancing Advisor**

You can control the z/OS Load Balancing Advisor from the operator console using the MODIFY command.

**Format:**

```
MODIFY procname, F
  DEBug,Level= debuglevel
  DISplay, DEBug
  LB, Index=lbindex
  MAX=100
  MAX=* 
  MAX= recs
```

**Parameters:**

- **procname**
  - The member name of the cataloged procedure used to start the z/OS Load Balancing Advisor.

- **DEBug,Level=debuglevel**
  - Changes the Advisor debug level. The needed debug level is *debuglevel*. See Debug settings and corresponding syslogd priority levels in the z/OS Communications Server: IP Diagnosis Guide and the Advisor debug_level statement in the z/OS Communications Server: IP Configuration Reference for details about valid Advisor debug levels.

- **DISplay,DEBug**
  - Displays the debug level in effect for the Advisor.

- **DISplay,LB**
  - Displays a summary of connected load balancers. The universally unique identifier (UUID), health value, flags, and an index are shown for each connected load balancer. The index will remain the same as long as the load balancer is connected.

- **DISplay,LB,MAX=recs**
  - Displays a summary of connected load balancers. The number of records (load balancers) displayed is limited by the MAX=recs parameter. The default is 100. If MAX=* is specified, then all connected load balancers are displayed.

- **DISplay,LB,Index=lbindex**
  - Displays all registered groups including detailed member data for the identified load balancer or for all connected load balancers (by specifying the ALL parameter). The lbindex value is the decimal index shown in the display of all load balancers. If you specify the ALL parameter, detailed member data for all connected load balancers is displayed.
**DISplay,LB,Index=lbindex,MAX=reces**

Displays all registered groups including detailed member data for the identified load balancer or for all connected load balancers (by specifying the ALL parameter). The **lbindex** is the decimal index shown in the display of all load balancers. If you specify the ALL parameter, detailed member data for all connected load balancers is displayed. The number of records (members) displayed is limited by the **MAX=reces** parameter. The default value is 100. If MAX=* is specified, then all members are displayed.

**Example 1** — The modify display LB command summarizes all load balancers that have connected to the Advisor.

```plaintext
F LBADV,DISP,LB
E2D1242I LOAD BALANCER SUMMARY
LB INDEX : 00    UUID : 637FFF175C
IPADDR..PORT : 10.42.105.154..50005
HEALTH : 20    FLAGS : NOCHANGE PUSH TRUST
LB INDEX : 01    UUID : 207FFF175C
IPADDR..PORT : 10.42.105.60..50006
HEALTH : 7F    FLAGS : PUSH TRUST
2 OF 2 RECORDS DISPLAYED
```

**LB INDEX**

Reference number used solely as the **lbindex** value on the MODIFY,DISPLAY,LB,INDEX= command. The same reference number is used for a load balancer as long as it is connected.

**UUID**

A hexadecimal value of the universally unique identifier assigned by the load balancer. This byte array can be up to 64 bytes in length.

**IPADDR..PORT**

The remote IP address and port at which the Advisor is connected to this load balancer. The IP address can be an IPv4 or an IPv6 address.

**HEALTH**

A hexadecimal value supplied by the load balancer that indicates the general health of the load balancer. Valid values are in the range 0 – X'7F'.

**FLAGS**

Flags that are set are displayed. Flag values are:

- **NOCHANGE**
  The Advisor sends only weights that have changed to the load balancer.

- **PUSH**
  The Advisor sends weights to the load balancer when any weights change.

- **TRUST**
  The load balancer trusts member applications to register themselves. Ignored by the Advisor.

**Example 2** — The modify display command supplies details about a specific load balancer. The load balancer is identified using the index shown in the output of the modify display LB command. For each group of target applications, the display shows each active registered instance of the group in the sysplex.

```plaintext
F LBADV,DISP,LB,I=0

FLAGS :
IPADDR..PORT: 10.42.105.22..0
```
For explanations of **LB INDEX, UUID, IPADDR..PORT, HEALTH, and FLAGS** see Example 1.

**GROUP**
The name of a group of related target applications. The group name is a UTF-8 string displayed in EBCDIC on the MVS console. Any non-displayable character is displayed as a question mark (?).

**GROUP FLAGS**
Flags that are currently applied to the group as a whole. Flag values are:

**BASEWLM**
Indicates that system WLM recommendations are being used to calculate the net weight for each member of the group.

**BASEWLM***
Indicates that SERVERWLM was coded on the Advisor WLM statement or was specified for this group on the PORT_LIST Advisor statement in order to use server-specific WLM.
recommendations. However, the Advisor is using system WLM recommendations instead to
calculate the net weight for each member of the group. This can occur if one or more of the Agents
owning the members within the group does not support server-specific WLM recommendations.

SERVERWLM
Indicates that server-specific WLM recommendations are being used to calculate the net weight
for each member of this group.

proctype
When BASEWLM recommendations are configured, the proctype value indicates the expected
proportion of each type of processor that a target application's workloads will consume. A composite
recommendation is determined from these proportions. A PROCTYPE value can be configured on the
port_list or wlm statement; when this value is not configured, it assumes a default value to indicate
that the composite recommendations include only the general CP weight.

CP
The expected general CP utilization proportion that will be consumed by the applications.

zAAP
The expected zAAP utilization proportion that will be consumed by the applications.

zIIP
The expected IBM System z9® or later Integrated Information Processor (zIIP) utilization
proportion that will be consumed by the applications.

Restrictions:
• zAAP and zIIP weight recommendations are available only if all systems in the sysplex are z/OS
release V1R9 or later. If all systems in the sysplex are not z/OS release V1R9 or later, only CP
weights are considered when determining a composite weight recommendation.
• zAAP and zIIP weight recommendations are not used when determining the composite weight for
system members.

IPADDR..PORT
Indicates the IP address and port to which the target application is bound. This is the
first of several
lines relating to the same target application. If this represents a system member, then IPADDR
represents an IP address belonging to a TCP/IP stack on one of the MVS systems in the sysplex, and
the PORT will be 0.

SYSTEM NAME
Indicates the MVS system name of the MVS system where the application exists. If this is a system
member, this indicates the MVS system name of the MVS system that owns the IP address.

PROTOCOL
Indicates the protocol that the application is using. If the protocol is not TCP or UDP, the decimal
number of the protocol is displayed. For system members, this will be 0.

AVAIL
Indicates whether the member is available for new workload distribution. A value of YES indicates
that the Advisor considers the application available for load balancing. A value of NO indicates that
the Advisor recommends that the application not be considered for load balancing.

WLM WEIGHT
Indicates the Workload Manager weight value for the MVS system or the server-specific WLM weight
based on the BASEWLM or SERVERWLM group flag. This value is in the range 0 – 64. This value is the
composite weight; it is the sum of the displayed proportional CP, zAAP, and zIIP weights for this
member.

CP
When the distribution method is BASEWLM the following apply:
• The Raw value is the WLM system general CP weight recommendation. The value is based on the
amount of displaceable general CPU capacity on this system as compared to the other target
systems.
• The Proportional value is the Raw value modified by the expected general CP utilization proportion configured on the portlist and wlm statement for this application.

When the distribution method is SERVERWLM the following apply:

• The Raw value is the WLM server-specific general CP recommendation. This is the amount of displaceable general CPU capacity based on the application workload's importance (as defined by the WLM policy) as compared to the other target systems.
• The Proportional value is the Raw value modified by the proportion of general CP capacity that is currently being consumed by the application's workload as compared to the other processors (zAAP and zIIP).

zAAP

When the distribution method is BASEWLM the following apply:

• The Raw value is the WLM system zAAP weight recommendation. This value is based on the amount of displaceable zAAP capacity on this system as compared to the other target systems.
• The Proportional value is the Raw value modified by the expected zAAP utilization proportion configured on the portlist and wlm statement for this application.

When the distribution method is SERVERWLM the following apply:

• The Raw value is the WLM server-specific zAAP recommendation. This value is the amount of displaceable zAAP capacity based on the application workload's importance (as defined by the WLM policy) as compared to the other target systems.
• The Proportional value is the Raw value modified by the proportion of zAAP capacity that is currently being consumed by the application's workload as compared to the other processors (general CPU and zIIP).

zIIP

When the distribution method is BASEWLM the following apply:

• The Raw value is the WLM system zIIP weight recommendation. This value is based on the amount of displaceable zIIP capacity on this system as compared to the other target systems.
• The Proportional value is the Raw value modified by the expected zIIP utilization proportion configured on the portlist and wlm statements for this application.

When the distribution method is SERVERWLM the following apply:

• The Raw value is the WLM server-specific zIIP recommendation. This value is the amount of displaceable zIIP capacity based on the application workload's importance (as defined by the WLM policy) as compared to the other target systems.
• The Proportional value is the Raw value modified by the proportion of zIIP capacity that is currently being consumed by the application's workload as compared to the other processors (general CPU and zAAP)

Restrictions:
• zAAP and zIIP weight recommendations are available only if all systems in the sysplex are z/OS release V1R9 or later. If all systems in the sysplex are not z/OS release V1R9 or later, only CP weights are considered when determining a composite weight recommendation.
• zAAP and zIIP weight recommendations are not used when determining the composite weight for system members.

CS WEIGHT
Indicates the weight value recommended by the Agent. The range is 0 – 100, with a higher weight indicating that the application is able to handle more work than an application with a lower weight. One exception is that when the Agent is gathering historical data for an application (which takes 2 update intervals), the weight will be 100 and the NODATA flag will be set.

NET WEIGHT
Indicates the relative weight of this application in the sysplex. A higher weight indicates that an application can handle more workload than a lower weight application in the same group. This weight
is based upon the WLM weight, the CS weight, the number of members in each group, and other factors. Net weights should be compared only within a group. Weights within a group are then normalized to yield the net weight. Normalization involves reducing the weight values while largely preserving the ratios between the weights. Normalization is performed within a group only if there is more than one available member in the group. Each group is calculated separately.

**Result:** In some cases, the value of NET WEIGHT is 1 (when the WLM WEIGHT or CS WEIGHT of all available members in the group is zero). This is done to force the load balancer to distribute workload in a round-robin fashion to those members rather than allowing the load balancer to potentially halt workload distribution to the entire group.

**ABNORM**
This field is displayed if the GROUP FLAGS values indicate that server-specific (SERVERWLM) WLM recommendations are being used. The value is nonzero if the server application is experiencing conditions in which transactions are completing abnormally. It represents a rate of abnormal transaction completions per 1000 total transaction completions. It is applicable only for target applications such as IWMRPT that act as Subsystem Work Managers and report transaction status using Workload Management Services. For example, the value 200 in this example indicates that 20% of all transactions processed by the server application are completing abnormally. Under normal conditions or if the server is not providing this information to WLM, this value should be 0.

A nonzero value indicates that the server application has reported some abnormal transaction completions to WLM and that WLM has reduced the server-specific recommendation for this server instance. The greater the value of this field, the greater the reduction in the recommendation provided by WLM. For more information about the conditions that cause the abnormal transaction completions for a given server application, see the documentation provided by the server application.

**Restriction:** Although WLM uses abnormal transaction completion rate information that is provided by the application to reduce the server-specific recommendation, this information is available for display on an Advisor only if the Load Balancing Agents and the Advisor are running on a z/OS V1R8 system or later. A z/OS V1R7 Load Balancing Agent does not provide this information to the Load Balancing Advisor. In this situation, a z/OS V1R8 Advisor shows a normal abnormal transaction completion rate of 0 even if WLM is reducing the server-specific recommendation because of a nonzero abnormal transaction completion rate reported from the application.

**HEALTH**
This field is displayed if the GROUP FLAGS values indicate that server-specific (SERVERWLM) WLM recommendations are being used. This health indicator is available only for applications that provide this information to WLM using the IWM4HNLTH or IWMSRSRG services. It indicates the general health of an application or subsystem. Under normal circumstances or if the server is not providing this information to WLM, the value of this field is 100, indicating that the server is 100% healthy.

Values less than 100 indicate that the server is experiencing problem conditions that are not enabling it to process new work requests successfully; this causes WLM to reduce the server-specific recommendation for this server instance. The lower the value of this field, the greater the reduction in the recommendation provided by WLM.

**Restriction:** Although WLM uses the health indicator provided by the application to reduce the server-specific recommendation, this information is available for display on an Advisor only if the Load Balancing Agents and the Advisor are running on a z/OS V1R8 system or later. A z/OS V1R7 Load Balancing Agent does not provide this information to the Load Balancing Advisor. In this situation, a z/OS V1R8 Advisor shows a normal health indicator of 100 even if WLM is reducing the server-specific recommendation because of an abnormal health indication from the application.

**FLAGS**
Flag values that are currently set. Flag values are:

**LBQ**
Load Balancer quiesce, which means that the load balancer has requested that no more additional work be assigned to the quiesced application or system.
**NOTARGETAPP**
Indicates that an Agent found the IP address configured on a TCP/IP stack, but the Agent did not find a specific application using the same port and protocol.

**NOTARGETIP**
Indicates that an Agent found the IP address configured on a TCP/IP stack, but the address is not usable. For example, the IP address might be unavailable.

**NOTARGETSYS**
Indicates that no Agent found this IP address.

**NODATA**
Indicates that an Agent has reported this application but does not yet have the historical data to recommend a CS weight.

**OPQ**
Operator quiesce, which means that the MVS operator at the owning Agent has requested that no more additional work be assigned to the quiesced application or system.

**MODIFY command: z/OS Load Balancing Agent**
You can control the z/OS Load Balancing Agent from the operator console using the MODIFY command.

**Format:**

```
MODIFY proname, F
```

```
MODIFY proname, DEBug,Level=debuglevel
MODIFY proname, DISPLAY, DEBug
MODIFY proname, MEMbers
MODIFY proname, MEMbers,DETail
MODIFY proname, MEMbers,DETail,PORT=portnum
MODIFY proname, MEMbers,DETail,TCPname=tcpname
MODIFY proname, Enable,Target options
MODIFY proname, Quiesce,Target options
MODIFY proname, PORT=portnum
MODIFY proname, PROTOcol=TCP
MODIFY proname, PROTOcol=proto
MODIFY proname, IPaddr=ipaddr
MODIFY proname, TCPname=tcpname
MODIFY proname, SYStem
```

**Target options**

- **PORT=portnum**
- **PROTOcol=TCP**
- **PROTOcol=proto**
- **IPaddr=ipaddr**
- **TCPname=tcpname**
- **SYStem**

**Parameters:**

**proname**
The member name of the cataloged procedure used to start the Agent.

**DEBug,Level=debuglevel**
Changes the Agent debug level. The required debug level is `debuglevel`. See the `debug_level` statement description in the z/OS Communications Server: IP Configuration Reference and Debug settings and corresponding syslogd priority levels in the z/OS Communications Server: IP Diagnosis Guide for details about valid Agent debug levels.
**DISplay,DEBbug**
Displays the debug level in effect for the Agent.

**DISplay,MEMbers**
Displays a summary of information about all registered local applications and systems.

**DISplay,MEMbers,DETail**
Displays detailed information about all registered local applications and systems.

**DISplay,MEMbers,DETail,PORT=portnum**
Displays detailed information about all registered local applications that are bound to the specified port (or system members if PORT=0 is entered).

**DISplay,MEMbers,DETail,TCPname=tcpname**
Displays detailed information about all registered local applications or system members that are associated with the specified TCP/IP address space. The tcpname value must be less than or equal to 8 characters in length.

**DISplay,MEMbers,....,MAX=rems**
Displays member information according to the specified parameters. The number of records (members) displayed is limited by the MAX=rems parameter. The default value is 100. If MAX=* is specified, all members are displayed.

**Enable**
Mark all matching quiesced active registered applications or system members as enabled. The Agent advises the load balancer to route work to the target applications.

**Quiesce**
Mark all matching active registered applications or system members as quiesced. The Agent advises the load balancer not to route work to the target applications.

**Target options:**
Either PORT, TCPNAME, or SYSTEM is required for ENABLE and for QUIESCE.

**PORT=portnum[,PROTOCOL=proto][,IPaddr=ipaddr]**
Mark all active registered target applications or system members using the specified target port as enabled or quiesced. The port number is a decimal value. If more than one application is sharing a port, all the applications are enabled or quiesced. You can further identify the applications to be enabled or quiesced by specifying the TCP or UDP keyword or by specifying the decimal protocol number. TCP is the default. Therefore, if you specify a system member (PORT=0), you must also specify PROTOCOL=0. To uniquely specify one specific application, use the IPADDR option. The port number, protocol, and (optionally) IP address are ANDed.

**TCPName=tcpname**
Mark all active registered target applications and system members associated with this TCP/IP address space as enabled or quiesced. The tcpname value must be less than or equal to 8 characters in length.

**SYStem**
Mark all active registered target applications and system members on this system as enabled or quiesced.

**Example** — Display detailed information about all registered local applications and system members.

</tr>
<tr>
<td>TCPNAME : TCPCS MATCHES : 001 PROTOCOL : UDP</td>
</tr>
</tbody>
</table>
LB INDEX, UUID, GROUP NAME, and IPADDR..PORT
For explanations of these items, see Example 1.

TCPNAME
The name of the Communications Server stack that owns the IP address in this member.

MATCHES
The number of ports on which the application is running. For applications sharing a port, this value can be more than 1. If the value of matches is zero, the Agent found the member's IP address reported by an active TCP/IP stack, but did not find a target application or system. For additional debugging information, see the z/OS Communications Server: IP Diagnosis Guide.

PROTOCOL
The protocol that the target application is using. If the protocol is not TCP or UDP, the decimal number of the protocol is displayed.

FLAGS
The flags that are currently set. Flag values are:

ANY
Indicates that the application is bound to INADDR_ANY or the unspecified IPv6 address (in6addr_any).

DISC
Indicates that the Agent is disconnected from the Advisor. The Agent continues trying to connect to the Advisor. Data displayed when the DISC flag is shown is current TCP/IP data for the last set of targets that were received from the Advisor.

NODATA
Indicates that the Agent is temporarily reporting a Communications Server weight (CS Weight) of 100 for the application. Two update intervals are needed for weight calculation so that the Agent calculates the weight beginning at the second update interval. CS Weight might continue to be reported as 100 at this point if the server is healthy. Configure the update interval in the Advisor configuration file (see the debug_level statement description in the z/OS Communications Server: IP Configuration Reference for details).

SYSQ, TCPQ, or APPQ
Operator quiesce, which means that the operator has requested that no more additional work be assigned to the quiesced application or system member. The different flags reflect the highest level of quiesce command that applies, and also the type of enable command that must be used to enable the application or system member.

SYSQ
Indicates that the application or system member was quiesced with the F procname,QUIESCE,SYSTEM command, and that the F procname,ENABLE,SYSTEM command must be used to enable it.

TCPQ
Indicates that the application or system member was quiesced with the F procname,QUIESCE,TCPNAME=tcpname command, and that the F procname,ENABLE,TCPNAME=tcpname command must be used to enable it.

APPQ
Means that the application or system member was quiesced with the F procname,QUIESCE,PORT= port command, and the F procname,ENABLE,PORT= port command must be used to enable it.

V6
Indicates the IPv6_V6ONLY socket option. It is able to communicate only with IPv6 clients.
JOBNAME
The MVS job name of the target application or system member.

Result: Displays as N/A for system members (port=0 and protocol=0).

ASID
The MVS address-space identifier of the target application or system member.

Result: Displays as N/A for system members (port=0 and protocol=0).

RESOURCE
An identifier that uniquely identifies one instance of an application or system member. If an application is stopped and started, the same job name and ASID could be reused, but with a different resource identifier. The resource identifier is also displayed in the DISPLAY TCPIP,,NETSTAT,CONN command.

Result: Displays as N/A for system members (port=0 and protocol=0).

VARY TCPIP command

Use the VARY TCPIP command from the MVS operator console to display help for a supported command or to control some functions of the address space that corresponds to the started procedure name that was specified on the command. The abbreviated version of the command is the letter V.

This is the general format of the VARY command:

```plaintext
Vary TCPIP, procname, parameter
```

**procmame**
The name of the member in a procedure library that was used to start the server or address space. You can omit the `procname` parameter when you direct the command to a TCP/IP stack address space and only one TCP/IP stack is currently active.

**parameter**
Any of the parameters that are valid for the server.

The following servers or address spaces support the MVS VARY TCPIP command. Not all servers support the same parameters. For further descriptions of the supported parameters, see Table 9 on page 209.

<table>
<thead>
<tr>
<th>Server or address space</th>
<th>Main parameters</th>
<th>Additional information</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP/IP address space</td>
<td>DATTRACE, DROP, EXPORTPROF, OBEYFILE, OSAENTA, PKTTRACE, PURGECACHE, SMCAT, START, STOP, SYNTAXCHECK, SYSPLEX</td>

</tbody>
</table>

Security considerations for the VARY command

You can restrict access to the VARY TCPIP command by defining RACF® profiles under the OPERCMDS class and specifying the list of users that are authorized to issue the VARY TCPIP command. You can decide on the level of control that is appropriate for your installation. For example, you might want to allow a user to be able to start or stop a TCP/IP device using the VARY TCPIP command but you do not want the user to be able to modify the TCP/IP configuration.
The RACF profile names that restrict access to each of the VARY TCPIP commands are listed under each command’s usage notes. You can use the control statements in the sample JCL job that is provided in SEZAINST(EZARACF) to define these profile names.

**Requirement:** CONTROL access to each profile is required to enable you to issue the VARY TCPIP command.

To restrict all of the VARY TCPIP commands, you can define a generic profile as follows:

```
RDEFINE OPERCMDS (MVS.VARY.TCPIP.**) UACC(NONE)
PERMIT MVS.VARY.TCPIP.** ACCESS(CONTROL) CLASS(OPERCMDS)
   ID(USER1)
```

In this example, only user ID USER1 is allowed to issue any VARY TCPIP operator commands. In another example, if you wanted to restrict usage of the VARY TCPIP,,OBEYFILE command to user ID USER2 you could make the following definitions:

```
RDEFINE OPERCMDS MVS.VARY.TCPIP.OBEYFILE UACC(NONE)
PERMIT MVS.VARY.TCPIP.OBEYFILE ACCESS(CONTROL)
   CLASS(OPERCMDS) ID(USER2)
```

**Note:** If you want to restrict the use of the VARY TCPIP,,OBEYFILE command, you must issue RDEFINE OPERCMDS for MVS.VARY.TCPIP and MVS.VARY.TCPIP,OBEYFILE, and issue a subsequent PERMIT defining the specified ID that will have an ACCESS of at least CONTROL for the OPERCMDS class.

The RACF OPERCMDS class must be activated for any of these profiles to take effect. You must also ensure that the appropriate RACF options are specified to enable you to define generic RACF profiles for these profiles. This can be accomplished by the following RACF commands:

```
SETR CLASSACT(OPERCMDS)
SETR GENERIC(OPERCMDS)
SETR GENCMD(OPERCMDS)
SETR RACLIST(OPERCMDS)
```

Before the profiles take effect, a refresh of these RACF profiles might be required. This can be accomplished by the following RACF commands:

```
SETR GENERIC(OPERCMDS) REFRESH
SETR RACLIST(OPERCMDS) REFRESH
```

**VARY command: TCP/IP address space**

The functions listed in Table 10 on page 210 support the VARY TCPIP command when it is directed to a TCP/IP stack address space.

**VARY TCPIP,,DATTRACE**

Use the VARY TCPIP,,DATTRACE command to trace socket data (transforms) into and out of the physical file structure (PFS). For TCP and UDP sockets, this command also creates the following records:

- A Start record with the API Data Flow Starts State field that indicates the first data sent or received by the application for the associated socket.
- An End record with the API Data Flow Ends State field that indicates that the socket is closed.

**Format**

```
Vary TCPIP, procname, DATtrace
```

**TRACE**

```
FULL, JOBNAME=* 
ABBREV=200, JOBNAME=job_name 
IP=*, PORTNum=* 
IPv4_address, SUBNet=255.255.255.255 
IPv6_address, SUBNet=prefixLength 
```

**IPv4_address**

```
ipv4_address, SUBNet=255.255.255.255 
```

**IPv6_address**

```
ipv6_address, /128 
```

**Parameters**

- **procname**
  The name of the member in a procedure library that was used to start the server or address space.

- **ON**
  Turns on socket data tracing, clears all settings previously defined, and refreshes just the default settings.
OFF
Turns off socket data tracing.

ABBREV
Specifies that a truncated portion of the socket data is to be traced. You can specify a length in the range 0 – 65535 or use the default value 200. The ABBREV parameter can be used to reduce the volume of data stored in the trace file.

FULL
Specifies that all of the socket data is to be traced

JOBNAME
Specifies the name of the application address space to be traced. The default (*) is for all jobs.

IP
Specifies an IP address (either a 32-bit IPv4 address in dotted decimal notation, or a 128-bit IPv6 address in colon hexadecimal notation) that is compared with both the source and destination addresses of associated sockets. If either the source or destination address of a socket matches the specified IP address, the data is traced. If the IP option is omitted, or an asterisk (*) is specified, then all IP addresses are traced.

If an IPv6 address is specified, then an optional prefixLength (range 1 – 128) is allowed. IPv4 addresses and IPv6-mapped IPv6 addresses are treated as equivalent addresses. The default prefixLength is 128. If an IPv4 address is specified, then /num_mask_bits can be used. The num_mask_bits and SUBNET are mutually exclusive. An error message is displayed if both are coded.

Note: IP address selection is not recommended for use with DATTRACE.

PORTNUM
Specifies a port number that is compared with the source and destination port numbers of associated sockets. The port number must be an integer in the range 1 – 65535. If either the source or the destination port matches the specified port number, the data is traced. If you omit the PORTNUM option or if you specify an asterisk (*), packets are not filtered based on source or destination ports.

Rule: Packets that use the RAW protocol type are not traced if you specify the PORTNUM option. The PORTNUM parameter applies only to the TCP and UDP protocols.

SUBNET
Specifies a subnet mask that applies to the host and network portions of the IP address specified on the IP=ipv4_address parameter. The subnet mask must be specified in dotted decimal notation and must be specified in conjunction with the IP=ipv4_address parameter. With an IPv4 address specified, the /num_mask_bits can be used. The num_mask_bits and SUBNET are mutually exclusive. An error message is displayed if both are coded.

Examples
You can start data traces for all job names using the VARY command:
• IPv4 addressing: v tcpip,,dat,jobname=*,ip=9.67.113.61/32
• IPv6 addressing: v tcpip,,dat,full,jobname=*,ip=C5::1:2:3:4/126

You can use the Netstat CONFIG/-f command to display data traces. The following example shows a data trace for a single entry.

Data Trace Setting:
Jobname: * TrRecCnt: 00000000 Length: FULL
IpAddr: * SubNet: 255.255.255.255
PortNum: *

The following example shows a data trace for multiple entries:

Data Trace Setting:
JobName: * TrRecCnt: 00000000 Length: FULL
IpAddr/PrefixLen: 10.1.1.1/24
PortNum: *
JobName: * TrRecCnt: 00000000 Length: FULL
Usage

• Users can be authorized to invoke the command by permitting their user IDs for CONTROL access to the RACF profile name MVS.VARY.TCPIP.DATTRACE.

VARY TCPIP,DROP

Use the VARY TCPIP,DROP command to drop a single TCP connection or UDP socket, or to stop all established TCP connections for a specified server. For detailed information about drop processing, see “Netstat DRop/-D command” on page 439.

Restriction: You can use this command only if the MVS.VARY.TCPIP.DROP security product resource profile is defined and the user ID associated with the DROP command is permitted for CONTROL access to this resource.

For dropping a single TCP connection or UDP socket

You can use this command with the connid or CONNECTION parameters to terminate the specific TCP/IP socket endpoint that is identified by its connection number, connid. You can determine the connection number from the Conn column in the Netstat Conn/-c or Netstat TELnet/-t display. This version of the command is the console environment equivalent of the Netstat DRop/-D commands in the TSO and z/OS UNIX environments.

When the command is issued against a socket endpoint, any outstanding or subsequent socket calls that refer to the dropped socket terminate with a negative return code. The socket endpoint that you drop can be a listening TCP server socket endpoint, a fully connected TCP socket (either server or client connection endpoint), or a UDP socket endpoint. When you drop a TCP connection or UDP endpoint, the associated socket does not close. The application that owns the associated socket is responsible for closing the socket.

Tips:

• You can use this command when you do not want to stop the server itself, but only want to drop an individual TCP connection with that server.

• You can use this command to stop old TCP connections if they prevent a server from being restarted. This is sometimes necessary when the server does not enable the SO_REUSEADDR socket option before binding to its well-known port.

If you want to terminate all socket activities from a specific sockets application, terminate the application by using the appropriate mechanism that is provided by the application. This command can have unpredictable results if it is issued against a listening socket or UDP socket. Some applications might not handle the subsequent socket errors as expected. To drop all connections that are associated with a server application without terminating the listening socket, use the form of the VARY DROP command specifying a PORT or JOBNAME, as described in the following information.

Format

```
VARY TCPIP, procname, DRop, CMD=DRop,

CONNection= connid
```

Operator commands and system administration 213
Parameters

**procname**
The identifier of the TCP/IP address space. When the **procname** value is not specified, there can be only one TCP/IP address space started. If more than one TCP/IP address space is available and no **procname** value is specified, the request will fail with an error message.

**CMD=DRop or DRop**
Synonymous syntax for parameter used to drop a connection.

**CONNection=connid or connid**
The **connid** value is a required parameter. It can be specified by itself or as the value of the **CONNECTION** parameter. Issue the Netstat **Conn/-c** command or the **DISPLAY TCPIP,,NETSTAT,CONN** command to obtain the connection identifier for the TCP/IP socket connection that you want to drop.

For dropping all TCP connections associated with a TCP/IP server

You can drop all TCP connections associated with a TCP/IP server using the **VARY TCPIP,,DROP** command by specifying filter parameters to identify the server whose TCP connections are to be terminated. If more than one server matches the filter criteria, you must specify additional parameters (for example, **JOBNAME** and **ASID**) to identify which TCP connections of the server will be dropped. When a TCP connection is dropped, the associated socket does not close. The application that owns the associated socket is responsible for closing the socket. The following message is issued to indicate that the command has completed processing:

```
EZD2013I numconn CONNECTIONS WERE SUCCESSFULLY DROPPED
```

**Tip:** Shut down the server before issuing this command to prevent new connections from using this server. For Sysplex Distributor connections, you can issue a **VARY TCPIP,,SYSPLEX,QUIESCE** command. For Load Balancing Advisor (LBA) connections, issue a **MODIFY LBAGENT,QUIESCE** command.

**Format:**

```
Vary TCPIP,, procname, CMD=DRop,
```

```
POrt=portnum
```

```
JOBNAME=jobname
```

```
ASID=asid
```

Parameters:

**procname**
The identifier of the TCP/IP address space. When the **procname** value is not specified, there can be only one TCP/IP address space started. If more than one TCP/IP address space is available and no **procname** value is specified, the request will fail with an error message.

**CMD=DRop or DRop**
Synonymous syntax for parameter that is used to drop a connection.

**POrt=portnum**
The port number parameter is an integer in the range 1- 65535.

Servers that are bound to this port number will have all their TCP connections reset. If the **portnum** value specifies a port that has more than one instance of a server bound to it with either a different **jobname** or **asid** value, then either the **JOBNAME** value, or the **JOBNAME** and **ASID** values must be specified to identify a unique server instance for which connections will be dropped.
**JOBNAME=jobname**

The *jobname* value specifies the MVS job name of the server with which the Drop command is to be associated.

- If the JOBNAME parameter is specified without the PORT keyword, then all servers with this *jobname* value will have their TCP connections dropped regardless of the port they are bound to.
- If the *jobname* value specifies a job name that has more than one instance of a server with that job name but that has a different *asid* value, then the ASID parameter must also be specified and all server instances that have a matching job name and address space ID will have their TCP connections dropped, regardless of the port they are using.
- The environment in which the server runs determines the job name that is to be associated with a particular server application.
- The *jobname* value can be up to 8 characters in length.

**ASID=asid**

The *asid* value specifies the hexadecimal address space ID associated with the server whose TCP connections are to be dropped. If more than one instance of that application is found and the *jobname* value is not unique, you must specify an *asid* value to drop TCP connections for all server instances that match this job name and *asid* value.

**Examples**

The following examples are about dropping TCP/IP socket connections.

- The first example is directed to a TCP/IP address space started by the identifier TCPIP, and demonstrates how to drop a TCP connection number 5001:
  ```
  VARY TCPIP,,CMD=DROP,CONNECTION=5001
  ```
- The next example assumes there is only one TCP/IP address space and demonstrates how to drop a UDP connection number 6001:
  ```
  VARY TCPIP,,CMD=DROP,CONNECTION=6001
  ```
- This example indicates how to drop all the TCP connections associated with a server listening on port 75, with job name JOBSRVR1:
  ```
  VARY TCPIP,,CMD=DROP,PORT=75,JOBNAME=JOBSRVR1
  ```
- This example indicates how to drop all the TCP connections associated with a server listening on port 75, with job name JOBSRVR1 in address space 15:
  ```
  VARY TCPIP,,CMD=DROP,PORT=75,JOBNAME=JOBSRVR1,ASID=15
  ```
- This example indicates how to drop all the TCP connections associated with a server with job name JOBSRVR1 in address space 15, regardless of port:
  ```
  VARY TCPIP,,CMD=DROP,JOBNAME=JOBSRVR1,ASID=15
  ```

**VARY TCPIP,,EXPORTPROF**

Use the `VARY TCPIP,,EXPORTPROF` command to export a TCP/IP stack profile for use with the IBM Configuration Assistant for z/OS Communications Server. The exported profile is saved in a z/OS UNIX file that is created by the `VARY TCPIP,,EXPORTPROF` command. You can then use the IBM Configuration Assistant for z/OS Communications Server to import the profile. This provides an easy method of defining your existing TCP/IP stack profile to the IBM Configuration Assistant for z/OS Communications Server. After you import the TCP/IP stack profile, you can use the IBM Configuration Assistant for z/OS Communications Server to modify the profile.

The command can be directed to any TCP/IP stack that has file access to the TCP/IP profile data set, including INCLUDE data sets, that you want to export.
**Requirements:**

- The TCP/IP stack must be running a release of z/OS Communications Server that supports all statements in the profile.
- If the profile you are exporting contains MVS system symbols, you must run the `VARY TCPIP,,EXPORTPROF` command on the same MVS image as the stack whose configuration you are exporting to ensure that correct system symbol values are imported.

Because the command does not update the profile of the stack to which it is directed, the command processing does not affect the system operation or network configuration. However, normal TCP/IP configuration syntax checking is performed for the profile statements and the command will stop processing if syntax errors are encountered.

**Rules:**

- You must invoke this command on the z/OS release that is required for the statements and parameters that are specified in the profile data set.
- Because the command stops if syntax errors are encountered, you might need to invoke the command several times until all syntax errors have been resolved.
- Ensure that statements, parameters, and comments in the profile data set adhere to the syntax rules and restrictions that are described in the introduction to Statement syntax for configuration statements in z/OS Communications Server: IP Configuration Reference.

**Guideline:** If you defined the resource profile MVS.VARY.TCPIP.EXPORTPROF in class OPERCMDS, authorize users to invoke the command by granting their user IDs CONTROL access to the resource profile.

**Results:**

- If the command is successful, the file that contains the exported profile is created.
- The command does not detect and report conflicts with the profile of the stack to which it is directed.
- The command itself can not detect logical profile errors, but the IBM Configuration Assistant for z/OS Communications Server ensures that the profile is valid when it imports the profile.
- For profile statements that support entries of configured values, for example, BEGINROUTES and NETACCESS, all duplicate entries are created in the exported profile. After the profile is imported into the IBM Configuration Assistant for z/OS Communications Server, duplicate entries will be displayed with a Status of Incomplete. You must review the duplicate entries and decide which entry you want to retain. You must manually delete the other duplicate entries to complete the configuration.

**Command-specific syntax errors**

The following additional syntax errors are specific to the `VARY TCPIP,,EXPORTPROF` command:

- `GLOBALCONFIG SEGMENTATIONOFFLOAD` and `NOSEGMENTATIONOFFLOAD` parameters
  
  Because the `SEGMENTATIONOFFLOAD` and `NOSEGMENTATIONOFFLOAD` parameters are deprecated on the `GLOBALCONFIG` profile statement, these parameters are accepted only on the `IPCONFIG` profile statement.
- `IPCONFIG` or `IPCONFIG6` `TCPSTACKSOURCEVIPA` parameter
  
  If the `TCPSTACKSOURCEVIPA` parameter is specified on the `IPCONFIG` or `IPCONFIG6` profile statement, the `SOURCEVIPA` parameter must also be specified on the statement.
- `SMFCONFIG` profile statement
  
  You can not specify both the `TYPE118` and `TYPE119` parameters on this statement. The IBM Configuration Assistant for z/OS Communications Server does not support configuring both types of SMF records.
- `SMFPARMS` profile statement
  
  This statement is not supported. You must convert the SMF record specifications on this statement to parameters on the `SMFCONFIG` profile statement.
• TRANSLATE profile statement
  This statement is not supported and must be removed from the profile that is being exported.
• Profile statements with no entries
  For the following profile statements that support entries, a specification of the statement without any entries is treated as a syntax error:
  – AUTOLOG
  – BEGINROUTES
  – BSDROUTINGPARMS
  – DEFADDRTABLE
  – HOME
  – IPSEC
    A syntax error is generated for this statement only if no rules are defined and no global parameters, such as DVIPSEC or LOGENABLE, are specified.
  – NETACCESS
  – SRCIP
  These statements must be removed from the profile that is being exported.

Variations on normal profile statement support

The **VARY TCPIP,,EXPORTPROF** command processes the following profile parameters differently than normal TCP/IP configuration processing does.

• HOME statement and SOURCEVIPA considerations
  The **VARY TCPIP,,EXPORTPROF** command only creates SOURCEVIPA information from the HOME statement in the exported profile if IPCONFIG SOURCEVIPA has been specified.
  **Requirement:** If the HOME statement contains static VIPA IP addresses that you want to be used as the source IP addresses for real interfaces, you must specify IPCONFIG SOURCEVIPA in the profile specified on the **VARY TCPIP,,EXPORTPROF** command.

• IPCONFIG ARPTO parameter
  The value of the IPCONFIG ARPTO parameter is converted from seconds to minutes and rounded up. This is because the IBM Configuration Assistant for z/OS Communications Server only supports a value in units of minutes.

• SACONFIG DISABLED parameter
  If the DISABLED parameter is specified on an SACONFIG profile statement, all the other parameters on the statement are ignored. In contrast, the normal TCP/IP configuration processing saves the values of the other parameters, so that they are in effect the next time that the TCP/IP subagent is enabled.

Ignored profile statements and parameters

The **VARY TCPIP,,EXPORTPROF** command ignores the following profile statements or parameters because the IBM Configuration Assistant for z/OS Communications Server does not support them. Message EZZ0405I is issued to indicate this.

• BSDROUTINGPARMS
  The TRUE/FALSE, cost_metric, and dest_addr parameters are ignored for all interfaces. The mtu and subnet_mask parameters are supported for IPAQENET and IPAQIDIO interfaces that are defined by DEVICE and LINK profile statements, and ignored for all other interfaces.

• DELETE

• INTERFACE
  – For LOOPBACK6 interfaces, the DELADDR and DEPRADDR parameters are ignored.
– For interfaces other than LOOPBACK6, the DELETE, ADDADDR, DELADDR, DEPRADDR, ADDTEMPPREFIX, and DELTEMPPREFIX parameters are ignored.

• ITRACE
• OSAENTA
• PKTTRACE
• STOP
• VIPADYNAMIC
  – VIPADELETE
  – VIPADISTRIBUTE DELETE
  – VIPARANGE DELETE
  – VIPAROUTE DELETE

### Exported profile file

The **VARY TCPIP,,EXPORTPROF** command saves the exported profile in a z/OS UNIX file in the /var/exportprof directory. The command issues message EZZ0070I that provides the file name. The file name is in the following format:

```
<systemname>.<stackname>.<timestamp>
```

where:

• **systemname** is the MVS system name on which the command executed.
• **stackname** is one of the following values:
  – The name that is specified as the optional TCP/IP stack name parameter on the command.
  – The name of the TCP/IP stack to which the command was directed, if no stack name was specified on the command.
• **timestamp** is the time that the file was created, in the format of YYYY.MM.DD.HH.MM.SS. The HH value for hours is based on a 24-hour clock.

The command creates the directory and the files under the TCP/IP stack's z/OS UNIX uid and gid, and sets the following file access permission bits values:

• **/var/exportprof**
  
The command creates the directory with a file access permission bits value of 660 (-rw-rw----).
• **z/OS UNIX files**
  
The command creates each z/OS UNIX file with a file access permission bits value of 640 (-rw-r-----).

In a CINET environment, the z/OS UNIX uid and gid values that you assign to the TCP/IP stacks must ensure that all stacks can access the directory.

### Exported profile organization

In the exported profile, the profile statement information is normally grouped under the data set that contains the profile statements except for the following interface configurations:

• Network interfaces that are configured by DEVICE profile statements

For network interfaces that are configured by DEVICE profile statements, you must also specify the corresponding LINK and HOME profile statements to completely define the interface. For these interfaces, all the profile information is grouped under the data set in which the DEVICE statement was specified. This applies to the following profile statements for the network interface:

– LINK
– HOME
• Network interfaces that are configured by INTERFACE profile statements

If a START profile statement was specified for the INTERFACE name in one of the profile data sets, the START specification is grouped under the data set in which the INTERFACE statement was specified.

**Format**

\[
\text{Vary } \text{TClPiP} , \quad \text{EXPOrtprof} , \quad \text{datasetname}
\]

**Parameters**

**proname**

The 1 to 8 character identifier of the TCP/IP stack to which the command is directed. If the *proname* value is not specified, only one TCP/IP address space can be started. If more than one TCP/IP address space is available and no *proname* value is specified, the request fails with an error message.

**Rule:** This stack must support the VARY TCPIP,,EXPORTPROF command and the statements in your profile.

**EXPORTPROF**

Specify this parameter to export a TCP/IP stack profile for use with the IBM Configuration Assistant for z/OS Communications Server. Specify your profile statements in the data set specified by the *datasetname* value.

**datasetname**

The name of the base data set that contains the TCP/IP profile statements that you want to export. The *datasetname* value must be a cataloged and fully-qualified data set name that is specified without any quotation marks. The *datasetname* value can be either a sequential data set or a member of a partitioned data set (PDS).

**Result:** Export processing includes profile statements that are specified on any INCLUDE statements.

**profile_stack**

The 1 to 8 character identifier of the TCP/IP stack that owns the profile that is being exported. If this optional parameter is specified, the value is used as the stackname qualifier in the name of the output z/OS UNIX file.

**Examples**

The following example directs the command to TCP/IP stack TCPIP1 and is invoked on MVS system, MVS1. The command exports the TCP/IP stack profile in data set SYS1.TCPPARMS(TCPIP). The optional name of the TCP/IP stack that owns the profile is not specified:

```
VARY TCPIP,TCPIP1,EXPO,SYS1.TCPPARMS(TCPIP)
EZZ0060I PROCESSING COMMAND: VARY TCPIP,TCPIP1,EXPO,SYS1.TCPPARMS(TCPIP)
EZZ0067I VARY EXPORTPROF COMMAND BEGINNING
EZZ0300I OPENED INCLUDE FILE 'SYS1.TCPPARMS(PORT)'
EZZ0300I OPENED INCLUDE FILE 'SYS1.TCPPARMS(INTFS)'
EZZ0300I OPENED EXPORTPROF FILE 'SYS1.TCPPARMS(TCPIP)'
EZZ0309I PROFILE PROCESSING BEGINNING FOR 'SYS1.TCPPARMS(TCPIP)'
EZZ0309I PROFILE PROCESSING BEGINNING FOR SYS1.TCPPARMS(PORT)
EZZ0316I PROFILE PROCESSING COMPLETE FOR FILE 'SYS1.TCPPARMS(PORT)'
EZZ0309I PROFILE PROCESSING BEGINNING FOR 'SYS1.TCPPARMS(TCPIP)'
EZZ0309I PROFILE PROCESSING COMPLETE FOR FILE 'SYS1.TCPPARMS(PORT)'
EZZ0316I PROFILE PROCESSING COMPLETE FOR FILE 'SYS1.TCPPARMS(TCPIP)'
EZZ0070I VARY EXPORTPROF COMMAND CREATED EXPORT FILE: MVS1.TCPIP1.2016.03.20.18.30.04
```
In this example, the exported profile is saved in z/OS UNIX file /var/exportprof/MVS1.TCPIP1.2016.03.20.18.30.04.

**VARY TCPIP,,OBEYFILE**

Use the VARY TCPIP,,OBEYFILE command to update TCP/IP profile configuration statements to make temporary dynamic changes to the system operation and network configuration without stopping and restarting the TCP/IP address space.

**Guidelines**

Before activating new configuration statements with the VARY TCPIP,,OBEYFILE command, use the VARY TCPIP,,SYNTAXCHECK command to verify that the configuration statements specified by the DSN= or datasetname parameter are free of syntax errors. For information about the VARY TCPIP,,SYNTAXCHECK command, see “VARY TCPIP,,SYNTAXCHECK” on page 243.

See the z/OS Communications Server: IP Configuration Reference for information about how different parameter updates take effect with Obeyfile processing.

**Format**

```
Vary TCPIP,,Obeyfile, CMD=Obeyfile, datasetname DSN= datasetname
```

**Parameters**

**procname**

The identifier of the TCP/IP address space. When the proname value is not specified, there can be only one TCP/IP address space started. If more than one TCP/IP address space is available and no proname value is specified, the request will fail with an error message.

**CMD=OBEYFILE or OBEYFILE**

Specify this parameter to make temporary dynamic changes to the system operation and network configuration without stopping and restarting the TCP/IP address space. These changes are in effect until the TCP/IP cataloged procedure is started again or until another VARY OBEYFILE overrides them. Put your changes in the data set specified by the datasetname value. You can maintain different data sets that contain a subset of the TCP/IP configuration statements and activate them while TCP/IP is running.

**DSN=datasetname or datasetname**

The datasetname value is required after specifying the OBEYFILE parameter. The datasetname value is the name of a data set that contains TCP/IP profile configuration statements. The datasetname value must be a cataloged and fully-qualified data set name that is specified without any quotation marks. The datasetname value can be either a sequential data set or a member in a PDS. The datasetname value cannot be a z/OS UNIX file. The DSN= parameter cannot be a z/OS UNIX file or a TCPIP.DATA data set. For more information about updating TCPIP.DATA configuration statements, see the information about dynamically changing TCPIP.DATA statements in z/OS Communications Server: IP Configuration Reference.

**Examples**

The following examples are about updating system operation and network configuration information without stopping and restarting the TCP/IP address space.
The first example is directed to a TCP/IP address space started by the identifier TCPPROC, and assumes the sequential data set USER99.TCPIP.OBEYFIL1 contains TCP/IP profile configuration statements:

```
VARY TCPIP,TCPPROC,CMD=OBEYFILE,DSN=USER99.TCPIP.OBEYFIL1
```

The next example assumes there is only one TCP/IP address space and that OBEYFIL2 is a member of the PDS USER99.TCPIP and contains TCP/IP profile configuration statements:

```
VARY TCPIP,,O,USER99.TCPIP(OBEYFIL2)
```

**Usage**

**Tip**

Users can be authorized to invoke the command by permitting their user IDs for CONTROL access to the RACF profile name MVS.VARY.TCPIP.OBEYFILE.

**VARY TCPIP, OSAENTA**

Use the VARY TCPIP,OSAENTA command to control the OSA-Express network traffic analyzer (OSAENTA) tracing facility in the OSA-Express adapter. You can use this command to select frames as candidates for tracing and for subsequent analysis. OSAENTA traces are recorded externally using the TRACE command. See the z/OS Communications Server: IP Diagnosis Guide for information about the steps required to perform an OSAENTA trace.

The OSAENTA command consists of two parts.

- The first part defines the OSA that is to be traced and the characteristics of the tracing.
- The second part turns tracing on or off, or clears the trace settings.

The tracing characteristics are identified by filters that specify under which conditions a frame should be traced. A frame must meet all of the conditions specified on the OSAENTA commands for it to be traced. For example, if the OSAENTA command identifies PROTOcol=TCP and PORTNum=21, then only IP packets that have both a protocol of TCP and a port number of 21 are traced. Only one value can be specified for a given filter each time the OSAENTA command is issued.

Multiple OSAENTA commands can be included in a profile data set and can control tracing for multiple OSAs. The filters on multiple OSAENTA commands are cumulative for a given OSA. As each OSAENTA command is issued with filters, those filters are added to the filters that are already in effect for that OSA. By using multiple OSAENTA commands, multiple filter values can be assigned to each filter. There is a limit of eight filter values for each filter for each OSA. For example, you can specify up to eight IP protocols, up to eight VLAN IDs, and so on. For IP addresses, you can specify up to eight IPv4 addresses and up to eight IPv6 addresses. If a frame matches any of the values for that filter, it meets the condition of that particular filter. For example, if you specify IPaddr=9.67.1.1, PROTOcol=TCP, and PORTNum=21 on one OSAENTA command for OSA1, and you specify IPaddr=9.67.1.2 on another OSAENTA command for OSA2, then all frames sent to either IP address 9.67.1.1 or 9.67.1.2 with a protocol of TCP and a port number of 21 are traced.

The OSAENTA command dynamically defines a QDIO interface to the OSA-Express adapter being traced, called an OSAENTA interface. That interface is used exclusively for capturing OSA-Express network traffic analyzer traces.

**Security Rule:** The OSAENTA command enables an installation to trace data from other hosts connected to an OSA. The trace data collected should be considered confidential and TCPIP system dumps and external trace files that contain this trace data should be protected. The OSAENTA command is protected by the operating system security product. The name of the protected OPERCMDS resource is MVS.VARY.TCPIP.OSAENTA.

**Tips:**

- You can specify the parameters for this statement in any order.
- If a keyword on a given command is specified multiple times, the last value specified is used.
• If an error is found while parsing the OSAENTA command, an error message is generated and the command is ignored.

**Format**

\[
\text{Vary TCPIP procname, OSAENTA Command}
\]

Command

\[
, PORTNAME= osa_port_name, ON OFF DEL
\]

Trace Parameters

\[
, ABBREV = abbrev_length, FULL, CLEARfilter
\]

\[
, DATA= trace_amount, DISCARD=EXCEPTION
\]

\[
, FRAMES= trace_count
\]

\[
, TIME= trace_time
\]

Protocol Type

\[
222 z/OS Communications Server: IP System Administrator's Commands
\]
IP Address

Packet Port

Device Identifier

Ethernet Type

MAC Address

VLAN ID
Notes:

1 Each option can be specified only once. The order of options is not important.
2 You must also issue the MVS TRACE command for component SYSTCPOT to activate the OSAENTA trace. See the z/OS Communications Server: IP Diagnosis Guide for details.

Parameters

procname
The identifier of the TCP/IP address space. When the procname value is not specified, there can be only one TCP/IP address space started. If more than one TCP/IP address space is available and no procname value is specified, the request fails with an error message.

OSAENTA
Specifies that this command is for OSAENTA information.

PORTNAME=osa_port_name
Specifies the name of the OSA port for which tracing is needed. This is the same port name that is defined on the VTAM TRLE statement PORTNAME keyword. This parameter is required. Specifies the name of the OSA port for which tracing is required. This is the same port name that is either defined on the VTAM TRLE statement PORTNAME keyword or is dynamically created by VTAM for OSX interfaces (configured with the CHPID parameter) or for OSM interfaces. This parameter is required. For more information about OSM and OSX interfaces, see TCP/IP in an intra ensemble network in z/OS Communications Server: IP Configuration Guide.

Tip:
• You are not required to also define OSA-Express to TCP/IP using the DEVICE/LINK or INTERFACE statement or activate it on the tracing stack in order to collect trace data from other stacks using that OSA-Express. For an OSX interface configured with the CHPID parameter or for an OSM interface, specify the port name according to the VTAM naming convention for these dynamic TRLEs, and VTAM will dynamically create the TRLE when you activate the OSAENTA interface. For details about the naming convention for these dynamically generated TRLEs, see Defining an OSA-Express device to z/OS Communications Server using QDIO in z/OS Communications Server: SNA Network Implementation Guide.

Restriction: Multiple stacks cannot use the tracing function concurrently for a given OSA.

FULL
Specifies that the entire frame is to be traced, if possible. (An OSA might limit the amount of data that is actually traced.)

ABBREV={abbrev_length|224}
Specifies the amount of data that is to be traced for each frame.
• You can specify a data length in the range 64–65472 or use the default value 224. The value is rounded up to the next 32 byte boundary.
• The ABBREV parameter can be used to control the volume of data stored in the trace buffers and file.
• The actual amount of data traced might be limited by the OSA.

Guideline: Use a large value or the FULL parameter if you want to maximize the amount of data traced for each packet because TCP segmentation offload packets are traced before the packet is segmented and can be larger than the largest frame size on the LAN. See TCP segmentation offload in the z/OS Communications Server: IP Configuration Guide for information about which parameters affect the size of TCP segmentation offload packets.

Restriction: Many OSA models limit the amount of data recorded to 120 bytes. The OSAENTA command accepts a larger size (or FULL) without any errors, but the actual trace entries are as if ABBREV=120 is specified.

CLEARFILTER
Clears any previous OSAENTA trace filters for the port specified by the osa_port_name value.
**Guideline:** If you specify the CLEARFILTER parameter and the OSAENTA interface is active, either all are frames traced or no frames are traced, depending on the setting of the NOFILTER parameter.

**Tip:** The CLEARFILTER parameter clears all filters. To clear all values for a single filter, use the OSAENTA command and specify an asterisk (*) for the filter that you want to use.

**DATA={trace_amount|1024}**
Specifies the number of megabytes (MB) of data to be collected before stopping the trace.

- The minimum value is 1 MB
- The default value is 1024 MB
- The maximum value is 2,147,483,647 MB

If a value of 0 is specified, then the maximum value is set.

**Result:** If the OSAENTA interface is inactive, then the limit specified by the DATA parameter takes effect when the OSAENTA trace is enabled with the ON parameter. If the OSAENTA interface is active and the DATA parameter value is modified, then the stack resets the data counter to 0 and puts the new DATA limit into effect.

**DEL**
Removes the OSAENTA interface definition. The OSAENTA interface must be inactive for you to specify the DEL parameter. To deactivate the OSAENTA interface, you can respecify the OSAENTA statement with the OFF parameter, or use the VARY TCPIP,,OSAENTA command with the OFF parameter.

**DEVICEID={device_id|*}**
Specifies the 8-digit hexadecimal value that identifies a host that is sharing the OSA. This value is in the form csmfclua where the digits have the following values:

- cs – The channel subsystem ID for this datapath device.
- mf – The LPAR multiple image facility ID for the LPAR using this datapath device.
- cl – The control unit logical identifier for this datapath device.
- ua – The unit address for this datapath device.

Each identifier is a 2-digit hexadecimal value in the range 00–FF.

If the frame was either inbound or outbound to the host that is identified by the device_id value, then the frame meets the criteria for this filter. If the DEVICEID option has been omitted or if an asterisk (*) is specified, then all packets meet the criteria for this filter.

**Tip:** You can obtain the device_id values for any user of the OSA by using the hardware management console (HMC). For a datapath device that is active on a z/OS stack, you can obtain the device_id value for that datapath device from message IST2190I of the output from the DISPLAY NET,TRL,TRLE= command.

**DISCARD={ALL|EXCEPTION|NONE|discard_code}**
Specifies which frames that were discarded by the OSA-Express device should be traced. Discarded frames include frames that the OSA-Express device could not transmit outbound or could not forward inbound. Discarded frames that match the DISCARD= setting are traced whether they match any filters that are in effect or not.

**ALL**
All frames discarded by the OSA-Express device are traced. This includes both exception conditions and more expected discards, such as ARP packets received for non-registered IP addresses or packets for non-supported Ethernet types.

**EXCEPTION**
Frames discarded by the OSA-Express device for exception conditions are traced. These are frames that are typically discarded for anomalous conditions. See the following examples of anomalous conditions:

- An inbound IP packet destined for an IP address that is not registered with the OSA-Express device and no PRIROUTER or SECROUTER parameter is in effect.
• An outbound IP packet that could not be delivered because no storage was available within the OSA-Express device.

NONE
No discarded frames are traced.

discard_code
Frames discarded for the reason specified by the discard_code value are traced. Use this option only under the direction of IBM Service personnel. Values in the range 1-4087 are accepted. Up to eight discard codes can be active for one OSA-Express device.

Rule: As with filters, the DISCARD keyword can be specified on multiple OSAENTA statements. The ALL and NONE options reset any previous DISCARD values that are in effect; the EXCEPTION option or a discard code resets a current setting of ALL or NONE. EXCEPTION and discard_code options are cumulative for a given OSA. If EXCEPTION and discard_code options are specified on multiple OSAENTA statements, all frames discarded for exception conditions and all frames discarded for any of the discard codes that are in effect are traced. When the EXCEPTION option is in effect, a limit of seven discard codes can be active for one OSA-Express device.

Result: A frame can be traced twice; once when the packet is passed to the OSA-Express device, and again as a dropped packet during the processing of the packet.

Guideline: To reset the current set of active discard codes, specify the value DISCARD=ALL or DISCARD=NONE followed by OSAENTA statements with the required DISCARD options that you want to specify.

ETHType={IPV4|IPV6|ARP|SNA|ethernet_type|*}
Specifies the Ethernet frame type to be traced. This can be specified as one of the literals IPV4, IPV6, ARP, SNA, or as a hexadecimal number in the range 0600–FFFF (IPV4=0800, IPV6=86DD, ARP=0806, and SNA=80D5). If the ETHType parameter has been omitted or if an asterisk (*) is specified, then all packets meet the criteria for this filter.

FRAMES={trace_count|2147483647}
Specifies the number of frames to be recorded before tracing is stopped. The minimum value is 100 frames. The maximum value is 2147483647 frames. If the value 0 is specified, then the maximum value is set.

Result: If the OSAENTA interface is inactive, then the FRAMES parameter limit takes effect when the OSAENTA trace is enabled with the ON parameter. If the OSAENTA interface is active and the FRAMES parameter value is modified, then the stack resets the frame counter to 0 and puts the new FRAMES parameter limit into effect.

IPaddr={ipv4_address[/num_mask_bits]|ipv6_address[/prefix_length]|*}
Specifies an IP address (either a 32-bit IPv4 address in dotted decimal notation, or a 128-bit IPv6 address colon hexadecimal notation) to be compared with both the source and destination addresses of inbound and outbound packets. If either the source or the destination address of a packet matches the specified IP address, the frame meets the criteria for this filter. If the IPaddr option is omitted or if an asterisk (*) is specified, then all packets meet the criteria for this filter. If the IPaddr filter is specified, then only frames that contain IP packets or ARP packets are subject to tracing.

If an IPv4 address is specified, then you can specify a /num_mask_bits value in the range 1–32 to designate a subnet. The default number of bits is 32.

If an IPv6 address is specified, then you can specify an optional prefix_length value in the range 1–128. The default prefix_length value is 128.

MAC={mac_address|*}
Specifies the 12 hexadecimal digits of the MAC address. The address is compared with both the source and destination MAC addresses of both inbound and outbound frames. If either the source or destination address of a frame matches the specified MAC address, the frame meets the criteria for this filter. If the MAC option has been omitted or if an asterisk (*) is specified, then all packets meet the criteria for this filter.
NOFILTER=ALL|NONE
Specifies the filtering behavior when all filters (DEVICEID, MAC, ETHTYPE, VLANID, IPADDR, PROTOCOL and PORTNUM) have been cleared or are inactive. This condition can exist if no filters have been specified, if CLEARFILTER is specified, or when the current setting for every filter is set to an asterisk (*). When the NOFILTER=ALL setting is in effect, all packets are traced. When the NOFILTER=NULL setting is specified, no packets are traced. The NOFILTER parameter applies only to packets that were not discarded by the OSA-Express device. The DISCARD parameter controls tracing of discarded packets.

Guideline: If you clear filters using the CLEARFILTER parameter with the OSAENTA interface active, and specify NOFILTER=ALL, ensure that you also specify sufficient new filters. The trace buffers are likely to fill up quickly if you clear all filters without setting new filters to filter out an adequate percentage of the packets.

OFF
Disables OSA tracing for the port specified by the *osa_port_name* value by stopping the OSAENTA interface. The trace parameters and filters remain in effect if the OSAENTA trace is subsequently re-enabled.

ON
Enables OSA tracing for the port specified by the *osa_port_name* value by starting the OSAENTA interface using the OSAENTA trace parameters and filters that are currently in effect. If the OSAENTA interface is already active, then the ON keyword causes the stack to reset the active counters on the DATA, FRAMES, and TIME parameter limits.

Guideline: Ensure that you have specified sufficient trace filters before starting the trace. The trace buffers are likely to fill very quickly if you activate the trace with no filters or with a set of filters that does not filter a significant percentage of the packets.

PORTNum={port_number | *}
Specifies a port number in the range 1–65535. The port number is compared with the destination or source port of both inbound and outbound packets. If the port of a packet is the same as the specified port number, then the frame meets the criteria for this filter. This comparison is performed only for packets using either the TCP or UDP protocol; frames using other protocols are not traced when a port filter is in effect. If the PORTNum parameter is omitted or if an asterisk (*) has been specified, then all packets meet the criteria for this filter. If the port filter is used, only frames containing IP packets are subject to tracing.

IPSec Encapsulating Security Payload (ESP) packets cannot be traced by specifying a port number because the TCP or UDP headers are encrypted.

PROTOCOL={TCP|UDP|ICMP|ICMPV6|protocol_number | *}
Specifies the IP protocol type to be traced. This can be specified as one of the literals TCP, UDP, ICMP, ICMPV6, or as a number in the range 0–255 (ICMP=1, TCP=6, UDP=17, ICMPV6=58). If the PROTOCOL parameter is omitted or if an asterisk (*) has been specified, then all packets meet the criteria for this filter. If a PROTOCOL value is specified and the frame does not contain an IP protocol packet, then the frame is not traced. If the PROTOCOL filter is used, only frames containing IP packets are subject to tracing.

Rule: For encapsulated packets, OSAENTA collects packets based on whether the specified protocol filter matches the outermost packet protocol. For example, if you specify TCP as the protocol filter and a TCP packet is received that is encapsulated in an IPSec packet with protocol 50, this TCP packet is not collected. You must specify Protocol 50 to collect these packets.

TIME={trace_time | 10080}
Specifies the number of minutes that trace records are recorded before stopping. The minimum value is 1 minute. The maximum value is 10 080 minutes (7 days). If a value 0 is specified, then the maximum value is set.

Result: If the OSAENTA interface is inactive, then the TIME parameter limit takes effect when the OSAENTA trace is enabled with the ON parameter. If the OSAENTA interface is active and the TIME parameter value is modified, then the stack resets the time counter to 0 and puts the new TIME parameter limit into effect.
VLANID={vlan_id*|ALL}

Specifies a VLAN identifier value, which is a decimal number in the range 0–4094. The ALL keyword specifies that all frames that have a VLAN tag are included. If the VLANID parameter has been omitted or if an asterisk (*) is specified, then all frames meet the filter criteria. If a VLAN identifier is specified and the frame does not contain a VLAN tag or does not match the VLAN identifier, then the frame is not traced.

The OSAENTA statements are cumulative for a given OSA-Express adapter, and any subsequent OSAENTA statement processed adds to the filters that are already in effect for that OSA. To actually change a value for a given filter, several options are available:

• Define an OSAENTA statement with a filter value specified by an asterisk (*), effectively deleting all values for that one filter entirely. Then define subsequent OSAENTA statements with the new filter values.

• Define an OSAENTA statement with the CLEARFILTER parameter, which removes all existing filters, and subsequently specify the entire list of filter attributes that you want to use.

Tip: If the trace is currently enabled, the trace continues to run while each filter is modified or added. This can become an issue when changing a value for a given filter as previously described. Because both options involve deleting current filters, more data than you want is being traced during this time. For a more efficient trace, first disable the trace (define an OSAENTA statement with the OFF parameter) before changing filter values.

Examples

To trace all the packets for a particular application port, enter the following OSAENTA command:

VARY TCPIP,,OSAENTA,PORTNAME=osa4,ON,PORTNUM=21

Usage

• You can use the Netstat DEVlinks/-d command to display the current OSAENTA trace settings.

• When the DATA, FRAMES, or TIME values are exceeded, the stack disables the OSAENTA trace, but this does not happen immediately. Trace records from the OSA continue to be recorded until the stack has successfully contacted the adapter to stop the OSAENTA trace.

• To verify that the Ctrace component SYSTCPOT is active for a stack, issue DISPLAY TRACE,COMP=SYSTCPOT,SUB=(tcpip_procname)

• To write the data to the external writer, use the MVS TRACE,CT,WTRSTART=writer_procedure command to start the writer and the TRACE CT,ON,COMP=SYSTCPOT,SUB=(tcpip_procname) command to connect to the writer.

• The last buffer trace data are not written to the external writer until the writer has been disconnected from TCP/IP and stopped.

• The TRACE CT,OFF,COMP=SYSTCPOT,SUB=(tcpip_procname) command stops the recording of trace data into TCP/IP buffers and to the external writer. It does not stop the receipt of trace data from the OSA. A TRACE ON command is required to start recording of the trace data into the buffers. To halt the receipt of trace data from the OSA, specify the OSAENTA statement with the OFF parameter, or use the VARY TCP/IP,OSAENTA command with the OFF parameter.

• Users can be authorized to invoke the command by permitting their user IDs for CONTROL access to the RACF profile name MVS.VARY.TCPIP.OSAENTA.

The following differences exist between OSAENTA and PKTtrace:

• The PKTTRACE command can collect only data for a single TCPIP stack. The OSAENTA command can collect data for other stacks sharing the OSA.

• The PKTtrace data collection starts immediately. The OSAENTA data collection is not started until the ON parameter is used.

• Each PKTtrace command or statement is one set of filters. OSAENTA command filters accumulate across multiple OSAENTA commands or statements.
**VARY TCPIP,PKTTRACE**

Use the PKTTRACE command to control the packet tracing facility in TCP/IP. You can use this command to select IP packets as candidates for tracing and subsequent analysis.

**Restriction:** An IP packet must meet all the conditions that are specified on the command for it to be traced. But SMC-R LLC traffic is always traced, regardless of the specified conditions on the PKTTRACE command.

The PKTTRACE command consists of two parts. The first part defines to TCP/IP the network interfaces that are to be traced and characteristics of how they are to be traced. The second part turns packet tracing ON, OFF or CLEARs packet trace settings for the interfaces specified on prior PKTTRACE commands or for a single interface if the LINKName/INTFName parameter is used.

Packet traces are recorded externally by using the TRACE command CTRACE writer instead of GTF. For information about the steps that are required to perform an IP packet trace, see [Using IP packet trace in z/OS Communications Server: IP Diagnosis Guide](#).

**Format**

Vary TCPIP, procname, PKTtrace Command

   - Packet Source Port
   - Packet Dest Port
   - Packet Port Number
   - Packet Discard Code

Packet Length

```
FULL
ABBREV = 200
```

Protocol Type
Notes:

1 Each option can be specified only once. The order of options is not important.

2 The MVS TRACE command must also be issued for component SYSTCPDA to activate the packet trace. See the z/OS Communications Server: IP Diagnosis Guide for details.
Parameters

procname
The identifier of the TCP/IP address space. When the procname value is not specified, there can be only one TCP/IP address space started. If more than one TCP/IP address space is available and no procname value is specified, the request will fail with an error message.

PKTtrace
Specifies this command is for PKTTRACE information.

LINKName=link_name
INTFName=intf_name

Specifies the name of the network interface that is defined on a preceding LINK or INTERFACE statement. If the LINKName/INTFName parameter is omitted or if an asterisk (*) is specified for either parameter, the PKTTRACE parameters apply to all IPv4 and IPv6 interfaces.

To facilitate defining packet tracing when many interfaces are involved, use the PKTTRACE statement with the LINKName=* or INTFName=* option to define packet tracing characteristics for the majority of the interfaces. Then use individual PKTTRACE statements with specific LINKName/INTFName parameters for each interface that must be defined differently from the majority.

The LINKName and INTFName parameters are interchangeable.

ON
Turns on packet tracing, clears all settings previously defined and refreshes just the default settings.

If you use LINKName=* or INTFName=* and all other parameters are defaults, even if the defaults are specified, the command results replaces any existing trace structures for all existing IPv4 and IPv6 interfaces.

If you use LINKName=link_name or INTFName=* and another non-default parameter, the command results are added to any existing trace structures. However, if the existing trace structure for link_name or intf_name is all defaults, the existing trace structure will be discarded.

OFF
Disables packet tracing for the interfaces specified and removes the characteristics defining how they should be traced.

If LINKName=* or INTFName=* and all other parameters are defaults, all trace structures are deactivated and removed from all existing IPv4 and IPv6 interfaces.

If LINKName=* or INTFName=* and PROT=UDP, all trace structures for all resources are analyzed; any matches are removed. If no trace structures remain, trace is deactivated for that resource.

If LINKName=link_name or INTFName=intf_name and there are no other parameters, all trace structures for link_name or intf_name are deactivated and removed.

If LINKName=link_name and IP=127.0.0.1 or INTFName=intf_name and IP=::1, that particular trace structure is removed if it is found. If there is only one trace structure, then that structure is removed and trace is deactivated for that resource.

CLEAR
Disables packet tracing for the interfaces specified and removes the characteristics that define how the interfaces should be traced.

FULL
Specifies that the entire IP packet is to be traced.

ABBREV
Specifies that a truncated portion of the IP packet is to be traced. You can specify a length in the range 0 - 65,535 or use the default of 200. The ABBREV parameter can be used to reduce the volume of data stored in the trace file.

Note: The protocol headers are always included even if they exceeds the ABBREV value.
PORTNUM
Specifies a port number that is compared with the destination port and source port of inbound and outbound packets. You can use this parameter instead of using the SRCPORT and DESTPORT parameters. The port number is an integer in the range 1 - 65,535. If the destination port or source port of a packet is the same as the specified port number, the packet is traced. This comparison is performed only for packets that use the TCP or UDP protocol; packets using other protocols are not traced. If the PORTNUM parameter is omitted and the SRCPORT and DESTPORT parameters are also omitted, the port numbers of packets are not checked. If an asterisk (*) is specified, packets of any protocol and of any destination or source port are traced. IPSec Encapsulating Security Payload (ESP) packets cannot be traced by port number because the TCP or UDP headers are encrypted.

Guideline: SRCPORT and DESTPORT parameters should not be specified on the same PKTTRACE statement as the PORTNUM parameter. When the PORTNUM parameter is specified after the DESTPORT or SRCPORT parameters, the DESTPORT and SRCPORT parameters are ignored.

PROT
Specifies the protocol type to be traced. This can be specified as one of the literals TCP, UDP, ICMP, or ICMPV6, or as a number in the range 1 - 255 (ICMP=1, TCP=6, UDP=17, and RAW=255). If the PROT parameter is omitted or an asterisk (*) is specified, packets of any protocol are traced.

IPaddr
Specifies an IP address (either a 32-bit IPv4 address in dotted decimal notation, or a 128-bit IPv6 address colon hexadecimal notation) that is compared with both the source and destination addresses of inbound and outbound packets. If either the source or destination address of a packet matches the specified IP address, the packet is traced. If the IP option is omitted, or an asterisk (*) is specified, then all IP addresses are traced.

If an IPv6 address is specified, then an optional prefixLength (range 1 - 128) is allowed. IPv4 addresses and IPv4-mapped IPv6 addresses are treated as equivalent addresses. The default prefixLength is 128. If an IPv4 address is specified, then /num_mask_bits can be used. The num_mask_bits and SUBNET values are mutually exclusive. An error message is displayed if both are coded.

SUBNET
Valid only with IP=ipv4_address. Specifies a subnet mask that applies to the host and network portions of the IP address specified on the IP=ipv4_address parameter. The subnet mask must be specified in dotted decimal notation and must be specified in conjunction with the IP=ipv4_address parameter. With an IPv4 address specified, the /num_mask_bits can be used. The num_mask_bits and SUBNET are mutually exclusive. An error message is displayed if both are coded.

SRCPORT
Specifies a port number that will be compared with the source port of inbound and outbound packets. The port number is an integer in the range 1 - 65,535. If the source port of a packet is the same as the specified port number, the packet is traced. This comparison is performed only for packets using either the TCP or UDP protocol; packets using other protocols are not traced. If the SRCPORT parameter is omitted, there is no checking of the source port of packets. If an asterisk (*) is specified, packets of any protocol and any source port are traced. If the SRCPORT and PORTNUM parameters are omitted, or if an asterisk (*) is specified for the SRCPORT parameter, the source port of packets is not checked. IPSec Encapsulating Security Payload (ESP) packets cannot be traced by port number because the TCP or UDP headers are encrypted.

DESTPORT
Specifies a port number that will be compared with the destination port of inbound and outbound packets. The port number is an integer in the range 1 - 65,535. If the destination port of a packet is the same as the specified port number, the packet is traced. This comparison is performed only for packets that use the TCP or UDP protocol; packets using other protocols are not traced. If the
DESTPORT and PORTNUM parameters are omitted or if an asterisk (*) is specified for the DESTPORT parameter, the destination port of packets is not checked.

IPsec Encapsulating Security Payload (ESP) packets cannot be traced by port number because the TCP or UDP headers are encrypted.

**DISCARD**
Specifies the IP packet discard reason code of the packets which should be traced. All IP packets contain a discard reason code that is normally set to 0. When the TCP/IP stack decides to discard a packet, a specific discard reason code is set in this field. See IP Discard reason codes information in z/OS Communications Server: IP and SNA Codes for a list of all the discard reason codes. Normally, the TCP/IP stack does not trace discarded packets. You must specify a DISCARD value other than NONE in order to trace discarded packets.

**NONE**
Specifies that only IP packets that were not discarded should be traced. This is the default value.

**ALL**
Specifies that IP packets with a nonzero discard reason code should be traced. Specifying this value results in tracing all discarded packets.

**reason_code**
Specifies that only IP packets with the specified discard reason code should be traced. Valid reason_code values are numbers in the range 4096 -20,479. The value 0 can also be specified, which is the equivalent of specifying DISCARD=NONE.

**Tips:**
- Specifying the SRCPORT, DESTPORT, IPADDR, PORTNUM, or PROTOCOL parameters might prevent malformed packets from being traced.
- A packet might be traced twice, once at the lower level IP layer when a packet arrives, and again as a discarded packet in an upper level protocol layer of TCP/IP.

You can use one packet trace profile statement per discard reason code. You can also specify a packet trace statement with the DISCARD=ALL option to trace all packets that are dropped. The other specified parameters further identify which discarded packets are traced. The following example collects packets with the discard reason code 4138 on all TCP and UDP packets that specify the PORT number 20.

```
PKTTRACE ON,DISCARD=4138,PORTNUM=20
```

**Examples**
To trace all packets for a particular application port, enter the following two PKTTRACE commands:

```
v tcpip,,pkt,on,dest=21
v tcpip,,pkt,on,srclp=21
```

The two commands will capture all the packets received and all the packets sent for a particular port. If other options are specified, then they should be the same on both commands.

**Usage**
- The results are cumulative when you issue multiple PKTTRACE commands. Use the NETSTAT DEvlinks (netstat -d) command to display the results. An IP packet is traced according to the first setting that matches. You might need to issue the CLEAR command to reset active PKTTRACE filters if existing filters are not needed before you enable new PKTTRACE filters.
- Users can be authorized to invoke the command by permitting their user IDs for CONTROL access to the RACF profile name MVS.VARY.TCP/IP.PKTTRACE.
**VARY TCPIP,,PURGECACHE**

Use the VARY TCPIP,,PURGECACHE command to delete the ARP cache entries or neighbor cache entries for an interface.

**Format**

```
Vary   TCPIP,,procname,,PURGECache,,name
```

**Parameters**

**name**

The interface name of the cache that is to be purged.

If the `name` value matches an IPv4 interface name, the local ARP cache or the outboard OSA cache entries (for QDIO token ring and QDIO Ethernet) for that interface is purged. If the `name` matches an IPv6 interface name, the IPv6 neighbor cache for that interface is purged.

**Note:**

1. Purging of the OSA outboard cache entries requires a level of microcode that supports the Flush ARP table ARP Assist Option Request. When this command is issued against an IPv4 QDIO token ring or Ethernet interface and the OSA-Express device is shared by multiple stacks, then this command purges the ARP cache for all stacks that share the OSA (because an OSA-Express device maintains a single ARP cache for all stacks that share it).

2. Translate entries are not deleted for ATM or LCS interfaces.

For ATM, the following conditions apply:

- PVC and ATMARP server entries are not deleted.
- ACTIVE SVC entries are not deleted because TCP/IP processing periodically validates these entries.
- A clear might be needed for SVC entries that are not ACTIVE. When the asynchronous clear completes, the entries are deleted.

**Examples**

The following example shows how to use PURGECache.

- **From TSO:**

  ```
  netstat arp all
  MVS TCP/IP NETSTAT CS V1R9 TCPIP Name: TCPCS
  Querying ARP cache for address 9.67.113.1
  Interface: TR1 IBMTR: 000BC6AA1B88
  Route info: 0000
  Querying ARP cache for address 9.67.113.61
  Interface: TR1 IBMTR: 08005A8B2EC7
  Route info: 02A0
  READY
  ```

- **On MVS console:**

  ```
  v tcpip,,purgec,tr1
  PROCESSING COMMAND: VARY TCPIP,,PURGEC,TR1
  COMMAND PURGECACHE COMPLETED SUCCESSFULLY
  PURGECACHE PROCESSED FOR LINK TR1
  ```

- **From TSO:**

  ```
  netstat arp all
  MVS TCP/IP NETSTAT CS V1R9 TCPIP Name: TCPCS
  Querying ARP cache for address 9.67.113.61
  Interface: TR1 IBMTR: 08005A8B2EC7
  Route info: 02A0
  READY
  ```
Usage

Users can be authorized to invoke the command by permitting their user IDs for CONTROL access to the RACF profile name MVS.VARY.TCPIP.PURGECACHE.

VARY TCPIP,,SMCAT

Use the VARY TCPIP,,SMCAT command to control the SMC Applicability Tool (SMCAT). Shared Memory Communications (SMC) provides optimized communications for qualifying TCP connections. SMC includes the following types:

• Shared Memory Communications - Direct Memory Access (SMC-D), introduced in z/OS V2R2
• Shared Memory Communications over RDMA (SMC-R), introduced in z/OS V2R1

You can use the SMCAT to evaluate TCP/IP network traffic and use the evaluation to plan for any potential use of SMC. To make the evaluation, you do not need to enable the SMC function on any system or enable the RoCE Express features.

You can use the SMCAT to monitor a TCP/IP stack for a set of configured destination IP addresses or subnets, and to provide a report in the job log for the TCP/IP stack. Enabling SMCAT does not modify any network flows for the TCP connections that are monitored. Use the VARY TCPIP,,SMCAT command to turn on or turn off the SMCAT.

The report indicates the following information for TCP connections on that stack that use the specified destination IP addresses or subnets:

• The percentage of all TCP connections that are connected to one of the configured IP addresses that qualify for SMC communications. These TCP connections are considered eligible to use SMC communications.

• The percentage of the eligible connections that have a workload pattern best suited for SMC communications. These eligible connections are considered well-suited connections. Connections that are short-lived and exchange a small amount of data are not well-suited for SMC communications.

• The percentage of all TCP workloads, measured in segments sent and received, that flowed over the SMC well-suited connections.

• A breakdown of the application send and receive sizes that are used by the well-suited connections. In general, the performance benefits of SMC versus TCP increase because the application send and receive size increases.

The report is generated at the end of the interval and contains the following sections:

• A TCP SMC traffic analysis for all matching connections section, containing data for all eligible TCP connections. All eligible TCP connections include connections that are not directly connected and those that are directly connected. This section indicates the total amount of workload that can use SMC communications with some network topology changes.
  – For the eligible TCP connections that are not directly connected, network traffic between the hosts requires traversal of a router that the SMC protocol does not support.
  – For the eligible TCP connections that are directly connected, network traffic between the hosts does not require traversal of any IP routers.

• A TCP SMC traffic analysis for matching direct connections section, containing data only for the eligible TCP connections that are directly connected. For the eligible TCP connections that are directly connected, network traffic between the hosts does not require traversal of any IP routers. This section indicates the amount of workload that can immediately use SMC communications after SMC enablement. This section is a subset of the TCP SMC traffic analysis for all matching connections section.

• An SMCAT Summary Report Export Area section, containing the values from the application send and receive sizes. This report can be sent to IBM for an analysis of potential network CPU savings that SMC might provide.
The SMCAT report is written as a multi-line WTO message to the TCP/IP stack job log by using routing code 11. To ensure that the report is not displayed on the consoles, your consoles must not be configured to receive routing code 11 messages. You can activate the IBM Health Checker for z/OS Consoles CNZ_Console_Routcode_11 to determine whether any consoles receive routing code 11 messages.

**Guidelines:**

- The TCP connections that meet the following requirements are considered eligible to SMC communications:
  - The destination IP address of the TCP connection matches an SMCAT configured IP address or subnet.
  - The TCP connections do not use IPSec or Fast Response Cache Accelerator (FRCA).
- When you consider workloads for SMC-R and select the IP address to be measured, consider that RoCE is an Ethernet based technology that imposes limits on the distance between exploiting hosts. The RoCE is typically deployed within a site but can be deployed across sites by using IBM Z® Qualified Wavelength Division Multiplexer (WDM) products for Multi-site Sysplex and GDPS® solutions to extend Ethernet LANs/VLANs up to 100 KM.
- When you have many instances of hosts that provide similar workloads using similar application servers, consider measuring only a subset of the hosts and extrapolating the SMCAT results of your sample across your enterprise data center.
- You can authorize users to invoke the command by permitting user IDs for CONTROL access to the RACF profile name MVS.VARY.TCPIP.SMCAT.

**Format**

```plaintext
Vary -- TCPIP , procname , SMCAT , datasetname OFF
```

**Parameters**

**procname**

The identifier of the TCP/IP address space. When the `procname` value is not specified, only one TCP/IP address space can be started. If more than one TCP/IP address space is available and no `procname` value is specified, the request fails with an error message.

**SMCAT**

Specify this parameter to turn on or turn off the analysis of TCP connections to determine whether the connections can potentially use the SMC function.

**datasetname**

If the `datasetname` value is specified, it indicates that the SMCAT is turned on. The `datasetname` value is the name of a data set that contains the SMCATCFG statement that specifies monitoring interval and the IP addresses or subnets to be monitored. The `datasetname` value must be a cataloged and fully-qualified data set name that is specified without any quotation marks. The `datasetname` value can be either a sequential data set or a member in a PDS. The `datasetname` value cannot be a z/OS UNIX file. See “SMCATCFG input statement” on page 237 for a description of the contents of `datasetname`.

If the tool is active, the following error message is issued:

```
EZZ0140I SMCAT COMMAND REJECTED - SMC APPLICABILITY TOOL ALREADY ACTIVE
```

**Guideline:** To modify an active SMCAT `datasetname` configuration, the tool must be turned off and restarted with the modified configuration.
OFF
Indicates that the SMCAT is turned off and a report is generated. If the tool is not active, the following error message is issued:

EZZ0141I SMCAT OFF COMMAND IGNORED - SMC APPLICABILITY TOOL NOT ACTIVE

Tip: Consider capturing SMCAT reports during periods of time of interest. For example, capture the typical workloads during periods of steady state traffic that are representative of the target hosts.

SMCATCFG input statement

The data set that is specified on the VARY TCPIP,SMCAT command must contain an SMCATCFG statement. This statement provides the monitoring interval value and the list of IP addresses or subnets whose TCP connections are to be monitored.

Restriction: Only one SMCATCFG statement can be specified in the data set.

Syntax

```
SMCATCFG
  INTERVAL 60
  INTERVAL minutes
  IPADDR
    ipv4_address
    ipv4_address/num_mask_bits
    ipv6_address
    ipv6_address/prefix_length
```

Parameters

SMCATCFG
This is a configuration statement for the SMCAT. The data set can contain only one SMCATCFG statement.

INTERVAL minutes
Specifies the length of time in minutes of the monitoring interval at which data is collected before the results are reported. Valid values are in the range 1 - 1440. The default value is 60 minutes.

IPADDR
Specifies a list of 32-bit IPv4 addresses in dotted decimal notation and 128-bit IPv6 addresses that use colon hexadecimal notation and IP subnets. You can use the SMCAT to monitor TCP connections from this stack to these remote IP addresses and IP subnets. SMC-R is a peer to peer protocol, so it requires that both peers are capable and enabled for SMC-R communications. As a result, the IP addresses that are specified reflect peer hosts that are either capable of SMC-R or might be capable in the future. The following information shows key considerations in specifying the destination IP addresses to be monitored:

- When you use an IPv4 subnet or IPv6 prefix specification, all hosts on these networks are considered SMC-R eligible. If the specified network contains hosts that will be SMC-R capable and hosts that will not, specification of individual IP addresses is recommended.
- If TCP connections from the local TCP/IP stack to a monitored peer use multiple IP addresses, all of the peer’s IP addresses that might be used are specified. The peer’s IP addresses include all IP addresses, static VIPAs, and dynamic VIPAs for that peer.

Guideline: If the destination peer and the local host can communicate directly over a shared subnet but the configured peer IP address is a static or dynamic VIPA in a different subnet, you must also
configure the host IP address of the OSA used on the remote system to connect to the shared subnet. This ensures that connections to that VIPA over the shared subnet will be counted as direct connections by SMCAT monitoring.

If the SMCAT is turned on, you must specify at least one IP address or IP subnet. A limit of 256 combined individual IP addresses and IP subnets can be specified.

The following values are not allowed for IPv4 addresses:
- Broadcast address (255.255.255.255)
- Multicast addresses
- Default loopback address (127.0.0.1)
- INADDR_ANY address (0.0.0.0)

The following values are not allowed for IPv6 addresses:
- Default loopback address (::1)
- IPv4-mapped IPv6 addresses
- IPv4-compatible IPv6 addresses
- Multicast addresses
- Unspecified address (::)
- Reserved addresses

Note: For information about the IPv6 reserved addresses, see Restrictions on IPv6 addresses configured in the TCP/IP profile in z/OS Communications Server: IP Configuration Reference.

Code examples

VARY,,SMCAT command

The following examples show the VARY command for the SMCAT.

- The following example shows the command for turning on the SMCAT and directing it to a TCP/IP address space named TCPPROC. In the example, the sequential data set USER99.TCPIP.SMCAT1 contains the SMCCATCFG statement.

  VARY TCPIP,TCPPROC,SMCAT,USER99.TCPIP.SMCAT1

- The following example shows the command for turning off the SMCAT.

  VARY TCPIP,TCPPROC,SMCAT,OFF

SMCCATCFG statement

The following examples show the SMCCATCFG statement in the input data set.

- The following example specifies one IP subnet to be monitored and uses the default interval of 60 minutes.

  SMCCATCFG IPADDR 9.10.1.3/24

- The following example specifies multiple IP subnets to be monitored and specifies an interval of 120 minutes.

  SMCCATCFG INTERVAL 120
  IPADDR
  C5::1:2:3:4/126
  9.67.113.61/24

Report examples
Configuration report

The following example shows the report that is created by using the SMCAT when it is turned on. This report provides the configuration parameters that are used for the monitoring interval. In the example, the tool monitors the TCP connections for stack TCPCS2 over a 3 minute interval, for the list of IP addresses or subnets.

EZD2040I TCP/IP CS V2R2 TCPIP Name: TCPCS2
SMC Applicability Configuration Parameters - 10/08/2014, 14:04:40.08
Interval: 3 minutes
IP addresses/subnets being monitored

- 9.3.1.2/32
- 2004::4/128
- 9.1.1.2/24
- 9.3.1.3/32
- 2001::1/96
- 9.3.3.2/20
- 2003::3/116
- 2002::3/96

End of configuration parameters

Report field descriptions

**Interval**

The interval that is in effect when the SMCAT is turned on.

**IP Addresses/subnets being monitored**

A list of IP addresses or subnets that the SMCAT monitors.

Interval report

The following example shows the interval report that is created by using the SMCAT when the monitoring interval expires or when the tool is turned off.
SMC Applicability Interval Report - 10/08/2014, 14:07:32.06

Configured Interval Duration: 3 minutes
Actual Interval Duration: 3 minutes

TCP SMC traffic analysis for all matching connections
---------------------------------------------------------------------
Includes connections not meeting direct connectivity requirements

- 20% of all TCP connections can use SMC (eligible)
- 90% of eligible connections are well-suited for SMC
- 22% of all TCP traffic (segments) is well-suited for SMC
- 20% of outbound traffic (segments) is well-suited for SMC
- 25% of inbound traffic (segments) is well-suited for SMC

Report field descriptions

Configured Interval Duration
The interval that is in effect when the SMCAT is turned on.

Actual Interval Duration
The interval that the report covers. This value might be different from the value of the Configured Interval Duration field if the SMCAT is stopped by using the VARY TCPIP,,SMCAT,OFF command.

TCP SMC traffic analysis for all matching connections
The data for all eligible TCP connections. The eligible TCP connections are connections with a destination IP address that match configured IP addresses or subnets. All eligible TCP connections include the connections that are not directly connected and the connections that are directly connected. This section indicates the total amount of workload that can use SMC communications with some network topology changes.

Percentage of all TCP connections can use SMC (eligible)
The percentage of all TCP connections that match the configured IP addresses or subnets. These TCP connections are the SMC eligible connections.
**Percentage of eligible connections are well-suited for SMC**
The percentage of all SMC eligible connections that have a workload pattern best suited for SMC communications. These eligible connections are well-suited connections for SMC.

**Percentage of all TCP traffic (segments) is well-suited for SMC**
The percentage of all TCP workload, measured in segments sent and received, that flowed over well-suited connections for SMC.

**Percentage of outbound traffic (segments) is well-suited for SMC**
The percentage of all outbound TCP workload, measured in segments sent, that flowed over well-suited connections for SMC.

**Percentage of inbound traffic (segments) is well-suited for SMC**
The percentage of all inbound TCP workload, measured in segments received, that flowed over well-suited connections for SMC.

**Interval details**
The breakdown of the data that is used to calculate the percentages.

**Total TCP connections**
The number of all active TCP connections during the SMCAT monitoring interval.

**Total SMC eligible connections**
The number of active TCP connections that are connected to a configured IP address during the SMCAT monitoring interval. These TCP connections are considered eligible to use SMC communications.

**Total SMC well-suited connections**
The number of eligible TCP connections that have a workload pattern best suited for SMC communications. These eligible connections are considered well-suited connections. Connections that are short-lived and that exchange a small amount of data are not considered well-suited for SMC communications.

**Total outbound traffic (in segments)**
The amount of outbound traffic over all TCP connections during the SMCAT monitoring interval.

**SMC well-suited outbound traffic (in segments)**
The amount of outbound traffic over the SMC well-suited connections during the SMCAT monitoring interval.

**Total inbound traffic (in segments)**
The amount of inbound traffic over all TCP connections during the SMCAT monitoring interval.

**SMC well-suited inbound traffic (in segments)**
The amount of inbound traffic over the SMC well-suited connections during the SMCAT monitoring interval.

**Application send sizes for well-suited connections**
The number and the percentage of the application send sizes that are used by the well-suited connections. These percentages might not add up to exactly 100% due to rounding.

**Application receive sizes for well-suited connections**
The number and the percentage of the application receive sizes that are used by the well-suited connections. These percentages might not add up to exactly 100% due to rounding.

**TCP SMC traffic analysis for matching direct connections**
The data for only the directly connected eligible TCP connections. The directly connected eligible TCP connections use one of the configured IP addresses or subnets. This section indicates the amount of workload that can use SMC communications immediately after SMC enablement. This section is a subset of the TCP SMC traffic analysis for all matching connections section.

The fields under this section are the same as the fields under the TCP SMC traffic analysis for matching connections with direct network connectivity.

**VARY TCPIP,,START or VARY TCPIP,,STOP**
Use the VARY TCPIP,,START command to start a device or interface. Use the VARY TCPIP,,STOP command to stop a device or interface.
**Format**

```markdown
VARY TCPIP,, proname, START, device_name
```

**Parameters**

*proname*  
The identifier of the TCP/IP address space. When the *proname* value is not specified, there can be only one TCP/IP address space started. If more than one TCP/IP address space is available and no *proname* value is specified, the request will fail with an error message.

*START*  
Start a device or interface known to TCP/IP.

*STOP*  
Stop a device or interface known to TCP/IP.

*device_name*  
The name of the device to be started or stopped.

*interface_name*  
The name of the interface to be started or stopped.

**Examples**

The following example shows how to start a device:

```verbatim
V TCPIP,,START,DEVD00
EZZ060I PROCESSING COMMAND: VARY TCPIP,,START,DEVD00
```

**Usage**

- Users can be authorized to invoke the command by permitting their user IDs for CONTROL access to the RACF profile name MVS.VARY.TCPIP.STRTSTOP.
- When the VARY START command is used for XCF connection (specifying the CP name of the other node), the ISTLSXCF major node must be active on both nodes and the XCF TRLE for the connection must be active.

**VARY TCPIP,,SYNTAXCHECK**

Use the VARY TCPIP,,SYNTAXCHECK command to check the syntax of TCP/IP profile configuration statements without affecting the system operation or network configuration.

Subject to the restrictions listed below, you can direct this command to any TCP/IP stack that is of the same release level as the profile statements in the profile data set. The profile statements do not need to be related in any way to the active configuration.

**Restriction:** The VARY TCPIP,,SYNTAXCHECK command makes no attempt to update the active configuration; therefore, it does not detect and report conflicts with the active configuration. The following list shows some examples of the conflicts with the active configuration that VARY TCPIP,,SYNTAXCHECK cannot detect:

- Defining an interface more than once
- Deleting an interface that is not currently configured
- Defining an IPv6 interface on an IPv4-only stack

**Format**

```markdown
VARY TCPIP,, proname, SYNTAXCHECK, datasetname
```
Parameters

procname
The identifier of the TCP/IP address space. When the procname value is not specified, only one TCP/IP address space can be started. If more than one TCP/IP address space is available and no procname value is specified, the request fails with an error message.

SYNTAXCHECK
Specify this parameter to check the syntax of profile statements without applying any changes to the system operation and network configuration. Put your profile statements in the data set specified by the datasetname value.

datasetname
The datasetname value is required if you specify the SYNTAXCHECK parameter. The datasetname value is the name of a data set that contains TCP/IP profile configuration statements. The datasetname value must be a cataloged and fully-qualified data set name that is specified without any quotation marks. The datasetname value can be either a sequential data set or a member in a PDS.

Result: Syntax checking continues with any data set specified on an INCLUDE statement.

Restriction: The datasetname value cannot be the name of a z/OS UNIX file or a TCPIP.DATA data set.

Usage

Guidelines
• If you have defined the resource profile MVS.VARY.TCPIP.SYNTAXCHECK in class OPERCMDS, authorize users to invoke the command by granting their user IDs CONTROL access to the resource profile.
• Issue this command to verify the statements in datasetname are free of syntax errors before activating the profile as the initial profile or with the VARY TCPIP,OBEYFILE command.
• You do not need to direct this command to the TCP/IP stack that will use datasetname unless your profile contains MVS system symbols. If your profile contains MVS system symbols, you must direct this command to the TCP/IP stack that will activate datasetname for consistent resolution of the MVS system symbols.
• If your profile does not contain MVS system symbols, you can check the profile statement syntax by using any TCP/IP stack or host that supports the VARY TCPIP,,SYNTAXCHECK command, and that supports the statements in your profile. For consistent syntax checking, check the datasetname statement syntax by using a TCP/IP stack of the same z/OS release level as the TCP/IP stack that will activate datasetname.

Requirements
• Because syntax checking might stop for the current statement after a syntax error is detected, you must issue the command again after fixing any syntax errors reported by this command to ensure all syntax errors have been detected.
• For syntax checking consistency, you must run this command on a system of the same release level as the system that will activate the datasetname statements.
• Syntax check ignores comments. You must ensure that comments adhere to the syntax rules and restrictions that are described in the introduction to Statement syntax for configuration statements in z/OS Communications Server: IP Configuration Reference.

Results
• The profile is parsed and syntax errors are reported.
• No configuration changes are applied.
• No SMF events are generated.

The VARY TCPIP,,SYNTAXCHECK command makes no attempt to update the active configuration; therefore, it does not detect and report conflicts with the active configuration. The following list shows
some examples of the conflicts with the active configuration that VARY TCPIP,,SYNTAXCHECK cannot detect:

- Defining an interface more than once
- Deleting an interface that is not currently configured
- Defining an IPv6 interface on an IPv4-only stack

**VARY TCPIP,,SYSPLEX**

Use the VARY TCPIP,,SYSPLEX command to change the sysplex configuration of the TCP/IP stack.

**Format**

```bash
Vary TCPIP,, procname,, SYSplex,,
```

**Parameters**

**procname**

The identifier of the TCP/IP address space. When the `procname` value is not specified, there can be only one TCP/IP address space started. If multiple TCP/IP address spaces are available and no `procname` value is specified, the request fails with an error message.

**SYSplex**

Requests to change a TCP/IP stack's DVIPA sysplex characteristics.

**LEAVEgroup**

Requests the TCP/IP stack to leave the sysplex group.

This causes the stack to leave the sysplex group, delete all dynamic DVIPAs, and deactivate all its configured VIPADYNAMIC definitions. The VIPADYNAMIC configuration information is retained for possible future use by the SYSPLEX,JOINGROUP command.

To rejoin the sysplex group it is necessary to issue a VARY TCPIP,,SYSPLEX,JOINGROUP operator command, which also reprocesses the stack's saved VIPADYNAMIC configuration.

**Guideline:** Do this only as a last resort if the operator has determined that this sysplex member is not functioning correctly and if the only other alternative would be to force the stack down. For more
information, see sysplex problem detection and recovery information in the z/OS Communications Server: IP Configuration Guide.

**Tip:** The Netstat VIPADCFG/-F report can be used to view the saved VIPADYNAMIC configuration.

### JOINgroup

Requests the TCP/IP stack to join the sysplex group.

When this command is issued, if VTAM is not running or if the DELAYJOIN parameter is configured for GLOBALCONFIG SYSPLEXMONITOR and OMPROUTE is not initialized, the join does not take place until after VTAM (and OMPROUTE, if DELAYJOIN is configured) is initialized. If this command is issued after the stack has left the sysplex group, it also reprocesses the stack's saved VIPADYNAMIC configuration.

If NOJOIN is configured on the GLOBALCONFIG SYSPLEXMONITOR statement, the JOINgroup command overrides NOJOIN. When you issue the JOINgroup command, the TCP/IP stack joins the sysplex group, as long as VTAM is running and OMPROUTE is initialized (if the DELAYJOIN parameter is also configured for GLOBALCONFIG SYSPLEXMONITOR).

**Tip:** The Netstat VIPADCFG/-F report can be used to view the saved configuration prior to issuing the JOINgroup command.

**Restriction:** You cannot use this command to cause the stack to rejoin the sysplex group if the Sysplex Problem Detection cleanup function was unsuccessful and message EZZ9675E was issued, or if a previous attempt to process the saved VIPADYNAMIC configuration and join the TCP/IP sysplex group failed and message EZD1194 was issued. If either has occurred, you must restart the stack before it will be able to rejoin the sysplex group.

### DEACTivate

Requests the TCP/IP stack to deactivate a dynamic VIPA. When you deactivate a dynamic VIPA, it appears as though the DVIPA has been deleted, but the DVIPA's configuration is saved.

**DVIPA=dvipa**

`dvipa` is the IPv4 address, IPv6 address, or IPv6 interface name of a dynamic VIPA (DVIPA) that is currently defined by VIPADEFINE or VIPABACKUP on this stack. The DVIPA can be in ACTIVE, BACKUP, or MOVING status.

The stack deactivates the DVIPA and ends any distribution for that DVIPA being done by this stack. The DVIPA configuration and any VIPADISTRIBUTE definitions are saved, and the deactivated DVIPA continues to be counted toward the maximum number of DVIPAs that can be defined on the stack. If there are existing connections to the DVIPA on this stack and there is another stack able to maintain the connections, the DVIPA is kept in QUIESCING status until the last connection terminates, and then the DVIPA is deactivated.

**Guidelines:**

- Deactivating an active DVIPA while the stack is part of the sysplex group allows an already-configured backup stack to takeover the DVIPA. (The stack that is serving as a backup for this DVIPA should have OMPROUTE active so that when it takes over the DVIPA it has the capability to advertise to others that it is the new owner).
- Deactivating a sysplex distributor DVIPA does not prevent the DVIPA from being marked as a target for distribution from another stack. As long as the application remains active on the stack, new connection requests can be distributed to it.
- Deactivating a backup DVIPA while the stack is part of the sysplex group makes the stack ineligible to takeover the DVIPA.
- This command can be issued after a stack has left the sysplex group. Because all the stack’s DVIPA definitions are inactive while the stack is out of the group, the DVIPA is marked deactivated. If the stack later rejoins the group and restores its VIPADYNAMIC configuration, the DVIPA remains deactivated.
- A deactivated DVIPA can be reactivated using the VARY TCPIP,,SYSPLEX,REACTIVATE command.
Restriction: You cannot deactivate a VIPARANGE DVIPA created by BIND, SIOCSVIPA or SIOCSVIPA6 ioctl, or the MODDVIPA utility.

**REACTivate**
Requests that the TCP/IP stack redefine a deactivated dynamic VIPA using its saved configuration.

**DVIPA=**`dvipa`
- `dvipa` is the IPv4 address, IPv6 address, or IPv6 interface name of a dynamic VIPA (DVIPA) that has been deactivated.

The stack will reestablish the DVIPA and any distribution for that DVIPA, based on the configuration that was saved when the DVIPA was deactivated.

**Guidelines:**
- Reactivating a VIPADEFINE DVIPA while the stack is part of the sysplex group allows a stack to take back the DVIPA.
- Reactivating a VIPABACKUP DVIPA while the stack is part of the sysplex group makes the stack again an eligible backup for the DVIPA, but does not typically trigger an immediate activation of the DVIPA. An exception to this behavior occurs when the following conditions are met:
  - The reactivated DVIPA's VIPABACKUP profile statement specified the MOVEABLE parameter.
  - The DVIPA is not active elsewhere in the sysplex.
- This command can be issued after a stack has left the sysplex group. Because all the stack’s DVIPA definitions are inactive while the stack is out of the group, the DVIPA is marked as reactivated. If the stack later rejoins the group and restores its VIPADYNAMIC configuration, the DVIPA definition is restored.

**QUIesce**
Requests that the specified application, or all applications on a particular TCP/IP stack, be quiesced from DVIPA sysplex distributor workload balancing. After the command is issued, sysplex distributor will no longer route new TCP connection requests to the specified applications. Existing connections to these applications are not affected. This command must be issued on the local system where the applications are to be quiesced. This command can be useful in scenarios where you would like to temporarily divert new TCP connection requests away from a specific application or target system. One such scenario is when a particular application or system is to be shutdown (for example, in order to apply maintenance). Issuing this command prior to the shutdown can allow applications to gracefully complete any existing workload requests. PORT, JOBNAME or TARGET parameters must be specified following the QUIESCE keyword.

**PORT=**`portnum`
- The port number parameter is an integer in the range 1 – 65535 and is optional. Applications bound to this port number are excluded from DVIPA sysplex distributor workload balancing (they do not receive new TCP connection requests from sysplex distributor). If the `portnum` value specifies a port that has more than one instance of an application bound to it with either a different `jobname` or `asid` value, then either the JOBNAME value or the JOBNAME and ASID values must be specified to identify a unique specific application instance to be quiesced. PORT or TARGET parameters must be specified following the QUIESCE keyword.

**JOBNAME=**`jobname`
- The `jobname` value specifies the MVS job name of the application with which the Quiesce command is associated.

  - If the JOBNAME parameter is specified without the PORT keyword, then all applications with this `jobname` or `asid` value are quiesced regardless of the port they are bound to.
  - If the `jobname` value specifies a job name that has more than one instance of an application with that job name but that has a different `asid` value, then the ASID parameter must also be specified and all application instances that have a matching job name are quiesced, regardless of the port they are using.
  - The environment in which the application runs determines the job name that is to be associated with a particular client or server application.
• The *jobname* value can be up to 8 characters in length and is optional.

**Guidelines:**

• Applications submitted as batch jobs use the batch job name.
• Job names associated with applications started from the MVS operator console using the START command are determined as follows:
  – If the START command is issued with the name of a member in a cataloged procedure library (for example, S APP1), the job name is the member name (for example, APP1).
  – If the member name on the START command is qualified by a started task identifier (for example, S APP1.ABC), the job name is the started task identifier (for example, ABC).
  – The JOBNAME parameter can also be used on the START command to identify the job name (for example, S APP1,JOBNAME=XYZ).
  – The JOBNAME parameter can also be included on the JOB card.
• Applications run from a TSO user ID use the TSO user ID as the job name.
• Applications run from the z/OS shell normally have a job name that is the logged on user ID plus a one-character suffix.
• Authorized users can run applications from the z/OS shell and use the _BPX_JOBNAME environment variable to set the job name. In this case, the value specified for the environment variable is the job name.
• z/OS UNIX applications started by INETD typically use the job name of the INETD server plus a one-character suffix.

**ASID=asid**

The *asid* value is optional and specifies the hexadecimal address space ID associated with the application to be quiesced. If the *portnum* value specifies a port that has more than one instance of that application bound to it and the *jobname* value is not unique, then you can specify an *asid* value to quiesce all application instances that match this port, job name, and *asid* value.

**Guidelines:**

• This command must be issued on the system and the TCP/IP stack where the application instance is running.
• This command applies to a single TCP/IP stack's application instance. If the server needs to be quiesced over multiple stacks in a CINET environment, the command would need to be issued on each stack.
• Any sysplex distributor timed affinities will be terminated. Existing connections are not affected.
• The quiesce state is associated with the application's active listening socket. If the application is recycled or if the application closes and opens a new listening socket on the specified port, the socket will no longer be in a quiesced state.
• If the application is bound to the unspecified address, it can continue to receive connection requests that are not using a distributed DVIPA as the destination IP address.
• Applications quiesced with the PORT= option can be resumed by issuing a RESUME command.

**Rule:** When applications are quiesced using the PORT= or JOBNAME= option followed by a quiesce TARGET option for the stack on which those applications reside, you can no longer resume individual applications using the PORT= or JOBNAME= option. Instead, you must resume the entire TCP/IP stack using the TARGET option.

**Tips:**

• The Netstat ALL command can be issued as follows to determine which applications have been quiesced: QUIESCED DEST|NO.
• When an application is quiesced, the ready count (Rdy) field that appears on the Netstat VDPT display (issued on the sysplex distributor routing stack) is decremented. If no other applications are listening on this port on this target TCP/IP stack, the count is zero.

**TARGET**
Requests that all applications on this TCP/IP stack be quiesced from DVIPA sysplex distributor workload balancing. Existing connections are not affected.

**Guidelines:**
- This command must be issued on the system and the TCP/IP stack that is being quiesced.
- This command applies to a single TCP/IP stack. If an entire system with multiple TCP/IP stacks in the CINET environment needs to be quiesced, then a command needs to be issued for each TCP/IP stack on the system.
- Any sysplex distributor timer-based affinities are terminated. Existing connections are not affected.
- While sysplex distributor will no longer route new distributed DVIPA TCP connection requests to this TCP/IP stack, any TCP connections that do not specify a distributed DVIPA address as the destination IP address continue to be serviced by this TCP/IP stack.
- The QUIESCE state for a TARGET persists for all applications (existing and new) running on this TCP/IP stack, until the TCP/IP stack is recycled or a V TCP/IP,,RESUME,TARGET command is issued.
- When an entire TCP/IP stack is quiesced using the TARGET option, you cannot resume individual applications for workload distribution. You can, however, resume distribution for the entire TCP/IP stack using the V TCP/IP,,RESUME,TARGET command.
- When an entire TCP/IP stack is quiesced using the TARGET option, a quiesce for an individual application on that target stack is ignored.

**Tips:**
- The Netstat ALL command can be issued to determine which applications have been quiesced: QUIESCED DEST|NO
- When a TCP/IP stack is quiesced, the ready count (Rdy) field that appears on the Netstat VDPT display (issued on the sysplex distributor routing stack) will be zero for all entries associated with this target TCP/IP stack.

**RESUME**
Requests that the specified application or all applications associated with a TCP/IP stack be resumed for DVIPA sysplex distributor workload balancing (become eligible for new TCP connection requests). A PORT, JOBNAME or TARGET value must be specified following the RESUME keyword.

**PORT**=portnum
The portnum value is an integer in the range 1 – 65 535. Applications bound to this port number will be resumed for DVIPA sysplex distributor workload balancing. If the portnum value specifies a port that has more than one instance of an application bound to it, then either the JOBNAME value or the JOBNAME and ASID values must be specified to identify a unique specific application instance to be resumed. PORT or TARGET value must be specified following the RESUME keyword.

**JOBNAME**=jobname
The jobname value specifies the MVS job name of the application with which the resume command is associated.

- If the JOBNAME parameter is specified without the PORT keyword, then all applications with this jobname or asid value are resumed, regardless of the port they are bound to.
- If the jobname value specifies a job name that has more than one instance of an application with that job name but with a different asid value, then you must also specify the ASID parameter and all application instances that have a job name that matches are resumed regardless of port value.
• The environment in which the application runs determines the job name that is to be associated with a particular client or server application.

• The *jobname* value is optional and can be up to 8 characters in length.

**Guidelines:**

• Applications submitted as batch jobs use the batch job name.

• The job name associated with applications started from the MVS operator console using the START command will be determined as follows:
  – If the START command is issued with the name of a member in a cataloged procedure library (for example, S APP1), the job name will be the member name (for example, APP1).
  – If the member name on the START command is qualified by a started task identifier (for example, S APP1.ABC), the job name will be the started task identifier (for example, ABC).
  – The JOBNAME parameter can also be used on the START command to identify the job name (for example, S APP1,JOBNAME=XYZ).
  – The JOBNAME value can also be included on the JOB card.

• Applications run from a TSO user ID use the TSO user ID as the job name.

• Applications run from the z/OS shell normally have a job name that is a combination of the logged on user ID plus a one-character suffix.

• Authorized users can run applications from the z/OS shell and use the _BPX_JOBNAME environment variable to set the job name. In this case, the value specified for the environment variable is the job name.

• z/OS UNIX applications started by INETD typically use the job name of the INETD server plus a one-character suffix.

**ASID=asid**

The optional *asid* value defines the hexadecimal address space ID that is associated with the application to be quiesced. If the *portnum* value specifies a port that has more than one instance of an application bound to it and the job name is not unique, then you can specify an *asid* value to quiesce all application instances that match this *portnum*, *jobname*, and *asid* value.

**TARGET**

Requests that all applications on this TCP/IP stack be resumed for DVIPA sysplex distributor workload balancing. PORT or TARGET must be specified following the RESUME keyword.

**Guidelines:**

• This command must be issued on the stack that is quiesced or the stack where the quiesced application instance is running.

• This command applies to a single TCP/IP stack's application instance. If the server needs to be resumed over multiple stacks in a CINET environment, the command would need to be issued on each stack.

• RESUME with the TARGET option is the only valid command following a QUIESCE with the TARGET option command.

**Examples**

To request a stack to delete all its dynamic VIPAs and leave the sysplex group:

```
VARY TCPIP,,SYSPLEX,LEAVEGROUP
EZ0060I PROCESSING COMMAND: VARY TCPIP,,SYSPLEX,LEAVEGROUP
EZ0053I COMMAND SYSPLEX,LEAVEGROUP COMPLETED SUCCESSFULLY
```
To request a stack to join the sysplex group and restore its dynamic VIPAs:

```
VARY TCPIP,,SYSPLEX,JOINGROUP
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,SYSPLEX,JOINGROUP
EZD1178I THE VARY TCPIP,,SYSPLEX,JOINGROUP COMMAND WAS ACCEPTED
EZD1176I TCPCS HAS SUCCESSFULLY JOINED THE TCP/IP SYSPLEX GROUP
EZD1192I THE VIPADYNAMIC CONFIGURATION WAS SUCCESSFULLY RESTORED FOR stack_name
```

To request a stack to deactivate a dynamic VIPA and save its configuration:

```
VARY TCPIP,,SYSPLEX,DEACTIVATE,DVIPA=203.1.1.99
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,SYSPLEX,DEACTIVATE,DVIPA=203.1.1.99
EZD1197I THE VARY TCPIP,,SYSPLEX,DEACTIVATE,DVIPA COMMAND COMPLETED SUCCESSFULLY
```

To request a stack to restore a dynamic VIPA that had been deactivated:

```
VARY TCPIP,,SYSPLEX,REACTIVATE,DVIPA=203.1.1.99
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,SYSPLEX,REACTIVATE,DVIPA=203.1.1.99
EZD1189I THE VARY TCPIP,,SYSPLEX,REACTIVATE,DVIPA COMMAND COMPLETED SUCCESSFULLY
```

To request a stack to quiesce for DVIPA sysplex distributor workload balancing, all instances of an application listening on port 500 with the same `jobname` and `asid` values:

```
VARY TCPIP,,SYSPLEX,QUIESCE,PORT=500
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,SYSPLEX,QUIESCE,PORT=500
EZD1189I THE VARY TCPIP,,SYSPLEX,QUIESCE COMMAND COMPLETED SUCCESSFULLY
```

To request a stack to quiesce, for DVIPA sysplex distributor workload balancing, a specific shareport application instance:

```
VARY TCPIP,,SYSPLEX,QUIESCE,PORT=23,JOBNAME=job1,ASID=71
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,SYSPLEX,QUIESCE,PORT=23,JOBNAME=job1,ASID=71
EZD1189I THE VARY TCPIP,,SYSPLEX,QUIESCE COMMAND COMPLETED SUCCESSFULLY
```

To request a stack to quiesce, for DVIPA sysplex distributor workload balancing, all application instances:

```
VARY TCPIP,,SYSPLEX,QUIESCE,TARGET
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,SYSPLEX,QUIESCE,TARGET
EZD1189I THE VARY TCPIP,,SYSPLEX,QUIESCE COMMAND COMPLETED SUCCESSFULLY
```

To request a stack to quiesce, for DVIPA sysplex distributor workload balancing, all instances of an application with the same `jobname` and `asid` values regardless of port:

```
VARY TCPIP,,SYSPLEX,QUIESCE,JOBNAME=job2
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,SYSPLEX,QUIESCE,JOBNAME=job2
EZD1189I THE VARY TCPIP,,SYSPLEX,QUIESCE COMMAND COMPLETED SUCCESSFULLY
```

To request a stack to resume for DVIPA sysplex distributor workload balancing, all instances of an application listening on port 500 with the same `jobname` and `asid` values:

```
VARY TCPIP,,SYSPLEX,RESUME,PORT=500
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,SYSPLEX,RESUME,PORT=500
EZD1189I THE VARY TCPIP,,SYSPLEX,RESUME COMMAND COMPLETED SUCCESSFULLY
```

To request a stack to resume, for DVIPA sysplex distributor workload balancing, a specific shareport application instance:

```
VARY TCPIP,,SYSPLEX,RESUME,PORT=23,JOBNAME=job1,ASID=71
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,SYSPLEX,RESUME,PORT=23,JOBNAME=job1,ASID=71
EZD1189I THE VARY TCPIP,,SYSPLEX,RESUME COMMAND COMPLETED SUCCESSFULLY
```
To request a stack to resume, for DVIPA sysplex distributor workload balancing, all application instances:

```
VARY TCPIP,,SYSPLEX,RESUME,TARGET
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,SYSPLEX,RESUME,TARGET
EZZ0053I COMMAND SYSPLEX,RESUME COMPLETED SUCCESSFULLY
```

To request a stack to resume, for DVIPA sysplex distributor workload balancing, all instances of an application with the same `jobname` and `asid` values regardless of port:

```
VARY TCPIP,,SYSPLEX,RESUME,JOBNAME=job2
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,SYSPLEX,RESUME,JOBNAME=JOB2
EZZ0053I COMMAND SYSPLEX,RESUME COMPLETED SUCCESSFULLY
```

**Usage**

Users can be authorized to invoke the command by permitting their user IDs for CONTROL access to the RACF profile name MVS.VARY.TCPIP.SYSPLEX.

**VARY command: TN3270E Telnet server address space**

The functions listed in Table 11 on page 252 support the VARY TCPIP command when it is directed to a TN3270E Telnet server.

<table>
<thead>
<tr>
<th>Function</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>HELP</td>
<td>“VARY TCPIP,tnproc,HELP” on page 252</td>
</tr>
<tr>
<td>OBEYFILE</td>
<td>“VARY TCPIP,tnproc,OBEYFILE” on page 253</td>
</tr>
<tr>
<td>TELNET</td>
<td>“VARY TCPIP,tnproc,&lt;TELNET&gt;” on page 254</td>
</tr>
<tr>
<td>LUNS</td>
<td>“VARY TCPIP,tnproc,LUNS” on page 259</td>
</tr>
</tbody>
</table>

**VARY TCPIP,tnproc,HELP**

Use the VARY TCPIP,tnproc,HELP command from the MVS operator console to display the syntax of MVS operator Vary commands for the TN3270E Telnet server (Telnet).

**Format**

```
/vary — TCPIP — — tnproc — — ,HELP
```

**Parameters**

**Obeyfile**

Shows help on the VARY OBEYFILE command.
Telnet
  Shows the available options on the DISPLAY TELNET command.

ABENDTRAP
  Shows help on the VARY TELNET,ABENDTRAP command.

ACT
  Shows help on the VARY TELNET,ACT command.

DEBUG
  Shows help on the VARY TELNET,DEBUG command.

INACT
  Shows help on the VARY TELNET,INACT command.

LUNS
  Shows help on the VARY LUNS commands.

QUIesce
  Shows help on the VARY TELNET,QUIESCE command.

RESUME
  Shows help on the VARY TELNET,RESUME command.

STOP
  Shows help on the VARY TELNET,STOP command.

Examples

```
V TCPIP,TNSERV,HELP,ABENDTRAP
EZ6123I V TCPIP,TNPROC<,TELNET>,ABENDTRAP,XMODNAME
<,XRCODE<,XINSTANCE>>
```

**VARY TCPIP,tnproc,OBEYFILE**

Use the VARY TCPIP,tnproc,OBEYFILE command to make dynamic changes to the TN3270E Telnet server (Telnet) configuration without stopping and restarting the Telnet address space.

See z/OS Communications Server: IP Configuration Guide for information about how different parameter updates take effect with Obeyfile processing.

**Format**

```
Vary  TCPIP  ,  tnproc  Obeyfile,  datasetname
```

**Parameters**

**tnproc**
  The member name of the cataloged procedure used to start the Telnet address space.

**CMD=OBEYFILE or OBEYFILE**
  Specify this parameter to make dynamic changes to Telnet configuration without stopping and restarting Telnet. These changes are in effect until the Telnet cataloged procedure is started again or until another VARY OBEYFILE overrides them. Put your changes in the data set that is specified by the **datasetname** value. You can maintain different data sets that contain a subset of the Telnet configuration statements and process them while Telnet is running.

**DSN=datasetname or datasetname**
  The **datasetname** value is required after specifying the OBEYFILE parameter. The **datasetname** value is the name of a data set containing Telnet configuration statements. The **datasetname** value must be a cataloged data set and specified as fully qualified without any quotation marks. The **datasetname** value can be either a sequential data set or a member in a PDS.

**Examples**
The following example updates Telnet configuration information without stopping and restarting the Telnet address space. In this example a Telnet address space is started by the identifier TNSERV and the sequential data set USER99.TNSERV.OBEYFIL1 contains Telnet configuration statements:

```
VARY TCPIP,TCPPROC,CMD=OBEYFILE,DSN=USER99.TCPIP.OBEYFIL1
```

**Usage**

- Users can be authorized to invoke the command by permitting their user IDs for CONTROL access to the RACF profile name MVS.VARY.TCPIP.TELNET.OBEYFILE.
- The DSN= parameter cannot be a z/OS UNIX file.

**VARY TCPIP,tnproc,<TELNET>**

Use the VARY TCPIP,tnproc,<TELNET> commands to control the TN3270E Telnet server (Telnet). For additional information about Telnet, see details about accessing remote hosts using Telnet in the z/OS Communications Server: IP Configuration Guide. You must specify the Telnet procedure name. Because Telnet no longer runs in the TCP/IP address space, the keyword TELNET can be omitted.

**Format**

```
[©] Vary — TCPIP — ,tnproc — ,Telnet — ,ABENDTRAP
                        — ,ACT
                        — ,DEBUG
                        — ,INACT
                        — ,QUIesce
                        — ,STOp
```

The IPv6 address format is accepted wherever an IP address is specified. The result might be no matches, but the IPv6 address format is always accepted.

The VARY TCPIP,tnproc,<TELNET> commands give the operator complete control over stopping and starting Telnet and allowing clients to connect. Using the VARY TCPIP,tnproc,<TELNET> commands, you can control the Telnet port and the LUs in the profile table. The combination of the STOP, QUIESCE, RESUME, and OBEYFILE commands gives the operator complete control over when to stop and start Telnet services and when to allow end users to connect. To help manage commands that are related to multiple ports, commands support a PORT keyword.

**Tip:** All parameters that are entered after these commands can be in any order.

Following provides details of the VARY TCPIP,tnproc,<TELNET> commands that can be used.

**VARY ABENDTRAP command**

The VARY ABENDTRAP command provides abend dumps that are based on a return code being set in a given module.

**Format**

```
[©] Vary — TCPIP — ,tnproc — ,Telnet — ,ABENDTRAP — ,modname
       — ,rcode
       — ,instance
```
Parameters

**tnproc**
  The member name of the cataloged procedure used to start the Telnet address space.

**Telnet**
  Legacy parameter that directs the command to the Telnet component when Telnet could run in the TCP/IP stack.

**ABENDTRAP**
  The Abend Trap keyword.

**modname**
  The exact module name, a partial name with an asterisk (*) at the far right, or just an *. The * is a wildcard.

**rcode**
  The exact return code reported on an earlier EZZ6035I message. If **rcode** is not specified, any **rcode** in the module listed is considered a match. The rcode value is the left portion of the RCODE field on the EZZ6035I message. For example, if RCODE: 3011-02 is presented, the rcode value is 3011 and the instance value is 02.

**instance**
  The exact instance reported on an earlier EZZ6035I message. To specify **instance**, **rcode** must also be specified. If **instance** is not specified, any instance is considered a match. The instance value is the right portion of the RCODE field on the EZZ6035I message. For example, if RCODE: 3011-02 is presented, the instance value is 02 and the rcode value is 3011.

Usage

Module name, return code, or instance will be syntax checked. If an incorrect module name is used, the Abend Trap must be turned off and reset with the correct name. The same process is used if an incorrect return code or instance is used.

After the Abend Trap is set, it stays in effect until the trap is sprung or until it is turned off by issuing **VTCPIP,TN3270,TELNET,ABENDTRAP,OFF**. To change the trap, the current trap must first be turned off.

Authorization is through the user's RACF profile containing the MVS.VARY.TCPIP.TELNET.ABENDTRAP definition for ABENDTRAP. The definition can contain a wildcard at the TELNET or TCPIP level (for example MVS.VARY.TCPIP:**).

**VARY ACT command**

The VARY ACT command changes the availability status of a VTAM LU for Telnet server usage. ACT enables the specified LU to be a candidate to represent a Telnet client.

**Format**

```
Vary TCPIP ,tnproc ,Telnet ,ACT ,luname
```

Parameters

**tnproc**
  The member name of the cataloged procedure used to start the Telnet address space.

**Telnet**
  Legacy parameter that directs the command to the Telnet component when Telnet could run in the TCP/IP stack.

**ACT**
  The activate keyword.
`luname`

The name of the LU that you are activating. The LU name ALL has special meaning. It enables all deactivated LUs.

**Usage**

The ACT command does not change the VTAM status of the LU. Use the INACTLUS display to show a list of LUs that are currently inactive.

Authorization is through the user’s RACF profile that contains the MVS.VARY.TCPIP:TELNET.ACT definition for ACT. The definition can contain a wildcard at the TELNET or TCPIP level (for example MVS.VARY.TCPIP.*).

**VARY DEBUG command**

The VARY DEBUG command changes the DEBUG function on all active Telnet profiles.

**Format**

```
Vary TCPIP ,tnproc ,Telnet ,DEBug ,OFF
```

**Parameters**

- `tnproc`
  The member name of the cataloged procedure used to start the Telnet address space.

- `Telnet`
  Legacy parameter that directs the command to the Telnet component when Telnet could run in the TCP/IP stack.

- `DEBug`
  The debug keyword.

- `OFF`
  All Telnet DEBUG functions are turned off for all active profiles.

**Usage**

Authorization is through the user's RACF profile that contains the MVS.VARY.TCPIP:TELNET.DEBUG definition for DEBUG. The definition can contain a wildcard at the TELNET or TCPIP level (for example MVS.VARY.TCPIP.*).

**VARY INACT command**

**Purpose**

The VARY INACT command changes the availability status of a VTAM LU for Telnet server usage. INACT disables the LU as a candidate to represent a Telnet client.

**Format**

```
Vary TCPIP ,tnproc ,Telnet ,INACT ,luname
```

**Parameters**

- `tnproc`
  The member name of the cataloged procedure used to start the Telnet address space.

- `Telnet`
  Legacy parameter that directs the command to the Telnet component when Telnet could run in the TCP/IP stack.
INACT
The inactive keyword.

luname
The name of the LU you are deactivating.

Usage

• The VARY INACT command does not change the VTAM status of the LU. Use the INACTLUS display to show a list of LUs currently inactive.
• If the specified LU has an active VTAM session, it is not affected by this command.
• Use the VTAM VARY NET,INACT command to end the SNA LU session.
• Use the TCP/IP VARY DROP command to end the TCP/IP connection.
• Authorization is through the user's RACF profile that contains the MVS.VARY.TCPIP.TELNET.INACT definition for INACT. The definition can contain a wildcard at the TELNET or TCPIP level (for example MVS.VARY.TCPIP.*).

VARY QUIESCE command

The VARY QUIESCE command removes the listener from the Telnet socket, which causes the specified port to not accept any new Telnet client connections. Currently established connections continue to be serviced.

Note: This command is not necessary for Obeyfile processing. An Obeyfile update creates a new profile for new connections but does not change configuration values for existing Telnet connections.

A qualified port cannot be specified. For information about qualified ports, see details about accessing remote hosts using Telnet in the z/OS Communications Server: IP Configuration Guide.

Format

```
Vary TCPIP '.tnproc',Telnet,QUIesce,POrt=ALL,POrt=num,POrt=num1..num2,POrt=Basic,POrt=Secure
```

Parameters

**tnproc**
The member name of the cataloged procedure used to start the Telnet address space.

**Telnet**
Legacy parameter that directs the command to the Telnet component when Telnet could run in the TCP/IP stack.

**QUIesce**
The QUIesce command keyword.

**POrt=ALL|num|num1..num2|Basic|Secure**
Specifies that ALL ports, a specific port (num), port number range (num1..num2), basic ports, or secure ports should be quiesced.

• Using POrt=Basic selects all ports defined as BASIC (that is, TELNETPARMS contains a PORT statement).
• Using POrt=Secure selects all ports defined as SECURE (that is, TELNETPARMS contains a SECUREPORT or TTLSPORT statement).
• Port is optional if only one port is active; otherwise, a port option must be specified.
Usage

Authorization is through the user's RACF profile containing the MVS.VARY.TCPIP.TELNET.QUIESCE definition for QUIESCE. The definition can contain a wildcard at the TELNET or TCPIP level (for example MVS.VARY.TCPIP.**).

VARY RESUME command

The VARY RESUME command causes the currently quiesced port to begin accepting new Telnet client connections again using either the existing profile or a new profile.

Note: This command is not necessary for Obeyfile processing. An Obeyfile update creates a new profile for new connections but does not change configuration values for existing Telnet Connections.

A qualified port cannot be specified. For details about qualified ports, see the information about accessing remote hosts using Telnet in z/OS Communications Server: IP Configuration Guide.

Format

```markdown
Vary TCPIP , tnproc , Telnet , RESUME
```

Parameters

tnproc

The member name of the cataloged procedure used to start the Telnet address space.

Telnet

Legacy parameter that directs the command to the Telnet component when Telnet could run in the TCP/IP stack.

RESUME

The RESUME keyword.

POrт=ALL|num|num1..num2|Basic|Secure

Specifies that ALL ports, a specific port (num), port number range (num1..num2), basic ports, or secure ports should be quiesced.

- Using POrт=Basic selects all ports defined as BASIC (that is, TELNETPARMS contains a PORT statement).
- Using POrт=Secure selects all ports defined as SECURE (that is, TELNETPARMS contains a SECUREPORT or TTLSPORT statement).
- Port is optional if only one port is active; otherwise, a port option must be specified.

Usage

Authorization is through the user's RACF profile containing the MVS.VARY.TCPIP.TELNET.RESUME definition for RESUME. The definition can contain a wildcard at the TELNET or TCPIP level (for example MVS.VARY.TCPIP.**).

VARY STOP command

The VARY STOP command ends the port connection and all active connections. The STOP command does not end all of Telnet. The command processor remains active. You can issue a VARY OBEYFILE command to ACTIVATE a Telnet port using the Telnet configuration parameters.
Note: A qualified port cannot be specified. For details about qualified ports, see the information about accessing remote hosts using Telnet in z/OS Communications Server: IP Configuration Guide.

Format:

VARY TCPIP,tnproc,STOP

- POrt=ALL
- POrt=num
- POrt=num1..num2
- POrt=Secure
- POrt=Basic

Parameters:

**tnproc**
The member name of the cataloged procedure used to start the Telnet address space.

**Telnet**
Legacy parameter that directs the command to the Telnet component when Telnet could run in the TCP/IP stack.

**STOP**
The STOP command keyword.

**POrt=**\[ALL|num|num1..num2|Basic|Secure\]
Specifies that ALL ports, a specific port (num), port number range (num1..num2), basic ports, or secure ports should be quiesced.

- Using POrt=Basic selects all ports defined as BASIC (that is, TELNETPARMS contains a PORT statement).
- Using POrt=Secure selects all ports defined as SECURE (that is, TELNETPARMS contains a SECUREPORT or TTLSPO RT statement).
- If only one port is active and POrt is not specified, the command affects that one port; otherwise, POrt is required.
- Port is optional if only one port is active; otherwise, a port option must be specified.

Usage: Users can be authorized to invoke the STOP command by permitting their user IDs for CONTROL access to the RACF profile name MVS.VARY.TCPIP.TELNET.STOP. This profile name can contain a wildcard.

**VARY TCPIP,tnproc,LUNS**

Use the VARY TCPIP,tnproc,LUNS command to control the TN3270E Telnet LU name server (LUNS). For additional details about the Telnet LUNS, see the information about accessing remote hosts using Telnet in z/OS Communications Server: IP Configuration Guide.

Format:

VARY TCPIP,tnproc,ACT

- MAX=100
- MAX=nn*/
- INACT
- QUIesce
- RESUME
- STArt

The operator can use the VARY TCPIP, tnproc,LUNS commands to control the Telnet LUNS and its operational status and available LUs. The operator can use a combination of the START, QUIESCE, RESUME, ACT, and INACT commands to control when to start the LUNS, when to allow the LUNS to
participate in recovery scenarios, when to allow Telnet LU name requesters (LUNRs) to connect, and which LUs are available for LUNRs to request.

Tip: You can enter all parameters for these commands in any order.

The following descriptions provide details of the VARY TCPIP,tnproc,TELNET,LUNS commands that you can issue.

**VARY TCPIP,tnproc,LUNS,ACT command**

The VARY TCPIP,tnproc,LUNS,ACT command changes the availability status of a VTAM LU for LUNS usage. The ACT command enables the specified LU to be a candidate for request by a LUNR. The LU must also be active on the LUNR. The ACT command does not change the VTAM status of the LU. Use the D TCPIP,tnproc,LUNS,INACTLUS command to list the LUs that are currently inactive.

Format:

```
Vary TCPIP,tnproc,LUNS,ACT,luname
```

Parameters:

- **tnproc**: The member name of the cataloged procedure that is used to start the Telnet address space.
- **LUNS**: Indicates that the command is directed to a LUNS rather than to a local Telnet server.
- **ACT**: The ACT command (activate) keyword.
- **luname**: The name of the LU that you are activating. The LUNAME ALL keyword enables all inactive LUs.

Usage:

Authorization is controlled through the user’s RACF profile that contains the MVS.VARY.TCPIP.TELNET.LUNS.ACT definition for the ACT command. The definition can contain a wildcard at the TELNET level (for example, MVS.VARY.TCPIP.TELNET.**).

**VARY TCPIP,tnproc,LUNS,INACT command**

The VARY TCPIP,tnproc,LUNS,INACT command changes the availability status of a VTAM LU for LUNS usage. The INACT command disables the LU as a candidate to be requested by a LUNR. The VARY INACT command does not change the VTAM status of the LU. Use the D TCPIP,tnproc,LUNS,INACTLUS to show a list of LUs currently inactive. If the specified LU is currently in use by a LUNR, it is not affected by this command. Use the VTAM VARY NET,INACT command to end the SNA LU session.

Format:

```
Vary TCPIP,tnproc,LUNS,INACT,luname
```

Parameters:

- **tnproc**: The member name of the cataloged procedure that is used to start the Telnet address space.
- **LUNS**: Indicates that the command is directed to a LUNS rather than to a local Telnet server.
- **INACT**: The INACT command (inactivate) keyword.
- **luname**: The name of the LU that you are deactivating.

Usage:
Authorization is controlled through the user’s RACF profile that contains the MVS.VARY.TCPIP.TELNET.LUNS.INACT definition for the INACT command. The definition can contain a wildcard at the TELNET level (for example MVS.VARY.TCPIP.TELNET.**).

**VARY TCPIP,tnproc,LUNS,QUIesce command**

The VARY TCPIP,tnproc,LUNS,QUIESCE command causes an LU name server (LUNS) that is in the STANDBY and JOIN state to be ineligible to participate in recovery scenarios or to start when the VARY START command is issued. A LUNS must be in the QUIESCE state to make a configuration change using the VARY TCPIP,tnproc,OBEYFILE,DSN command.

**Format:**

```
Vary TCPIP  — ,tnproc  — ,LUNS  — ,QUIesce  
```

**Parameters:**

- **tnproc**
  The member name of the cataloged procedure that is used to start the Telnet address space.

- **LUNS**
  Indicates that the command is directed to a LUNS rather than to a local Telnet server.

- **QUIesce**
  The QUIesce command keyword.

**Usage:**

Authorization is controlled through the user’s RACF profile that contains the MVS.VARY.TCPIP.TELNET.LUNS,QUIESCE definition for the QUIESCE command. The definition can contain a wildcard at the TELNET level (for example, MVS.VARY.TCPIP.TELNET.**).

**VARY TCPIP,tnproc,LUNS,RESUME command**

The VARY TCPIP,tnproc,LUNS,RESUME command causes the currently QUIESCED LU Name Server (LUNS) to be eligible to participate in recovery scenarios and start when the VARY START command is issued.

**Format:**

```
Vary TCPIP  — ,tnproc  — ,LUNS  — ,RESUME  
```

**Parameters:**

- **tnproc**
  The member name of the cataloged procedure that is used to start the Telnet address space.

- **LUNS**
  Indicates that the command is directed to a LUNS rather than to a local Telnet server.

- **RESUME**
  The RESUME command keyword.

**Usage:**

Authorization is controlled through the user’s RACF profile that contains the MVS.VARY.TCPIP.TELNET.LUNS,RESUME definition for the RESUME command. The definition can contain a wildcard at the TELNET level (for example MVS.VARY.TCPIP.TELNET.**).

**VARY TCPIP,tnproc,LUNS,START command**

The VARY TCPIP,tnproc,LUNS,START command causes the current LU name server (LUNS) that is in standby mode to become active.
Format:

- Vary TCPIP — .tnproc — .LUNS — .START —

Parameters:

**tnproc**
- The member name of the cataloged procedure that is used to start the Telnet address space.

**LUNS**
- Indicates that the command is directed to a LUNS rather than to a local Telnet server.

**START**
- The START command keyword.

Usage:

Authorization is controlled through the user's RACF profile that contains the MVS.VARY.TCPIP.TELNET.LUNS.START definition for the START command. The definition can contain a wildcard at the TELNET level (for example, MVS.VARY.TCPIP.TELNET.**).

**EZACMD command**

Use the EZACMD command to issue selected z/OS Communications Server UNIX shell commands from the following environments:

- MVS console
- TSO
- NetView

**EZACMD command installation**

The EZACMD command is installed in the following target data sets:

- SYS1.SAXREXEC (placed in the System REXX system library for use with MVS console invocation)
- **hlq.SEZAEXEC** (for use with TSO or NetView invocations)

The following z/OS Communications Server UNIX shell commands are supported by EZACMD:

- **trmdstat** - see “The z/OS UNIX trmdstat command: Display traffic regulation management daemon (TRMD) log” on page 767 for details about command option syntax.
- **ipsec** - see “The z/OS UNIX ipsec command syntax” on page 647 for details about command option syntax.
- **nssct1** - see “The z/OS UNIX nssct1 command syntax” on page 740 for details about command option syntax.
- **pasearch** - see “The z/OS UNIX pasearch command: Display policies” on page 749 for details about command option syntax.
- **ping** - see “The z/OS UNIX ping command: Send an echo request” on page 615 for details about command option syntax.

**Restriction:** For the EZACMD command, the ping command is supported only from the MVS console and NetView.

**MVS console invocation of the EZACMD command**

To use the EZACMD command from the MVS console, you must meet the following requirements:

- Verify that EZACMD was installed in the SYS1.SAXREXEC System REXX system library.
- The System REXX component must be configured and enabled on the z/OS image. See the System REXX information in z/OS MVS Programming: Authorized Assembler Services Guide and the AXR00 (default...
System REXX data set concatenation) information in z/OS MVS Initialization and Tuning Reference for details about enabling System REXX on your z/OS image.

- An operator must be logged on to the console (using the LOGON console command).
- The operator user ID must have a valid OMVS segment in the security database.

**Guideline:** The output from the command might not be formatted correctly as a result of the line width restriction for the MVS console. For the best formatting results, invoke the command from TSO, NetView, or the UNIX shell.

**Rule:** You must enclose the command and options in single quotation marks (') so that the MVS console support does not convert the command name and options to uppercase characters.

**Format:**

```
  prefix  EZACMD  'command name\n          command options\n          MAX=lines'  
```

**Parameters**

**prefix**

The System REXX command prefix as defined in the AXRnn parmlib member. For example, if the prefix is defined as %%% then invoke the command as %%%EZACMD.

**command name and options**

The command name is one of the supported z/OS Communications Server UNIX shell commands. Command options are any options that the UNIX shell command supports. You must enter the command options in the exact format and case that is required by the z/OS UNIX command.

**MAX=lines**

MAX is an optional keyword that limits the number of output lines that are produced by the z/OS UNIX command and that are displayed on the MVS console. The default value is 100. The value can be any numeric value in the range 1 - 64 000.

**Example 1**

Display currently active IPSec filters, limiting the number of output lines to 9.

```
%%%EZACMD 'ipsec -f display max=9'
```

**Example 2**

Ping host w3.ibm.com:

```
%%%EZACMD 'ping -v w3.ibm.com'
```
Packets: Sent=3, Received=3, Lost=0 (0% loss)
Approximate round trip times in milliseconds:
Minimum=61.98 ms, Maximum=86.88 ms, Average=70.45 ms, StdDev=14.23 ms
System REXX EZACMD: ping command - end - RC=0

**TSO invocation of the EZACMD command**

To use the EZACMD command in the TSO environment, you must meet the following requirements:

- Concatenate the *hlq.SEZAEXEC* library to the SYSEXEC or SYSPROC DD statements in your TSO logon procedure.
- The TSO user ID must have a valid corresponding OMVS segment defined in the security database.

TSO commands can be entered using ISPF option 6.

**Format:**

```
EZACMD  command name  command options
```

**Parameters**

**command name and options**

The command name is one of the supported z/OS Communications Server UNIX shell commands.

Command options are any options that the UNIX shell command supports. You must enter the command options in the exact format and case that is required by the z/OS UNIX command.

**MAX=lines**

MAX is an optional keyword that limits the number of output lines that are produced by the z/OS UNIX command and that are displayed for TSO. The default value is 100. The value can be any numeric value that is in the range 1 - 64 000.

**Example 1**

Display currently active IPSec filters, limiting the number of output lines to 9.

```bash
====> EZACMD ipsec -f display max=9
TSO REXX EZACMD: ipsec command - start - userID=USER1
TSO REXX EZACMD: ipsec -f display
CS V2R4 ipsec  Stack Name: TCPCS  Fri Oct  7 14:30:02 2011
Primary:  Filter          Function: Display            Format:   Detail
Source:   Stack Policy    Scope:    Current            TotAvail: 730
Logging:  On              Predecap: Off                DVIPSec:  No
NatKeepAlive:  0
Defensive Mode: Inactive
FilterName:                   DVIPA1~2
FilterNameExtension:          1
TSO REXX EZACMD: Maximum number of output lines (9) has been reached.
TSO REXX EZACMD: ipsec command - end - RC=4
```
Format:

NETVASIS EZACMD — command name — command options

Parameters

**Command name and options**
Command name is one of the supported z/OS Communications Server UNIX shell commands.

Command options are any option that the UNIX shell command supports. The command options must be entered in the exact format and case that is required by the z/OS UNIX command.

**MAX= lines**
MAX is an optional keyword that limits the number of output lines that are produced by the z/OS UNIX command and that are displayed for NetView. The default value is 100. The value can be any numeric value that is in the range 1 - 64 000.

**Example 1**
Display currently active IPSec filters, limiting number of output lines to 9.

```shell
cnetvasis EZACMD ipsec -f display max=9
```

**Example 2**
Ping host w3.ibm.com.

```shell
cnetvasis ezacmd ping -v w3.ibm.com
```

---

**TSO commands**
The following topics describe some of the system administrator TSO commands.

- “Using the SMSG interface” on page 266
- “MAKESITE command ” on page 266
- “TESTSITE command” on page 270
Using the SMSG interface

The TSO SMSG interface also allows you to change the characteristics of an active task. This is the general format of SMSG.

**Format:**

```
SMSG proname parameter
```

**Parameters:**

- **proname**
  
  The name of the member in a procedure library that was used to start the server or address space.

  **Note:** The SMSG command works when issued from TSO and should not be issued from the operator console.

- **parameter**
  
  Any of the parameters that are valid for the server.

**Usage:**

The following servers support the MVS SMSG command. Not all servers support the same parameters. You can find further descriptions of the supported parameters in the information for that server. See TSO SMSG command—Monitoring the Status of LPD in the z/OS Communications Server: IP User's Guide and Commands for information about using the TSO SMSG command to provide an interactive interface to the LPD server.

**Server/Addr Space Supported Parameters**

**Remote Print Server (LPD)**

PRINT WORK, TRACE OFF, TRACE ON

**MAKESITE command**

Use MAKESITE as a TSO command or in a batch job to generate new hlq.HOSTS.SITEINFO and hlq.HOSTS.ADDRINFO data sets. The parameters are the same for either a TSO command or a batch job invocation of MAKESITE.

**Tip:** Use ETC.IPNODES (in the format etc/ipnodes) to define local hosts tables as the preferred alternative to MAKESITE. For more information, see Resolver configuration in the z/OS Communications Server: IPv6 Network and Application Design Guide, which discusses the use of IPNODES by the resolver to locate IPv4 and IPv6 addresses and site names.

**Format:**

```
MAKESITE HLQ=hlq, MGMTclas=management_class, DATAclas=data_class, STORclas=storage_class, Unit=unit, VOLser=volume_serial
```

**Parameters:**

- **HLQ**
  
  hlq

- **MGMTclas**
  
  management_class

- **DATAclas**
  
  data_class

- **STORclas**
  
  storage_class

- **Unit**
  
  unit

- **VOLser**
  
  volume_serial
HLQ=hlq
The high-level qualifier of both the input and output data sets. The name specified is appended to the HOSTS.LOCAL, HOSTS.SITEINFO and HOSTS.ADDRINFO data set names.

Minimum abbreviation: HLQ=
Maximum length: 29 characters

MGMTclas=management_class
The SMS-managed management class. MGMTCLAS is valid only in an SMS environment.

Minimum abbreviation: MGMT=
Maximum length: eight characters

DATAclas=data_class
The SMS-managed data class. DATACLAS is valid only in an SMS environment.

Minimum abbreviation: DATA=
Maximum length: eight characters

STORclas=storage_class
The SMS-managed storage class. STORCLAS is valid only in an SMS environment.

Minimum abbreviation: STOR=
Maximum length: eight characters

Unit=unit
An esoteric device name.

Minimum abbreviation: U=
Maximum length: eight characters

VOLser=volume_serial
Volume serial number.

Minimum abbreviation: VOL=
Maximum length: 6 characters

Usage:
• The optional parameters can be in any order.
• Blanks are not allowed in the syntax.
• MAKESITE gets its input from hlq.HOSTS.LOCAL, where the HLQ is derived in this order:
  – HLQ parameter specified either with the command or in the batch job.
  – TSO user ID or the TSO PROFILE PREFIX, if it is different from the userid. In a batch job, userid can come from any of several sources depending on the environment. It can be the user ID of the user who submitted the batch job, or it can be the batch job name.
  – The value specified with the DATASETPREFIX statement in TCPIP.DATA.
  – System default.

The output data sets produced by MAKESITE are prefixed by either the HLQ parameter specified either on the command or batch job or the TSO user ID or TSO PROFILE PREFIX, if it is different from the userid.

• If any MAKESITE parameters are specified incorrectly, MAKESITE still executes using defaults (for example, for an incorrect hlq, the default is the active userid or jobname).

• Components that use the output from MAKESITE follow the standard naming conventions. If a DATASETPREFIX has been specified, it is used as the high-level qualifier for HOSTS.SITEINFO and HOSTS.ADDRINFO.

Examples:
If your current active HLQ was TCPIP.MVSA, you would follow these steps to run MAKESITE and rename the output data sets.

1. Run MAKESITE with the appropriate parameters to generate 2 new data sets from the new hlq.HOSTS.LOCAL data set.

As a TSO command, you might enter:

```
MAKESITE HLQ=TCPIP.H0004,MGMT=M0001,VOLSER=STRG01,UNIT=SYSDA
```

As a batch job, you might use this JCL:

```
//MAKESITE JOB ,TIME=2,NOTIFY=USER7
//*BATCH EXEC PGM=MAKESITE,REGION=8000K,
//* PARM='VOLSER=STRG01,UNIT=SYSDA,HLQ=TCPIP.H0004,MGMT=M0001'
//* STEPLIB DD DISP=SHR,DSN=TCPIP.SEZALOAD
//SYSPRINT DD SYSOUT=*,DCB=(LRECL=132,RECFM=FBA,BLKSIZE=3960)
//SYSPRINT DD SYSOUT=* 
```

Note the following information:

- This JCL is not shipped with TCP/IP.
- The size of the parameter string is limited to 100 bytes.
- Keywords in the parameter string can be abbreviated as shown in the MAKESITE syntax descriptions.
- Region size varies according to your configuration. Make sure that the region size specified is valid for your configuration.

This will create TCPIP.H004.HOSTS.SITEINFO and TCPIP.H0004.HOSTS.ADDRINFO.

2. Rename your existing HOSTS.SITEINFO and HOSTS.ADDRINFO data sets. These data sets are currently accessed by TCP/IP users on the system and should not be deleted while TCP/IP is running.

For example, change TCPIP.MVSA.HOSTS.SITEINFO to TCPIP.MVSA.HOSTS.SITEOLD and TCPIP.MVSA.HOSTS.ADDRINFO to TCPIP.MVSA.HOSTS.ADDROLD.

3. Rename the new HOSTS.ADDRINFO and HOSTS.SITEINFO data sets to replace the old ones.

For example, change TCPIP.H0004.HOSTS.SITEINFO to TCPIP.MVSA.HOSTS.SITEINFO and TCPIP.H0004.HOSTS.ADDRINFO to TCPIP.MVSA.HOSTS.ADDRINFO.

The following example shows the output when the MAKESITE command is run as a batch job. When the MAKESITE command is run as a TSO command, the report format is the same except that the message numbers are not displayed.

**Tip:** Messages with numbers that end with an "E" (for errors) or a "W" (for warning) are issued when an error occurs. Messages with numbers that end with an "I" are informational messages and do not represent a problem. Some of the messages in the following example reflect internal processing statistics.
EZA0549I
Identifies the start of the MAKESITE statistics report.

EZA0550I
Displays the name of the HOSTS.LOCAL data set processed by the MAKESITE command. The indented lines following this message apply to the HOSTS.LOCAL data set.

EZA0551I
Displays the total number of lines in the HOSTS.LOCAL data set, including comment lines.

EZA0552W
Displays the number of lines in the HOSTS.LOCAL data set that were not processed because of syntax errors.

EZA0553I
Displays the number of duplicate names found in the HOSTS.LOCAL data set.

EZA0554I
Displays the number of potential conflicts. A potential conflict is detected if an address defined in the HOSTS.LOCAL data set maps to multiple names and the first 8 bytes of these names are the same.

EZA0555I
Displays the number of each record type in the HOSTS.LOCAL data set. Valid record types are NET, GATEWAY, and HOST. The number displayed for hosts includes the entry generated by the MAKESITE command for the loopback address.

EZA0556I
Displays the name of the HOSTS.SITEINFO data set. The indented lines following this message apply to the HOSTS.SITEINFO data set.

EZA0557I
Displays the number of table entries created in the HOSTS.SITEINFO data set.

EZA0558I
Displays the number of HOSTS.SITESINFO table entries used and shown as Total Entries in this report.

EZA0559I
Displays the number of names processed (excluding duplicates) and shown as Distinct Names in this report. There can be more Distinct Names than Total Entries if an address maps to more than one name.

EZA0560I
Displays the number of times a hash value was mapped to a slot that was already in use; this value is shown as Collisions in this report. This message is informational only and does not indicate a problem.

EZA0561I
Displays the result of the following calculation: 1 + (Collisions /Distinct Names).

EZA0562I
Displays the name of the HOSTS.ADDRINFO data set. The indented lines following this message apply to the HOSTS.ADDRINFO data set.

EZA0563I
Displays the number of table entries created in the HOSTS.ADDRINFO data set.

EZA0564I
Displays the number of HOSTS.SITESINFO table entries used.

EZA0565I
Displays the number of times a hash value was mapped to a slot that was already in use. This message is informational only and does not indicate a problem.

EZA0566I
Displays the number of names that were dropped because more than six names were mapped to a particular address.

Usage:
After running the MAKESITE command, you can test the correctness of the hlq.HOSTS.ADDRINFO and hlq.HOSTS.SITEINFO data sets with the TESTSITE command.

TESTSITE command

Use TESTSITE to verify that the hlq.HOSTS.ADDRINFO and hlq.HOSTS.SITEINFO data sets can correctly resolve the name of a host, gateway, or net.

Requirement: VMCF must be started for the TSO TESTSITE command to be successful because the TSO TESTSITE command uses the Pascal socket API. If VMCF is not started, an ABEND0D6 can occur.

Format:

```plaintext
TESTSITE
```

Parameters:

There are no parameters for this command.

Examples:

To test your HOSTS data sets, enter:

```plaintext
TESTSITE
```

When prompted for a name, enter the host, gateway or net name you want to verify.

When you have checked all the names in question, enter QUIT and press ENTER.

Usage:

TESTSITE gets its input from the hlq.HOSTS.ADDRINFO and hlq.HOSTS.SITEINFO data sets, where the HLQ is derived in this order:

- TSO user ID or the TSO PROFILE PREFIX, if it is different from the userid.
- The value specified with the DATASETPREFIX statement in PROFILE.TCPIP and TCPIP.DATA.
- System default.

HOMETEST command

Use HOMETEST to verify your host name and address configuration. See Verifying PROFILE.TCPIP and TCPIP.DATA using HOMETEST in the z/OS Communications Server: IP Configuration Guide for additional details about the use of the HOMETEST command.

Enter HOMETEST as a TSO command.

Requirement: VMCF must be started for the TSO HOMETEST command to be successful because the TSO HOMETEST command uses the Pascal socket API. If VMCF is not started, an ABEND0D6 can occur.

Restriction: When you use this function, the total number of IPv4 IP addresses that can be configured to the TCP/IP stack is limited to 255 IP addresses. This limitation of 255 IP addresses applies to all IPv4 IP addresses, including loopback and dynamic VIPA.

Format:

```plaintext
HOMETEST
```

Parameters:

There are no parameters for this command.
MVPXDIS command

The MVPXDISP command can be used for debugging VMCF problems. See Diagnosing VMCF/IUCV problems with the MVPXDISP command in z/OS Communications Server: IP Diagnosis Guide for more information about this command.

UNIX command

The UNIX command `pwtokey` can be used for password security. See “Using the pwtokey facility” on page 889 for more information about this command.
Chapter 2. Monitoring the TCP/IP network

This information describes how to use the following TCP/IP commands to obtain information from the network.

- The TSO NETSTAT and z/OS UNIX netstat/onetstat commands provide information about the status of the network. See “Netstat” on page 273.
- The TSO PING and z/OS UNIX ping/oping commands determine the accessibility of a foreign node. See “Ping” on page 607.
- The TSO RPCINFO and z/OS UNIX orpcinfo commands display the servers that are using RPC binding protocol Version 2 that are registered and operational with any portmapper or rpcbind servers on your network. See “Rpcinfo” on page 624.
- The TSO TRACERTE and z/OS UNIX traceroute/otracert commands help debug network problems. See “Traceroute” on page 628.

Netstat

The TSO NETSTAT and z/OS UNIX netstat/onetstat commands provide the following information:

- Information about the status of the local host, including information about TCP/IP connections, network clients, gateways, and devices
- DNS cache information from the system-wide resolver
- The ability to drop connections for users who have the MVS.VARY.TCPIP.DROP statement defined in their RACF profile

As new functions are added to TCP/IP in the z/OS Communications Server, new information is also needed from the Netstat command in terms of new command options, new Netstat reports, or changes to existing Netstat reports. Any program that post processes output lines from the Netstat command and depends on the content of these output lines from the Netstat command should be reviewed and possibly modified when maintenance or a new release of z/OS is being installed. For every new release, see z/OS Release Upgrade Reference Summary for a summary of the changes to the following Netstat commands and their associated report output:

- The DISPLAY TCPIP,,NETSTAT operator command
- The TSO NETSTAT command
- The z/OS UNIX netstat command

TSO NETSTAT command output parsing considerations

No message identifiers are displayed in the output for TSO NETSTAT if the command is issued from an IPv6-enabled stack or if the command is issued from an IPv4-only stack but the request is for a long format display. If you have developed REXX programs that issue Netstat commands under TSO and parse the output lines based on message identifiers, you need to change those REXX programs to use some other token in the output lines to decide the format of the line you are trying to parse.

Here are some tips that might make the migration easier for you:

- Several Netstat reports display table entries such as the CONN report or the BYTEINFO report. If you are receiving Netstat output in LONG format, these table entries now take up more than one output line. The first line in a table entry always starts at position one in the line, and the remaining lines that belong to that same table entry start with an offset of two (position three). You can use that to determine which lines are the start of a table entry and which are follow-on lines that belong to that same table entry.
• For the non-table type of reports, depending on the report you are parsing and the pieces of information you are looking for, you need to identify the individual lines on some other token than the MSGID, such a LNKNAME or DEVNAME.

A small REXX program produced the output in the following example based on a NETSTAT DEVLINKS report:

```
<table>
<thead>
<tr>
<th>Link/Intf name</th>
<th>Bytes in</th>
<th>Bytes out</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOOPBACK</td>
<td>12387</td>
<td>12387</td>
</tr>
<tr>
<td>VIPA1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>LINKEE</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>TR1</td>
<td>110614</td>
<td>363744</td>
</tr>
<tr>
<td>VIPL092A689F</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>
```

This output was produced with a REXX program that used MSGIDs to identify lines. The sample REXX program is shown in the following example:

```rexx
/* REXX */
/* Requires PROFILE MSGID - uses MSGIDs to identify lines */
netstr = 'DEVLINKS'
address TSO "NETSTAT "netstr" STACK"
n = queued()
if n > 0 then do x=1 to n
  i = (n-x)+1
  pull line.i
end
line.0 = n
do x=1 to line.0
  parse upper var line.x msgid t1 t2 t3 t4 .
  if msgid = 'EZZ2761I' then do /* MSGID EZZ2761I */
    interface = t2
  end
  if msgid = 'EZZ2820I' then do /* MSGID EZZ2820I */
    bytesin = t2
    bytesout = t4
    st1 = 'Link/Intf name ='||substr(interface,1,18)
    st1 = st1||' Bytes in ='||substr(bytesin,1,10)
    st1 = st1||' Bytes out ='||substr(bytesout,1,10)
    say st1
  end
end
exit
```

The exact same output can be produced using a modified REXX program that does not use MSGIDs but specific tokens in the Netstat report. In the following example, the only changes required are in the `parse` and `if` statements.

```rexx
/* REXX */
/* Does not require MSGIDs, uses tokens to identify lines */
/* This REXX works with z/OS V1R10 */
netstr = 'DEVLINKS'
address TSO "NETSTAT "netstr" STACK"
n = queued()
if n > 0 then do x=1 to n
  i = (n-x)+1
  pull line.i
end
line.0 = n
do x=1 to line.0
  parse upper var line.x t1 t2 t3 t4 .
  if t1 = 'LNKNAME:' | t1 = 'INTFNAME:' then do
    interface = t2
  end
  if t1 = 'BYTESIN' then do
    bytesin = t3
  end
  if t1 = 'BYTESOUT' then do
    bytesout = t3
    st1 = 'Link/Intf name ='||substr(interface,1,18)
    st1 = st1||' Bytes in ='||substr(bytesin,1,10)
    st1 = st1||' Bytes out ='||substr(bytesout,1,10)
    say st1
  end
end
exit
```
Provide security product access to Netstat command

Controlling access to Netstat command can be added by using security product resources defined in the following table. You can define the following new security product resource names in the SERVAUTH class to control users' access to the TSO NETSTAT or UNIX shell netstat command options. See the sample EZARACF member for examples of the security product commands used to create the resource names. If the SERVAUTH class is not active or if security product resource name is not defined, access to the Netstat command will not be restricted.

Note: Take care with applications that might be invoking Netstat under the covers. If the Netstat security resource names are defined, the user IDs associated with applications invoking Netstat under the covers need to be permitted for READ access to the resource names.

</table>
You can use the control statements in the sample JCL job provided in SEZAINST(EZARACF) to define these authorizations.

- If this is the first SERVAUTH class profile that your installation is using, activate the SERVAUTH class using the following commands:
  ```plaintext
  SETROPTS CLASSACT(SERVAUTH)
  SETROPTS RACLIST(SERVAUTH)
  ```

- **Example 1**: If you wanted to permit USER2 access to the Netstat CONN/-c option for TCP/IP stack TCP1 on system MVSA you could use the following definitions:
  ```plaintext
  RDEFINE SERVAUTH (EZB.NETSTAT.MVSA.TCP1.CONN) UACC(NONE)
  PERMIT (EZB.NETSTAT.MVSA.TCP1.CONN) ACCESS(READ) CLASS(SERVAUTH) ID(USER2)
  ```

- **Example 2**: If you wanted to permit USER4 to have access to all of Netstat options you could use the following definitions:
  ```plaintext
  SETROPTS GENERIC(SERVAUTH)
  RDEFINE SERVAUTH (EZB.NETSTAT.MVSA.TCP1.*) UACC(NONE)
  PERMIT (EZB.NETSTAT.MVSA.TCP1.*) ACCESS(READ) CLASS(SERVAUTH) ID(USER4)
  SETROPTS GENERIC(SERVAUTH) REFRESH
  ```

- Refresh RACLIST
  ```plaintext
  SETROPTS RACLIST(SERVAUTH) REFRESH
  ```

### The TSO NETSTAT command syntax

Use the TSO NETSTAT command to display the configuration and network status on a local TCP/IP stack.

**Syntax**

```plaintext
NETSTAT [Report Option] [Target] [Output] [Filter]
```

**Report Option**
Monitoring the TCP/IP network 277
TCp — tcpname —

Output

- FORMAT LONG
  - SHORT

- REPORT
  - DSN dsname
  - HLQ hlqname

- STACK
  - TITLes

Filter
Notes:

1 The minimum abbreviation for each parameter is shown in uppercase letters.
2 The CLIENT filter is valid with ALL, ALLConn, BYTEinfo, CONn, CLients, SOCKets, and TELnet.
3 The HOSTName filter is valid only with ALL, ALLConn, BYTEinfo, CONn, RESCache, SOCKets, TELnet, and VCRt.
4 The IPAddr filter is valid only with ALL, ALLConn, BYTEinfo, CONn, Gate, ND, RESCache, ROUTe, SOCKets, TELnet, VCRt, and VDPT, and VIPADCFG.
5 The NOTN3270 filter is valid only with ALL, ALLConn, BYTEinfo, CONn, CLients, and SOCKets.
6 The PORT filter is valid only with ALL, ALLConn, CONn, PORTList, SOCKets, TELnet, VCRt, and VDPT.
7 The IPPort filter is valid only with ALL, ALLConn, CONn, SOCKets, TELnet, VCRt, and VDPT.
8 The APPLD filter is valid only with ALL, ALLConn, and CONn.
9 The SMCID filter is valid only with ALL, ALLConn, CONn, and DEvlinks.
The CONNType filter is valid only with ALLConn and CONn.
The INTFName filter is valid only with DEvlinks and HOMe.
The valid protocol values are TCP and UDP.
The DNSAddr filter is valid only with RESCache.
The POLicyn filter is valid only with SLAP.
The valid protocol values are IP, ICMP, TCP, and UDP.
The APPLname filter is valid only with TELnet.
The LUName filter is valid only with TELnet.

The z/OS UNIX netstat command syntax

Use the z/OS UNIX netstat command to display the network configuration and status on a local TCP/IP stack.

Note:
1. netstat is a synonym for the onetstat command in the z/OS UNIX shell. The onetstat command syntax is the same as that for the netstat command.
2. Some option modifiers for the z/OS UNIX netstat command are shown below using uppercase letters followed by lowercase letters (for example, SUMmary). The portion of the modifier shown using uppercase letters indicates the minimum abbreviation for the modifier. The modifier used must be entered using all uppercase letters.

Syntax

Report Option  Target  Output  Filter

Command  Target

Report Option
The image contains a diagram illustrating various command options and parameters, likely for configuring or monitoring network settings in a z/OS Communications Server environment. The diagram shows options such as `-A`, `-a`, `-b`, `-c`, `-d`, `-F`, `-g`, `-J`, `-k`, `-l`, `-n`, and `-O`, each with corresponding parameters like `SERVER`, `APPLDATA`, `IDLETIME`, `PNETID`, `DETAIL`, `ACTIVE`, `SUMmary`, and `PROTOCOL`. The numbers 123456789 are annotated at various points, likely indicating specific values or sequence numbers for each option. The diagram is from the book "z/OS Communications Server: IP System Administrator's Commands."
Monitoring the TCP/IP network
Notes:

1. -B filter is valid only with -A, -a, -c, -s, -t, -O, and -V.
2. -E filter is valid only with -A, -a, -b, -c, -e, -s, and -t.
3. -H filter is valid only with -A, -a, -b, -c, -q, -s, -t, and -V.
The Netstat parameter overview

The following describes the individual parameter topics that are identified in the syntax diagram. The parameter format that is used below is the TSO parameter keyword followed by a slash and the z/OS UNIX shell character parameter. If a TSO parameter is not followed by a slash and a z/OS UNIX shell character parameter, then no corresponding support is available in the UNIX shell environment.

The Netstat command report option

The following report options can be used with the Netstat command. If no report option is specified, Netstat displays the default CONN/\-c report.

**ALL/\-A**
Displays detailed information about TCP connections and UDP sockets, including some recently closed ones. See “Netstat ALL/-A report” on page 298 for more details.

**ALLConn/-a**
Displays information for all TCP connections and UDP sockets, including some recently closed ones. See “Netstat ALLConn/-a report” on page 334 for more details.

**ARp/-R**
Queries the IPv4 ARP cache information. See “Netstat ARp/-R report” on page 340 for more details.

**BYTEinfo/-b**
Displays the byte-count information for each active TCP connection and UDP socket. See “Netstat BYTEinfo/-b report” on page 342 for more details.

**CACHinfo/-C**
Displays information about TCP connections using the Cache Accelerator. See “Netstat CACHinfo/-C report” on page 347 for more details.

**CLIENTs/-e**
Displays information about local users of TCP/IP services (jobnames). See “Netstat CLIENTs/-e report” on page 351 for more details.

**CONFIG/-f**
Displays the TCP/IP configuration information about IP, TCP, UDP, SMF parameters, GLOBALCONFIG profile statement, network monitor, data trace, and autolog settings. See “Netstat CONFIG/-f report” on page 353 for more details.

**CONN/-c**
Displays information about each active TCP connection and UDP socket. CONN/-c is the default parameter. See “Netstat CONN/-c report” on page 383 for more details.

**DEFADDRT/-l**
Displays the policy table for IPv6 default address selection. See “Netstat DEFADDRT/-l report” on page 391 for more details.
DEvlinks/-d
Displays the information about interfaces that are defined to the TCP/IP stack. See “Netstat DEvlinks/-d report” on page 392 for more details.

Gate/-g
Displays information about the stack routing table for IPv4 destinations. See “Netstat Gate/-g report” on page 441 for more details.

HELP or ?/-?
Displays help information for the Netstat parameters. See “Netstat HELP/-? report” on page 445 for more details.

HOme/-h
Displays information about each home IP address and its associated link or interface name. See “Netstat HOme/-h report” on page 449 for more details.

IDS/-k
Displays information about intrusion detection services. See “Netstat IDS/-k report” on page 454 for more details.

ND/-n
Displays the IPv6 Neighbor cache entries. See “Netstat ND/-n report” on page 466 for more details.

PORTList/-o
Displays the list of reserved ports and the port access control configuration for unreserved ports. See “Netstat PORTList/-o report” on page 469 for more details.

RESCache/-q
Displays resolver cache information. See “Netstat RESCache/-q report” on page 472 for more details.

ROUTE/-r
Displays stack routing information. Information for IPv4 destinations is always displayed. If the stack is IPv6 enabled, information about IPv6 destinations is also displayed. See “Netstat ROUTE/-r report” on page 484 for more details.

SLAP/-j
Displays the QoS policy statistics. See “Netstat SLAP/-j report” on page 497 for more details.

SOCKets/-s
Displays information for open TCP or UDP sockets associated with a client name. See “Netstat SOCKets/-s report” on page 501 for more details.

SRCIP/-J
Displays information for all job-specific and destination-specific source IP address associations on the TCP/IP address space. See “Netstat SRCIP/-J report” on page 506 for more details.

STATS/-S
Displays TCP/IP statistics for IP, ICMP, TCP, and UDP protocols. See “Netstat STATS/-S report” on page 509 for more details.

TELnet/-t
Displays information for TN3270 Telnet server connections. See “Netstat TELnet/-t report” on page 526 for more details.

TTLS/-x
Displays Application Transparent Transport Layer Security (AT-TLS) group and connection information. See “Netstat TTLS/-x report” on page 532 for more details.

Up/-u
Displays the date and time that the TCP/IP stack was started and specifies whether the stack is IPv6 enabled or disabled. See “Netstat Up/-u report” on page 553 for more details.

VCRT/-V
Displays the dynamic VIPA Connection Routing Table used for sysplex distributor and moveable dynamic VIPA support. See “Netstat VCRT/-V report” on page 554 for more details.
VDPT/-O
Displays the dynamic VIPA Destination Port Table information for TCP/IP stacks, and the dynamic
VIPA Destination Port Table for non-z/OS targets. See “Netstat VDPT/-O report” on page 562 for more
details.

VIPADCFG/-F
Displays the dynamic VIPA configuration for a TCP/IP stack. See “Netstat VIPADCFG/-F report” on
page 579 for more details.

VIPADyn/-v
Displays the current dynamic VIPA and VIPAROUTE information for a TCP/IP stack. See “Netstat
VIPADyn/-v report” on page 597 for more details.

The Netstat command target
You can get information for a specific TCP/IP address space by using TCp/-p tcpname with any report
option. This option is needed only if you use the Common INET physical file system (PFS) and have more
than one TCP/IP address space active in a z/OS image. In such a multi-stack environment, use this option
to specify which TCP/IP address space you want Netstat to gather information from. If this option is not
specified in a multi-stack environment, then the information displayed is gathered only from the default
TCP/IP address space that was specified with the TCPIPJOBNAME statement in the appropriate resolver
configuration file or data set.

Rule: The Netstat RESCache/-q option gets its information from the system-wide resolver. The
information is not specific to the TCP/IP address space name that is specified on the TCp/-p target
parameter, or to the default TCP/IP address space.

TCp/-p tcpname
Displays detailed information about the specified TCP/IP address space. You can use TCp/-p tcpname
with any other Netstat parameter to get information about the specified TCP/IP address space.

The tcpname is an 8-byte procedure name that is used to start the TCP/IP address space. When the S
member.identifier method of starting TCP/IP is used, the value specified for identifier must be used
as tcpname.

Netstat command output
Use the following options to specify where and in which format output is written. If an output option is not
specified, by default the output is displayed on the user’s terminal.

FORMat/-M
Display a Netstat report in a given format.

SHORT
Display a Netstat report in short format. The short format is the format that supports only IPv4 IP
addresses. This option is valid only if the stack is not IPv6 enabled.

LONG
Display a Netstat report in long format. The long format can accommodate both IPv4 and IPv6 IP
addresses.

<table>
<thead>
<tr>
<th>If . . .</th>
<th>Then . . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>The stack is IPv6 enabled</td>
<td>The default format for the Netstat report is the long format.</td>
</tr>
<tr>
<td>The stack is IPv6 enabled and the FORMAT/-M</td>
<td>The default format for the Netstat report is the short format.</td>
</tr>
<tr>
<td>SHORT is specified from the command</td>
<td>The error message EZZ2383I is issued and command processing is stopped.</td>
</tr>
<tr>
<td>The stack is not IPv6 enabled and the FORMAT/-M</td>
<td>The default format for Netstat report is the long format.</td>
</tr>
<tr>
<td>option is not specified from the Netstat</td>
<td></td>
</tr>
<tr>
<td>command line nor in the IPCONFIG profile</td>
<td></td>
</tr>
<tr>
<td>statement</td>
<td></td>
</tr>
</tbody>
</table>
REPort (TSO NETSTAT only)
Causes the output to be stored in an MVS data set. If there is no additional parameter specified, the output is stored in a data set named tsoprefix.NETSTAT.option. If NOPREFIX is set in the TSO user profile, then the data set name is NETSTAT.option. The data set is created and cataloged if it does not already exist. If the data set already exists, the output from the requested option replaces any existing data. The name of the data set depends on whether either of the following additional parameters were specified:

**DSN dsnname**
Specifies the data set name in which the output is stored. The dsnname can be either a fully qualified name surrounded by single quotation marks (for example, 'abc.xyz') or an unqualified name (for example, abc). If an unqualified name is specified, then the unqualified name is prefixed with the TSO prefix value.

**HLQ hlqname**
Specifies the high-level qualifier for the data set in which the output is stored. The resulting data set name is hlqname.NETSTAT.option.

The following shows the relationship between the parameters and the stored data set name:

<table>
<thead>
<tr>
<th>Parameters</th>
<th>No tsoprefix</th>
<th>tsoprefix is available</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nothing specified</td>
<td>NETSTAT.option</td>
<td>tsoprefix.NETSTAT.option</td>
</tr>
<tr>
<td>HLQ specified</td>
<td>hlqname.NETSTAT.option</td>
<td>hlqname.NETSTAT.option</td>
</tr>
<tr>
<td>Unqualified DSN</td>
<td>dsnname</td>
<td>tsoprefix.dsnname</td>
</tr>
<tr>
<td>Fully qualified DSN</td>
<td>dsnname</td>
<td>dsnname</td>
</tr>
</tbody>
</table>

Use the REPort option to store the information returned by NETSTAT in a file used for later reference. For example, to store the output of the NETSTAT CONn report in a file, issue the following command: `netstat conn report`.

After you issue the preceding command, a data set named tsoprefix.NETSTAT.CONN is created, which contains output similar to the following information:

<table>
<thead>
<tr>
<th>MVS TCP/IP NETSTAT CS V2R4</th>
<th>TCPIP NAME: TCPCS</th>
<th>17:48:36</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Id  Conn   Local Socket</td>
<td>Foreign Socket</td>
<td>State</td>
</tr>
<tr>
<td>FTPD1  0000003B 0.0.0.0..21</td>
<td>0.0.0.0..0</td>
<td>Listen</td>
</tr>
<tr>
<td>FTPD1  0000003D 9.37.65.146..21</td>
<td>9.67.115.5..1026</td>
<td>Establish</td>
</tr>
<tr>
<td>FTPD1  0000003F 9.37.65.146..21</td>
<td>9.27.13.21..3711</td>
<td>Establish</td>
</tr>
<tr>
<td>TCPCS  0000000F 0.0.0.0..23</td>
<td>0.0.0.0..0</td>
<td>Listen</td>
</tr>
<tr>
<td>TCPCS  0000000C 9.67.115.5..23</td>
<td>9.27.11.182.4886</td>
<td>Establish</td>
</tr>
<tr>
<td>SYSLOGD1 00000010 0.0.0.0..514</td>
<td><em>..</em></td>
<td>UDP</td>
</tr>
</tbody>
</table>

STAck (TSO NETSTAT only)
Causes the report, stripped of title lines, to be placed in the TSO data stack when NETSTAT is issued from a CLIST or a REXX EXEC. No information is displayed at the user’s terminal.

**TITLes**
Causes the report, including title lines, to be placed in the TSO data stack when NETSTAT is issued from a CLIST or a REXX EXEC.

The Netstat command filter
The following parameters can be used to filter the output of the specified report. If you specify a filter parameter on the TSO NETSTAT command, it must be the last parameter on the command line preceded by a left parenthesis.

**APPLD/-G appldata**
Filter the output of the ALL/-A, ALLConn/-a, and CONn/-c reports using the specified application data appldata. You can enter one filter value at a time that can be 40 characters in length.
**APPLname/-N applname**
Filter the output of the TELnet/-t report using the specified VTAM application name applname. You can enter up to six filter values and each specified value can be eight characters in length.

**CLIENT/-E clientname**
Filter the output of the ALL/-A, ALLConn/-a, BYTEinfo/-b, CLIENT/-e, CONN/-c, SOCKets/-s, and TELnet/-t reports using the specified client name clientname. You can enter up to six filter values and each specified value can be eight characters in length.

**CONNType/-X**
Filter the report using the specified connection type. You can enter one filter value at a time.

**NOTTLSPolicy**
Filter the output of the ALLConn/-a and CONN/-c reports, displaying only connections that have not been matched to an Application Transparent Transport Layer Security (AT-TLS) rule. This includes connections that were established while the AT-TLS function was disabled (the value NOTTLS was specified on the TCPCONFIG statement or is in effect by default) and all connections that are not TCP protocol. For TCP connections that were established when the AT-TLS function was enabled, this includes the following connections:

- Connections for which AT-TLS policy lookup has not yet occurred (typically the first send or receive has not yet been issued)
- Connections for which AT-TLS policy lookup has occurred but no matching rule was found

**TTLSPolicy**
Filter the output of the ALLConn/-a and CONN/-c reports, displaying only connections that match an Application Transparent Transport Layer Security (AT-TLS) rule. This includes only connections that were established while the AT-TLS function was enabled, for which an AT-TLS policy rule was found with the value TTLSEnabled ON or TTLSEnabled OFF specified in the TTLSGroupAction. Responses can be further limited on AT-TLS connection type. AT-TLS connection type has the following values:

- **CURRENT**
  Display only connections that are using AT-TLS where the rule and all actions are still available to be used for new connections.

- **GROUP groupid**
  Display only connections that are using the AT-TLS group specified by the groupid value. The specified groupid value is a number that is assigned by the TCP/IP stack to uniquely identify an AT-TLS group. You can determine the groupid value from the GroupID field that is displayed in the Netstat TTLS/-x GROUP report.

- **STALE**
  Display only connections that are using AT-TLS where the rule or at least one action is no longer available to be used for new connections.

**DNSAddr/-Q dnsaddr**
Filter the output of the RESCache/-q report using the specified DNS IP address dnsaddr. You can enter one filter value at a time. The specified IPv4 dnsaddr value can be 1–15 characters in length; the specified IPv6 dnsaddr value can be 1–45 characters in length.

**Restriction:** The DNSAddr/-Q filter does not support wildcard characters.

**HOSTName/-H hostname**
Filter the output of the ALL/-A, ALLConn/-a, BYTEinfo/-b, CONN/-c, RESCache/-q, SOCKets/-s, TELnet/-t, and VCRT/-V reports using the specified host name value hostname. You can enter one filter value at a time and the specified value can be up to 255 characters in length.

**Result:** For reports other than those produced using the RESCache/-q option, at the end of the report, the Netstat command displays the host name that the resolver used for the resolution and the list of IP addresses returned from the resolver that it used as filters.

**Restrictions:**
1. The HOSTName/-H filter supports wildcard characters only for the RESCache/-q option, but not for other options.

2. With options other than the RESCache/-q option, using the HOSTName filter might cause delays in the output because the hostname value must be resolved (depending on resolver and DNS configuration).

3. For the RESCache/-q option, the HOSTName/-H filter applies only to the HostName to IPAddress translation portion of the report.

**INTFName/-K intfname**
Filter the output of the DEvlinks/-d and HOme/-h reports using the specified interface name value intfname. You can enter one filter value at a time and the specified value can be 1–16 characters in length.

For the DEvlinks and HOme report options, the INTFName filter can be one of the following names:

- The network interface name that was displayed in the LnkName/LinkName or INTFName field in the report (this option selects one interface).
- The port name of an OSA-Express feature in QDIO mode. This is the name that is specified on the PORTNAME keyword in the TRLE (this option selects all interfaces that are associated with the OSA-Express port, including an OSAENTA trace interface).
- The name of a HiperSockets TRLE (this option selects all interfaces that are associated with the HiperSockets TRLE).

Additionally, for the DEvlinks report option, the INTFName filter can also be the interface name of an OSAENTA trace interface, which is EZANTAportname, where the portname value is the name that is specified on the PORTNAME keyword in the TRLE for the OSA-Express port that is being traced (this option selects one interface). The INTFName/-K filter is not supported for the DEvlinks/-d report if the PNETID modifier is specified.

**Guideline:** For the DEvlinks/-d option, if a network resource has been coded in TCPIP.PROFILE using the DEVICE/LINK/HOME statements, then the intfname value that should be used is the link name that was specified on the LINK profile statement. Otherwise, use the interface name that was specified on the INTERFACE profile statement.

**Restriction:** The INTFName filter does not support wildcard characters.

**IPAddr/-I ipaddr/IPAddr/-I ipaddr/prefixlength/IPAddr/-I ipaddr/subnetmask**
Filter the report output using the specified IP address ipaddr, ipaddr/prefixlength, or ipaddr/subnetmask. For options other than the RESCache/-q option, you can enter up to six filter values; the RESCache/-q option accepts only one filter value at a time in ipaddr format. Each specified IPv4 ipaddr value can be 1–15 characters in length and each selected IPv6 ipaddr value can be 1–45 characters in length.

**ipaddr**
Filter the output of the ALL/-A, ALLConn/-a, BYTEinfo/-b, CONn/-c, Gate/-g, ND/-n, RESCache/-q, ROUTe/-r, SOCKets/-s, TELnet/-t, VCRT/-V, VDPT/-O, and VIPADCFG/-F reports using the specified IP address ipaddr. For all options except the RESCache/-q option, the default subnet mask 255.255.255.255 is used for IPv4 addresses; for IPv6 addresses, the default prefixlength value 128 is used. The RESCache/-q option does not support any default subnet mask or default prefixlength values.

**ipaddr/prefixlength**
Filter the output of the ALL/-A, ALLConn/-a, BYTEinfo/-b, CONn/-c, ND/-n, ROUTe/-r, SOCKets/-s, TELnet/-t, VCRT/-V, VDPT/-O, and VIPADCFG/-F reports using the specified IP address and prefix length ipaddr/prefixlength. For an IPv4 address, the prefix length range is 1 – 32. For an IPv6 address, the prefix length range is 1 – 128.

**ipaddr/subnetmask**
Filter the output of the ALL/-A, ALLConn/-a, BYTEinfo/-b, CONn/-c, Gate/-g, ROUTe/-r, SOCKets/-s, TELnet/-t, VCRT/-V, VDPT/-O, and VIPADCFG/-F reports using the specified IP address and subnetmask.
address and subnet mask \textit{ipaddr/subnetmask}. The IP address \textit{ipaddr} in this format must be an IPv4 IP address.

**Note:**
1. For the \texttt{Gate/-g} option, \textit{ipaddr} is the destination IP address; it is not the destination network address.
2. When filtering \texttt{Gate/-g} and \texttt{ROUTE/-r} outputs on a specified IP address, the DEFAULT and DEFAULTNET routes are not displayed.

**Guidelines:**
- For \texttt{ALL/-A}, \texttt{ALLConn/-a}, \texttt{CONN/-c}, and \texttt{TELnet/-t} options, \textit{ipaddr} can be either the local or remote IP address. For the \texttt{BYTEinfo/-b} option, \textit{ipaddr} can be a remote IP address. For the \texttt{SOCKets/-s} option, \textit{ipaddr} can be an address to which the socket is bound or connected. For the \texttt{VCRT/-V} option, \textit{ipaddr} can be a source IP address, a destination IP address, or a destination XCF IP address. For the \texttt{VIPADCFG/-F} option, \textit{ipaddr} can be a dynamic VIPA address, a destination IP address, or a destination XCF IP address.
- For an IPv6-enabled stack (except for \texttt{RESCache/-q} option):
  - Both IPv4 and IPv6, \textit{ipaddr} values are accepted and can be mixed on the \texttt{IPAddr/-I} option.
  - For an IPv6-enabled stack, an IPv4-mapped IPv6 address is accepted as a valid \textit{ipaddr} value and usually provides the same result as its IPv4 address. But, for \texttt{ROUTE/-r} and \texttt{ND/-n} options, an IPv4-mapped IPv6 address is treated as an IPv6 address. If an IPv4-mapped IPv6 address is entered as an \textit{ipaddr} value for these two options, no matching entry is found.
- For the \texttt{RESCache/-q} option, the \textit{ipaddr} value can be either an IPv4 or IPv6 address regardless of whether the stack is configured for IPv4 or IPv6 operation.

**Restrictions:**
- The \texttt{IPAddr/-I} filter for \texttt{RESCache/-q}, \texttt{VCRT/-V}, \texttt{VDPT/-O}, and \texttt{VIPADCFG/-F} options does not support wildcard characters.
- The \texttt{IPAddr/-I} filter for an IPv6 address does not support wildcard characters.
- For a UDP endpoint socket, the filter value applies only to the local or source IP address.
- For all options except the \texttt{RESCache/-q} option, for an IPv4-only stack, only IPv4 \textit{ipaddr} values are accepted. The \texttt{RECache/-q} option always accepts IPv4 and IPv6 addresses, regardless of the capability of the stack.
- For the \texttt{ND/-n} option, an IPv4 \textit{ipaddr} value is not accepted.
- For the \texttt{RESCache/-q} option, the \texttt{IPAddr/-I} filter applies only to the IPAddress to HostName translation portion of the report.
- The \texttt{RECache/-q} option accepts only one filter value at a time in \textit{ipaddr} format.

**IPPort/-B \textit{ipaddr}+\textit{portnum}**
Filter the report output of the \texttt{ALL/-A}, \texttt{ALLConn/-a}, \texttt{CONN/-c}, \texttt{SOCKets/-s}, \texttt{TELnet/-t}, \texttt{VCRT/-V}, and \texttt{VDPT/-O} reports using the specified IP address and port number. You can enter up to six filter values. Each specified IPv4 \textit{ipaddr} value can be up to 15 characters in length, denoting a single IPv4 IP address; each specified IPv6 \textit{ipaddr} value can be up to 45 characters in length, denoting a single IPv6 IP address. Valid \textit{portnum} values are in the range 0 – 65535. The filter values \textit{ipaddr} and \textit{portnum} will match any combination of the local and remote IP address and local and remote port.

**Guidelines:**
- For the \texttt{ALL/-A}, \texttt{ALLConn/-a}, \texttt{CONN/-c}, and \texttt{TELnet/-t} options, the \textit{ipaddr} value can be either the local or remote IP address. For the \texttt{SOCKets/-s} option, the \textit{ipaddr} value can be an address to which the socket is bound or connected. For the \texttt{VCRT/-V} option, the \textit{ipaddr} value can be a source IP address, a destination IP address, or a destination XCF IP address. For the \texttt{VDPT/-O} option, the \textit{ipaddr} value can be a destination IP address or a destination XCF IP address.
- For an IPv6-enabled stack, the following apply:
– Both IPv4 and IPv6 `ipaddr` values are accepted and can be mixed on the IPPort/-B option.
– An IPv4-mapped IPv6 address is accepted as a valid `ipaddr` value and usually provides the same result as the IPv4 address.

**Restrictions:**

- The `ipaddr` value in the IPPort/-B filter does not support wildcard characters.
- For an IPv4-only stack, only IPv4 `ipaddr` values are accepted.
- For a UDP endpoint socket, the filter value applies only to the local or source IP address and port.
- An entry is returned only when both the `ipaddr` and `portnum` values match.

**LUName/-L luname**

Filter the output of the TELnet/-t report using the specified LU name `luname`. You can enter up to six filter values and each specified value can be up to eight characters in length.

**NOTN3270/-T**

Filter the output of the ALL/-A, ALLConn/-a, BYTEinfo/-b, CLIENT/-e, CONn/-c, and SOCKets/-s reports, excluding TN3270 server connections.

**POLicyName/-Y policyname**

Filter the output of the SLAP/-j report using the specified policy rule name `policyname`. You can enter one filter value at a time and the specified value can be up to 48 characters in length.

**PORT/-P portnum**

Filter the output of the ALL/-A, ALLConn/-a, CONn/-c, PORTList/-o, SOCKets/-s, TELnet/-t, VCRT/-V, and VDPT/-O reports using the specified port number `portnum`. You can enter up to six filter values.

**Guidelines:**

- The port number can be either a local port or a remote port.
  
  For the SOCKets/-s option, the port can be a port to which the socket is bound or connected.

- For the ALL/-A, ALLConn/-a, CONn/-c, SOCKets/-s, TELnet/-t, VCRT/-V, and VDPT/-O reports, the port value range is 0-65535

- For the PORTList/-o option only, the port value range is 1-65535 and you can also filter on the keyword UNRSV

**Restriction:**

- No wildcards are allowed.
- For a UDP endpoint socket, the filter value applies only to the local or source IP address.

**SMCID/-U smcid**

Filter the output of the ALL/-A, ALLConn/-a, CONn/-c, and DEvlkinks/-d reports by using the specified Shared Memory Communications over Remote Direct Memory Access (SMC-R) link, SMC-R link group, or Shared Memory Communications - Direct Memory Access (SMC-D) link identifier `smcid`. If an asterisk (*) is specified for the filter value, Netstat provides output only for the entries that are associated with SMC-R links, SMC-R link groups, and SMC-D links. You can enter one filter value at a time. The SMCID filter is not supported for the DEvlkinks/-d report if the PNETID modifier is specified.

Except for PORT/-P, INTFName/-K, CONNType/-X TTLSPolicy Group `groupid`, DNSAddr/-Q, SMCID/-U and IPPort/-B, the filter value can be a complete or partial string using wildcard characters. A wildcard character can be an asterisk (*), which matches a null string or any character or character string, at the same position. A wildcard character can be a question mark (?), which matches any single character at the same position. For example, a string `searchee` matches with `*ar?he*`, but the string `searhee` does not match with `*ar?he*`. If you want to use the wildcard character on the IPAddr/-I parameter, you must specify the value in the `ipaddr` format. The wildcard character is not accepted for the `ipaddr/subnetmask` or `ipaddr/prefixlen` format of IPAddr/-I values.

When you use z/OS UNIX `netstat/onetstat` command in a z/OS UNIX shell environment, take care when you use a z/OS UNIX MVS special character in a character string such as using a wildcard character in a filter value. It might cause an unpredictable result. To be safe, if you want to use a z/OS UNIX MVS
special character in a character string, surround the character string with single (‘) or double (") quotation marks. For example, to use an asterisk (*) in the IP address, 10.*.0.0 for the -I filter, issue the command as: netstat -g -I ‘10.*.0.0' or netstat -g -I “10.*.0.0”.

**Command to terminate a socket endpoint**

You can terminate a specific TCP/IP socket end-point using the following command:

**DRop/-D n**

Terminates the socket endpoint that is identified by the connection number n. You can determine the connection number from the Conn column in the Netstat CONn/-c or Netstat TELnet/-t display. You can use this parameter only if the OPERCMDS class resource MVS.VARY.TCPIP.DROP is defined to the security product (such as RACF) and the user ID associated with the DRop/-D command is permitted to this resource. See “Netstat DRop/-D command” on page 439 for detailed information.

**Netstat report details and examples**

In order to fully understand the following concepts and fields, you need to have some general knowledge of TCP/IP. See the IBM Redbooks publication *TCP/IP tutorial and Technical Overview*, GG24-3376 for more information.

**Netstat report general concepts**

**TCP connection status**

A TCP connection progresses through a series of states during its lifetime. The following diagram illustrates the possible states for a TCP connection and how the states transition based on various events from either the network or from the local TCP sockets application.
Figure 1. TCP state transition diagram

<table>
<thead>
<tr>
<th>TCP connection state</th>
<th>Abbreviation in MVS console</th>
<th>Abbreviation in TSO or UNIX shell</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LISTEN</td>
<td>Listen</td>
<td>Listen</td>
<td>Waiting for a connection request from a remote TCP application. This is the state in which you can find the listening socket of a local TCP server.</td>
</tr>
<tr>
<td>SYN-SENT</td>
<td>SynSent</td>
<td>SynSent</td>
<td>Waiting for an acknowledgment from the remote endpoint after having sent a connection request. Results after step 1 of the three-way TCP handshake.</td>
</tr>
<tr>
<td>TCP connection state</td>
<td>Abbreviation in MVS console</td>
<td>Abbreviation in TSO or UNIX shell</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>----------------------------</td>
<td>----------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>SYN-RECEIVED</td>
<td>SynRcvd</td>
<td>SynRcvd</td>
<td>This endpoint has received a connection request and sent an acknowledgment. This endpoint is waiting for final acknowledgment that the other endpoint did receive this endpoint's acknowledgment of the original connection request. Results after step 2 of the three-way TCP handshake.</td>
</tr>
<tr>
<td>ESTABLISHED</td>
<td>Estblsh</td>
<td>Establish</td>
<td>Represents a fully established connection; this is the normal state for the data transfer phase of the connection.</td>
</tr>
<tr>
<td>FIN-WAIT-1</td>
<td>FinWt1</td>
<td>FinWait1</td>
<td>Waiting for an acknowledgment of the connection termination request or for a simultaneous connection termination request from the remote TCP. This state is normally of short duration.</td>
</tr>
<tr>
<td>FIN-WAIT-2</td>
<td>FinWt2</td>
<td>FinWait2</td>
<td>Waiting for a connection termination request from the remote TCP after this endpoint has sent its connection termination request. This state is normally of short duration, but if the remote socket endpoint does not close its socket shortly after it has received information that this socket endpoint closed the connection, then it might last for some time. Excessive FIN-WAIT-2 states can indicate an error in the coding of the remote application.</td>
</tr>
<tr>
<td>CLOSE-WAIT</td>
<td>ClosWt</td>
<td>ClosWait</td>
<td>This endpoint has received a close request from the remote endpoint and this TCP is now waiting for a connection termination request from the local application.</td>
</tr>
<tr>
<td>CLOSING</td>
<td>Closing</td>
<td>Closing</td>
<td>Waiting for a connection termination request acknowledgment from the remote TCP. This state is entered when this endpoint receives a close request from the local application, sends a termination request to the remote endpoint, and receives a termination request before it receives the acknowledgment from the remote endpoint.</td>
</tr>
<tr>
<td>LAST-ACK</td>
<td>LastAck</td>
<td>LastAck</td>
<td>Waiting for an acknowledgment of the connection termination request previously sent to the remote TCP. This state is entered when this endpoint received a termination request before it sent its termination request.</td>
</tr>
<tr>
<td>TIME-WAIT</td>
<td>TimeWt</td>
<td>TimeWait</td>
<td>Waiting for enough time to pass to be sure the remote TCP received the acknowledgment of its connection termination request.</td>
</tr>
<tr>
<td>CLOSED</td>
<td>Closed</td>
<td>Closed</td>
<td>Represents no connection state at all.</td>
</tr>
</tbody>
</table>
Clients or Users
For various reasons, TCP/IP refers to MVS jobs or address spaces that use TCP/IP services as clients or users of TCP/IP services. The term client in this context has nothing to do with the traditional client/server roles of a network application. Both local server programs and local client programs on z/OS are clients or users of TCP/IP services. For most purposes you can substitute Client name, User ID, and User in the Netstat reports with MVS jobname.

UDP socket status
UDP, unlike TCP, does not operate with strict states. The state that is shown in the various Netstat reports is always UDP for UDP sockets.

Client ID or Connection number
A generated number that uniquely identifies a socket endpoint that might represent a connection on this TCP/IP host. This number can be used to drop a socket or connection with the Netstat DROP/-D parameter.

Client name or User ID
The client name from a TCP/IP perspective is in general the job name of the address space that owns the socket. For batch jobs this is the job name. For TSO users, this is the TSO user ID. For UNIX processes this is the job name as determined during process creation, either by appending a digit to the job name (INETD creates INETD1) of the parent process or by setting the job name to the value of the _BPX_JOBNAME environment variable. For started tasks, the job name is generally the procedure name. If a procedure is started with the JOBNAME keyword (S procname,JOBNAME=myjob), then the job name becomes the value that was specified on that JOBNAME keyword. If a procedure is started with a start modifier (S procname.modif), then the modifier is what is shown as the TCP/IP client name.

Local IP address
A socket might have no address information at all (right after it has been created by a program using the socket() call); it might have just a local address (a local IP address and/or a local port number) that was set using a bind() socket call; or it might have both a local address and a remote address, in which case it represents a connected socket (a socket that is in connection with a remote socket).

The local IP address of a socket is either zero (not bound to any local IP address) or it is an IP address that is in the HOME list of this TCP/IP host.

The listening socket of a server program has only the local address filled in. If the local IP address of the server's listening socket is zero, then remote clients are allowed to send connection requests to any IP address that is in this TCP/IP host's HOME list. If the local IP address of the server's listening socket is nonzero, then remote clients can connect to this server only by sending connection requests to that specific IP address. A connected socket has both the local and the remote address filled in.

Foreign/remote IP address
The remote IP address is present for connected sockets and represents the IP address that is associated with the remote socket endpoint to which this socket is connected. A connected socket might be one of the following sockets:

• A server socket where the remote client that is represented by this remote IP address connected to a server on this TCP/IP host.

• A socket belonging to a client program on this TCP/IP host that is connected to a server on the remote TCP/IP host that is represented by this remote IP address.

Local port
The local port is part of the local address of a socket. For a server's listening socket, the port represents the specific server. If remote clients need to use the services of this server, they send a connection request to this TCP/IP host to this server's specific port number.

Connected sockets might represent one of the following case:

• A connection with a local server from a remote client, for example, the local port number is the same port number that appears on the server's listening socket.
• A local client connected to a remote server, for example, the port number could be any port number the TCP/IP host found available when the connection was being established (also known as an ephemeral or short-lived port number). This is typically a port number higher than 1024.

Foreign/remote port
The remote port is part of the remote address of a socket and is present only for connected sockets. It represents the port number of the remote socket that is connected to this socket. If the connected socket belongs to a client program on this TCP/IP host, then the remote port number identifies the server on the remote TCP/IP host to which this client program is connected.

Local socket
The IP address and port number to which the application on the local stack was bound.

Foreign socket
The IP address and port number to which the application on the remote host was bound. For UDP sockets, the foreign socket field that is shown in the various Netstat reports is displayed as *.* if the socket is not connected. For connected UDP sockets, the foreign socket field shows the remote IP address and port specified on the connect request. When a UDP socket is connected, it accepts packets only from the specified remote IP address and port.

Last touched time
For TCP, the last time one of the following events occurred to the connection:
• The server side receives a connection request.
• The server side accepts the connection request.
• Either the server or client side of a connection receives a packet.
• Either the server or client side of a connection sends a packet.

For UDP, the last time one of the following events occurred to the connection:
• Either the server or client side of a connection receives a packet.
• Either the server or client side of a connection sends a packet.

Redirecting Netstat output:
Netstat screen output can be redirected for all Netstat reports. The following example uses the BYTEINFO report:

From TSO environment:
• You can redirect TSO NETSTAT screen output to a disk file by appending a REPORT option.

    NETSTAT BYTEINFO REPORT
    The data set MV$USER.NETSTAT.BYTEINFO (where MV$USER is the user ID) is created containing the screen output from a BYTEINFO command. See “Netstat command output” on page 287 for more description of the REPORT option.

• You can also redirect TSO NETSTAT screen output to the TSO data stack by appending a STACK option.

    NETSTAT BYTEINFO STACK
    Causes the report, stripped of title lines, to be placed in the TSO data stack containing the screen output from a BYTEINFO command. See “Netstat command output” on page 287 for more description of the STACK option.

From z/OS UNIX shell environment:
You can redirect the netstat screen output to a file by using the redirect function (>) in the following format:

    netstat -b > byteinfo

The file byteinfo is created in your current directory containing the screen output shown previously.
**Time stamp**

The time stamp displayed in the header for each Netstat report is in local time. The time field displayed in reports ALL/ - A, BYTEinfo/ - b, CLients/ - e, HOME/ - h, RESCache/ - q, ROUTe/ - r, SLAP/ - j, UP/ - u, and VIPADyn/ - v is Coordinated Universal Time (UTC). UTC time does not take leap seconds into account.

**Netstat ALL/-A report**

Displays detailed information about TCP connections and UDP sockets, including some recently closed ones. The purpose of this report is to aid in debugging problems with TCP connections and UDP sockets.

**TSO syntax**

```
NETSTAT  ALL  Modifier  Target  Output  (Filter)
```

**Modifier**

```
SERVER
```

**SERVER**

Provide detailed information only for TCP connections that are in the listen state.

**Target**

Provide the report for a specific TCP/IP address space by using Tcp tcpname. See “The Netstat command target” on page 287 for more information about the T Cp parameter.

**Output**

The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**Filter**

![Diagram of filter options]
**Netstat ALL/-A report z/OS UNIX syntax**

```
netstat -A Modifier Target Output Filter
```

**Modifier**

```
SERVER
```

**SERVER**
Provide detailed information only for TCP connections that are in the listen state.

**Target**

Provide the report for a specific TCP/IP address space by using `-p tcpname`. See “The Netstat command target” on page 287 for more information about the `-p` parameter.

**Output**

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

**Filter**

```
-B ipaddr+portnum
-E clientname
-G appldata
-H hostname
-I ipaddr
-I ipaddr/prefixLen
-I ipaddr/subnetmask
-P portnum
-T
-U smcid
```

**Filter description**

**APPLD/-G appldata**
Filter the output of the ALL/-A report using the specified application data `appldata`. You can enter one filter value at a time and the specified value can be 40 characters in length.

**CLIENT/-E clientname**
Filter the output of the ALL/-A report using the specified client name `clientname`. You can enter up to six filter values and each specified value can be eight characters in length.

**HOSTName/-H hostname**
Filter the output of the ALL/-A report using the specified host name `hostname`. You can enter one filter value at a time and the specified value can be up to 255 characters in length.
**Result:** At the end of the report, Netstat displays the host name that the resolver used for the resolution and the list of IP addresses returned from the resolver that it used as filters.

**Restrictions:**
1. The HOSTName/-H filter does not support wildcard characters.
2. Using the HOSTName/-H filter might cause delays in the output due to resolution of the hostname value depending upon resolver and DNS configuration.

**IPAddr/-I**
Filter the report output using the specified IP address ipaddr, ipaddr/prefixlength, or ipaddr/subnetmask. You can enter up to six filter values. Each specified IPv4 ipaddr value can be up to 15 characters in length and each selected IPv6 ipaddr value can be 45 characters in length.

- **ipaddr**
  Filter the output of the ALL/-A report using the specified IP address ipaddr. For IPv6 addresses, the default prefixlength 128 is used.

- **ipaddr/prefixlength**
  Filter the output of the ALL/-A report using a specified IP address and prefix length ipaddr/prefixlength. For an IPv4 address, the prefix length range is 1 – 32. For an IPv6 address, the prefix length range is 1 – 128.

- **ipaddr/subnetmask**
  Filter the output of the ALL/-A report using the specified IP address and subnet mask ipaddr/subnetmask. The IP address ipaddr in this format must be an IPv4 IP address.

**Guidelines:**
1. The filter value ipaddr can be either the local or remote IP address.
2. For an IPv6-enabled stack:
   - Both IPv4 and IPv6 ipaddr values are accepted and can be mixed on the IPAddr/-I option.
   - An IPv4-mapped IPv6 address is accepted as a valid ipaddr value and usually provides the same result as its IPv4 address.

**Restrictions:**
1. For an IPv4-only stack, only IPv4 ipaddr values are accepted.
2. The filter value for an IPv6 address does not support wildcard characters.
3. For a UDP endpoint socket, the filter value applies only to the local or source IP address.

**IPPort/-B**
Filter the report output of the ALL/-A report using the specified IP address and port number. You can enter up to six filter values. Each specified IPv4 ipaddr value can be up to 15 characters in length, denoting a single IPv4 IP address; each specified IPv6 ipaddr value can be up to 45 characters in length, denoting a single IPv6 IP address. Valid portnum values are in the range 0 – 65535. The filter values ipaddr and portnum will match any combination of the local and remote IP address and local and remote port.

**Guidelines:**
- The filter value ipaddr can be either the local or remote IP address.
- For an IPv6-enabled stack, the following apply:
  - Both IPv4 and IPv6 ipaddr values are accepted and can be mixed on the IPPort/-B option.
  - An IPv4-mapped IPv6 address is accepted as a valid ipaddr value and usually provides the same result as the IPv4 address.

**Restrictions:**
- The ipaddr value in the IPPort/-B filter does not support wildcard characters.
- For an IPv4-only stack, only IPv4 ipaddr values are accepted.
• An entry is returned only when both the `ipaddr` and `portnum` values match.
• For a UDP endpoint socket, the filter value applies only to the local or source IP address and port.

**NOTN3270/-T**
Filter the output of the ALL/-A report, excluding TN3270 server connections.

**PORT/-P portnum**
Filter the output of the ALL/-A report using the specified port number `portnum`. You can enter up to six filter values. For all `portnum` values that were reserved by the same PORTRANGE profile statement, only one output line is displayed.

**Guideline:** The port number can be either a local or remote port.

**Restriction:** For a UDP endpoint socket, the filter value applies only to the local or source port.

**SMCID/-U smcid**
Filter the output of the ALL/-A report by using the specified Shared Memory Communications over Remote Direct Memory Access (SMC-R) link, SMC-R link group, or Shared Memory Communications - Direct Memory Access (SMC-D) link identifier `smcid`. If an asterisk (*) is specified for the filter value, Netstat provides output only for the entries that are associated with SMC-R links, SMC-R link groups, and SMC-D links. You can enter one filter value at a time.

The filter value for CLIent/-E, IPAddr/-I, and APPLD/-G can be a complete string or a partial string using wildcard characters. A wildcard character can be an asterisk (*), which matches a null string or any character or character string, at the same position. A wildcard character can be a question mark (?), which matches any single character at the same position. For example, a string `searchee` matches with `*ar?he*`, but the string `searhee` does not match `*ar?he*`. To use the wildcard character on the IPAddr/-I filter, specify the value in the `ipaddr` format. The wildcard character is not accepted for the `ipaddr/prefixlen` or `ipaddr/subnetmask` format of IPAddr/-I values.

When you use z/OS UNIX netstat/onetstat command in a z/OS UNIX shell environment, take care if you use a z/OS UNIX MVS special character in a character string. It might cause an unpredictable result. To be safe, if you want to use a z/OS UNIX MVS special character in a character string, surround the character string with single (') or double (") quotation marks. For example, to use an asterisk (*) in the IP address, `10.*.0.0` for the `-I` filter, issue the command as: `netstat -A -I '10.*.0.0'`.

**Command syntax examples**

From TSO environment

```
NETSTAT ALL
Display detailed information about TCP connections and UDP sockets in the default TCP/IP stack.
NETSTAT ALL TCP TCPCS6
Display detailed information about TCP connections and UDP sockets in TCPCS6 stack.
NETSTAT ALL TCP TCPCS8 (IPADDR 9.43.1.1 9.43.2.2
Display detailed information about those TCP connections and UDP sockets in TCPCS8 stack whose local or remote IP addresses match the specified filter IP address values.
NETSTAT ALL (PORT 2222 6666 88
Display detailed information about those TCP connections and UDP sockets in the default TCP/IP stack whose local or remote ports match the specified filter port numbers.
NETSTAT ALL SERVER TCP TCPCS
Display detailed information about those TCP connections in listen state on TCP/IP stack TCPCS
NETSTAT ALL TCP TCPCS (IPPORT 127.0.0.1+21
Display detailed information about connections using ip address 127.0.0.1 and port 21 on TCP/IP stack TCPCS
```
From UNIX shell environment

netstat -A
netstat -A -p tcpcs6
netstat -A -p tcpcs6 -I 9.43.1.1 9.43.2.2
netstat -A -p 2222 6666 88
netstat -A SERVER -p tcpcs
netstat -A -B 127.0.0.1+21 -p tcpcs

Report examples

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

Not IPv6 enabled (SHORT format)

NETSTAT ALL MVS TCP/IP NETSTAT CS V2R4 TCPIP Name: TCPCS 22:24:30

Monitoring the TCP/IP network 311
### Report field descriptions

- The following fields are displayed for a TCP connection entry:

**Client Name**

See the Client name or User ID information in “Netstat report general concepts” on page 293 for a detailed description.
Client ID
See the Client ID or Connection Number information in “Netstat report general concepts” on page 293 for a detailed description.

Local Socket
See the Local Socket information in “Netstat report general concepts” on page 293 for a detailed description.

Foreign Socket
See the Foreign Socket information in “Netstat report general concepts” on page 293 for a detailed description.

StartDate
Date of the last one of the following events that occurred for the TCP connection or UDP endpoint:
- UDP bind
- TCP bind
- TCP listen
- TCP connection establishment

StartTime
Time of the last one of the following events that occurred for the TCP connection or UDP endpoint:
- UDP bind
- TCP bind
- TCP listen
- TCP connection establishment

BytesIn
The number of bytes of data the stack has received for this connection. This includes both the total bytes that the application has received and the total bytes in the receive buffer that have not yet been read by the application.

Restriction: The TCP/IP stack maintains 64-bit counters for TCP connections and UDP endpoints. However, if you are running an IPv4-only stack, and the Netstat output is in the SHORT format, only the lower 32-bit counter value is displayed. If a large amount of data has been received, the number of bytes can exceed a 32-bit counter so the value displayed will appear to have been reset. Use the FORMAT/-M LONG output option on the Netstat command to cause Netstat to use the LONG format for the output. The LONG format displays the full 64-bit counter value. You can also specify the FORMAT parameter on the IPCONFIG profile statement to set FORMAT LONG as the default value for all Netstat commands.

BytesOut
The number of bytes of data the application has sent. This includes all the data that has been sent to the remote connection and all the data that has not been sent but is buffered and waiting to be sent by the local stack.

Restriction: The TCP/IP stack maintains 64-bit counters for TCP connections and UDP endpoints. However, if you are running an IPv4-only stack, and the Netstat output is in the SHORT format, only the lower 32-bit counter value is displayed. If a large amount of data has been sent, the number of bytes can exceed a 32-bit counter so the value displayed will appear to have been reset. Use the FORMAT/-M LONG output option on the Netstat command to cause Netstat to use the LONG format for the output. The LONG format displays the full 64-bit counter value. You can also specify the FORMAT parameter on the IPCONFIG profile statement to set FORMAT LONG as the default value for all Netstat commands.

SegmentsIn
The number of non-retransmitted TCP packets received for this connection.

Guideline: This value, when displayed for a TCP connection across an SMC-R link, includes the number of Remote Direct Memory Access (RDMA) inbound operations.
**SegmentsOut**
The number of non-retransmitted TCP packets sent for this connection.

**Guideline:** This value, when displayed for a TCP connection across an SMC-R link, includes the number of RDMA outbound operations.

**Last touched**
See the Last touched time information in “Netstat report general concepts” on page 293 for a detailed description.

**State**
Describes the state of the TCP connection. See “TCP connection status” on page 293 for more information.

**RcvNxt**
The sequence number of the next byte this side of the connection is expecting to receive. Each byte that is sent or received in a TCP connection has its own unique, ascending sequence number.

**SndNxt**
The sequence number of the next byte that the stack can send.

**ClientRcvNxt**
The sequence number of the next byte that the application will read from the receive buffer.

**ClientSndNxt**
The sequence number of the next byte of data that the application can add to the send buffer.

**InitRcvSeqNum**
The first sequence number that was received from the remote stack host when establishing the connection.

**InitSndSeqNum**
The first sequence number that the local stack sent out when establishing the connection.

**CongestionWindow**
The value that is used when congestion is detected in the network to limit the amount of data that is sent by the local stack. This value represents the maximum amount of data that is sent without waiting for an acknowledgment from the remote socket.

**SlowStartThreshold**
The slow-start threshold is used to determine whether the connection is recovering from congestion. If the congestion window is smaller than the slow-start threshold, the connection will take actions to more quickly recover from congestion.

**IncomingWindowNum**
The incoming window number is the maximum sequence number that the remote socket can send until the local application reads more data from the local socket.

**OutgoingWindowNum**
The outgoing window number is the maximum sequence number that can be sent without waiting for the remote socket to read data (see the send window).

**SndWl1**
The sequence number from the segment that last updated the SndWnd field.

**SndWl2**
The acknowledgment number from the segment that last updated the SndWnd field.

**SndWnd**
The amount of available buffer space that is advertised by the remote side into which data can be sent.

**MaxSndWnd**
The largest send window the remote socket has sent to the local socket.

**SndUna**
This value is the sequence number of the first byte of data in the local socket's send buffer that has not been acknowledged by the remote socket.
rtt_seq
The sequence number of the byte of data sent in a packet for which the local socket is measuring
the round-trip time (the time it takes between the local socket sending a packet and receiving an
acknowledgment from the remote socket).

MaximumSegmentSize
The largest amount of data the local socket can send in a single packet.

DSField
The Differentiated Services Code Point value being used for this connection.
The DSField represents one of the following values:
– If there is a Service Policy Agent policy in effect for this entry, one of the following values is used:
  - The ToS value defined by RFC 791 and RFC 1349.
  - The Differentiated Services field value defined by RFC 2474.
– If there is no Service Policy Agent policy in effect for this entry, the value is 0.

Round-trip information
The round-trip time is the amount of time that elapses between the time a packet is sent and the
time an acknowledgment for that packet is received.

Smooth trip time
The average amount of time it has taken for a packet to be sent and an acknowledgment to be
received for this connection, measured in milliseconds.

SmoothTripVariance
The average variation in round-trip time, measured in milliseconds.

ReXmt
The total number of times a packet has been retransmitted for this connection. This count is
historical for the life of the connection.

ReXmtCount
The number of times the last packet that was sent has been retransmitted.

DupACKs
The total number of duplicate acknowledgments that have been received by this connection.

RcvWnd
The amount of available buffer space that is advertised to the remote side into which data can be
received.

SockOpt
Socket option flag. For TCP/IP stacks that are not IPv6 enabled, it is a one-byte hexadecimal value
of common socket options. For IPv6-enabled TCP/IP stacks, it is a one-byte hexadecimal value of
common socket options, followed by a one-byte hexadecimal value of IPv6-specific socket options.

Common socket options:

80 1... ....
Indicates that the socket option SO_REUSEADDR has been set for this socket. This socket option
allows the socket to be bound to the same port that other sockets are bound to.

40 .1... ....
Indicates that the socket option SO_OOBINLINE has been set for this socket. If this socket
option is set, out-of-band data is returned in a normal read operation. If this socket option is not
set, out-of-band data can be retrieved only by setting the MSG_OOB flag on a read operation.

20 ..1. ....
Indicates that the socket option SO_LINGER has been set for this socket. The SO_LINGER
socket option allows an application to specify whether unsent data is discarded when the socket
is closed, and how long to wait if the data is not discarded.
Indicates that the socket option SO_DONTROUTE has been set for this socket. If this socket option is set, data is sent without regard to routes. This is equivalent to the MSG_DONTROUTE flag on a write operation.

Indicates the socket option TCP_NODELAY has been set for this socket. Unless this socket option is set, the TCP/IP stack will attempt to optimize the sending of small data packets by holding them briefly in case it has more data to send.

Indicates that the SO_KEEPALIVE socket option has been set for this socket. If this socket option is set, the TCP/IP stack will periodically send empty packets to the remote stack to make sure the connection is still alive.

IPv6 socket options:

Indicates that the IPV6_UNICAST_HOPS option has been set for this socket.

Indicates that the IPV6_USE_MIN_MTU for unicast option has been set for this socket.

Indicates that the IPV6_TCLASS option has been set for this socket.

Indicates that the IPV6_RECVTCLASS option has been set for this socket.

Indicates that the IPV6_RECVHOPLIMIT option has been set for this socket.

Indicates that the IPV6_V6ONLY option has been set for this socket.

Any other value
Used for diagnostic purposes only under the direction of IBM Service personnel.

TcpTimer
TCP timer flag. It is a one-byte hexadecimal value that is used for diagnostic purposes only under the direction of IBM Service personnel.

TcpSig
TCP signal flag. It is a one-byte hexadecimal value and can have one of the following values:

Indicates the application has requested to receive the SIGURG signal when urgent data is received on this socket.

Indicates the application has requested to receive the SIGIO signal when data is received on this socket.

Any other value
Is used for diagnostic purposes only under the direction of IBM Service personnel.

TcpSel
TCP select flag. It is a one-byte hexadecimal value that is used for diagnostic purposes only under the direction of IBM Service personnel.

TcpDet
Special TCP protocol flag. It is a one-byte hexadecimal value:

Indicates the TCP_KEEPALIVE socket option has been set for this socket. This socket option is used to set a socket-specific time interval value for use with the SO_KEEPALIVE socket option. See the description of field SockOpt for an explanation of the SO_KEEPALIVE socket option. The TCP_KEEPALIVE time interval value is in effect only if the SO_KEEPALIVE socket option is set for the socket.
Any other value
Is used for diagnostic purposes only under the direction of IBM Service personnel.

TcpPol
TCP poll flag. It is a one-byte hexadecimal value to be used for diagnostic purposes only under the direction of IBM Service personnel.

TcpPrf
A 1-byte hexadecimal TCP performance flag that can have any of the following values:

80 1... ....
Indicates that this connection is eligible for dynamic right sizing (DRS) optimization support. For more information about DRS, see TCP receive window in z/OS Communications Server: IP Configuration Guide.

40 .1... ....
Indicates that DRS is active for this connection so that the stack automatically tunes the receive buffer size. The ReceiveBufferSize field shows the current size of the receive buffer for this connection.

02 .... ...1.
Indicates that DRS was active for this connection, but has been disabled. This is caused by the associated application not reading the data as fast as the data arrives and CSM high virtual common or fixed storage being constrained.

Any other value
Used for diagnostic purposes only under the direction of IBM Service personnel.

TcpPrf2
A 1-byte hexadecimal TCP performance flag that can have any of the following values:

40 ..1. ....
If outbound right sizing (ORS) is active for this connection, the stack expanded the send buffer beyond its original size. For more information about ORS, see TCP send window in z/OS Communications Server: IP Configuration Guide.

20 ..1. ....
Indicates that this connection is eligible for ORS optimization support.

10 ...1 ....
Indicates that ORS is active for this connection so that the stack automatically tunes the send buffer size. The SendBufferSize field shows the current size of the send buffer for this connection.

Any other value
Used for diagnostic purposes only under the direction of IBM Service personnel.

TcpPrf3
Used for diagnostic purposes only under the direction of IBM Service personnel.

DelayAck
Indicates how the TCP/IP stack controls the transmission of acknowledgments for packets received with the PUSH bit on in the TCP header. This field can have the following values:

AutoYes
The TCP/IP stack has autonomically determined to delay transmission of acknowledgments for packets received with the PUSH bit on in the TCP header.

Yes
The TCP/IP stack delays transmission of acknowledgments for packets received with the PUSH bit on in the TCP header.

AutoNo
The TCP/IP stack has autonomically determined to immediately return acknowledgments for packets received with the PUSH bit on in the TCP header.
The TCP/IP stack immediately returns acknowledgments for packets received with the PUSH bit on in the TCP header.

**QOSP**
Indicates whether a matching QoS policy rule has been found for this connection. This field can have the following values:

- **No** Indicates that a matching QoS policy rule was not found for this connection.
- **Yes** Indicates that a matching QoS policy rule was found for this connection. When the QOSP field has the value Yes, the following information is displayed:
  - **QOSRuleName** The name of the Policy rule that is in use for this connection. This policy is for outbound traffic only.

**TTLSP**
Indicates whether a matching Application Transparent Transport Layer Security (AT-TLS) policy rule has been found for this connection. This set of fields is not displayed if the AT-TLS function was disabled when the connection was established (NOTTLS was specified on the TCPCONFIG statement or is in effect by default) or policy lookup has not yet occurred.

- **TTLSPolicy: No** indicates that no matching AT-TLS policy rule was found for this connection. There is no rule or action listed.
- **TTLSPolicy: Yes** indicates one of the following cases:
  - A matching AT-TLS policy rule was found for this connection with an indication that AT-TLS should be enabled (TTLSEnabled ON was specified on the TTLSGroupAction). The rule and actions are displayed.
  - A matching AT-TLS policy rule was found for this connection with an indication that AT-TLS should be disabled (TTLSEnabled OFF was specified on the TTLSGroupAction). The rule and actions are displayed.

**TTLSR**
The name of the AT-TLS policy rule that is in use for this connection, followed by (Stale) when the rule is no longer available for use by new connections. This field is not displayed when the connection does not match a policy rule.

**TTLSG**
The name of the AT-TLS policy group action that is in use for this connection, followed by (Stale) when the action is no longer available for use by new connections. This field is not displayed when the connection does not match a policy rule.

**TTLSE**
The name of the AT-TLS policy environment action that is in use for this connection, followed by (Stale) when the action is no longer available for use by new connections. This field is not displayed when the connection does not match a policy rule or when no TTLSEnvironmentAction was specified.

**TTLSC**
The name of the AT-TLS policy connection action that is in use for this connection, followed by (Stale) when the action is no longer available for use by new connections. This field is not displayed when the connection does not match a policy rule or when no TTLSConnectionAction was specified.

**RoutingP**
Indicates whether a matching routing policy rule has been found for this connection. This field can have the following values:

- **No** Indicates that no matching routing policy rule was found for this connection.
For an Enterprise Extender (EE) UDP socket entry, the RoutingPolicy value is always No. Display the routing policy information for an Enterprise Extender (EE) UDP socket entry by using the DISPLAY NET,EEDIAG,TEST=YES command. See z/OS Communications Server: SNA Operation for details.

**Yes**
Indicates that a matching routing policy rule was found for this connection.

When the RoutingPolicy value is Yes, the following information is displayed:

**RoutingTableName**
The name of the routing table that was used to find the route for this connection or *NONE* if a route was not found. The value EZBMAIN is displayed when the main routing table was used.

**RoutingRuleName**
The name of the routing policy rule in use for this connection.

**ReceiveBufferSize**
The number of bytes received from the remote application that this connection is allowed to maintain in a buffer. All the data that is received is kept in a buffer until the local application reads the data.

**SendBufferSize**
The number of bytes the local application has sent that this connection is allowed to maintain in a buffer. All data that the application has sent is kept in the buffer until the remote side acknowledges receiving the sent data.

**TcpClusterConnFlag**
TCP cluster connection type flag. It is a one-byte hexadecimal field and can have one of the following values:

80
Indicates that the SO_CLUSTERCONNTYPE socket option or the SIOCGBPARTNERINFO ioctl was requested.

08
If the SO_CLUSTERCONNTYPE socket option or the SIOCGBPARTNERINFO ioctl was issued for this socket, this bit indicates that the communication from this node to the stack hosting the partner application is not sent on links/interfaces exposed outside the cluster (sysplex).

04
If the SO_CLUSTERCONNTYPE socket option or the SIOCGBPARTNERINFO ioctl was issued for this socket, this bit indicates that the connection partners are in the same MVS image.

02
If the SO_CLUSTERCONNTYPE socket option or the SIOCGBPARTNERINFO ioctl was issued for this socket, this bit indicates that the connection partners are in the same cluster.

01
If the SO_CLUSTERCONNTYPE socket option or the SIOCGBPARTNERINFO ioctl was issued for this socket, this bit indicates that the connection partners are not in the same cluster.

00
Any other value
Used for diagnostic purposes only under the direction of IBM Service personnel.

For more information about the cluster connection type, see the z/OS Communications Server: IP Sockets Application Programming Interface Guide and Reference. For more information about the SIOCGBPARTNERINFO ioctl, see z/OS Communications Server: IP Programmer’s Guide and Reference.
**TcpTrustedPartner**

The TCP trusted connection flag is displayed in the following situations:

- Security credentials of a partner within a sysplex or subplex have been retrieved over a trusted TCP connection using the SIOCGPARTNERINFO ioctl.
- The SIOCSPARTNERINFO ioctl has been issued for the socket.

The TCP trusted connection flag is a 1-byte hexadecimal field and can have the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>80</td>
<td>1... .... This bit indicates that the partner address-space user ID has been retrieved, as well as the task-level user ID if it is available.</td>
</tr>
<tr>
<td>40</td>
<td>.1... .... This bit indicates that the partner address-space UTOKEN has been retrieved, as well as the task-level UTOKEN if it is available.</td>
</tr>
<tr>
<td>20</td>
<td>..1. .... This bit indicates that the SIOCSPARTNERINFO ioctl has been successfully issued or inherited from the listener socket.</td>
</tr>
</tbody>
</table>

For information about trusted TCP/IP connections and the SIOCGPARTNERINFO and SIOCSPARTNERINFO ioctl calls, see z/OS Communications Server: IP Programmer's Guide and Reference.

**ReceiveDataQueued**

The number of bytes of data on the receive queue from the remote application yet to be read. This field is not displayed for a connection that is in listen state. The amount of data queued can be up to double the ReceiveBufferSize size. When the number of bytes is not zero, the following information is displayed:

- **OldQDate**: The date of the oldest data on the receive queue.
- **OldQTime**: The time of the oldest data on the receive queue. This value does not include leap seconds.

The ReceiveDataQueued information is not displayed for a connection that is in listen state.

**SendDataQueued**

The number of bytes of data on the send queue waiting for the remote side to acknowledge. This field is not displayed for a connection that is in listen state. The amount of data queued can be up to double the size of the SendBufferSize. When the number of bytes is not zero, the following information is displayed:

- **OldQDate**: The date of the oldest data on the send queue.
- **OldQTime**: The time of the oldest data on the send queue. This value does not include leap seconds.

The SendDataQueued information is not displayed for a connection that is in listen state.

**SendStalled**

Indicates whether this connection's send data flow is stalled. The send data flow is considered stalled if one or more of the following conditions are true:

- The TCP send window size is less than 256 or is less than the smaller of the largest send window that has been seen for the connection and the default MTU. The TCP send window size is set based on values provided by the TCP peer. The default MTU for IPv4 is 576. The default MTU for IPv6 is 1280.
- The TCP send queue is full and the data is not being retransmitted.

This field is not displayed for a connection that is in listen state. If the value is Yes, then this connection's send data flow is stalled.
SMC Information

- For server connections, this section is the SMC information for connections in Listen state. This section is displayed for connections in one of the following situations:
  - At least one Peripheral Component Interconnect® Express (PCIe) function ID (PFID) was defined by using the SMCR parameter of the GLOBALCONFIG statement.
  - The SMCD parameter was defined in the GLOBALCONFIG statement.

The SMC Information section contains the following information that is related to inbound connections to the server application:

**SMCDCurrConns**
The number of currently established connections, which use SMC-D and have an SMCDStatus of Active, to this server. The value of SMCDCurrConns is a subset of the value of the CurrentConnections field in this report.

**SMCDTotalConns**
The total number of connections to this server that uses SMC-D. The value of SMCDTotalConns is a subset of the value of the ConnectionsIn field in this report.

**SMCRCurrConns**
The number of currently established connections with an SMCRStatus of Active to this server that uses SMC-R. The value of SMCRCurrConns is a subset of the value of the CurrentConnections field in this report.

**SMCRTotalConns**
The total number of connections to this server that uses SMC-R. The value of SMCRTotalConns is a subset of the value of the ConnectionsIn field in this report.

**UseSMC**
Indicates whether SMC is used. This field is displayed only for a connection that is in Listen state when the AUTOSMC monitoring function is enabled. The AUTOSMC monitoring function is enabled by specifying the AUTOSMC subparameter of the SMCGLOBAL parameter on the GLOBALCONFIG profile statement. The AUTOSMC subparameter of the SMCGLOBAL parameter on GLOBALCONFIG is the default setting. For more information about the AUTOSMC monitoring function, see AUTOSMC monitoring function in z/OS Communications Server: IP Configuration Guide.

**Guideline:** A client is best suited for both SMC-R and SMC-D communications, or is best suited for neither of the communications. The workload pattern criteria are the same for determining whether a client is best suited for SMC-R and SMC-D communications.

**Yes**
Indicates one of the following situations:
  - This server had SMC configured on its PORT or PORTRANGE statement.
  - The AUTOSMC monitoring function detected during the previous monitoring interval that most client connections that request SMC-R or SMC-D to this server had a workload pattern that was best suited for SMC communications.

**No**
Indicates one of the following situations:
  - This server had NOSMC configured on its PORT or PORTRANGE statement.
  - The AUTOSMC monitoring function detected during the previous monitoring interval that most client connections that request SMC-R or SMC-D to this server did not have a workload pattern that was best suited for SMC communications.

**Source**
Indicates how the value of UseSMC is determined. This field is displayed only for a connection that is in Listen state when the AUTOSMC monitoring function is enabled. The AUTOSMC monitoring function is enabled by specifying the AUTOSMC subparameter of the SMCGLOBAL parameter on the GLOBALCONFIG profile statement. The AUTOSMC subparameter of the
SMCGLOBAL parameter on GLOBALCONFIG is the default setting. For more information about the AUTOSMC monitoring function, see AUTOSMC monitoring function in z/OS Communications Server: IP Configuration Guide.

**AUTOSMC**

Indicates that the value of UseSMC was determined by the AUTOSMC monitoring function.

**Config**

Indicates that the value of UseSMC was determined by the configuration of the PORT or PORTRANGE statement for the server.

**AutoSMC%**

The percentage of inbound TCP connections that request SMC-R or SMC-D to this server that had a workload pattern best suited for SMC communications during the last AUTOSMC monitoring interval. An N/A will be displayed if the number of connections to analyze in the last monitored interval is not large enough. Only connections that meet the criteria for SMC-R or SMC-D enablement are monitored. These connections where the peers are SMC-R or SMC-D enabled, can be reached directly over an SMC-R or SMC-D eligible subnet, do not have IPSEC enabled, and do not exploit the Fast Response Cache Accelerator (FRCA) feature. This field is only displayed when the AUTOSMC monitoring function is enabled and Source is AutoSMC. The AUTOSMC monitoring function is enabled by the AUTOSMC subparameter of the SMCGLOBAL parameter on the GLOBALCONFIG profile statement. The AUTOSMC subparameter of the SMCGLOBAL parameter on GLOBALCONFIG is the default setting.

**Guideline:** A client is best suited for both SMC-R and SMC-D communications, or is best suited for neither of the communications. The workload pattern criteria are the same for determining whether a client is best suited for SMC-R and SMC-D communications.

- For client connections, this section is the SMC information for established connections. This section is displayed for connections in one of the following situations:
  - At least one Peripheral Component Interconnect Express (PCIe) function ID (PFID) was defined by using the SMCR parameter of the GLOBALCONFIG statement.
  - The SMCD parameter was defined in the GLOBALCONFIG statement.

The SMC Information section contains the following information:

**SMCDStatus**

Indicates whether this connection is traversing a Shared Memory Communications - Direct Memory Access (SMC-D) link. This field can have the following values:

**Inactive**

Indicates that this connection does not use an SMC-D link.

When the SMCDStatus value is Inactive, the following information is displayed:

**SMCreason reasonCode - reasonText**

This field explains why the connection is not using an SMC-D link. The following reason codes are possible values.

**Note:** An asterisk (*) might be displayed after the reason code value, for example, 5302*. The asterisk indicates that a previous attempt to establish an SMC-D link to the destination IP address failed and that TCP/IP cached this failure. Therefore, TCP/IP did not attempt to use SMC-D for this connection. For more information about SMC-D caching, see GLOBALCONFIG statement in z/OS Communications Server: IP Configuration Reference.

**5302 - Route not SMC eligible**

SMC-D communications cannot be used for this connection because of connectivity issues or the absence of an active interface that supports SMC-D processing.

**5306 - No storage for SMC negotiation**

Storage for SMC-D negotiation over this TCP connection cannot be obtained.
5307 - Connection uses IPSec
SMC-D communications cannot be used for this connection because the connection is using IP security.

5308 - FRCA server
SMC-D communications cannot be used for this connection because the connection is used by a Fast Response Cache Accelerator (FRCA) server.

5309 - Pascal application
SMC-D communications cannot be used because the connection is used by a Pascal API application.

530A - NOSMC Port server
SMC-D communications cannot be used for this connection because the server port was configured with the NOSMC option.

530C - No prefix on interface
SMC-D communications cannot be used for this connection because of no valid IPv6 prefixes for the associated OSD or HiperSockets interface.

530D - AUTOSMC detected workload
SMC-D communications cannot be used for this connection because of AUTOSMC monitoring. AUTOSMC monitoring detects whether SMC-D is suitable for workload on inbound connections to a particular server. For more information about the AUTOSMC monitoring function, see AUTOSMC monitoring function in z/OS Communications Server: IP Configuration Guide.

530E - No active ISMs for the PNetID
No active Internal Shared Memory (ISM) interface is detected for the PNetID.

530F - Peer did not accept SMC-D request
The remote connection peer is not configured to use SMC-D communications.

5708 - Peer not reachable for SMC-D
The peer host supports SMC-D, but the peer is not reachable via SMC-D. For example, the peer might be located on a different CEC, the peer might not have SMC-D enabled for the same PNetID, or the defined VLANs for SMC-D are not consistent on both peers.

5803 - Insufficient virtual storage
SMC-D communications cannot be used for this connection because TCP private 64-bit virtual storage could not be allocated for a direct memory buffer (DMB).

5804 - SMCD FIXEDMemory limit exceeded reached
SMC-D communications cannot be used for this connection because the required SMC-D memory could not be allocated.

5805 - TCP connection limit reached
SMC-D communications cannot be used for this connection because another DMB for a new connection could not be obtained.

5806 - VLAN ID not found
SMC-D communications cannot be used for this connection because no VLAN that SMC-D enabled was found.

5809 - No qualifying active ISMs
No active ISM interfaces are detected in the SMC-D layer that can be used for this TCP connection.

5819 - Peer is out of synch
SMC-D communications cannot be used for this connection because of a condition that the peer is out of synchronization during negotiation.

581E - Peer subnet/prefix mismatch
SMC-D communications cannot be used for this connection because the peer does not have an active interface in the same subnet that is eligible for SMC-D.
5821 - Both peers reside on the same endpoint
SMC-D communications cannot be used for this connection because both endpoints of the connection reside on the same endpoint. Same LPAR and the same TCP/IP stack instance.

reasonCode - Internal error
SMC-D communications cannot be used for this connection because of an internal error.

reasonCode - *Peer generated*
SMC-D communications cannot be used for this connection because the peer reported an error. See the peer product's documentation for additional details. A value of NA indicates that the TCP/IP stack could not obtain the reason code from the peer.

Active
Indicates that this connection uses an SMC-D link.
When the SMCDStatus value is Active, the following information is displayed and the SMCRStatus field is not displayed:

LocalSMCLinkId
This field identifies the SMC-D link on this TCP/IP stack that this connection traverses. This TCP/IP stack generates the SMC-D link identifier dynamically.

RemoteSMCLinkId
This field identifies the SMC-D link on the remote peer that this connection traverses. The remote peer generates this SMC-D link identifier and provides it to this TCP/IP stack during SMC-D link activation.

LocalSMCRcvBuf
This field indicates the size of the DMB element that the local host uses for receiving data on this connection from the remote host.

RemoteSMCRcvBuf
This field indicates the size of the DMB element that the remote host uses for receiving data on this connection from the local host.

SMCRStatus
Indicates whether this connection is traversing a Shared Memory Communications over Remote Direct Memory Access (SMC-R) link. This field can have the following values:

Inactive
Indicates that this connection does not use an SMC-R link.
When the SMCRStatus value is Inactive, the following information is displayed:

SMCReason
This field explains why the connection is not using an SMC-R link. The following reason codes are possible values.

Note: An asterisk (*) might be displayed after the reason code value, for example, 5013*. The asterisk indicates that a previous attempt to establish an SMC-R link to the destination IP address failed and that TCP/IP cached this failure. Therefore, TCP/IP did not attempt to use SMC-R for this connection. For more information about SMC-R caching, see GLOBALCONFIG statement in z/OS Communications Server: IP Configuration Reference.

5013 - RDMA connectivity failure
SMC-R communications cannot be used for this connection because the first attempt to send data over RDMA encountered an error. A likely reason for this error is a configuration problem in the switch that is connected to the RNIC interface. For example, an incorrect VLANID value was configured on the switch port for the RNIC interface.
5203 - Insufficient virtual storage
SMC-R communications cannot be used for this connection because TCP private 64-bit virtual storage could not be allocated for an RMB buffer.

5204 - SMC-R FIXED Memory limit exceeded reached
SMC-R communications cannot be used for this connection because the required SMC-R memory could not be allocated.

5205 - TCP connection limit reached
SMC-R communications cannot be used for this connection because another RMB for a new connection could not be obtained.

5206 - VLAN ID not found
SMC-R communications cannot be used for this connection because no VLAN that was enabled by SMC-R was found.

5209 - No qualifying active RNICs
No active "RoCE Express" interfaces are detected in the SMC-R layer that can be used for this TCP connection.

5219 - Peer is out of synch
SMC-R communications cannot be used for this connection because the peer is out of synchronization condition during negotiation.

521E - Peer subnet/prefix mismatch
SMC-R communications cannot be used for this connection because the peer does not have an active interface in the same subnet that is eligible for SMC-R.

5301 - Peer did not accept SMC-R request
The remote connection peer is not configured to use SMC-R communications.

5302 - Route not SMC eligible
SMC-R communications cannot be used for this connection because of connectivity issues or the absence of an active interface that supports SMC-R processing.

5303 - No active RNICs for the PNetID
No active "RoCE Express" features are detected for the PNetID.

5304 - Connection is local
The connection peers are on the same TCP/IP stack.

5306 - No storage for SMC negotiation
Storage for SMC-R negotiation over this TCP connection cannot be obtained.

5307 - Connection uses IPsec
SMC-R communications cannot be used for this connection because the connection is using IP security.

5308 - FRCA server
SMC-R communications cannot be used for this connection because the connection is used by a Fast Response Cache Accelerator (FRCA) server.

5309 - Pascal application
SMC-R communications cannot be used because the connection is used by a Pascal API application.

530A - NOSMC Port server
SMC-R communications cannot be used for this connection because the server port was configured with the NOSMC option.

530B - Invalid MTU from peer
SMC-R communications cannot be used for this connection because the peer had an invalid MTU size for this SMC-R link.

530C - No prefix on interface
SMC-R communications cannot be used for this connection because of no valid IPv6 prefixes for the associated OSD interface.
530D - AUTOSMC detected workload
SMC-R communications cannot be used for this connection because of AUTOSMC monitoring. AUTOSMC monitoring detects whether SMC-R is suitable for workload on inbound connections to a particular server. For more information about the AUTOSMC monitoring function, see AUTOSMC monitoring function in z/OS Communications Server: IP Configuration Guide.

reasonCode - Internal error
SMC-R communications cannot be used for this connection because of an internal error.

reasonCode - *Peer generated*
SMC-R communications cannot be used for this connection because the peer reported an error. See the peer product's documentation for additional details.

Active
Indicates that this connection uses an SMC-R link.

When the SMCRStatus value is Active, the following information is displayed:

SMCGROUPid
This field identifies the SMC-R link group that includes the individual SMC-R link that this connection traverses. This TCP/IP stack generates the SMC-R link group identifier dynamically.

LOCALSMCLinkId
This field identifies the SMC-R link on this TCP/IP stack that this connection traverses. This TCP/IP stack generates the SMC-R link identifier dynamically.

REMOTECMCLinkId
This field identifies the SMC-R link on the remote peer that this connection traverses. The remote peer generates this SMC-R link identifier and provides it to this TCP/IP stack during SMC-R link activation.

LOCALSMCRcvBuf
This field indicates the size of the RMB element that the local host uses for receiving data on this connection from the remote host.

REMOTECMCRecvBuf
This field indicates the size of the RMB element that the remote host uses for receiving data on this connection from the local host.

Ancillary Input Queue
Indicates whether this connection is registered to the TCP bulk data ancillary input queue. This field is not displayed for a connection that is in listen state. This field can have the following values:

N/A
Indicates that this connection is not registered to the TCP bulk data ancillary input queue.

Yes
Indicates that this connection is registered to the TCP bulk data ancillary input queue.

When the Ancillary Input Queue value is Yes, the following information is displayed:

BulkDataIntfName
This field indicates the name of the interface over which the inbound traffic is being received.

ConnectionsIn
The number of connections that a server has accepted. This field is displayed only for a connection that is in listen state. Once a connection has been accepted, communication can begin between the client and server applications.

ConnectionsDropped
The number of connection requests that have been received by the server and dropped because the maximum number of connection requests was already in the backlog queue. This field is displayed only for a connection that is in listen state.
MaximumBacklog
The maximum number of connections that a server maintains on the backlog queue. This field is displayed only for a connection that is in listen state. Connection requests that are received when the maximum number of connections requests is already on the backlog queue are typically discarded. A high maximum backlog queue value causes more simultaneous connection requests than a server can handle without having to drop requests.

ConnectionFlood
Indicates whether this server is experiencing a potential connection flood attack. A server is considered under a potential connection flood attack when backlog queue expansion is required to handle the incoming connection requests. The point where a potential connection flood attack is detected is based on the initial size of the backlog queue. A small initial backlog queue (for example, 10 entries) is allowed to expand twice before the server is considered under attack, while a server with a large initial backlog queue (for example, 500 entries) can expand once, up to a maximum of 768 entries, before it is considered under attack. This field is displayed only for a connection that is in listen state. If the value is Yes, then this server is experiencing a potential connection flood attack.

CurrentBacklog
The number of connections that are currently in the backlog queue. This field is displayed only for a connection that is in listen state. This value includes connections that are fully established and that are ready to be accepted by the server application; it also includes connections that are not yet fully established (the TCP connection establishment handshake is not yet complete). To determine the number of connections in the backlog queue that are not fully established, subtract the ServerBacklog value from the CurrentBacklog value. If the server application uses the Fast Response Cache Accelerator (FRCA) feature, fully established connections that are being serviced by TCP/IP from the FRCA cache are also included in the CurrentBacklog value. The FRCABacklog value in this report indicates the number of these connections.

ServerBacklog
The number of connections currently in the backlog queue that are established and that have not yet been accepted.

FRCABacklog
The number of connections currently in the backlog queue that are established FRCA connections and that are being serviced by TCP/IP from the FRCA cache. These connections do not need to be accepted by the server application. This field is applicable only for server applications that use the FRCA feature.

CurrentConnections
The number of currently established connections to the server. This field is displayed only for a connection that is in listen state.

SEF
The server accept efficiency fraction (SEF) is a measure, calculated at intervals of approximately one minute, of the efficiency of the server application in accepting new connection setup requests and managing its backlog queue. The value is displayed as a percentage. A value of 100 indicates that the server application is successfully accepting all its new connection setup requests. A value of 0 indicates that the server application is not responding to new connection setup requests. This field is displayed only for a connection that is in listen state.

When using SHAREPORTWLM, the SEF value is used to modify the WLM server-specific weights, thereby influencing how new connection setup requests are distributed to the servers sharing this port. When using SHAREPORT, the SEF value is used to weight the distribution of new connection setup requests among the SHAREPORT servers. Whether SHAREPORT or SHAREPORTWLM are specified, the SEF value is reported back to the distributor to be used as part of the target server responsiveness fraction calculation, which influences how new connection setup requests are distributed to the target servers.

Quiesced
Indicates whether this server application has been quiesced for DVIPA sysplex distributor workload balancing. This field is displayed only for a connection that is in listen state. If the value is Dest, then
this server will receive no new DVIPA sysplex distributor workload connections until the server 
application has been resumed. When the server application is resumed, the quiesced value changes 
to No.

**SharePort**
Indicates that multiple TCP listening servers are sharing the same port. This field is displayed only 
for a connection that is in listen state. The method used by TCP to distribute incoming connections 
to the listeners is indicated by Base or WLM described below. See the PORT profile statement in the 
z/OS Communications Server: IP Configuration Reference for more information on sharing a TCP 
port.

**Base**
Connections are proportionally distributed among the available shareport listeners using the 
SEF value. This value corresponds to the SHAREPORT parameter on the PORT profile statement.

**WLM**
Connections are distributed among the available shareport listeners using the normalized WLM 
server-specific weights. This value corresponds to the SHAREPORTWLM parameter on the PORT 
profile statement.

**RawWeight**
The raw composite weight for this server. The composite weight is based on the application's 
general CPU, zAAP, and zIIP processor utilization.

**NormalizedWeight**
The normalized values of the WLM server-specific weights. The original raw weights received 
from WLM are proportionally reduced for use by the distribution algorithm. Connections are 
distributed to these servers in a weighted round-robin fashion using the normalized weights if 
SHAREPORTWLM is specified on the PORT profile statement. The displayed normalized weight is 
shown after it has been modified by the SEF value. This field is shown regardless of the 
distribution method (Base or WLM) that is used.

**Abnorm**
Indicates whether the server application is experiencing conditions that cause transactions to 
complete abnormally. The value represents a rate of abnormal transaction completions per 
1000 total transaction completions. It is applicable only for TCP applications that act as 
Subsystem Work Managers and report transaction status using Workload Management Services, 
such as IWMRPT. For example, the value 100 indicates that 10% of all transactions processed 
by the server application are completing abnormally. Under normal conditions, this value is 0. A 
nonzero value indicates that the server application has reported some abnormal transactions 
completions to WLM and that WLM has reduced the recommendation provided to sysplex 
distributor for this server instance. This reduction in the WLM recommendation enables more 
new TCP connections to be directed to servers that are not experiencing problem conditions that 
lead to abnormal transaction completions.

The greater the Abnorm rate field value, the greater the reduction WLM applies to the 
recommendation for this target instance. For more information about the conditions that cause 
the abnormal transaction completions for a given server application, see the documentation 
provided by the server application.

If applications do not provide this transaction status to WLM or SHAREPORTWLM is not 
configured, then this field has the value 0. For more information about workload management 
interfaces, see z/OS MVS Programming: Workload Management Services.

**Health**
The server application health indicator. This health indicator is available only for applications 
that provide this information to WLM using the IWM4HLTH or IWMSRSRG services. It provides a 
general health indication for an application or subsystem. Under normal circumstances, the 
value of this field is 100, indicating that the server is 100% healthy. Any value that is less than 
100 indicates that the server is experiencing problem conditions that might prevent new work 
requests from being successfully processed. A value of less than 100 also causes the WLM to 
reduce the recommendation provided to the sysplex distributor for this server instance. This
reduction in the WLM recommendation enables more new TCP connections to be directed to servers that are not experiencing problem conditions.

The reduction in the WLM recommendation is proportional to value of the Health indicator. For example, if the health value is 20%, WLM reduces the recommendation for this server by 80%. For more information about the conditions leading to a health indicator of less than 100, see the documentation for the server application.

If applications do not provide this health indicator to WLM or SHAREPORTWLM is not configured, then the value of this field is 100. For more information about workload management interfaces, see z/OS MVS Programming: Workload Management Services.

**RawCP**
The raw WLM server-specific general CP weight.

**RawzAAP**
The raw WLM server-specific zAAP weight.

**RawzIIP**
The raw WLM server-specific zIIP weight.

**PropCP**
The RawCP value modified by the proportion of CP capacity that is currently being consumed by the application's workload as compared to the other processors (zIIP and zAAP).

**PropzAAP**
The RawzAAP value modified by the proportion of zAAP capacity that is currently being consumed by the application's workload as compared to the other processors (CP and zIIP).

**PropzIIP**
The RawzIIP value modified by the proportion of zIIP capacity that is currently being consumed by the application's workload as compared to the other processors (CP and zAAP).

**ILWeighting**
The weighting factor the workload manager (WLM) uses when it compares displaceable capacity at different importance levels (ILs) in order to determine a SERVERWLM recommendation for each system.

**XcostzAAP**
The crossover cost that is applied to the workload that was targeted to run on a zAAP processor but that ran on the conventional processor.

**XcostzIIP**
The crossover cost that is applied to the workload that was targeted to run on a zIIP processor but that ran on the conventional processor.

**Application Data**
The application data that makes it easy for users to locate and display the connections that are used by the application. The beginning of the application data identifies the format of the application data area. For z/OS Communications Server applications, see application data in the z/OS Communications Server: IP Programmer’s Guide and Reference for a description of the format, content, and meaning of the data supplied by the application. For other applications, see the documentation that is supplied by the application. The data is displayed in character format if application data is present. Non-printable characters, if any, are displayed as dots.

- The following fields are displayed for a UDP socket entry:

**Client Name**
See the Client name or User ID information in “Netstat report general concepts” on page 293 for a detailed description.

**Client ID**
See the Client ID or Connection Number information in “Netstat report general concepts” on page 293 for a detailed description.

**Local Socket**
See the Local Socket information in “Netstat report general concepts” on page 293 for a detailed description.
**Foreign Socket**
See the Foreign Socket information in “Netstat report general concepts” on page 293 for a detailed description.

**BytesIn**
The number of bytes of data the stack has received for this UDP socket. Includes both the total bytes that all applications have received for this socket and the total bytes in stack buffers that have not yet been read by any application.

**BytesOut**
Number of outbound bytes of user data sent from this socket.

**DgramIn**
The number of datagrams the stack has received for this UDP socket. This includes both the total datagrams that all applications have received for this socket and the total datagrams in stack buffers that have not yet been read by any application. A datagram is the group of data bytes contained in a UDP packet.

**DgramOut**
Number of outbound datagrams sent from this socket.

**Last touched time**
See the Last touched time information in “Netstat report general concepts” on page 293 for a detailed description.

**MaxSendLim**
Maximum allowed size of a user datagram sent from this socket.

**MaxRecvLim**
Maximum allowed size of a user datagram received on this socket.

**SockOpt**
Socket option flag. For TCP/IP stacks that are not IPv6 enabled, it is a one-byte hexadecimal value of common socket options. For IPv6-enabled TCP/IP stacks, it is a one-byte hexadecimal value of common socket options, followed by a three-byte hexadecimal value of IPv6-specific socket options.

**IPv4 socket options:**

- **80 1... ****
  Allow use of broadcast address (IPv4 only)**
- **40 .1... ****
  Allow loopback of datagrams**
- **20 ..1. ****
  Bypass normal routing**
- **10 ...1 ****
  Forward ICMP messages (Pascal API)**
- **08 .... 1...**
  Last sent a multicast packet
- **04 .... .1..**
  Multicast packets can be received by this socket
- **02 .... ..1.**
  Reuse address

**other values**
reserved

**IPv6 socket options:**

- **Byte 1**
- **80 1... ****
  AF_INET6 socket**
40 ..1....
   IPV6_V6ONLY option set
20 ..1....
   IPV6_RECVPKTINFO option set
10 ...1....
   IPV6_RECVHOPLIMIT option set
08 .... 1...
   IPV6_USE_MIN_MTU for unicast option
04 .... .1..
   IPV6_PKTINFO src IP@ option set
02 .... ..1.
   IPV6_PKTINFO interface index option set
01 .... ...1
   IPV6_UNICAST_HOPS option set

Byte 2
80 1....
   IPV6_USE_MIN_MTU for multicast option set

   IPV6_RECVTCLASS option set
04 .... .1..
   IPV6_NEXTHOP option set
02 .... ..1.
   IPV6_RTHDR option set
01 .... ...1
   IPV6_HOPOPTS option set

Byte 3
80 1....
   IPV6_DSTOPTS option set
40 .1....
   IPV6_RTHDRDSTOPTS option set
20 ..1....
   IPV6_TCLASS option set
10 ...1....
   IPV6_DONTFRAG option set
08 .... 1...
   IPV6_RECVPATHMTU option set

other values
   reserved

**DSField**
The Differentiated Services Code Point value being used for this connection.
The DSField represents one of the following values:
- If there is a Service Policy Agent policy in effect for this entry, one of the following values is used:
- The ToS value defined by RFC 791 and 1349
- The Differentiated Services field value defined by RFC 2474

– For UDP entries for which there is no Service Policy Agent policy in effect but the entry is being used for an Enterprise Extender connection, the hexadecimal value of one of the following VTAM IP Type of Service values is displayed:

  20 Low
  40 Medium
  80 High
  C0 Network

  See the z/OS Communications Server: SNA Network Implementation Guide for additional information.

– If neither of these is true, this value is 0.

**QOSPolicy**
Indicates whether a matching QoS policy rule has been found for this connection. This field can have the following values:

  **No**
  Indicates that a matching QoS policy rule was not found for this connection.

  **Yes**
  Indicates that a matching QoS policy rule was found for this connection. When the QOSPolicy field has the value Yes, the following information is displayed:

    **QOSRuleName**
    The name of the Policy rule that is in use for this connection. This policy is for outbound traffic only.

**RoutingPolicy**
Indicates whether a matching routing policy rule has been found for this connection. This field can have the following values:

  **No**
  Indicates that no matching routing policy rule was found for this connection.

  **Yes**
  Indicates that a matching routing policy rule was found for this connection.

  When the RoutingPolicy field has the value Yes, the following information is displayed:

    **RoutingTableName**
    The name of the routing table that was used to find the route for this connection or *NONE* if a route was not found. The value EZBMAIN is displayed when the main routing table was used.

    **RoutingRuleName**
    The name of the routing policy rule in use for this connection.

**ReceiveDataQueued**
The number of bytes of data on the receive queue from the remote application yet to be read. When the number of bytes is not zero, the following information is displayed:

  **OldQDate**
  The date of the oldest datagram on the receive queue.

  **OldQTime**
  The time of the oldest datagram on the receive queue.

**ReceiveMsgCnt**
The number of datagrams on the receive queue.

**Multicast Specific**
Indicates that there is multicast data associated with this socket.

  For outgoing multicast data the following field descriptions apply:
HopLimit
The time-to-live value.

LoopBack®
Indicates whether datagrams are sent to loopback.

OutgoingIpAddr
The IPv4 IP address of the link on which the datagrams are sent. The value of this field is 0.0.0.0 if the socket has not been set with the IP_MULTICAST_IF setsockopt option. This field is not applicable for an IPv6 multicast entry.

OutgoingIntf
The IPv6 interface name on which the datagrams are sent. The value of this field is blank if the socket has not been set with the IPV6_MULTICAST_IF setsockopt option. This field is not applicable for an IPv4 multicast entry.

For incoming multicast data the following field descriptions apply:

Group
The multicast IP addresses (up to a maximum of 20) for which data is being received.

IncomingIpAddr
The IPv4 IP address of the link over which multicast datagrams are accepted. This field is not applicable for an IPv6 multicast entry.

IncomingIntf
The IPv6 interface name over which multicast datagrams are accepted. This field is not applicable for an IPv4 multicast entry.

SrcFltMd
The source filter mode, which can have a value of either Include or Exclude. A source filter applies only to incoming multicast data. This source filter function is set by an application for the UDP socket. See the information about Designing multicast programs in the z/OS Communications Server: IP Sockets Application Programming Interface Guide and Reference for details. The source filter applies to all the IP addresses in the SrcAddr fields for the associated IncomingIPAddr address or IncomingIntf interface.

Include
Indicates that the socket receives only multicast datagrams that have a source IP address that matches an IP address indicated in the SrcAddr field.

Exclude
Indicates either that the source filter function is not active for the socket or that the application has requested to receive only multicast datagrams that have a source IP address that does not match an IP address indicated in the SrcAddr field. If the source filter function is not active or if the source filter function is active but no SrcAddr value is set, then the SrcAddr field contains the value None.

SrcAddr
Source address information for the socket.

ipaddr
The source IP addresses (up to a maximum of 64), used in conjunction with the SrcFltMd value, that is used to determine which incoming multicast datagrams should be passed to an application.

None
This value is displayed only when the source filter function is not active for the socket or when no source IP address is associated with group multicast address, IncomingIPAddr address, or IncomingIntf interface. The value of the corresponding SrcFltMd field is Exclude.

StartDate
See the StartDate information in “Netstat report general concepts” on page 293.

StartTime
See the StartTime information in “Netstat report general concepts” on page 293.
**Netstat ALLConn/-a report**

Provides information for all TCP connections and UDP sockets, including recently closed ones.

**TSO syntax**

```
NETSTAT ALLConn  Modifier  Target  Output  (Filter)
```

**Modifier**

```
appldata
```

**APPLDATA**

Provides application data in the output report.

**Target**

Provide the report for a specified TCP/IP address space by using Tcp tcpname. See “The Netstat command target” on page 287 for more information about the Tcp parameter.

**Output**

The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**Filter**

```
appldata
```
z/OS UNIX syntax

```
$ netstat -a Modifier Target Output Filter
```

**Modifier**

**APPLDATA**

Provides application data in the output report.

**Target**

Provide the report for a specified TCP/IP address space by using `-p tcpname`. See “The Netstat command target” on page 287 for more information about the `-p` parameter.

**Output**

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

**Filter**

Filter description

**APP LD/-G appldata**

Filter the output of the ALLConn/-a report using the specified application data `appldata`. You can enter one filter value at a time and the specified value can be up to 40 characters in length.
**CLIent/-E clientname**
Filter the output of the ALLConn/-a report using the specified client name clientname. You can enter up to six filter values and each specified value can be up to eight characters in length.

**HOSTName/-H hostname**
Filter the output of the ALLConn/-a report using the specified host name hostname. You can enter one filter value at a time and the specified value can be up to 255 characters in length.

**Result:** At the end of the report, Netstat displays the host name that the resolver used for the resolution and the list of IP addresses returned from the resolver that it used as filters.

**Restrictions:**
1. The HOSTName/-H filter does not support wildcard characters.
2. Using HOSTName/-H filter might cause delays in the output due to resolution of the hostname value depending upon resolver and DNS configuration.

**IPAddr/-I ipaddr/IPAddr/-I ipaddr/prefixlength/IPAddr/-I ipaddr/subnetmask**
Filter the report output using the specified IP address ipaddr, ipaddr/prefixlength, or ipaddr/subnetmask. You can enter up to six filter values. Each specified IPv4 ipaddr value can be up to 15 characters in length and each selected IPv6 ipaddr value can be up to 45 characters in length.

**ipaddr**
Filter the output of the ALLConn/-a report using the specified IP address ipaddr. For IPv4 addresses, the default subnet mask of 255.255.255.255 is used. For IPv6 addresses, the default prefixlength of 128 is used.

**ipaddr/prefixlength**
Filter the output of the ALLConn/-a report using the specified IP address and prefix length ipaddr/prefixlength. For an IPv4 address, the prefix length range is 1 – 32. For an IPv6 address, the prefix length range is 1 – 128.

**ipaddr/subnetmask**
Filter the output of the ALLConn/-a report using the specified IP address and subnet mask ipaddr/subnetmask. The IP address ipaddr in this format must be an IPv4 IP address.

**Guidelines:**
1. The filter value ipaddr can be either the local or remote IP address.
2. For an IPv6-enabled stack:
   - Both IPv4 and IPv6 ipaddr values are accepted and can be mixed on the IPAddr/-I option.
   - An IPv4-mapped IPv6 address is accepted as a valid ipaddr value and will usually provide the same result as its IPv4 address.

**Restrictions:**
1. The filter value for an IPv6 address does not support wildcard characters.
2. For an IPv4-only stack, only IPv4 ipaddr values are accepted.
3. For a UDP endpoint socket, the filter value applies only to the local or source IP address.

**IPPort/-B ipaddr+portnum**
Filter the report output of the ALLConn/-a report using the specified IP address and port number. You can enter up to six filter values. Each specified IPv4 ipaddr value can be up to 15 characters in length, denoting a single IPv4 IP address; each specified IPv6 ipaddr value can be up to 45 characters in length, denoting a single IPv6 IP address. Valid portnum values are in the range 0 – 65535. The filter values ipaddr and portnum will match any combination of the local and remote IP address and local and remote port.

**Guidelines:**
- The filter value ipaddr can be either the local or remote IP address.
- For an IPv6-enabled stack, the following apply:
- Both IPv4 and IPv6 ipaddr values are accepted and can be mixed on the IPPort/-B option.
- An IPv4-mapped IPv6 address is accepted as a valid ipaddr value and usually provides the same result as the IPv4 address.

Restrictions:
- The ipaddr value in the IPPort/-B filter does not support wildcard characters.
- For an IPv4-only stack, only IPv4 ipaddr values are accepted.
- An entry is returned only when both the ipaddr and portnum values match.
- For a UDP endpoint socket, the filter value applies only to the local or source IP address and port.

NOTN3270/-T
Filter the output of the ALLConn/-a report, excluding TN3270 server connections.

PORT/-P portnum
Filter the output of the ALLConn/-a report using the specified port number portnum. You can enter up to six filter values.

Guideline: The port number can be either a local or remote port.

Restriction: For a UDP endpoint socket, the filter value applies only to the local or source port.

SMCID/-U smcid
Filter the output of the ALLConn/-a report by using the specified Shared Memory Communications over Remote Direct Memory Access (SMC-R) link, SMC-R link group, or Shared Memory
Communications - Direct Memory Access (SMC-D) link identifier smcid. If an asterisk (*) is specified
for the filter value, Netstat provides output only for entries that are associated with SMC-R links, SMC-
R link groups, and SMC-D links. You can enter one filter value at a time.

CONNTType/-X
Filter the report using the specified connection type. You can enter one filter value at a time.

NOTTLS_Policy
Filter the output of the ALLConn/-a report, displaying only connections that have not been
matched to an Application Transparent Transport Layer Security (AT-TLS) rule. This includes
connections that were established while the AT-TLS function was disabled (the value NOTTLS was
specified on the TCPCONFIG statement or is in effect by default) and all connections that are not
TCP protocol. For TCP connections that were established while the AT-TLS function was enabled,
this includes the following information:
- Connections for which AT-TLS policy lookup has not yet occurred (typically the first send or
receive has not been issued yet)
- Connections for which AT-TLS policy lookup has occurred but no matching rule was found

TTLSPolicy
Filter the output of the ALLConn/-a report, displaying only connections that match an Application
Transparent Transport Layer Security (AT-TLS) rule. This includes only connections that were
established while the AT-TLS function was enabled, for which an AT-TLS policy rule was found that
has the value TTLSenabLed ON or TTLSenabLed OFF specified in the TTLSGroupAction policy
statement. Responses can be further limited on AT-TLS connection type. AT-TLS connection type
has the following values:

CURRENT
Display only connections that are using AT-TLS where the rule and all actions are still available
to be used for new connections.

GROUP groupid
Display only connections that are using the AT-TLS group specified by the groupid value. The
specified groupid value is a number that is assigned by the TCP/IP stack to uniquely identify an
AT-TLS group. You can determine the groupid value from the GroupID field in the Netstat
TTLS/-x GROUP report.
STALE
Display only connections that are using AT-TLS where the rule or at least one action is no longer available to be used for new connections.

The filter value for CLIent/-E, IPAddr/-I, and APPLD/-G can be a complete string or a partial string using wildcard characters. A wildcard character can be an asterisk (*), which matches a null string or any character or character string, at the same position. A wildcard character can be a question mark (?), which matches any single character at the same position. For example, a string sear{h}ee matches with "ar?he", but the string sear{h}ee does not match with "ar{h}ee". If you want to use the wildcard character on the IPAddr/-I filter, you must specify the value in the ipaddr format. The wildcard character is not accepted for the ipaddr/prefixlen or ipaddr/subnetmask format of IPAddr/-I values.

When you use z/OS UNIX netstat/onetstat command in a z/OS UNIX shell environment, take care if you use a z/OS UNIX MVS special character in a character string. It might cause an unpredictable result. To be safe, if you want to use a z/OS UNIX MVS special character in a character string, surround the character string with single quotation marks. For example, to use an asterisk (*) in the IP address, 10.*.0.0 for the -I filter, issue the command as: netstat -a -I '10.*.0.0'.

### Report field descriptions

**User Id**

See the Client name or User ID information in “Netstat report general concepts” on page 293 for a detailed description.

**Conn**

See the Client ID or Connection Number information in “Netstat report general concepts” on page 293 for a detailed description.

**Local Socket**

See the Local Socket information in “Netstat report general concepts” on page 293 for a detailed description.

**Foreign Socket**

See the Foreign Socket information in “Netstat report general concepts” on page 293 for a detailed description.

**State**

See the TCP connection status and UDP socket status information in “Netstat report general concepts” on page 293 for a detailed description.

**Application Data**

The application data that makes it easy for users to locate and display the connections that are used by the application. The beginning of the application data identifies the format of the application data area. For z/OS Communications Server applications, see application data information in the z/OS Communications Server: IP Programmer’s Guide and Reference for a description of the format, content, and meaning of the data supplied by the application. For other applications, see the...
documentation that is supplied by the application. The data is displayed in character format if application data is present. Non-printable characters, if any, are displayed as dots.

**Netstat ARp/-R report**
Queries the ARP cache information. In addition to ARP cache entries for physical devices, when applicable, ARP cache entries for all configured static and dynamic VIPAs are displayed as potential ARP targets, even when they might not be used.

**Tip:** This report can also display all IPv4 addresses on the HiperSockets internal LAN to which the stack has a route over this interface.

**Guideline:** For HiperSockets interfaces, the stack requests this data from the appropriate device. If a device does not return this data in a timely fashion, then Netstat will not display data for that interface.

**TSO syntax**

```
% NETSTAT ARp [Modifier] Target [Output]
```

**Modifier**

```
netAddress| ALL
```

**netAddress**
Queries the ARP cache for a given address.

**ALL**
Queries all ARP cache entries. In addition to ARP cache entries for physical devices when applicable, ARP cache entries for all configured static and dynamic VIPAs are displayed as potential ARP targets, even when they might not be used.

**Target**

Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**

The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**z/OS UNIX syntax**

```
netstat -R [Modifier] Target [Output]
```

**Modifier**

```
netAddress| ALL
```

**netAddress**
Queries the ARP cache for a given address.

**ALL**
Queries all ARP cache entries. In addition to ARP cache entries for physical devices when applicable, ARP cache entries for all configured static and dynamic VIPAs are displayed as potential ARP targets, even when they might not be used.
Target
Provide the report for a specific TCP/IP address space by using `-p tcpname`. See “The Netstat command target” on page 287 for more information about the `-p` parameter.

Output
The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

Command syntax examples

From TSO environment

<table>

Tip: This report does not reflect information for certain devices that support ARP offload. The information provided differs depending on the type of device. See the z/OS Communications Server: IP Configuration Reference or the z/OS Communications Server: SNA Network Implementation Guide for more information.

Report field descriptions

**IP address**
The IP address from the ARP cache.

**Interface**
The interface name.

**Interface Type**
The interface type.

**MAC address**
The MAC address associated with the IP address. This field is not displayed for HiperSockets links.

**OSX**
For HiperSockets interfaces that use the Internal Queued Direct I/O extensions function (IQDX), this field indicates the associated OSX interface.

**IQC**
For OSD interfaces with an associated HiperSockets Converged Interface (IQDC), this field indicates the associated IQDC interface.

**Route info**
The Token Ring Routing Information Field (RIF). See the RIF portion of RFC 1042 for detailed information about this field. This field is displayed only for Token Ring links.

Netstat BYTEinfo/-b report
Displays byte-count information for each active TCP connection and UDP socket.

**TSO syntax**

```plaintext
NETSTAT BYTEinfo Modifier Target Output (Filter)
```

**Modifier**

```plaintext
IDLETIME
```

**IDLETIME**

Displays byte-count information plus the idle time for each TCP connection and UDP socket.

Idle time is displayed in the following format:

hours:minutes:seconds.

**Target**

Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**

The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.
**Filter**

```
<table>
<thead>
<tr>
<th>Filter</th>
<th>CLIent</th>
<th>Clientname</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>HOSTName</td>
<td>hostname</td>
</tr>
<tr>
<td>IPAddr</td>
<td>ipaddr</td>
<td></td>
</tr>
<tr>
<td></td>
<td>ipaddr/subnetmask</td>
<td></td>
</tr>
<tr>
<td></td>
<td>ipaddr/prefixLen</td>
<td></td>
</tr>
<tr>
<td>NOTN3270</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**z/OS UNIX syntax**

```
netstat -b  Modifier  Target  Output  Filter
```

**Modifier**

```
-IDLETIME
```

**IDLETIME**

Displays the byte-count information plus the idle time for each TCP connection and UDP socket.

The idle time is displayed in the following format:

hours:minutes:seconds

**Target**

Provide the report for a specific TCP/IP address space by using `-p tcpname`. See “The Netstat command target” on page 287 for more information about the Tcp parameter.

**Output**

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

**Filter**

```
<table>
<thead>
<tr>
<th>Filter</th>
<th>-E</th>
<th>Clientname</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-H</td>
<td>hostname</td>

<td></td>
</tr>
<tr>
<td></td>
<td>ipaddr/prefixLen</td>
<td></td>
</tr>
<tr>
<td>-T</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```
Filter description

CLIent/-E clientname
Filter the output of the BYTEinfo/-b report using the specified client name clientname. You can enter up to six filter values and each specified value can be up to eight characters in length.

HOSTName/-H hostname
Filter the output of the BYTEinfo/-b report using the specified host name hostname. You can enter one filter value at a time and the specified value can be up to 255 characters in length.

Result: At the end of the report, Netstat displays the host name that the resolver used for the resolution and the list of IP addresses returned from the resolver that it used as filters.

Restrictions:
1. The HOSTName/-H filter does not support wildcard characters.
2. Using HOSTName/-H filter might cause delays in the output due to resolution of the hostname value, depending upon resolver and DNS configuration.

IPAddr/-I ipaddr/IPAddr/-I ipaddr/prefixlength/IPAddr/-I ipaddr/subnetmask
Filter the report output using the specified IP address ipaddr, ipaddr/prefixlength, or ipaddr/subnetmask. You can enter up to six filter values. Each specified IPv4 ipaddr value can be up to 15 characters in length and each selected IPv6 ipaddr value can be up to 45 characters in length.

ipaddr
Filter the output of the BYTEinfo/-b report using the specified IP address ipaddr. For IPv4 addresses, the default subnet mask of 255.255.255.255 is used. For IPv6 addresses, the default prefixlength of 128 is used.

ipaddr/prefixlength
Filter the output of the BYTEinfo/-b report using the specified IP address and prefix length ipaddr/prefixlength. For an IPv4 address, the prefix length range is 1 – 32. For an IPv6 address, the prefix length range is 1 – 128.

ipaddr/subnetmask
Filter the output of the BYTEinfo/-b report using the specified IP address and subnet mask ipaddr/subnetmask. The IP address ipaddr in this format must be an IPv4 IP address.

Guidelines:
1. The filter value ipaddr can be either the local or remote IP address.
2. For an IPv6-enabled stack:
   • Both IPv4 and IPv6 ipaddr values are accepted and can be mixed on the IPAddr/-I option.
   • An IPv4-mapped IPv6 address is accepted as a valid ipaddr value and will usually provide the same result as its IPv4 address.

Restrictions:
1. The filter value for an IPv6 address does not support wildcard characters.
2. For an IPv4-only stack, only IPv4 ipaddr values are accepted.
3. For a UDP endpoint socket, the filter value applies only to the local or source IP address.

NOTN3270/-T
Filter the output of the BYTEinfo/-b report, excluding TN3270 server connections.

The filter value for CLIent/-E and IPAddr/-I can be a complete string or a partial string using wildcard characters. A wildcard character can be an asterisk (*), which matches a null string or any character or character string, at the same position. A wildcard character can be a question mark (?), which matches any single character at the same position. For example, a string "searchee" matches with "*ar?he*", but the string "searhee" does not match with "*ar?he*". If you want to use the wildcard character on the IPAddr/-I filter, specify the value in the ipaddr format. The wildcard character is not accepted for the ipaddr/subnetmask or ipaddr/prefixlen format of IPAddr/-I values.
When using the z/OS UNIX netstat/onetstat command in a z/OS UNIX shell environment, take care if you use a z/OS UNIX MVS special character in a character string. It might cause an unpredictable result. To be safe, if you want to use a z/OS UNIX MVS special character in a character string, surround the character string with single ('') or double (") quotation marks. For example, to use an asterisk (*) in the IP address, 10.*0.0 for the -I filter, issue the command as: netstat -b -I '10.*0.0' or netstat -b -I "10.*0.0".

**Command syntax examples**

**From TSO environment**

```
NETSTAT BYTEINFO
   Displays the byte-count information about each TCP connection and UDP socket in the default TCP/IP stack.
NETSTAT BYTEINFO TCP TCPCS6
   Displays the byte-count information about each TCP connection and UDP socket in TCPCS6 stack.
NETSTAT BYTEINFO TCP TCPCS8 (IPADDR 9.43.1.1 9.43.2.2
   Displays the byte-count information about each TCP connection and UDP socket in TCPCS8 stack whose foreign IP addresses match the specified filter IP address values.
```

**From UNIX shell environment**

```
netstat -b
netstat -b -p tcpcs6
netstat -b -p tcpcs6 -I 9.43.1.1 9.43.2.2.
```

**Report examples**

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

**Not IPv6 enabled (SHORT format)**

```
NETSTAT BYTEINFO

### Guideline:
For the NETSTAT BYTEINFO IDLETIME display, the BytesOut and BytesIn counts are in two forms:

**Guideline:** For the NETSTAT BYTEINFO IDLETIME display, the BytesOut and BytesIn counts are in two forms:

\[ nnnnnnnnnnnnnn \]

Number range 0 – 999 999 999 999 999 999

\[ nnnnnnnnnnnnnK \]

Number range 1 000 000 000 000 000 000 – 999 999 999 999 999 999 999 499 (K = \( nnnnnnnnnnnnnn \times 1000 \))
**Report field descriptions**

**User Id**
See the Client name or User ID information in “Netstat report general concepts” on page 293 for a detailed description.

**BytesIn / B In**
For a TCP entry, the number of bytes of data the stack has received for this TCP connection. This includes both the total number of bytes that the application has received and the total number of bytes in the receive buffer that have not yet been read by the application. For a UDP entry, it is the number of bytes of data the stack has received for this UDP socket. This includes both the total number of bytes that all applications have received for this socket and the total number of bytes in stack buffers that have not yet been read by any application.

**Restriction:** The TCP/IP stack maintains 64-bit counters for TCP connections and UDP endpoints. However, if you are running an IPv4-only stack, and the Netstat output is in the SHORT format, only the lower 32-bit counter value is displayed. If a large amount of data has been received, the number of bytes can exceed a 32-bit counter so the value displayed will appear to have been reset. Use the FORMAT/-M LONG output option on the Netstat command to cause Netstat to use the LONG format for the output. The LONG format displays the full 64-bit counter value. You can also specify the FORMAT parameter on the IPCONFIG profile statement to set FORMAT LONG as the default value for all Netstat commands.

**BytesOut / B Out**
For a TCP entry, it is the number of bytes of data the application has sent. This includes all of the data that has been sent to the remote connection and all of the data that has not been sent but is buffered and waiting to be sent by the local stack. For a UDP entry, it is the number of outbound bytes of user data sent from this socket.

**Restriction:** The TCP/IP stack maintains 64-bit counters for TCP connections and UDP endpoints. However, if you are running an IPv4-only stack, and the Netstat output is in the SHORT format, only the lower 32-bit counter value is displayed. If a large amount of data has been sent, the number of bytes can exceed a 32-bit counter so the value displayed will appear to have been reset. Use the FORMAT/-M LONG output option on the Netstat command to cause Netstat to use the LONG format for the output. The LONG format displays the full 64-bit counter value. You can also specify the FORMAT parameter on the IPCONFIG profile statement to set FORMAT LONG as the default value for all Netstat commands.

**LPort**
See the Local port description in “Netstat report general concepts” on page 293 for a detailed description.

**Foreign Socket**
See the Foreign socket information in “Netstat report general concepts” on page 293 for a detailed description.

**State**
See the TCP connection status and UDP socket status information in “Netstat report general concepts” on page 293 for a detailed description.

**IdleTime**
The time interval between the current time and the last time the connection was touched. See Last touched time in “Netstat report general concepts” on page 293 for a detailed description of the last touched time.

**Netstat CACHinfo/-C report**
Displays statistics for TCP listening sockets that are using the Fast Response Cache Accelerator (FRCA). For more information about the FRCA, see the Fast Response Cache Accelerator information in z/OS Communications Server: IP Configuration Guide.
**TSO syntax**

```
NETSTAT CACHINFO Target Output
```

**Target**

Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**

The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**z/OS UNIX syntax**

```
netstat -C Target Output
```

**Target**

Provide the report for a specific TCP/IP address space by using -p tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

**Command syntax examples**

**From TSO environment**

- `NETSTAT CACHINFO`
  Displays information about Fast Response Cache Accelerator statistics for the default TCP/IP stack.
- `NETSTAT CACHINFO TCP TCPCS6`
  Displays information about Fast Response Cache Accelerator statistics for the TCPCS6 stack.

**From UNIX shell environment**

- `netstat -C`
- `netstat -C -p tcpcs6`

**Report examples**

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

### Report field descriptions

For each listening socket configured for Cache Accelerator support, the following information is displayed:

**Client**

The user name of the application that bound the listening socket.

**Socket**

The local IP address and port pair to which the listening socket is bound.

**CacheType**

The type of FRCA cache that is used by the listening socket. It can be one of the following value:

- **Shared**
  
  The cache can be shared by more than one listening socket in the same address space. All listening sockets in the same address space that use a shared cache can access objects stored in
the shared cache. Listening sockets from different address spaces cannot access objects that are stored in the cache for a different address space. The values of the MaxCacheSize, CurrCacheSize, MaxNumObjects, and CurrNumObjects fields are the same for all sockets that share a cache.

**Exclusive**

The cache can be used only by the listening socket. No other listening socket has access to objects stored in the cache.

**ASID**

The hexadecimal address space identifier for the address space that is making the request to enable FRCA on the listening socket.

**MaxCacheSize**

The maximum number of 4K pages that can be used for storing cache objects by the Cache Accelerator for the given socket.

**CurrCacheSize**

The number of 4K pages that are currently being used by the Cache Accelerator for storing cache objects.

**MaxNumObjects**

The maximum number of cache objects that can be stored by the Cache Accelerator.

**CurrNumObjects**

The current number of cache objects that are stored by the Cache Accelerator.

**NumConns**

The number of connections established through a listening socket that have been configured with Cache Accelerator support.

**ConnsProcessed**

The number of connections that have successfully completed an in-kernel transaction, resulting in a response being transmitted to the client. This counter is incremented at most one time per connection.

**Tip:** It is possible for a single connection to be processed by the Cache Accelerator for some cache entries and then deferred to the application for additional processing. If this occurs, the connection is included in both the ConnsProcessed and ConnsDeferred counts.

**ConnsDeferred**

The number of connections that require user-space application processing.

**Tip:** This counter is not incremented because of the connection timeout expiration, even if the action taken is to defer the connection.

**ConnsTimedOut**

The number of times the connection timeout timer has expired.

**RequestsProcessed**

The number of requests that were at least partially processed by the Cache Accelerator. This counter can be incremented multiple times for a single connection.

**Tip:** It is possible for a single connection to be processed by the Cache Accelerator for some cache objects and then deferred to the application for additional processing. If this occurs, the connection is included in both the RequestsProcessed and RequestsDeferred counts.

**IncompleteRequests**

The number of times that a request is received from the client where additional data is required to process the request. This counter can be incremented multiple times for a single connection.

**NumCacheHits**

The number of cache objects that were successfully located and transmitted to clients.

**NumCacheMisses**

The number of cache objects that were not successfully located and transmitted to clients.
NumUnprodCacheHits
The number of cache entries that were successfully found within the cache but not transmitted to the client.

Netstat CLists/-e report
Displays information about local IPv4 users of TCP/IP services (job names).

**TSO syntax**

```
> NETSTAT CLists  Target  Output  [Filter]
```

**Target**
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**
The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**Filter**

```
> CLIent  clientname  NOTN3270
```

**z/OS UNIX syntax**

```
> netstat -e  Target  Output  Filter
```

**Target**
Provide the report for a specific TCP/IP address space by using the -p tcpname option. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**
The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

**Filter**

```
> -E  clientname  -T
```

**Filter description**

**CLIent/-E clientname**
Filter the output of the CLists/- e report using the specified client name clientname. You can enter up to six filter values and each specified value can be up to eight characters in length.

**NOTN3270/-T**
Filter the output of the CLists/- e report, excluding TN3270 server connections.
The filter value for CLIent/-E can be a complete string or a partial string using wildcard characters. A wildcard character can be an asterisk (*), which matches a null string or any character or character string, at the same position. A wildcard character can be a question mark (?), which matches any single character at the same position. For example, a string "searchee" matches with "*ar?he*", but the string "searhee" does not match with "*ar?he*".

When you use z/OS UNIX netstat/onetstat command in a z/OS UNIX shell environment, take care if you use a z/OS UNIX MVS special character in a character string. It might cause an unpredictable result. To be safe, if you want to use a z/OS UNIX MVS special character in a character string, surround the character string with single ('') or double (") quotation marks. For example, to use an asterisk (*) in the client name, new*clnt for the -E filter, issue the command as: netstat -e -E 'new*clnt' or netstat -e -E "new*clnt".

**Command syntax examples**

From TSO environment

```
NETSTAT CLIENTS
  Display information for each client in the default TCP/IP stack.
NETSTAT CLIENTS TCP TCPCS6
  Display information for each client in TCPCS6 stack.
NETSTAT CLIENTS TCP TCPCS8 (CLIent CSCLNT1 OSGMEM1
  Display information for these clients in TCPCS8 stack whose client name
  match the specified filter client name values.
```

From UNIX shell environment

```
netstat -e
netstat -e -p tcpcs6
netstat -e -p tcpcs6 -E CSCLNT1 OSGMEM1
```

**Report examples**

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

```
NETSTAT CLIENTS
MVS TCP/IP NETSTAT CS V2R4       TCPIP Name: TCPCS       12:34:56
Current Clients:
  Client: INETD1
  Authorization: Autologged
  Last Touched:   4:01:17
  Client: TCPCS
  Authorization: None
  Last Touched:   3:14:47
```

**Report field descriptions**

**Client**

See Client name or User ID descriptions in “Netstat report general concepts” on page 293 for detailed description.

**Authorization**

The only values that can currently be shown here are Autologged and None. In earlier versions and releases of TCP/IP for MVS and z/OS, certain types of authorizations for users of TCP/IP services could be configured in the TCP/IP configuration data set. That practice has, over the years, been abandoned and security-related information is now specified in RACF or an equivalent security product.

The following list shows the valid values for this field:

**Autologged**

This service is being monitored by the TCP/IP autolog function, based on definitions in the AUTOLOG and PORT statements of the TCP/IP profile.
None
No special client authorizations.

Last touched time
See the Last touched time information in “Netstat report general concepts” on page 293 for a detailed description.

Netstat CONFIG/-f report
Displays TCP/IP configuration information about IP, TCP, UDP, SMF parameters, GLOBALCONFIG profile statement, network monitor, data trace, and autolog settings.

**TSO syntax**

```plaintext
NETSTAT CONFIG
```

**Target**
Provide the report for a specific TCP/IP address space by using the Tcp tcpname parameter. See “The Netstat command target” on page 287 for more information about the Tcp parameter.

**Output**
The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**z/OS UNIX syntax**

```plaintext
netstat -f
```

**Target**
Provide the report for a specific TCP/IP address space by using the -p tcpname option. See “The Netstat command target” on page 287 for more information about the Tcp parameter.

**Output**
The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

**Command syntax examples**

**From TSO environment**

```plaintext
NETSTAT CONFIG
Display the TCP/IP configuration information for the default TCP/IP stack.
NETSTAT CONFIG TCP TCPCS6
Display the TCP/IP configuration information for TCPCS6 stack.
```

**From UNIX shell environment**

```plaintext
netstat -f
netstat -f -p tcpcs6
```

**Report examples**
The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.
Not IPv6 enabled (SHORT format)

Report field descriptions

• TCP Configuration Table

Display the following configured TCP information that is defined in the TCPCONFIG and SOMAXCONN profile statements. For more information about each field, see the TCPCONFIG or SOMAXCONN profile statement information in z/OS Communications Server: IP Configuration Reference.

DefaultRcvBufSize
The TCP receive buffer size that was defined using the TCPRCVBUFRSIZE parameter in the TCPCONFIG statement. The size is between 256 and TCPMAXRCVBUFRSIZE; the default size is 65536 (64 KB). This value is used as the default receive buffer size for those applications that do not explicitly set the buffer size using SETSOCKOPT(). If the TCPRCVBUFRSIZE parameter was not specified in the TCPCONFIG statement, then the default size 65536 (64 KB) is displayed.

DefaultSndBufSize
The TCP send buffer size that was defined using the TCPSENDBFRSIZE parameter in the TCPCONFIG statement. The size is between 256 bytes and TCPMAXSENDBUFRSIZE; the default size is 65536 (64 KB). This value is used as the default send buffer size for those applications that do not explicitly set the buffer size using SETSOCKOPT(). If the TCPSENDBFRSIZE parameter was not specified in the TCPCONFIG statement, then the default size 65536 (64 KB) is displayed.

DefltMaxRcvBufSize
The TCP maximum receive buffer size that was defined using the TCPMAXRCVBUFRSIZE parameter in the TCPCONFIG statement. The maximum receive buffer size is the maximum value that an application can set as its receive buffer size using SETSOCKOPT(). The minimum acceptable value is the value that is coded on the TCPRCVBUFRSIZE parameter, the maximum size is 2 MB, and the
default size is 256 KB. If you do not have large bandwidth interfaces, you can use this parameter to limit the receive buffer size that an application can set. If the TCMPAXRCVBFRSIZE parameter was not specified in the TCPCONFIG statement, then the default size 262144 (256 KB) is displayed.

**SoMaxConn**
The maximum number of connection requests that can be queued for any listening socket, as defined by the SOMAXCONN statement. The minimum value is 1, the maximum value is 2147483647, and the default value is 1024.

**MaxReTransmitTime**
The maximum retransmit interval in seconds. The range is 0 - 999.990. The default value is 120.

**Rules:**
- If none of the following parameters is specified, this MAXIMUMRETRANSMITTIME parameter is used and the MINIMUMRETRANSMITTIME parameters of the following statements are not used.
  - MAXIMUMRETRANSMITTIME on the BEGINROUTES statement
  - MAXIMUMRETRANSMITTIME on the GATEWAY statement
  - MAXIMUMRETRANSMITTIME on the ROUTETABLE statement
  - Max_Xmit_Time on the OSPF_INTERFACE statement
  - Max_Xmit_Time on the RIP_INTERFACE statement
- The TCPCONFIG version is used if no route parameter has been explicitly specified. If the TCPCONFIG version of maximum retransmit time is used, the MINIMUMRETRANSMITTIME value that is specified on the route parameter is not used, which means the value of the minimum retransmit time is 0.

**DefaultKeepAlive**
The default keepalive interval that was defined using the INTERVAL parameter in the TCPCONFIG statement. It is the number of minutes that TCP waits after it receives a packet for a connection before it sends a keepalive packet for that connection. The range is 0 - 35791 minutes; the default value is 120. The value 0 disables the keepalive function. If the INTERVAL parameter was not specified in the TCPCONFIG statement, then the default interval 120 is displayed.

**DelayAck**
Indicates whether the DELAYACKS option is enabled or disabled. The value Yes indicates that acknowledgments are delayed when a packet is received (the DELAYACKS parameter was defined in the TCPCONFIG profile statement or is in effect by default); the value No indicates that acknowledgments are not delayed when a packet is received (the NODELAYACKS parameter was defined in the TCPCONFIG statement).

**RestrictLowPort**
Indicates whether ports in the range 1 - 1023 are reserved for users by the PORT and PORTRANGE statements. The value Yes indicates that RESTRICTLOWPORTS is in effect (the RESTRICTLOWPORTS parameter was defined in the TCPCONFIG profile statement); the value No indicates that RESTRICTLOWPORTS is not in effect (the UNRESTRICTLOWPORTS parameter was defined in the TCPCONFIG statement or is in effect by default).

**SendGarbage**
Indicates whether the keepalive packets sent by TCP contain 1 byte of random data. The value Yes indicates that SENDGARBAGE TRUE is in effect (SENDGARBAGE TRUE was defined in the TCPCONFIG profile statement); the value No indicates that SENDGARBAGE TRUE is not in effect (SENDGARBAGE FALSE was defined in the TCPCONFIG statement or is in effect by default).

**TcpTimeStamp**
Indicates whether the TCP Timestamp Option is enabled or disabled. The value Yes indicates that TCPTIMESTAMP is in effect (the TCPTIMESTAMP parameter was defined in the TCPCONFIG profile statement or is in effect by default); the value No indicates that TCPTIMESTAMP is not in effect (the NOTCPTIMESTAMP parameter was defined in the TCPCONFIG statement).
**FinWait2Time**
The FinWait2Time number that was defined using the FINWAIT2TIME parameter in the TCPCONFIG statement. It is the number of seconds a TCP connection should remain in the FINWAIT2 state. The range is 60 - 3600 seconds; the default value is 600 seconds. When this timer expires, it is reset to 75 seconds; when this timer expires a second time, the connection is dropped. If the FINWAIT2TIME parameter was not specified in the TCPCONFIG statement, then the default value 600 is displayed.

**TimeWaitInterval**
The number of seconds that a connection remains in TIMEWAIT state. The range is 0 - 120. The default value is 60.

*Note:* For local connections, a TIMEWAITINTERVAL of 50 milliseconds is always used.

**DefltMaxSndBufSize**
The maximum send buffer size. The range is the value that is specified on TCPSENBDBFRSIZE to 2 MB. The default value is 256K.

**RetransmitAttempt**
The number of times a segment is retransmitted before the connection is aborted. The range is 0 - 15. The default value is 15.

**ConnectTimeOut**
The total amount of time before the initial connection times out. This value also applies to TCP connections that are established over SMC-R links. The range is 5 - 190 seconds. The default value is 75.

**ConnectInitIntval**
The initial retransmission interval for the connect(). The range is 100 to 3000 milliseconds (ms). The default value is 3000.

**KAProbeInterval**
The interval in seconds between keepalive probes. The range is 1 - 75. The default value is 75.

This parameter does not change the initial keepalive timeout interval. It controls the time between the probes that are sent only after the initial keepalive interval has expired.

You can specify setsockopt() TCP_KEEPALIVE to override the parameter.

**KeepAliveProbes**
The number of keepalive probes to send before the connection is aborted. The range is 1 - 10. The default value is 10.

This parameter does not change the initial keepalive timeout interval. It controls the number of probes that are sent only after the initial keepalive interval has expired.

You can specify setsockopt() TCP_KEEPALIVE to override this parameter.

**Nagle**
Indicates whether the Nagle option is enabled or disabled. The value Yes indicates that packets with less than a full maximum segment size (MSS) of data are buffered unless all data on the send queue has been acknowledged.

**QueuedRTT**
The threshold at which outbound serialization is engaged. The range is 0 - 50 milliseconds. The default value is 20 milliseconds.

**FRRTTheshold**
The threshold of duplicate ACKs for FRR to engage. The range is 1 - 2048. The default value is 3.

**TTLS**
Indicates whether Application Transparent Transport Layer Security (AT-TLS) is active in the TCP/IP stack. The value Yes indicates that AT-TLS is active (the TTLS parameter was specified in the TCPCONFIG profile statement). The value No indicates that AT-TLS is not active (the NOTTLS parameter was specified in the TCPCONFIG profile statement or is in effect by default).
EphemeralPorts
The range of ephemeral ports that was defined using the EPHEMERALPORTS parameter in the TCPCONFIG statement or by default. The range specified must be within the range of 1024 to 65535. If the EPHEMERALPORTS parameter was not specified in the TCPCONFIG statement, then the default range 1024 - 65535 is displayed.

SelectiveACK
Indicates whether Selective Acknowledgment (SACK) support is active in the TCP/IP stack. This field can have the following values:

Yes
Indicates that SACK options are exchanged with partners when transmitting data. The SELECTIVEACK parameter was specified on the TCPCONFIG profile statement.

No
Indicates that SACK options will not be exchanged. The NOSELECTIVEACK parameter was specified on the TCPCONFIG profile statement or is in effect by default.

Note: The values displayed in the MaxReTransmitTime, MinReTransmitTime, RoundTripGain, VarianceGain, VarianceMultiplier, and MaxSegLifeTime fields are actual default values that are assigned by the TCP/IP stack; you cannot configure them externally using the TCPCONFIG profile statement. You can override the MaxReTransmitTime, MinReTransmitTime, RoundTripGain, VarianceGain, VarianceMultiplier values on a per-destination basis using either the BEGINROUTES configuration statement, the old GATEWAY configuration statement, or the configuration file for OMPROUTE.

UDP Configuration Table
Display the following configured UDP information defined in the UDPCONFIG profile statement. For more information about each UDP parameter, see UDPCONFIG profile statement information in the z/OS Communications Server: IP Configuration Reference.

DefaultRcvBufSize
The UDP receive buffer size that was defined using the UDPRCVBUFRSIZE parameter in the UDPCONFIG statement. The size is in the range 1 - 65535; the default size is 65535. If the UDPRCVBUFRSIZE parameter was not specified in the UDPCONFIG statement, then the default size 65535 is displayed.

DefaultSndBufSize
The UDP send buffer size that was defined using the UDPSENDBFRSIZE parameter in the UDPCONFIG statement. The size is in the range 1 - 65535; the default size is 65535. If the UDPSENDBFRSIZE parameter was not specified in the UDPCONFIG statement, then the default size 65535 is displayed.

Checksum
Indicates whether UDP does checksumming. The value Yes indicates that UDP checksumming is in effect (the UDPPCHKSUM parameter was defined in the UDPCONFIG profile statement or is in effect by default); the value No indicates that UDP checksumming is not in effect (the NOUDPCHKSUM parameter was defined in the UDPCONFIG statement).

EphemeralPorts
The range of ephemeral ports that was defined using the EPHEMERALPORTS parameter in the UDPCONFIG statement or by default. The range specified must be within the range of 1024 to 65535. If the EPHEMERALPORTS parameter was not specified in the UDPCONFIG statement, then the default range 1024 - 65535 is displayed.

RestrictLowPort
Indicates whether ports 1 - 1023 are reserved for users by the PORT and PORTRANGE statements. The value Yes indicates that ports in the range 1 - 1023 are reserved (the RESTRICTLOWPORTS parameter was defined in the UDPCONFIG profile statement); the value No indicates that the ports are not reserved (the UNRESTRICTLOWPORTS parameter was defined in the UDPCONFIG statement or is in effect by default).

UdpQueueLimit
Indicates whether UDP should have a queue limit on incoming datagrams. The value Yes indicates that there is a UDP queue limit in effect (the UDPQUEUELIMIT parameter was defined in the
UDPCONFIG profile statement or is in effect by default); the value No indicates that a UDP queue limit is not in effect (the NOUDPQUEUELIMIT parameter was defined in the UDPCONFIG statement).

• IP Configuration Table
Displays the following configured IP information defined in the IPCONFIG profile statement. For more information about each IP parameter, see the IPCONFIG profile statement information in the z/OS Communications Server: IP Configuration Reference.

Forwarding
Indicates whether the transfer of data between networks is enabled for this TCP/IP stack. Possible values are:

Pkt
Indicates that packets that are received but not destined for this stack are forwarded and use multipath routes if they are available on a per-packet basis (the DATAGRAMFWD FWDMULTIPATH PERPACKET was specified in the IPCONFIG profile statement).

Yes
Indicates that packets that are received but not destined for this stack are forwarded but do not use multipath routes even if they are available. (the DATAGRAMFWD NOFWDMULTIPATH was specified in the IPCONFIG profile statement or is in effect by default).

No
Indicates that packets that are received but that are not destined for this stack are not forwarded in route to the destination (the NODATAGRAMFWD parameter was specified in the IPCONFIG profile statement).

TimeToLive
The time to live value that was defined using the TTL parameter in the IPCONFIG statement. The time to live value is the number of hops that packets originating from this host can travel before reaching the destination. Valid values are in the range 1 - 255; the default value is 64. If the TTL parameter was not specified in the IPCONFIG statement, then the default value 64 is displayed.

RsmTimeOut
The reassembly timeout value that was defined using the REASSEMBLYTIMEOUT parameter in the IPCONFIG statement. It is the amount of time (in seconds) that is allowed to receive all parts of a fragmented packet before discarding the packets received. Valid values are in the range 1 - 240; the default value is 60. If the REASSEMBLYTIMEOUT parameter was not specified in the IPCONFIG statement, then the default value 60 is displayed.

IpSecurity
Indicates whether the IP filtering and IPSec tunnel support is enabled. The value Yes indicates that IP security is in effect (the IPSECURITY parameter was defined on the IPCONFIG profile statement). The value No indicates that IP security is not in effect.

ArpTimeout
The ARP timeout value that was defined using the ARPTO parameter in the IPCONFIG statement. It indicates the number of seconds between creation or revalidation and deletion of ARP table entries. Valid values are in the range 60 - 86400; the default value is 1200. If the ARPTO parameter was not specified in the IPCONFIG statement, then the default value 1200 is displayed.

MaxRsmSize
The maximum packet size that can be reassembled. If an IP datagram is fragmented into smaller packets, the complete reassembled datagram cannot exceed this value. Valid values are in the range 576 - 65535; the default value is 65535.

Restriction: The value that is displayed in the MaxRsmSize field is the actual default value that was assigned by the TCP/IP stack; users cannot configure this value externally using the IPCONFIG profile statement.

Format
The stack-wide command format that was defined using the FORMAT parameter in the IPCONFIG statement or that was assigned by default by TCP/IP stack. This field can have the following values:
SHORT
Indicates that the command report is displayed in the short format (the FORMAT SHORT parameter was specified in the IPCONFIG profile statement).

LONG
Indicates that the command report is displayed in the long format (the FORMAT LONG parameter was specified in the IPCONFIG profile statement).

If the FORMAT parameter was not specified in the IPCONFIG profile statement, then the TCP/IP stack assigned the default format based on whether the stack was IPv6 enabled or not. If the stack is IPv6 enabled, then the format value LONG is assigned by default. If the stack is configured for IPv4-only operation, then the format value SHORT is assigned by default. You can override the stack-wide command format using the Netstat FORMAT/-M option.

IgRedirect
Indicates whether TCP/IP is to ignore ICMP Redirect packets. This field can have the following values:

Yes
Indicates that IGNOREREDIRECT is in effect. The IGNOREREDIRECT parameter was defined on the IPCONFIG profile statement, OMPROUTE has been started and IPv4 interfaces are configured to OMPROUTE, or intrusion detection services (IDS) policy is in effect to detect and discard ICMP Redirects.

No
Indicates that ICMP Redirects are not ignored.

SysPixRout
Indicates whether this TCP/IP host is part of an MVS sysplex domain and should communicate interface changes to the workload manager (WLM). This field can have the following values:

Yes
Indicates that SYSPLEXROUTING is in effect (the SYSPLEXROUTING parameter was specified in the IPCONFIG profile statement).

No
Indicates that SYSPLEXROUTING is not in effect (the NOSYSPLEXROUTING parameter was specified in the IPCONFIG profile statement or is in effect by default).

DoubleNop
Indicates whether to force channel programs for CLAW devices to have two NOP CCWs to end the channel programs. This field can have the following values:

Yes
Indicates that CLAWUSEDOUBLENOP is in effect (the CLAWUSEDOUBLENOP parameter was defined on the IPCONFIG profile statement).

No
Indicates that CLAWUSEDOUBLENOP is not in effect.

StopClawEr
Indicates whether to stop channel programs (HALTIO and HALTSIO) when a device error is detected. This field can have the following values:

Yes
Indicates that STOPONCLAWERROR is in effect (the STOPONCLAWERROR parameter was specified in the IPCONFIG profile statement).

No
Indicates that STOPONCLAWERROR is not in effect.

SourceVipa
Indicates whether the TCP/IP stack uses the corresponding virtual IP address in the HOME list as the source IP address for outbound datagrams that do not have an explicit source address. This field can have the following values:
Yes
Indicates that SOURCEVIPA is in effect (the SOURCEVIPA parameter was specified in the IPCONFIG profile statement).

No
Indicates that SOURCEVIPA is not in effect (the NOSOURCEVIPA parameter was specified in the IPCONFIG profile statement or is in effect by default).

MultiPath
Indicates whether the multipath routing selection algorithm for outbound IP traffic is enabled for this TCP/IP stack. Possible values are:

Pkt
Indicates that outbound traffic uses the multipath routes in a round-robin fashion for each outbound packet (the MULTIPATH PERPACKET parameter was specified in the IPCONFIG profile statement).

Conn
Indicates that outbound traffic uses the multipath routes in a round-robin fashion for each outbound connection request (the MULTIPATH PERCONNECTION parameter was specified in the IPCONFIG profile statement).

No
Indicates that outbound traffic always uses the first active route in a multipath group (the NOMULTIPATH parameter was specified in the IPCONFIG profile statement or is in effect by default).

PathMtuDsc
Indicates whether TCP/IP is to dynamically discover the PMTU, which is the smallest MTU of all the hops in the path. This field can have the following values:

Yes
Indicates that PATHMTUDISCOVERY is in effect (the PATHMTUDISCOVERY parameter was specified in the IPCONFIG profile statement).

No
Indicates that PATHMTUDISCOVERY is not in effect (the NOPATHMTUDISCOVERY parameter was specified in the IPCONFIG profile statement or is in effect by default).

DevRtryDur
The retry period duration (in seconds) for a failed device or interface that was defined using the DEVRETRYDURATION parameter in the IPCONFIG statement. TCP/IP performs reactivation attempts at 30 second intervals during this retry period. The default value is 90 seconds. The value 0 indicates an infinite recovery period; reactivation attempts are performed until the device or interface is either successfully reactivated or manually stopped. The maximum value is 4294967295. If the DEVRETRYDURATION parameter was not specified in the IPCONFIG statement, then the default value 90 is displayed.

DynamicXCF
Indicates whether IPv4 XCF dynamic support is enabled for this TCP/IP stack. This field can have the following values:

Yes
Indicates that XCF dynamic support is in effect (the DYNAMICXCF parameter was specified in the IPCONFIG profile statement).

No
Indicates that XCF dynamic support is not in effect (the NODYNAMICXCF parameter was specified in the IPCONFIG profile statement or is in effect by default).

When XCF dynamic support is in effect, the following information is displayed:

IpAddr
The IPv4 address that was specified for DYNAMICXCF in the IPCONFIG profile statement.
Subnet

The subnet mask that was specified for DYNAMICXCF in the IPCONFIG profile statement.

Guidelines:

1. If the IpAddr/PrefixLen format was used for DYNAMICXCF in the IPCONFIG profile statement, then it is displayed in the same format in the Netstat report. The PrefixLen is the integer value in the range 1 - 32 that represents the number of left-most significant bits for the address mask.

2. If the IPv6_address/prefix_route_len format was used for DYNAMICXCF in the IPCONFIG profile statement, then it is displayed in the same format in the Netstat report. The length of routing prefix is an integer value in the range 1 - 128.

Metric

The interface routing metric represents the configured cost_metric value to be used by dynamic routing daemons for routing preferences. It is configured using the cost_metric value in the IPCONFIG DYNAMICXCF statement.

SecClass

Indicates the IP Security security class value that is associated with the dynamic XCF link. Valid values are in the range 1 - 255.

SMCD

Indicates whether the HiperSockets interface that dynamic XCF generates supports Shared Memory Communications - Direct Memory Access (SMC-D). This field can have the following values:

Yes

Indicates that the HiperSockets interface that dynamic XCF generates can be used for new TCP connections with SMC-D. The SMCD parameter was specified on the IPCONFIG profile statement or the value was set by default.

No

Indicates that the HiperSockets interface that dynamic XCF generates cannot be used for new TCP connections with SMC-D. The NOSMCD parameter was specified on the IPCONFIG profile statement.

SrcVipaInt

The source VIPA interface name that was defined using the DYNAMICXCF SOURCEVIPAINTERFACE parameter in the IPCONFIG statement. It must be a VIRTUAL interface. This field indicates the value No if the SOURCEVIPAINTERFACE subparameter was not specified for the DYNAMICXCF in the IPCONFIG statement.

QDIOAccel

Indicates whether QDIO Accelerator is enabled for this TCP/IP stack. This field can have the following values:

Yes

Indicates that the QDIO Accelerator is enabled (the QDIOACCELERATOR parameter was specified in the IPCONFIG profile statement).

SD only

Indicates that the QDIO Accelerator is enabled (the QDIOACCELERATOR parameter was specified in the IPCONFIG profile statement), but only for Sysplex Distributor traffic and not for routed traffic. This might be the case if IP forwarding is disabled on this stack, or if IP filters or defensive filters require this stack to perform special processing for routed traffic. For more information, see QDIO Accelerator and IP security in z/OS Communications Server: IP Configuration Guide.

No

Indicates that the QDIO Accelerator is not enabled (the NOQDIOACCELERATOR parameter was specified in the IPCONFIG profile statement or is in effect by default).
**QDIOAccelPriority**
Indicates which QDIO outbound priority level should be used if the QDIO Accelerator is routing packets to a QDIO device. If the NOQDIOACCELERATOR parameter was specified in the IPCONFIG profile statement or is in effect by default, then the QDIOAccelPriority field is not displayed.

**IQDIORoute**
Indicates whether HiperSockets Accelerator is enabled for this TCP/IP stack. This field can have the following values:
- **Yes**
  Indicates that HiperSockets Accelerator is enabled (the IQDIOROUTING parameter was specified in the IPCONFIG profile statement).
- **No**
  Indicates that HiperSockets Accelerator is not enabled (the NOIQDIOROUTING parameter was specified in the IPCONFIG profile statement or is in effect by default).
- **n/a**
  Indicates that HiperSockets Accelerator does not apply because QDIO Accelerator is enabled.

**QDIOPriority**
Indicates which QDIO outbound priority level should be used if the HiperSockets Accelerator is routing packets to a QDIO device. If the NOIQDIOROUTING parameter was specified in the IPCONFIG profile statement or is in effect by default, then the QDIOPriority field is not displayed. This field is displayed only when the IQDIORoute field value is Yes.

**TcpStackSrcVipa**
The IPv4 address that was defined using the TCPSTACKSOURCEVIPA parameter in the IPCONFIG statement. It must be the source IP address for outbound TCP connections if SOURCEVIPA has been enabled. This field has the value No if the TCPSTACKSOURCEVIPA parameter was not specified in the IPCONFIG statement.

**ChecksumOffload**
Indicates whether the IPv4 checksum offload function is enabled or disabled. This field can have the following values:
- **Yes**
  Indicates that the checksum processing for IPv4 packets is offloaded to OSA-Express interfaces that support the checksum offload function. The CHECKSUMOFFLOAD parameter was specified on the IPCONFIG profile statement or the value was set by default.
- **No**
  Indicates that the checksum processing is performed by the TCP/IP stack. The NOCHECKSUMOFFLOAD parameter was specified on the IPCONFIG profile statement.

**SegOffload**
Indicates whether the IPv4 TCP segmentation offload function is enabled or disabled. This field can have the following values:
- **Yes**
  Indicates that IPv4 TCP segmentation is performed by OSA-Express interfaces that support the segmentation offload function. The SEGMENTATIONOFFLOAD parameter was specified on the IPCONFIG profile statement.
- **No**
  Indicates that the segmentation is performed by the TCP/IP stack. The NOSEGMENTATIONOFFLOAD parameter was specified on the IPCONFIG profile statement or the value was set by default.

- **IPv6 Configuration Table if the TCP/IP stack is IPv6 enabled**
Displays the following configured IPv6 information that is defined in the IPCONFIG6 profile statement. For more information about each IPv6 IP parameter, see the IPCONFIG6 profile statement information in the z/OS Communications Server: IP Configuration Reference.
**Forwarding**
Indicates whether the transfer of data between networks is enabled for this TCP/IP stack. Possible values are:

- **Pkt**
  Indicates that packets that are received but that are not destined for this stack are forwarded and use multipath routes if available on a per-packet basis (the DATAGRAMFWD FWDMULTIPATH PERPACKET was specified in the IPCONFIG6 profile statement).

- **Yes**
  Indicates that packets that are received but that are not destined for this stack are forwarded but do not use multipath routes even if they are available. (the DATAGRAMFWD NOFWDMULTIPATH was specified in the IPCONFIG6 profile statement or is in effect by default).

- **No**
  Indicates that packets that are received but that are not destined for this stack are not forwarded in route to the destination (the NODATAGRAMFWD parameter was specified in the IPCONFIG6 profile statement).

**HopLimit**
The hop limit value that was defined using the HOPLIMIT parameter in the IPCONFIG6 statement. It is the number of hops that a packet that originates at this host can travel in route to the destination. Valid values are in the range 1 - 255; the default value is 255. If the HOPLIMIT parameter was not specified in the IPCONFIG6 statement, then the default value 255 is displayed.

**IgRedirect**
Indicates whether TCP/IP is to ignore ICMP Redirect packets. This field can have the following values:

- **Yes**
  Indicates that IGNOREREDIRECT is in effect. The IGNOREREDIRECT parameter was defined on the IPCONFIG6 profile statement, OMPROUTE has been started and IPv6 interfaces are configured to OMPROUTE, or intrusion detection services (IDS) policy is in effect to detect and discard ICMP Redirects.

- **No**
  Indicates that ICMP Redirects are not ignored.

**SourceVipa**
Indicates whether to use a virtual IP address that is assigned to the SOURCEVIPAINT interface as the source address for outbound datagrams that do not have an explicit source address. You must specify the SOURCEVIPAINT parameter on the INTERFACE profile statement for each interface where you want the SOURCEVIPA address to take effect. This field can have the following values:

- **Yes**
  Indicates that SOURCEVIPA is in effect (the SOURCEVIPA parameter was specified in the IPCONFIG6 profile statement).

- **No**
  Indicates that SOURCEVIPA is not in effect (the NOSOURCEVIPA parameter was specified in the IPCONFIG6 profile statement or is in effect by default).

**MultiPath**
Indicates whether the multipath routing selection algorithm for outbound IP traffic is enabled for this TCP/IP stack. Possible values are:

- **Pkt**
  Indicates that outbound traffic uses the multipath routes in a round-robin fashion for each outbound packet (the MULTIPATH PERPACKET parameter was specified in the IPCONFIG6 profile statement).

- **Conn**
  Indicates that outbound traffic uses the multipath routes in a round-robin fashion for each outbound connection request (the MULTIPATH PERCONNECTION parameter was specified in the IPCONFIG6 profile statement).
No
Indicates that outbound traffic always uses the first active route in a multipath group (the NOMULTIPATH parameter was specified in the IPCONFIG6 profile statement is in effect by default).

IcmperrLim
The ICMP error limit value that was defined using the ICMPERRORLIMIT parameter in the IPCONFIG6 statement. It controls the rate at which ICMP error messages can be sent to a particular IPv6 destination address. The number displayed is the number of messages per second. Valid values are in the range 1 - 20; the default value is 3. If the ICMPERRORLIMIT parameter was not specified in the IPCONFIG6 statement, then the default value 3 is displayed.

IgRtrHopLimit
Indicates whether the TCP/IP stack ignores a hop limit value that is received from a router in a router advertisement. This field can have the following values:

Yes
Indicates that IGNOREROUTERHOPLIMIT is in effect (the IGNOREROUTERHOPLIMIT parameter was defined on the IPCONFIG6 profile statement).

No
Indicates that IGNOREROUTERHOPLIMIT is not in effect (the NOIGNOREROUTERHOPLIMIT parameter was defined on the IPCONFIG6 profile statement or is in effect by default).

IpSecurity
Indicates whether the IP filtering and IPSec tunnel support is enabled.

Yes
Indicates that IP security is in effect (the IPSECURITY parameter was defined on the IPCONFIG6 profile statement). When IP security is in effect, the following information is displayed:

OSMSecClass
Indicates the IP Security security class value that is associated with the OSM interfaces. Valid values are in the range 1 - 255.

No
Indicates that IP security is not in effect.

DynamicXCF
Indicates whether IPv6 XCF dynamic support is enabled for this TCP/IP stack. This field can have the following values:

Yes
Indicates that XCF dynamic support is in effect (the DYNAMICXCF parameter was specified in the IPCONFIG6 profile statement).

No
Indicates that XCF dynamic support is not in effect (the NODYNAMICXCF parameter was specified in the IPCONFIG6 profile statement or is in effect by default).

When XCF dynamic support is in effect, the following information is displayed:

IpAddr
The IPv6 address that was specified for DYNAMICXCF in the IPCONFIG6 profile statement.

Tip: If the IpAddr/PrefixRouteLen format was used for DYNAMICXCF in the IPCONFIG6 profile statement, then it is displayed in the same format in the Netstat report. The PrefixRouteLen is the integer value in the range 1 - 128.

IntfId
The 64-bit interface identifier in colon-hexadecimal format that was specified using INTFID subparameter for DYNAMICXCF in the IPCONFIG6 profile statement. If the INTFID subparameter was not specified, then this field is not displayed.
**SrcVipaInt**
The source VIPA interface name that was defined using the DYNAMICXCF SOURCEVIPAINTERFACE parameter in the IPCONFIG6 statement. It must be a VIRTUAL6 interface. This field indicates the value No if the SOURCEVIPAINTERFACE subparameter was not specified for the DYNAMICXCF in the IPCONFIG6 statement.

**SecClass**
Indicates the IP Security security class value that is associated with the IPv6 dynamic XCF interfaces. Valid values are in the range 1 - 255.

**SMCD**
Indicates whether the HiperSockets interface that dynamic XCF generates supports SMC-D. This field can have the following values:

- **Yes**
  Indicates that the HiperSockets interface that dynamic XCF generates can be used for new TCP connections with SMC-D. The SMCD parameter was specified on the IPCONFIG6 profile statement or the value was set by default.

- **No**
  Indicates that the HiperSockets interface that dynamic XCF generates cannot be used for new TCP connections with SMC-D. The NOSMCD parameter was specified on the IPCONFIG6 profile statement.

**TcpStackSrcVipa**
The IPv6 interface name that was defined using the TCPSTACKSOURCEVIPA parameter in the IPCONFIG6 statement. It must be the source interface for outbound TCP connections if SOURCEVIPA has been enabled. This field indicates the value No if the TCPSTACKSOURCEVIPA parameter was not specified in the IPCONFIG6 statement.

**TempAddresses**
Indicates whether the TCP/IP stack generates IPv6 temporary addresses for IPv6 interfaces for which stateless address autoconfiguration is enabled. This field can have the following values:

- **Yes**
  Indicates that this behavior is enabled (the TEMPADDRS parameter was defined on the IPCONFIG6 profile statement).

- **No**
  Indicates that this behavior is not enabled (the NOTEMPADDRS parameter was defined on the IPCONFIG6 profile statement or is in effect by default).

When TEMPADDRS support is in effect, the following information is displayed:

**PreferredLifetime**
The preferred lifetime for IPv6 temporary addresses, which was defined using the PREFLIFETIME parameter in the IPCONFIG6 statement.

At the expiration of the preferred lifetime, a new temporary address is generated and the existing address is deprecated. The number that is displayed is the preferred lifetime, in hours. Valid values are in the range of 1 - 720 hours (30 days). The default value is 24 hours.

**ValidLifetime**
The valid lifetime for IPv6 temporary addresses that was defined using the VALIDLIFETIME parameter in the IPCONFIG6 statement.

When the valid lifetime expires, the temporary address is deleted. The number displayed is the valid lifetime in hours. Valid values are in the range 2 - 2160 hours (90 days). The default value is 7 times the preferred lifetime value, with a maximum of 90 days.

**ChecksumOffload**
Indicates whether the IPv6 checksum offload function is enabled or disabled. This field can have the following values:
Yes
Indicates that the checksum processing for IPv6 packets is offloaded to OSA-Express interfaces that support the checksum offload function. The CHECKSUMOFFLOAD parameter was specified on the IPCONFIG6 profile statement or the value was set by default.

No
Indicates that the checksum processing is performed by the TCP/IP stack. The NOCHECKSUMOFFLOAD parameter was specified on the IPCONFIG6 profile statement.

SegOffload
Indicates whether the IPv6 TCP segmentation offload function is enabled or disabled. This field can have the following values:

Yes
Indicates that the IPv6 TCP segmentation is offloaded to OSA-Express interfaces that support the segmentation offload function. The SEGMENTATIONOFFLOAD parameter was specified on the IPCONFIG6 profile statement.

No
Indicates that the segmentation is performed by the TCP/IP stack. The NOSEGMENTATIONOFFLOAD parameter was specified on the IPCONFIG6 profile statement or the value was set by default.

• SMF parameters

Display the following configured SMF information defined in the SMFCONFIG profile statement. For more information about each SMF parameter, see SMFCONFIG profile statement information in the z/OS Communications Server: IP Configuration Reference.

Type 118

TcpInit
Indicates whether SMF subtype 1 records are created when TCP connections are established. A value of the subtype indicates that TYPE118 TCPINIT is in effect (the TCPINIT or TYPE118 TCPINIT was specified on the SMFCONFIG profile statement or a nonzero value of inittype was specified on the SMFPARMS profile statement).

The value 0 indicates that TYPE118 TCPINIT is not in effect (the NOTCPINIT or TYPE118 NOTCPINIT was specified in the SMFCONFIG profile statement (or is in effect by default), or zero value of inittype was specified on the SMFPARMS profile statement).

TcpTerm
Indicates whether SMF subtype 2 records are created when TCP connections are established. A value of the subtype indicates that TYPE118 TCPTERM is in effect (the TCPTERM or TYPE118 TCPTERM was specified on the profile SMFCONFIG statement or a non zero value of termtype was specified on the SMFPARMS profile statement).

The value 0 indicates that TYPE118 TCPTERM is not in effect (the NOTCPTERM or TYPE118 NOTCPTERM was specified in the SMFCONFIG profile statement (or is in effect by default), or zero value of termtype was specified on the SMFPARMS profile statement).

FTPClient
Indicates whether SMF subtype 3 records are created when TCP connections are established. A value of the subtype indicates that TYPE118 FTPCLIENT is in effect (the FTPCLIENT or TYPE118 FTPCLIENT was specified on the SMFCONFIG profile statement or a non zero value of clienttype was specified on the SMFPARMS profile statement).

The value 0 indicates that TYPE118 FTPCLIENT is not in effect (the NOFTPCLIENT or TYPE118 NOFTPCLIENT was specified in the SMFCONFIG profile statement (or is in effect by default), or zero value of clienttype was specified on the SMFPARMS profile statement).

TN3270Client
Indicates whether SMF subtype 4 records are created when TCP connections are established. A value of the subtype indicates TYPE118 TN3270CLIENT is in effect (the TN3270CLIENT or
TYPE118 TN3270CLIENT was specified on the SMFCONFIG profile statement or a non zero value of clienttype was specified on the SMFPARMS profile statement).

The value 0 indicates that TYPE118 TN3270CLIENT is not in effect (the NOTN3270CLIENT or TYPE118 NOTN3270CLIENT was specified in the SMFCONFIG profile statement (or is in effect by default), or zero value of clienttype was specified on the SMFPARMS profile statement).

**TcpIpStates**
Indicates whether SMF subtype 5 records are created when TCP connections are established. A value of the subtype indicates that TYPE118 TCPIPSTATISTICS is in effect (the TCPIPSTATISTICS or TYPE118 TCPIPSTATISTICS was specified on the SMFCONFIG statement).

The value 0 indicates that TYPE118 TCPIPSTATISTICS is not in effect (the NOTCPIPSTATISTICS or TYPE118 NOTCPIPSTATISTICS was specified in the SMFCONFIG profile statement or is in effect by default).

**Type 119**

**TcpInit**
Indicates whether SMF records of subtype 1 are created when TCP connections are established. This field can have the following values:

Yes  
Indicates that TYPE119 TCPINIT is in effect (the TYPE119 TCPINIT was specified on the SMFCONFIG statement).

No  
Indicates that TYPE119 TCPINIT is not in effect (the TYPE119 NOTCPINIT was specified in the SMFCONFIG profile statement or is in effect by default).

**TcpTerm**
Indicates whether SMF subtype 2 records are created when TCP connections are established. This field can have the following values:

Yes  
Indicates that TYPE119 TCPTERM is in effect (the TYPE119 TCPTERM was specified on the SMFCONFIG statement).

No  
Indicates that TYPE119 TCPTERM is not in effect (the TYPE119 NOTCPTERM was specified in the SMFCONFIG profile statement or is in effect by default).

**FTPClient**
Indicates whether SMF subtype 3 records are created when TCP connections are established. This field can have the following values:

Yes  
Indicates that TYPE119 FTPCLIENT is in effect (the TYPE119 FTPCLIENT was specified on the SMFCONFIG statement).

No  
Indicates that TYPE119 FTPCLIENT is not in effect (the TYPE119 NOFTPCLIENT was specified in the SMFCONFIG profile statement or is in effect by default).

**TcpIpStats**
Indicates whether SMF subtype 5 records are created when TCP connections are established. This field can have the following values:

Yes  
Indicates that TYPE119 TCPIPSTATISTICS is in effect (the TYPE119 TCPIPSTATISTICS was specified on the SMFCONFIG statement).

No  
Indicates that TYPE119 TCPIPSTATISTICS is not in effect (the TYPE119 NOTCPIPSTATISTICS was specified in the SMFCONFIG profile statement or is in effect by default).
**IfStats**
Indicates whether SMF subtype 6 and subtype 44 records are created. This field can have the following values:

Yes
Indicates that TYPE119 IFSTATISTICS is in effect (the TYPE119 IFSTATISTICS was specified on the SMFCONFIG statement).

No
Indicates that TYPE119 IFSTATISTICS is not in effect (the TYPE119 NOIFSTATISTICS was specified in the SMFCONFIG profile statement or is in effect by default).

**PortStats**
Indicates whether SMF subtype 7 records are created when TCP connections are established. This field can have the following values:

Yes
Indicates that TYPE119 PORTSTATISTICS is in effect (the TYPE119 PORTSTATISTICS was specified on the SMFCONFIG statement).

No
Indicates that TYPE119 PORTSTATISTICS is not in effect (the TYPE119 NOPORTSTATISTICS was specified in the SMFCONFIG profile statement or is in effect by default).

**Stack**
Indicates whether SMF subtype 8 records are created when TCP connections are established. This field can have the following values:

Yes
Indicates that TYPE119 TCPSTACK is in effect (the TYPE119 TCPSTACK was specified on the SMFCONFIG statement).

No
Indicates that TYPE119 TCPSTACK is not in effect (the TYPE119 NOTCPSTACK was specified in the SMFCONFIG profile statement or is in effect by default).

**UdpTerm**
Indicates whether SMF subtype 10 records are created when TCP connections are established. This field can have the following values:

Yes
Indicates that TYPE119 UDPTERM is in effect (the TYPE119 UDPTERM was specified on the SMFCONFIG statement).

No
Indicates that TYPE119 UDPTERM is not in effect (the TYPE119 NOUDPTERM was specified in the SMFCONFIG profile statement or is in effect by default).

**TN3270Client**
Indicates whether SMF subtype 22 and 23 records are created when TCP connections are established. This field can have the following values:

Yes
Indicates that TYPE119 TN3270CLIENT is in effect (the TYPE119 TN3270CLIENT was specified on the SMFCONFIG statement).

No
Indicates that TYPE119 TN3270CLIENT is not in effect (the TYPE119 NOTN3270CLIENT was specified in the SMFCONFIG profile statement or is in effect by default).

**IPSecurity**
Indicates whether SMF records of subtypes 77, 78, 79, and 80 are created when dynamic tunnels are removed and when manual tunnels are activated and deactivated. This field can have the following values:
Yes
Indicates that TYPE119 IPSECURITY is in effect (the TYPE119 IPSECURITY was specified on the SMFCONFIG statement).

No
Indicates that TYPE119 IPSECURITY is not in effect (the TYPE119 NOIPSECURITY was specified or is in effect by default in the SMFCONFIG profile statement).

Profile
Indicates whether SMF subtype 4 event records are created when the TCP/IP stack is initialized or when a profile change occurs. This record provides TCP/IP stack profile information. This field can have the following values:

Yes
Indicates that this behavior is enabled (the TYPE119 PROFILE parameter was specified on the SMFCONFIG statement).

No
Indicates that this behavior is not enabled (the TYPE119 NOPROFILE parameter was specified on the SMFCONFIG statement or is in effect by default).

DVIPA
Indicates whether SMF subtypes 32, 33, 34, 35, 36, and 37 event records are created for sysplex events. These records provide information about changes to dynamic virtual IP addresses (DVIPAs), DVIPA targets, and DVIPA target servers. This field can have the following values:

Yes
Indicates that this behavior is enabled (the TYPE119 DVIPA parameter was specified on the SMFCONFIG statement).

No
Indicates that this behavior is not enabled (the TYPE119 NODVIPA parameter was specified on the SMFCONFIG statement or is in effect by default).

SmcrGrpStats
Indicates whether SMF subtype 41 records are created. These records are SMC-R link group statistics records. The records collect information about Shared Memory Communications over Remote Direct Memory Access (SMC-R) link groups and the SMC-R links within each group. This field can have the following values:

Yes
Indicates that this behavior is enabled. The TYPE119 SMCRGROUPSTATISTICS parameter was specified on the SMFCONFIG statement.

No
Indicates that this behavior is not enabled. The TYPE119 NOSMCRGROUPSTATISTICS parameter was specified on the SMFCONFIG statement or is in effect by default.

SmcrLnkEvent
Indicates whether SMF subtype 42 and 43 records are created. The SMF records of subtype 42 are created when SMC-R links are started, and the SMF records of subtype 43 are created when SMC-R links are ended. This field can have the following values:

Yes
Indicates that this behavior is enabled. The TYPE119 SMCRLINKEVENT parameter was specified on the SMFCONFIG statement.

No
Indicates that this behavior is not enabled. The TYPE119 NOSMCRLINKEVENT parameter was specified on the SMFCONFIG statement or is in effect by default.

SmcdLnkStats
Indicates whether SMF subtype 38 records are created. These records are SMC-D link statistics records. The records collect information about Shared Memory Communications - Direct Memory Access (SMC-D) links. This field can have the following values:
Yes
Indicates that this behavior is enabled. The TYPE119 SMCDLINKSTATISTICS parameter was specified on the SMFCONFIG statement.

No
Indicates that this behavior is not enabled. The TYPE119 NOSMCDLINKSTATISTICS parameter was specified on the SMFCONFIG statement or is in effect by default.

SmcdLnkEvent
Indicates whether SMF subtype 39 and 40 records are created. The SMF records of subtype 39 are created when SMC-D links are started, and the SMF records of subtype 40 are created when SMC-D links are ended. This field can have the following values:

Yes
Indicates that this behavior is enabled. The TYPE119 SMCDLINKEVENT parameter was specified on the SMFCONFIG statement.

No
Indicates that this behavior is not enabled. The TYPE119 NOSMCDLINKEVENT parameter was specified on the SMFCONFIG statement or is in effect by default.

ZertDetail
Indicates whether SMF subtype 11 records are created. A subtype 11 record is created anytime one of the conditions occurs:

– When new TCP and Enterprise Extender connections are established
– When significant changes to a connection's cryptographic protection state occur
– When a connection terminates

You can also get these records when the z/OS Encryption Readiness Technology (zERT) function is enabled or disabled.

This field can have the following values:

Yes
Indicates that this behavior is enabled. The TYPE119 ZERTDETAIL parameter was specified on the SMFCONFIG statement.

No
Indicates that this behavior is not enabled. The TYPE119 NOZERTDETAIL parameter was specified on the SMFCONFIG statement or is in effect by default.

ZertSummary
Indicates whether SMF subtype 12 records are created. Subtype 12 records are interval records that report zERT summary statistics.

You also get subtype 12 event records when the zERT aggregation function is enabled or disabled.

This field can have the following values:

Yes
Indicates that this behavior is enabled. The TYPE119 ZERTSUMMARY parameter was specified on the SMFCONFIG statement.

No
Indicates that this behavior is not enabled. The TYPE119 NOZERTSUMMARY parameter was specified on the SMFCONFIG statement or is in effect by default.

Note: The TCPIP statistics field under SMF Parameters displays the subtype value used when creating the SMF type 118 record (if the value is nonzero). The TCPIP statistics field under Global Configuration Information indicates whether the TCP/IP stack will write statistics messages to the TCP/IP job log when TCP/IP is terminated. For the Type 119 fields, the subtype cannot be changed and the setting indicates if the record is requested (Yes) or not (No).

• Global Configuration Information
Display the following global configured information defined in the GLOBALCONFIG profile statement. For more information about each global parameter, see GLOBALCONFIG profile statement information in the z/OS Communications Server: IP Configuration Reference.

**TcpIpStats**
Indicates whether the several TCP/IP counter values are to be written to the output data set designated by the CFGPRINT JCL statement. The value Yes indicates that TCPIPSTATISTICS is in effect (the TCPIPSTATISTICS parameter was specified in the GLOBALCONFIG profile statement). The value No indicates that TCPIPSTATISTICS is not in effect (the NOTCPISPSTATISTICS parameter was specified in the GLOBALCONFIG profile statement or is in effect by default).

*Tip:* The TCPIPSTATS field that is shown under the SMF PARAMETERS section of the Netstat CONFIG/-f output reflects the TcpIpStatistics value or NoTcpIpStatistics value that is specified on the SMFCONFIG statement in the TCP/IP Profile or Obeyfile. The TCPIPSTATS field that is shown under the GLOBAL CONFIGURATION section of the Netstat CONFIG/-f output reflects the value from the GLOBALCONFIG statement in the TCP/IP Profile or Obeyfile.

**ECSALimit**
The maximum amount of extended common service area (ECSA) that was defined using the ECSALIMIT parameter in the GLOBALCONFIG statement. This limit can be expressed as a number followed by the letter K (which represents 1024 bytes), or a number followed by the letter M (which represents 1048576 bytes). If the K suffix is used, then the value displayed must be in the range 10240K - 2096128K inclusive, or 0K. If the M suffix is used, the value displayed must be in the range 10M - 2047M inclusive, or 0K. If the ECSALIMIT parameter was not specified in the GLOBALCONFIG statement, then the default value 0K is displayed (which means no limit).

**PoolLimit**
The maximum amount of authorized private storage that was defined using the POOLLIMIT parameter in the GLOBALCONFIG statement. This limit can be expressed as a number followed by the letter K (which represents 1024 bytes), or a number followed by the letter M (which represents 1048576 bytes). If the K suffix is used, then the value displayed must be in the range 10240K - 2096128K inclusive, or 0K. If the M suffix is used, the value displayed must be in the range 10M - 2047M inclusive, or 0K. If the POOLLIMIT parameter was not specified in the GLOBALCONFIG statement, then the default value 0K is displayed (which means no limit).

**MlsChkTerm**
Indicates whether the stack should be terminated when inconsistent configuration information is discovered in a multilevel-secure environment. The value Yes indicates that MLSCHKTERMINATE is in effect (the MLSCHKTERMINATE parameter was specified in the GLOBALCONFIG profile statement). The value No indicates that MLSCHKTERMINATE is not in effect (the NOMLSCHKTERMINATE parameter was specified in the GLOBALCONFIG profile statement or is in effect by default).

**XCFGRPID**
Displays the TCP 2-digit XCF group name suffix. The two digits displayed are used to generate the XCF group that the TCP/IP stack has joined. The group name is EZBTvvtt, where vv is the VTAM XCF group ID suffix (specified as a VTAM start option) and tt is the displayed XCFGRPID value. If no VTAM XCF group ID suffix was specified, the group name is EZBTCpPt. You can use the D TCPIP,,SYSPLEX,GROUP command to display the group name that the TCP/IP stack has joined.

These digits are also used as a suffix for the EZBDVIPAnd EZBEPoRT structure names in the form EZBDVIPAnvtt and EZBEPoRTvtt. If no VTAM XCF group ID suffix was specified, the structure names are EZBDVIPAn01tt and EZBEPoRT01tt. If no XCFGRPID value was specified on the GLOBALCONFIG statement in the TCP/IP profile, then no value is displayed for XCFGRPID field in the Netstat output.

**IQDVLANID**
Displays the TCP/IP VLAN ID that is to be used when a HiperSockets link or interface is generated for dynamic XCF connectivity between stacks on the same CPC. The VLAN ID provides connectivity separation between TCP/IP stacks using HiperSockets for dynamic XCF when subplexing is being used (when XCFGRPID was specified on the GLOBALCONFIG statement). TCP/IP stacks with the same XCFGRPID value (stacks in the same subplex) should specify the same IQDVLANID value if
the stacks are in the same CPC and use the same CHPID value. TCP/IP stacks with different XCFGRPID values should specify different IQDVLANID values if the stacks are in the same CPC and use the same CHPID value. If no IQDVLANID value was specified on the GLOBALCONFIG statement in the TCP/IP profile, then the value 0 (no value) is displayed for the IQDVLANID field in the Netstat output.

**SysplexWLMPoll**
The rate, in seconds, at which the sysplex distributor and its target servers poll WLM for new weight recommendations. A shorter rate indicates a quicker response; however, shorter rates might result in unneeded queries.

**MaxRecs**
The maximum number of records that are displayed by the DISPLAY TCPIP,,NETSTAT operator command, if the MAX parameter is not specified on that command. The maximum number of records is specified on the MAXRECS parameter of the GLOBALCONFIG profile statement. An asterisk (*) indicates that all records are displayed.

**ExplicitBindPortRange**
The range of ephemeral ports that is assigned uniquely across the sysplex when an explicit bind() is issued using INADDR_ANY or the unspecified IPv6 address (in6addr_any) and when the specified port is 0.

**Tip:** This range is the range that was configured on this stack. It might not be the actual range that is in use throughout the sysplex at this time, because another stack that was started later with a different explicit bind port range configured (or with a VARY OBEYFILE command specifying a file with a different EXPLICITBINDPORTRANGE value) can override the range that is configured by this stack. Use the Display TCPIP,,SYSPLEX,PORTS command to display the currently active port range.

**AutoIQDC**
Indicates whether to dynamically create Internal Queued Direct I/O (IQD) interfaces and transparently converge the dynamic IQD interfaces with the associated OSA interfaces for OSD CHPIDs. The IQD interface that is dynamically created and managed is logically converged with the OSA interface and is referred to as a HiperSockets Converged Interface (IQDC). This field can have the following values:

- **No**
  Do not use dynamic IQD (HiperSockets) converged interfaces. The NOAUTOIQDC parameter was specified on the GLOBALCONFIG statement.

- **AllTraffic**
  Indicates to use IQDC interfaces for all eligible outbound traffic flowing on the external IP data network. This value is the default value for the AutoIQDC field.

- **NoLargeData**
  Indicates to not use IQDC dynamic interfaces for outbound TCP socket data transmissions of length 32 KB or larger. Use dynamic IQDC interfaces for all other eligible outbound traffic.

**AutoIQDX**
Indicates whether dynamic Internal Queued Direct I/O extensions function (IQDX) interfaces are used for connectivity to the intraensemble data network (IEDN). This field can have the following values:

- **No**
  Indicates that access to the IEDN using HiperSockets (IQD CHPIDs) with the IQDX is disabled. The NOAUTOIQDX parameter was specified on the GLOBALCONFIG statement.

- **AllTraffic**
  Indicates that IQDX interfaces are used for all eligible outbound traffic to the IEDN. The AUTOIQDX ALLTRAFFIC parameter was specified on the GLOBALCONFIG statement. This value is the default value for the AutoIQDX field.

- **NoLargeData**
  Indicates that IQDX interfaces are used for all eligible outbound traffic to the IEDN, except for large outbound TCP protocol traffic. The AUTOIQDX NOLARGEDATA parameter was specified on
the GLOBALCONFIG statement. Large outbound TCP traffic is sent to the IEDN by using OSX OSA-Express interfaces.

**IQDMultiWrite**
Indicates whether all HiperSockets interfaces are configured to move multiple output data buffers using a single write operation. You must stop and restart the interface for a change in this value to take effect for an active HiperSockets interface. This field can have the following values:

**Yes**
Indicates that the HiperSockets interfaces are configured to use HiperSockets multiple write support when this function is supported by the IBM Z® environment (the IQDMULTIWRITE parameter was specified on the GLOBALCONFIG profile statement).

**No**
Indicates that the HiperSockets interfaces are not configured to use HiperSockets multiple write support (the NOIQDMULTIWRITE parameter was specified on the GLOBALCONFIG profile statement or the value was set by default).

**WLMPriorityQ**
Indicates whether OSA-Express QDIO write priority values are being assigned to outbound OSA-Express packets that are associated with Workload Manager (WLM) service classes, and to forwarded packets that are not being accelerated. The displayed priorities are applied only when the IPv4 type of service (ToS) byte or the IPv6 traffic class value in the IP header is 0 and the packet is sent from an OSA-Express device that is in QDIO mode. This field can have the following values:

**Yes**
Indicates that QDIO write priority values are assigned to outbound OSA-Express packets that are associated with Workload Manager (WLM) service classes, and to forwarded packets that are not being accelerated (the WLMPRIORITYQ parameter was specified on the GLOBALCONFIG profile statement). When the WLMPriorityQ field has the value Yes, the following information is displayed:

**IOPRIn control_values**
Indicates which QDIO priority value is assigned to each control value. The QDIO priority values are in the range of 1 - 4. These QDIO priority values are displayed as the identifiers IOPRI1, IOPRI2, IOPRI3, and IOPRI4. The values that follow the identifiers are the control values. The control values represent Workload Manager service classes and forwarded packets. Most of the control values correlate directly to Workload Manager service class importance levels. See the WLMPRIORITYQ parameter in the GLOBALCONFIG profile statement information in z/OS Communications Server: IP Configuration Reference for more details about the control values. If no control value was specified for a specific QDIO priority value, then the identifier for that QDIO priority value is not displayed.

**No**
Indicates that QDIO write priority values are not assigned to outbound OSA-Express packets that are associated with Workload Manager (WLM) service classes or forwarded packets that are not accelerated (the NOWLMPRIORITYQ parameter was specified on the GLOBALCONFIG profile statement or is in effect by default).

**Sysplex Monitor**
Displays the parameter values for the Sysplex Problem Detection and Recovery function.

**TimerSecs**
Displays the timer value (in seconds) that is used to determine how soon the sysplex monitor timer reacts to problems with needed sysplex resources. This value can be configured using the SYSPLEXMONITOR parameter on the GLOBALCONFIG profile statement. Valid values are in the range 10 - 3600 seconds; the default value is 60 seconds.

**Recovery**
Indicates the action that is to be taken when a sysplex problem is detected.

The value Yes indicates that when a problem is detected, the stack issues messages about the problem, leaves the sysplex group, and deactivates all DVIPA resources that are owned by this stack; the VIPADYNAMIC configuration is restored if the stack rejoins the sysplex group. The
default value is No. The value Yes can be configured by specifying the RECOVERY keyword for the SYSPLEXMONITOR parameter on the GLOBALCONFIG profile statement.

The value No indicates that when a problem is detected, the stack issues messages regarding the problem but takes no other action. The value No can be configured by specifying the NORECOVERY keyword for the SYSPLEXMONITOR parameter on the GLOBALCONFIG profile statement.

**DelayJoin**
Indicates whether the TCP/IP stack delays joining the sysplex group during stack initialization or rejoining the sysplex group following a VARY TCPIP,,OBEYFILE command.

The value No indicates that TCP/IP immediately joins the sysplex group during stack initialization. The default value is No and can be configured by specifying the NODELAYJOIN keyword for the SYSPLEXMONITOR parameter on the GLOBALCONFIG profile statement.

The value Yes indicates that TCP/IP delays joining the sysplex group during stack initialization until the following conditions true:
- OMPROUTE is started and active
- At least one of monitored interfaces is defined and active (if MONINTERFACE is configured)
- At least one dynamic route over the monitored interfaces is available (if MONINTERFACE DYNROUTE is configured)

Any sysplex-related definitions within the TCP/IP profile (for example, VIPADYNAMIC or IPCONFIG/IPCONFIG6 DYNAMICXCF statements) are not processed until the sysplex group is joined. The value Yes can be configured by specifying the DELAYJOIN keyword for the SYSPLEXMONITOR parameter on the GLOBALCONFIG profile statement.

**Join**
Indicates whether the TCP/IP stack joins the sysplex group during stack initialization.

The value Yes indicates that the TCP/IP stack immediately attempts to join the sysplex group during stack initialization. This is the default setting.

The value No indicates that the TCP/IP stack does not join the sysplex group during stack initialization. You can configure the value No by specifying the NOJOIN keyword for the SYSPLEXMONITOR parameter on the GLOBALCONFIG profile statement.

If NOJOIN is configured, the TCP/IP stack does not process any VIPADYNAMIC block or DYNAMICXCF statements. Any other GLOBALCONFIG SYSPLEXMONITOR parameter settings (configured or default) are ignored, and the settings are saved in case you want the TCP/IP stack to join the sysplex group at a later time.

If you subsequently issue a VARY TCPIP,,SYSPLEX,JOINGROUP command, the NOJOIN setting is overridden and the saved GLOBALCONFIG SYSPLEXMONITOR parameter settings become active. For example, if you configure NOJOIN and DELAYJOIN, DELAYJOIN is initially ignored. After you issue a V TCPIP,,SYSPLEX,JOINGROUP command, NOJOIN is overridden, DELAYJOIN becomes active, and the stack joins the sysplex group if OMPROUTE is initialized.

Any sysplex-related definitions within the TCP/IP profile, such as VIPADYNAMIC or IPCONFIG DYNAMICXCF statements, are not processed until the TCP/IP stack joins the sysplex group.

**MonIntf**
Indicates whether the TCP/IP stack is monitoring the status of specified network interfaces.

The value No indicates that the TCP/IP stack is not monitoring the status of network interfaces. The default value is No and it can be configured by specifying the NOMONINTERFACE keyword for the SYSPLEXMONITOR parameter on the GLOBALCONFIG profile statement.

The value Yes indicates that the TCP/IP stack is monitoring the status of network interfaces that have the MONSYSPLEX attribute specified on the LINK or INTERFACE profile statement. The value Yes can be configured by specifying the MONINTERFACE keyword for the SYSPLEXMONITOR parameter on the GLOBALCONFIG profile statement.
DynRoute
Indicates whether the TCP/IP stack is monitoring the presence of dynamic routes over the monitored network interfaces.

The value No indicates that the TCP/IP stack is not monitoring the presence of dynamic routes over monitored network interfaces. The default value is No and it can be configured by specifying the NODYNROUTE keyword for the SYSPLEXMONITOR MONINTERFACE parameter on the GLOBALCONFIG profile statement.

The value Yes indicates that the TCP/IP stack is monitoring the presence of dynamic routes over monitored network interfaces that have the MONSYSPLEX attribute specified on the LINK or INTERFACE statement. It can be configured by specifying the DYNROUTE keyword for the SYSPLEXMONITOR MONINTERFACE parameter on the GLOBALCONFIG profile statement.

AutoRejoin
Indicates whether the TCP/IP stack automatically rejoins the sysplex group when all detected problems that caused the stack to leave the group are relieved.

The value No indicates that the stack does not rejoin the group or restore its VIPADYNAMIC definitions when all detected problems have been relieved. The default value is No and it can be configured by specifying the NOAUTOREJOIN keyword for the SYSPLEXMONITOR parameter on the GLOBALCONFIG profile statement.

The value Yes indicates that the stack automatically rejoins the sysplex group and restores all of its VIPADYNAMIC configuration definitions. The value Yes can be configured by specifying the AUTOREJOIN keyword for the SYSPLEXMONITOR parameter on the GLOBALCONFIG profile statement.

Restriction: You can specify the AUTOREJOIN keyword only if the RECOVERY keyword is also specified (or is currently enabled) on the SYSPLEXMONITOR parameter on the GLOBALCONFIG profile statement.

zIIP
Displays information about displacing CPU cycles for various functions onto a System z® Information Integration Processor (zIIP). The value Yes for a function indicates that cycles can be displaced to a zIIP when at least one zIIP device is online. Issue the MVS D M=CPU command to display zIIP status. See displaying system configuration information details in z/OS MVS System Commands for more information about displaying processor status.

IPSecurity
Indicates whether the stack is configured to displace CPU cycles for IPSec workload onto a zIIP. This field can have the following values:

Yes
Indicates that IPSec CPU cycles are displaced to a zIIP as long as at least one zIIP device is online.

No
Indicates that IPSec CPU cycles are not being displaced to a zIIP.

IQDIOMultiWrite
Indicates whether the stack is configured to displace CPU cycles for HiperSockets multiple write workload onto a zIIP. This field can have the following values:

Yes
Indicates that the stack is configured to permit HiperSockets multiple write CPU cycles to be displaced to a zIIP.

No
Indicates that the stack is configured to not permit HiperSockets multiple write CPU cycles to be displaced to a zIIP.

SMCGlobal
Displays the global settings for Shared Memory Communications (SMC). SMC includes Shared Memory Communications over Remote Direct Memory Access (RDMA), or SMC-R, for external data
network communications and Shared Memory Communications - Direct Memory Access (SMC-D). This field has the following values:

**AutoCache**
Indicates whether AUTOCACHE support is enabled for this TCP/IP stack. The following values are valid:

- **Yes**
  Indicates that AUTOCACHE support is enabled. The AUTOCACHE subparameter was specified with the SMCGLOBAL parameter on the GLOBALCONFIG profile statement or AUTOCACHE support is enabled by default. This support is started only when SMC is enabled. SMC is enabled if the value of either the SMCR or the SMCD field is Yes.

- **No**
  Indicates that AUTOCACHE support is not enabled. The NOAUTOCACHE subparameter was specified with the SMCGLOBAL parameter on the GLOBALCONFIG profile statement.

**AutoSMC**
Indicates whether the AUTOSMC monitoring function is enabled for this TCP/IP stack. For more information about the AUTOSMC monitoring function, see AUTOSMC monitoring function in z/OS Communications Server: IP Configuration Guide. The following values are valid:

- **Yes**
  Indicates that the AUTOSMC monitoring function is enabled. The AUTOSMC subparameter was specified with the SMCGLOBAL parameter on the GLOBALCONFIG profile statement or the AUTOSMC monitoring function was enabled by default. This function is started only when SMC is enabled. SMC is enabled if the value of either the SMCR or the SMCD field is Yes.

- **No**
  Indicates that the AUTOSMC monitoring function is not enabled. The NOAUTOSMC subparameter was specified with the SMCGLOBAL parameter on the GLOBALCONFIG profile statement.

**SMCR**
Indicates whether this stack supports Shared Memory Communications over Remote Direct Memory Access (SMC-R) for external data network communications. This field can have the following values:

- **Yes**
  Indicates that this stack can communicate with other stacks on the external data network by using SMC-R. The SMCR parameter was specified on the GLOBALCONFIG profile statement. When the SMCR field has the value Yes, the following information is displayed:

  - **FixedMemory**
    Indicates the maximum amount, in megabytes, of 64-bit private storage that the stack can use for the send and receive buffers that are required for SMC-R communications. The fixed memory value was defined by using the SMCR FIXEDMEMORY parameter on the GLOBALCONFIG. If the SMCR FIXEDMEMORY parameter was not specified on the GLOBALCONFIG statement, the default value of 256 is displayed.

  - **TcpKeepMinInt**
    Indicates the minimum supported TCP keepalive interval for SMC-R links. Use the SMCR TCPKEEPMININTERVAL parameter on the GLOBALCONFIG statement to define the interval. For applications that are using the TCP_KEEPALIVE setsockopt() option, this interval indicates the minimum interval that TCP keepalive packets are sent on the TCP path of an SMC-R link. The range is 0 - 2147460 seconds. If the interval value is set to 0, TCP keepalive probe packets on the TCP path of an SMC-R link are disabled. If the SMCR TCPKEEPMININTERVAL parameter was not specified on the GLOBALCONFIG statement, then the default interval value of 300 is displayed.

- **PFID**
  Indicates the Peripheral Component Interconnect Express (PCIe) function ID (PFID) value that was defined using SMCR PFID parameter. The combination of PFID and port number uniquely identifies an "RoCE Express". The stack uses "RoCE Express" for SMC-R
communications with other stacks on the external data network. The PFID is a 2-byte hexadecimal value.

**PortNum**
Indicates the "RoCE Express" port number that is used for the associated PFID. The PortNum value was specified with the PFID value on the SMCR parameter of the GLOBALCONFIG statement in the TCP/IP profile. The port number can be 1 or 2; the default port is 1.

*Note:* When PFID represents a RoCE Express2 feature, the PortNum value is the port number configured for the PFID in the Hardware Configuration Definition (HCD). The port number is learned by VTAM during activation of the PFID and might be different from the value coded for PORTNUM for this PFID on the GLOBALCONFIG SMCR statement.

**MTU**
Indicates the configured maximum transmission unit (MTU) value that is used for the associated PFID. The MTU value can be 1024 or 2048 and the default MTU value is 1024.

**No**
Indicates that this stack cannot communicate with other stacks on the external data network by using SMC-R communications. The NOSMCR parameter was specified on the GLOBALCONFIG profile statement or the value was set by default.

**SMCD**
Indicates whether this stack supports SMC-D. This field can have the following values:

**Yes**
Indicates that this stack can communicate with other stacks by using SMC-D. The SMCD parameter was specified on the GLOBALCONFIG profile statement. When the SMCD field has the value Yes, the following information is displayed:

**FixedMemory**
Indicates the maximum amount, in megabytes, of 64-bit private storage that the stack can use for the receive buffers that are required for SMC-D communications. The fixed memory value was defined by using the SMCD FIXEDMEMORY parameter on the GLOBALCONFIG statement. If the SMCD FIXEDMEMORY parameter was not specified on the GLOBALCONFIG statement, the default value of 256 is displayed.

**TcpKeepMinInt**
Indicates the minimum supported TCP keepalive interval for SMC-R links. Use the SMCD TCPKEEPMININTERVAL parameter on the GLOBALCONFIG statement to define the interval. For applications that are using the TCP_KEEPALIVE setsockopt() option, this interval indicates the minimum interval that TCP keepalive packets are sent on the TCP path of an SMC-D link. The range is 0 - 2147460 seconds. If the interval value is set to 0, TCP keepalive probe packets on the TCP path of an SMC-D link are disabled. If the SMCD TCPKEEPMININTERVAL parameter was not specified on the GLOBALCONFIG statement, the default interval value of 300 is displayed.

**No**
Indicates that this stack cannot communicate with other stacks by using SMC-D communications. The NOSMCD parameter was specified on the GLOBALCONFIG profile statement or the value was set by default.

**ZERT**
Indicates whether this stack supports z/OS Encryption Readiness Technology (zERT).

The value Yes indicates that ZERT is in effect (the ZERT parameter was specified in the GLOBALCONFIG profile statement) and that the ZERT discovery function is enabled for this TCP/IP stack. When the ZERT field has the value Yes, the following information is displayed:

**Aggregation**
Indicates whether the zERT aggregation function is enabled for this TCP/IP stack. The following values are valid:
Yes
Indicates that the zERT aggregation function is enabled. The AGGREGATION subparameter was specified with the ZERT parameter on the GLOBALCONFIG profile statement.

No
Indicates that the zERT aggregation function is not enabled. The NOAGGREGATION subparameter was specified with the ZERT parameter on the GLOBALCONFIG profile statement, or the zERT aggregation function was not enabled by default.

The value No indicates that zERT is not in effect (the NOZERT parameter was specified in the GLOBALCONFIG profile statement or is in effect by default).

Network Monitor Configuration information
Display the following configured network monitor information defined in the NETMONITOR profile statement. For more information about each network monitor parameter, see the NETMONITOR profile statement information in the z/OS Communications Server: IP Configuration Reference.

PktTrcSrv
Indicates whether the packet trace service is enabled or disabled. The value Yes indicates that PKTTRCSERVICE is in effect (the PKTTRCSERVICE parameter was specified in the NETMONITOR profile statement). The value No indicates that PKTTRCSERVICE is not in effect (the NOTPKTTRCSERVICE parameter was specified in the NETMONITOR profile statement or is in effect by default).

TcpCnnSrv
Indicates whether the TCP connection information service is enabled or disabled. The value Yes indicates that TCPCONNSERVICE is in effect (the TCPCONNSERVICE parameter was specified in the NETMONITOR profile statement). The value No indicates that TCPCONNSERVICE is not in effect (the NOTTCPCONNSERVICE parameter was specified in the NETMONITOR profile statement or is in effect by default).

MinLifTim
The minimum lifetime for a new TCP connection to be reported by the service when the TCP connection information service is enabled. If the NOTTCPCONNSERVICE parameter was specified in the NETMONITOR profile statement or is in effect by default, then the MinLifTim field is not displayed.

NtaSrv
Indicates whether the OSAENTA trace service is enabled or disabled. The value Yes indicates that NTATRCSERVICE is in effect (the NTATRCSERVICE parameter was specified in the NETMONITOR profile statement). The value No indicates that NTATRCSERVICE is not in effect (the NOTNTATRCSERVICE parameter was specified in the NETMONITOR profile statement or is in effect by default).

SmfSrv
Indicates whether the real-time SMF information service is enabled or disabled. The value Yes indicates that SMFSERVICE is enabled (the SMFSERVICE parameter was specified in the NETMONITOR profile statement). The value No indicates that SMFSERVICE is disabled (the NOSMFSERVICE parameter was specified in the NETMONITOR profile statement or is disabled by default).

IPSecurity
Indicates whether the real-time SMF service is providing IPSec SMF records. The value Yes indicates that IPSec SMF records are being provided (either the SMFSERVICE parameter was specified with the IPSECURITY subparameter on the NETMONITOR profile statement or the SMFSERVICE parameter was specified without any subparameters). The value No indicates that IPSec SMF records are not being provided (the SMFSERVICE parameter was specified with the NOIPSECURITY subparameter on the NETMONITOR profile statement). This field is displayed only if the SmfSrv value is Yes.

Profile
Indicates whether the real-time SMF service is providing TCP/IP profile SMF records. The value Yes indicates that TCP/IP profile SMF records are being provided (either the SMFSERVICE
parameter was specified with the PROFILE subparameter on the NETMONITOR profile statement, or the SMFSERVICE parameter was specified without any subparameters). The value No indicates that TCP/IP profile SMF records are not being provided (the SMFSERVICE parameter was specified with the NOPROFILE subparameter on the NETMONITOR profile statement). This field is displayed only if the SmfSrv value is Yes.

**CSSMTP**
Indicates whether the real-time SMF service is providing CSSMTP SMF 119 records for subtype 48, 49, 51 and 52. The value Yes indicates that CSSMTP SMF records are being provided (either the SMFSERVICE parameter was specified with the CSSMTP subparameter on the NETMONITOR profile statement or the SMFSERVICE parameter was specified without any subparameters). The value No indicates that CSSMTP SMF records are not being provided (the SMFSERVICE parameter was specified with the NOCSSMTP subparameter on the NETMONITOR profile statement). This field is displayed only if the SmfSrv value is Yes.

**CSMAIL**
Indicates whether the real-time SMF service is providing CSSMTP SMF 119 records for subtype 50. The value Yes indicates that CSSMTP SMF mail records are being provided (either the SMFSERVICE parameter was specified with the CSSMTP subparameter on the NETMONITOR profile statement or the SMFSERVICE parameter was specified without any subparameters). The value No indicates that CSSMTP SMF mail records are not being provided (the SMFSERVICE parameter was specified with the NOCSSMTP subparameter on the NETMONITOR profile statement). This field is displayed only if the SmfSrv value is Yes.

**DVIPA**
Indicates whether the real-time SMF service is providing sysplex event SMF records. The value Yes indicates that sysplex event SMF records are being provided (either the SMFSERVICE parameter was specified with the DVIPA subparameter on the NETMONITOR profile statement, or the SMFSERVICE parameter was specified without any subparameters). The value No indicates that sysplex event SMF records are not being provided (the SMFSERVICE parameter was specified with the NODVIPA subparameter on the NETMONITOR profile statement). This field is displayed only if the SmfSrv value is Yes.

**ZertSrv**
Indicates whether the real-time zERT Detail SMF information service is enabled or disabled. The value Yes indicates that the zERT Detail service is enabled (the ZERTSERVICE parameter was specified on the NETMONITOR profile statement). The value No indicates that the zERT Detail service is disabled (the NOZERTSERVICE parameter was specified on the NETMONITOR profile statement or is disabled by default).

**ZertSum**
Indicates whether the real-time zERT Summary SMF information service is enabled or disabled. The value Yes indicates that the zERT Summary service is enabled (the ZERTSUMMARY parameter was specified on the NETMONITOR profile statement). The value No indicates that the zERT Summary service is disabled (the NOZERTSUMMARY parameter was specified on the NETMONITOR profile statement or is disabled by default).

**• Autolog Configuration Information**

**WaitTime**
The time, displayed in seconds, that is specified on the AUTOLOG statement that represents the length of time TCP/IP waits for a procedure to stop if the procedure is still active at startup and TCP/IP is attempting to start the procedure again. The procedure could still be active if it did not stop when TCP/IP was last shut down.

**ProcName**
The procedure that the TCP/IP address space starts.

**JobName**
The job name used for the PORT reservation statement. The job name might be identical to the procedure name; however, for z/OS UNIX jobs that spawn listener threads, the names are not the same.
ParmString
A string to be added following the START ProcName value. The ParmString value can be up to 115 characters in length and can span multiple lines. If the PARMSTRING parameter on the AUTOLOG profile statement was not specified or if the parm_string value was specified with a blank string, then this field displays blanks.

DelayStart
Indicates whether TCP/IP delays starting this procedure until the TCP/IP stack has completed one or more processing steps. This field can have the following values:

Yes
Indicates that the TCP/IP stack does not start this procedure until it has completed all of the processing steps identified by the following subparameters:

DVIPA
TCP/IP delays starting this procedure until after the TCP/IP stack has joined the sysplex group and processed its dynamic VIPA configuration (DELAYSTART was specified on the entry for this procedure in the AUTOLOG profile statement with no additional subparameters, or DELAYSTART was specified with the DVIPA subparameter).

TTLS
TCP/IP delays starting this procedure until after the Policy Agent has successfully installed the AT-TLS policy in the TCP/IP stack and AT-TLS services are available (DELAYSTART was specified with the TTLS subparameter on the entry for this procedure in the AUTOLOG profile statement).

No
Indicates that this procedure is started when TCP/IP is started (DELAYSTART was not specified on the entry for this procedure in the AUTOLOG profile statement).

• Data Trace Settings if socket data trace is on

JobName
The application address space name specified on the DATTRACE command or asterisk (*), if not specified.

TrRecCnt
The number of packets traced for this DATTRACE command.

Length
The value of the ABBREV keyword of the DATTRACE command or FULL to capture the entire packet.

IpAddr
The IP address from the IP keyword of the DATTRACE command or asterisk (*), if not specified.

SubNet
The subnet mask from the SUBNET keyword of the DATTRACE command or asterisk (*), if not specified.

PrefixLen
The prefix length specified on the DATTRACE command.

PortNum
The port number from the PORTNUM keyword of the DATTRACE command or an asterisk (*), if a value was not specified.

Netstat CONn/-c report
Displays the information about each active TCP connection and UDP socket. CONn/-c is the default parameter.

TSO syntax

<table>
<thead>
<tr>

</table>
Modifier

APPLDATA
Provides application data in the output report.

SERVER
Provide detailed information only for TCP connections in the listen state.

Target
Provide the report for a specific TCP/IP address space by using T Cp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

Output
The default output option displays the output on the user’s terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

Filter
### z/OS UNIX syntax

```bash
netstat -c Modifier Target Output Filter
```

**Modifier**

- **APPLDATA**
  - Provides application data in the output report.
- **SERVER**
  - Provides detailed information only for TCP connections in the listen state.

**Target**

 Provide the report for a specific TCP/IP address space by using `-p tcpname`. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**

 The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.
Filter description

**APPLD/-G appldata**
Filter the output of the CONN/ -c report using the specified application data appldata. You can enter one filter value at a time; the specified value can be up to 40 characters in length.

**CLIENT/-E clientname**
Filter the output of the CONN/ -c report using the specified client name clientname. You can enter up to six filter values; each specified value can be up to eight characters in length.

**HOSTName/-H hostname**
Filter the output of the CONN/ -c report using the specified host name hostname. You can enter one filter value at a time; the specified value can be up to 255 characters in length.

**Result:** At the end of the report, Netstat displays the host name that the resolver used for the resolution and the list of IP addresses returned from the resolver which it used as filters.

**Restrictions:**
1. The HOSTName/-H filter does not support wildcard characters.
2. Using HOSTName/-H filter might cause delays in the output due to resolution of the hostname value depending on the resolver and DNS configuration.

**IPAddr/-I ipaddr/ipaddr/prefixlength/ipaddr/subnetmask**
Filter the report output using the specified IP address ipaddr, ipaddr/prefixlength, or ipaddr/subnetmask. You can enter up to six filter values; each specified IPv4 ipaddr value can be up to 15 characters in length.
**ipaddr**
Filter the output of the COnn/-c report using the specified IP address `ipaddr`. For IPv4 addresses, the default subnet mask of 255.255.255.255 is used. For IPv6 addresses, the default `prefixlength` value of 128 is used.

**ipaddr/prefixlength**
Filter the output of the COnn/-c report using the specified IP address and prefix length `ipaddr/prefixlength`. For a IPv4 address, the prefix length range is 1 – 32. For an IPv6 address, the prefix length range is 1 – 128.

**ipaddr/subnetmask**
Filter the output of the COnn/-c report using the specified IP address and subnet mask `ipaddr/subnetmask`. The IP address `ipaddr` in this format must be IPv4 IP address.

---

**Guidelines:**
1. The filter value `ipaddr` can be either the local or remote IP address.
2. For an IPv6 enabled stack:
   - Both IPv4 and IPv6 `ipaddr` values are accepted and can be mixed on the IPAddr/-I option.
   - An IPv4-mapped IPv6 address is accepted as a valid `ipaddr` value and usually provides the same result as its IPv4 address does.

**Restrictions:**
1. The filter value for an IPv6 address does not support wildcard characters.
2. For an IPv4-only stack, only IPv4 `ipaddr` values are accepted.
3. For a UDP endpoint socket, the filter value applies only to the local or source IP address.

---

**IPPort/-B ipaddr+portnum**
Filter the report output of the COnn/-c report using the specified IP address and port number. You can enter up to six filter values. Each specified IPv4 `ipaddr` value can be up to 15 characters in length, denoting a single IPv4 IP address; each specified IPv6 `ipaddr` value can be up to 45 characters in length, denoting a single IPv6 IP address. Valid `portnum` values are in the range 0 – 65535. The filter values `ipaddr` and `portnum` will match any combination of the local and remote IP address and local and remote port.

---

**Guidelines:**
- The filter value `ipaddr` can be either the local or remote IP address.
- For an IPv6-enabled stack, the following apply:
  - Both IPv4 and IPv6 `ipaddr` values are accepted and can be mixed on the IPPort/-B option.
  - An IPv4-mapped IPv6 address is accepted as a valid `ipaddr` value and usually provides the same result as its IPv4 address does.

**Restrictions:**
- The `ipaddr` value in the IPPort/-B filter does not support wildcard characters.
- For an IPv4-only stack, only IPv4 `ipaddr` values are accepted.
- An entry is returned only when both the `ipaddr` and `portnum` values match.
- For a UDP endpoint socket, the filter value applies only to the local or source IP address and port.

---

**NOTN3270/-T**
Filter the output of the COnn/-c report excluding TN3270 server connections.

---

**PORT/-P portnum**
Filter the output of the COnn/-c report using the specified port number `portnum`. You can enter up to six filter values.

**Guideline:** The port number can be either a local or remote port.

**Restriction:** For a UDP endpoint socket, the filter value applies only to the local or source port.
SMCID/-U smcid
Filter the output of the COnn/-c report by using the specified Shared Memory Communications over Remote Direct Memory Access (SMC-R) link, SMC-R link group, or Shared Memory Communications - Direct Memory Access (SMC-D) link identifier smcid. If an asterisk (*) is specified for the filter value, Netstat provides output only for entries that are associated with SMC-R links, SMC-R link groups, and SMC-D links. You can enter one filter value at a time.

CONNType/-X
Filter the report using the specified connection type. You can enter one filter value at a time.

NOTTLSPolicy
Filter the output of the COnn/-c report, displaying only connections that have not been matched to an Application Transparent Transport Layer Security (AT-TLS) rule. This includes connections that were established while the AT-TLS function was disabled (NOTTLS was specified on the TCPCONFIG statement or in effect by default) and all connections that do not use the TCP protocol. For TCP connections that were established while the AT-TLS function was enabled, this includes:
- Connections for which AT-TLS policy lookup has not yet occurred (typically the first send or receive has not been issued yet)
- Connections for which AT-TLS policy lookup has occurred but no matching rule was found

TTLSPolicy
Filter the output of the COnn/-c report, displaying only connections that match an Application Transparent Transport Layer Security (AT-TLS) rule. This includes only connections that were established while the AT-TLS function was enabled, for which an AT-TLS policy rule was found with either TTLSEnabled ON or TTLSEnabled OFF specified in the TTLSGroupAction. Responses can be further limited on AT-TLS connection type. AT-TLS connection type has the following values:
- CURRENT
  Display only connections that are using AT-TLS where the rule and all actions are still available to be used for new connections.
- GROUP groupid
  Display only connections that are using the AT-TLS group that is specified by the groupid value. The specified groupid value is a number that is assigned by the TCP/IP stack that uniquely identifies an AT-TLS group. You can determine the groupid value from the GroupID field value that is displayed in the Netstat TTLS/-x GROUP report.
- STALE
  Display only connections that are using AT-TLS where the rule or at least one action is no longer available to be used for new connections.

The filter value for CLient/-E, IPAddr/-I, and APPLD/-G can be a complete string or a partial string using wildcard characters. A wildcard character can be an asterisk (*), which matches a null string or any character or character string, at the same position. A wildcard character can be a question mark (?), which matches any single character at the same position. For example, a string "searchee" matches with "*ar?he*", but the string "searhee" does not match with "*ar?he*". If you want to use the wildcard character on the IPAddr/-I filter, you must specify the value in the ipaddr format. The wildcard character is not accepted for the ipaddr/prefixlen or ipaddr/subnetmask format of IPAddr/-I values.

When you use z/OS UNIX netstat/onetstat command in a z/OS UNIX shell environment, take care if you use a z/OS UNIX MVS special character in a character string. It might cause an unpredictable result. To be safe, if you want to use a z/OS UNIX MVS special character in a character string, surround the character string with single (') or double (") quotation marks. For example, to use an asterisk (*) in the IP address, 10.*.0.0 for the -I filter, issue the command as: netstat -c -I '10.*.0.0' or netstat -c -I "10.*.0.0".

Command syntax examples
From TSO environment

NETSTAT CONN
Display information for all active TCP connections and UDP sockets in the default TCP/IP stack.

NETSTAT CONN TCP TCPCS6
Display information for all active TCP connections and UDP sockets in TCPCS6 stack.

NETSTAT CONN TCP TCPCS8 (IPADDR 9.43.1.1 9.43.2.2
Display information for these active TCP connections and UDP sockets in TCPCS8 stack whose local or remote IP addresses match the specified filter IP address values.

NETSTAT CONN (PORT 2222 6666 88
Display information for those active TCP connections and UDP sockets in the default TCP/IP stack whose local or remote ports match the specified filter port numbers.

From UNIX shell environment

netstat -c
netstat -c -p tcpcs6
netstat -c -p tcpcs6 -I 9.43.1.1 9.43.2.2
netstat -c -P 2222 6666 88

Report examples

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

Not IPv6 enabled (SHORT format)

IPv6 enabled or request for LONG format

Report field descriptions

User Id
See the Client name or User ID information in “Netstat report general concepts” on page 293 for a detailed description.

Conn
See the Client ID or Connection Number information in “Netstat report general concepts” on page 293 for a detailed description.

Local Socket
See the Local Socket information in “Netstat report general concepts” on page 293 for a detailed description.

Foreign Socket
See the Foreign Socket information in “Netstat report general concepts” on page 293 for a detailed description.

State
See the TCP connection status and UDP socket status information in “Netstat report general concepts” on page 293 for a detailed description.

Application Data
The application data that makes it easy for you to locate and display the connections that are used by the application. The beginning of the application data identifies the format of the application data area. For z/OS Communications Server applications, see application data in the z/OS Communications Server: IP Programmer's Guide and Reference for a description of the format, content, and meaning of the data that is supplied by the application. For other applications, see the documentation that is supplied by the application. The data is displayed in character format if application data is present. Non-printable characters, if any, are displayed as dots.
Netstat DEFFADDR/-l report
Displays the policy table for IPv6 default address selection. See the information about the policy table for IPv6 default address selection in z/OS Communications Server: IPv6 Network and Application Design Guide.

**TSO syntax**

```
NETSTAT DEFFADDR
```

**Target**
Provide the report for a specific TCP/IP address space by using the TCP tcpname parameter. See “The Netstat command target” on page 287 for more information about the TCP parameter.

**Output**
The default output option displays the output on the user terminal. For other options, see “Netstat command output” on page 287.

**z/OS UNIX syntax**

```
netstat -l
```

**Target**
Provide the report for a specific TCP/IP address space by using the -p tcpname parameter. See “The Netstat command target” on page 287 for more information about the -p parameter.

**Output**
The default output option displays the output on the user terminal. For other options, see “Netstat command output” on page 287.

**Command syntax examples**

**From TSO environment**

```
NETSTAT DEFFADDR
```

**From UNIX shell environment**

```
netstat -l
```

**Report examples**
You can generate reports by using the TSO NETSTAT command. The z/OS UNIX command displays the data in the same format as the TSO NETSTAT command.
Report field descriptions

Source
The source of the data in the report. The data source can be one of the following values:

  Configured
  The policy table displayed in the report was configured using the DEFADDRTABLE TCP/IP profile
  statement.

  Default
  The policy table displayed in the report is the default policy table defined by the TCP/IP stack.

Precedence
An integer value in the range 0 - 65530 that indicates the precedence that is used to sort destination
addresses.

Label
An integer value in the range 0 - 65530 that indicates that a particular source address prefix is
preferred for use with a destination address prefix.

Prefix
The address prefix that is used to select the policy table entry that best matches a source address or a
destination address. The digits (in colon-hexadecimal format) before the slash (/) indicate the prefix.
The digits that follow the slash (/) indicate the length of the prefix, in bits. The prefix length is an
integer value in the range 1-128.

Netstat DEvlinks/-d report
Displays information about interfaces that are defined to the TCP/IP stack.

TSO syntax

```
  NETSTAT DEvlinks Modifier Target Output (Filter)
```

Modifier

```
  PNETID
  SMC
```

PNETID=netid
Displays information about interfaces for the specified physical network ID (netid). If an asterisk (*)
is specified for the PNETID value, all interfaces with a PNETID value are displayed. This modifier is
mutually exclusive with the SMC modifier.

SMC
Displays only Shared Memory Communications (SMC) information.
  • For Shared Memory Communications over Remote Direct Memory Access (SMC-R), the information
    is about "RoCE Express" interfaces and their associated SMC-R link groups and SMC-R links.
• For Shared Memory Communications - Direct Memory Access (SMC-D), the information is about Internal Shared Memory (ISM) interfaces and their associated SMC-D links.

This modifier is mutually exclusive with the PNETID modifier.

**Tip:** If the INTFName/-K filter is specified with the SMC modifier, the SMC-R link group information is not displayed.

**Target**

Provide the report for a specific TCP/IP address space by using TCP tcpname. See “The Netstat command target” on page 287 for more information about the TCP parameter.

**Output**

The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**Filter**

```
  INTFName
   infname
  SMCID
   smcid
```

**z/OS UNIX syntax**

```
netstat -d
```

**Modifier**

```
PNETID
   pnetid
  SMC
```

**PNETID=pnetid**

Displays information about interfaces for the specified physical network ID (pnetid). If an asterisk (*) is specified for the PNETID value, all interfaces with a PNETID value are displayed. This modifier is mutually exclusive with the SMC modifier.

**SMC**

Provide only Shared Memory Communications (SMC) information.

• For Shared Memory Communications over Remote Direct Memory Access (SMC-R), the information is about "RoCE Express" interfaces and their associated SMC-R link groups and SMC-R links.

• For Shared Memory Communications - Direct Memory Access (SMC-D), the information is about Internal Shared Memory (ISM) interfaces and their associated SMC-D links.

This modifier is mutually exclusive with the PNETID modifier.

**Tip:** If the INTFName/-K filter is specified with the SMC modifier, the SMC-R link group information is not displayed.

**Target**

Provide the report for a specific TCP/IP address space by using -p tcpname. See “The Netstat command target” on page 287 for more information about the TCP parameter.

**Output**

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.
Filter description

INTFName/-K intfname
Filter the output of the DEvlinks/-d report using the specified interface name *intfname*. You can enter one filter value at a time and the specified value can be up to 16 characters in length.

The INTFName/-K filter value *intfname* can be one of the following values:

- The network interface name that was displayed in the LnkName/LinkName or INTFName field in the report (this option selects one interface).
- The interface name of an OSAENTA trace interface, which is EZANTA*portname*, where the *portname* value is the name that is specified on the PORTNAME keyword in the TRLE for the OSA-Express port that is being traced (this option selects one interface).
- The port name of an OSA-Express feature in QDIO mode, where the port name is the name that is specified on the PORTNAME keyword in the TRLE (this option selects all interfaces that are associated with the OSA-Express port, including an OSAENTA trace interface).
- The name of a HiperSockets TRLE. This option selects all interfaces that are associated with the HiperSockets TRLE.

Restriction:

- The INTFName/-K filter value does not support wildcard characters.
- The INTFName/-K filter value does not display information for a device that does not have a link defined.
- The INTFName/-K filter is not supported for the report if the PNETID modifier is specified.

SMCID/-U smcid
Filter the output of the DEvlinks/-d report by using the specified Shared Memory Communications over Remote Direct Memory Access (SMC-R) link, SMC-R link group, or Shared Memory Communications - Direct Memory Access (SMC-D) link identifier *smcid*. You can enter one filter value at a time.

- If the filter value is an SMC-R link ID, then the report shows details about that SMC-R link and information about the SMC-R link group to which that link belongs.
- If the filter value is an SMC-R link group ID, then the report shows details about all SMC-R links in the link group and information about the SMC-R link group.
- If the filter value is an SMC-D link ID, then the report shows details about that SMC-D link.
- If the filter value is an asterisk (*), then the report provides the same information that the SMC modifier provides.

Rule: If you specify the SMCID/-U filter on the command, the report is generated as if the SMC modifier was also specified. The report includes detailed information about the SMC-R link or SMC-D link that *smcid* defines, regardless of whether the SMC modifier was explicitly coded. Using the SMCID/-U filter with the filter value asterisk (*) is equivalent to using the SMC modifier. The SMCID/-U filter is not supported for the report if the PNETID modifier is specified.

Command syntax examples
From TSO environment

NETSTAT DEVLINKS
Displays the information about devices and defined interfaces or links in the default
TCP/IP address space.

NETSTAT DEVLINKS TCP TCPCS6
Displays the information about devices and defined interfaces or links in the TCPCS6
TCP/IP address space.

NETSTAT DEVLINKS SMC
Displays additional SMC-D information about ISM interfaces, and SMC-R information about
RNIC interfaces.

NETSTAT DEVLINKS PNEDID NETID1
Displays the information about interfaces with a PNEDID value of NETID1.

NETSTAT DEVLINKS TCP TCPCS8 (INTFNAME OSAQDIOLINK
Display the information for the OSAQDIOLINK in the TCPCS8 TCP/IP address space.

From UNIX shell environment

netstat -d
netstat -d -p tcpcs6
netstat -d SMC
netstat -d PNEDID NETID1
netstat -d -p tcpcs8 -K OSAQDIOLINK

Report examples

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat
command displays the data in the same format as the TSO NETSTAT command.

- **Mac:** *
- **VLANid:** *
- **ETHType:** *
- **IPAddr:** *
- **Protocol:** *
- **PortNum:** *
Report field descriptions

DevName
The device name that is configured on the DEVICE statement.

DevType
The device type that is configured on the DEVICE statement.

DevNum
The device number that is configured on the DEVICE statement. This field is significant only for device types CTC, CLAW, LCS, and CDLC.

DevStatus
The device status. You can use this field if you are having activation problems with the device or interface. Table 13 on page 414 describes the possible status values:

<table>
<thead>
<tr>
<th>Device status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starting</td>
<td>A START of the device has been issued by the operator, and TCP/IP has sent an Activation request to the Data Link Control (DLC) layer.</td>
</tr>
<tr>
<td>Sent SETUP</td>
<td>DLC has acknowledged the TCP/IP Activation request, and TCP/IP has requested DLC to perform the initial I/O sequence with the device.</td>
</tr>
<tr>
<td>Enabling</td>
<td>DLC has acknowledged the TCP/IP Activation request, and TCP/IP has requested DLC to allow data connections to be established for the device.</td>
</tr>
<tr>
<td>Connecting</td>
<td>DLC has accepted the Initial I/O Sequence request.</td>
</tr>
<tr>
<td>Connecting2</td>
<td>The control connection for a CLAW device has been established, and the second connection (on which IP traffic is carried) is being established.</td>
</tr>
<tr>
<td>Negotiating</td>
<td>The initial I/O sequence with the device is complete, and TCP/IP is performing additional link-layer initialization.</td>
</tr>
<tr>
<td>Ready</td>
<td>The initialization sequence with the device is complete. The device is now ready.</td>
</tr>
<tr>
<td>Deactivating</td>
<td>DLC has performed the first stage of an orderly device deactivation.</td>
</tr>
<tr>
<td>Not active</td>
<td>The device is not active. (The device has never been started, or has been stopped after having been started.)</td>
</tr>
</tbody>
</table>

Configured router status (CfgRouter)
The router attribute (PRIROUTER/SECROUTER/NONROUTER) that is specified on the DEVICE or INTERFACE statement. This field is significant only for MPCIPA devices and for IPAQENET and IPAQENET6 interfaces. This field is not displayed if virtual MAC (VMAC) has been configured.

Actual router status (ActRouter)
The router attribute in effect for the device or interface. It matches the configured router status unless the configured value conflicted with the configured value of another stack that is sharing the adapter. This field is significant only for MPCIPA devices and for IPAQENET and IPAQENET6 interfaces. The router attribute is determined when the device or interface starts. This field is not displayed if virtual MAC (VMAC) has been configured.

Virtual MAC address (VMACAddr)
The virtual local hardware address for this link or interface. This field is significant for the following types of devices:

- An IPAQENET link or interface, or an IPAQENET6 interface, where a virtual MAC address was configured by specifying the VMAC parameter. The value n/a is displayed if VMAC was configured but a virtual MAC address was not configured.
• An RNIC interface that is created when an IPAQENET or IPAQENET6 interface specified SMCR. The VMAC address is provided by VTAM, and is not configured on the INTERFACE profile statement. VMACAddr is displayed for active RNIC interfaces only.

**Virtual MAC origin (VMACOrigin)**
Displays whether the virtual MAC address (VMACAddr) was configured on the LINK or INTERFACE statement, or was generated by OSA-Express. This field is significant only for IPAQENET links or interfaces and for IPAQENET6 interfaces for which virtual MAC (VMAC) has been configured. The following list shows the possible values:

- **Cfg**
  The virtual MAC address is configured on the LINK statement or on the INTERFACE statement.

- **OSA**
  The virtual MAC address has been generated by OSA-Express.

**Virtual MAC router status (VMACRouter)**
Displays the virtual MAC router attribute that was specified on the LINK or INTERFACE statement using the ROUTEALL or ROUTELCL keywords. This field is significant only for IPAQENET links or interfaces and for IPAQENET6 interfaces for which virtual MAC (VMAC) has been configured. See OSA Routing information in the z/OS Communications Server: IP Configuration Guide for more information about Virtual MAC router attributes. The following list shows the possible values:

- **All**
  Corresponds to the ROUTEALL keyword. Indicates that all IP traffic destined to the Virtual MAC is forwarded by the OSA-Express device to the TCP/IP stack.

- **Local**
  Corresponds to the ROUTELCL keyword. Indicates that only traffic destined to the Virtual MAC whose destination IP address is registered with the OSA-Express device by this TCP/IP stack is forwarded by the OSA-Express device.

**Configured packing status (CfgPacking)**
This field is the packing attribute (Packed/None) specified on the DEVICE statement. This field is significant only for CLAW devices.

**Actual packing status (ActPacking)**
This field indicates the packing attribute in effect for the device. It will match the configured packing status unless packing was requested and the device does not support packing. This field is significant only for a CLAW device and is determined when the device starts.

**LnkName/IntfName**
This field is the link name or the interface name of the particular device or interface being displayed. If the device or interface is configured, this field is the link name configured in the LINK statement or the interface name configured in the INTERFACE statement. If the link name or interface name is dynamically generated by the TCP/IP stack, this field is the dynamically generated link name or interface name.

**LnkType/IntfType**
This field is the link type or the interface type of the particular device or interface being displayed. If the device or interface is configured, this field is the link type configured in the LINK statement or the interface type configured in the INTERFACE statement. If the link type or interface type is dynamically generated by the TCP/IP stack, this field is the dynamically generated link type or interface type.

**LnkStatus/IntfStatus**
This field is the link or interface status. The following list describes the possible link or interface status values:

<table>
<thead>
<tr>
<th>Link/Interface status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ready</td>
<td>A START of the device/interface has been issued by the operator, and TCP/IP has been sent an Activation request to the Data Link Control (DLC) layer.</td>
</tr>
<tr>
<td>Link/Interface status</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Not Active            | The link or interface is not active. There is no command to start a link; link activation is normally performed during START device processing. Interface activation is performed during START interface processing. A link or interface is marked Not Active when:  
  • The device or interface has not yet been started.  
  • A failure has been encountered during the link or interface activation phase. (Such a failure produces an error message to the operator console, indicating the cause.) |
| DAD Pend              | Duplicate Address Detection (DAD) for the link-local address is in progress on the IPv6 interface. |

**PortName**
The name of the OSA-Express port. This is the value that was specified on the PORTNAME parameter on the INTERFACE statement. This field is significant only for IPAQENET and IPAQENET6 interfaces.

**Datapath**
The subchannel address that is associated with the TRLE definition. This value is one of the addresses that was specified on the DATAPATH parameter on the TRLE definition and is the subchannel address that VTAM assigned to this interface. If VTAM has not yet assigned a subchannel address to this interface, then this field contains the value Unknown. This field is significant only for IPAQENET, IPAQIDIO, IPAQENET6, IPAQIDIO6, IPAQIQDC, and IPAQIQDC6 interfaces.

**DatapathStatus**
The datapath status. This field is significant only for IPAQENET, IPAQIDIO, IPAQENET6, IPAQIDIO6, IPAQIQDC, and IPAQIQDC6 interfaces. This field contains information that is useful if the interface is not activating correctly. See Table 13 on page 414 for possible status values.

**CHPIDType**
The CHPID type that is associated with this interface. This value was specified on the CHPIDTYPE parameter on the INTERFACE statement (or was generated by the stack) for OSA-Express QDIO interfaces. This field is significant only for IPAQENET, IPAQENET6, IPAQIQDC, and IPAQIQDC6 interfaces. The possible values and meanings are:

- **IQD**  
  A CHPID with connectivity to an internal HiperSockets network

- **OSD**  
  A CHPID with connectivity to the external data network

- **OSX**  
  A CHPID with connectivity to the intra ensemble data network

- **OSM**  
  A CHPID with connectivity to the intra node management network

**IPAddr**
The IP address and optional number of bits (leftmost significant bits), which identifies the subnet mask of the interface. This value was specified on the IPADDR parameter on the INTERFACE statement. This field is significant for IPAQENET interfaces only. If the interface is defined with the TEMPIP keyword, the IP address is 0.0.0.0.

**CHPID**
The CHPID value that is associated with this interface. For HiperSockets, this value was specified on the CHPID parameter on the INTERFACE statement for predefined HiperSockets interfaces or is the value obtained from VTAM for HiperSockets interfaces that are created by dynamic XCF definitions. For OSA-Express QDIO interfaces that are configured with CHPIDTYPE OSX, this value was specified on the CHPID parameter. For IPAQIQDC or IPAQIQDC6 interfaces, this value was defined in HCD and learned by VTAM during dynamic IQDC TRLE generation. This field is significant only for IPAQIDIO, IPAQIDIO6, IPAQENET, IPAQENET6, IPAQIQDC, or IPAQIQDC6 interfaces.
SMCR
Indicates whether this interface can be used for new TCP connections for Shared Memory Communications over Remote Direct Memory Access (SMC-R) for external data network communications. This value was specified on the SMCR or NOSMCR parameter on the INTERFACE statement for OSA-Express QDIO interfaces. This field is significant only for IPAQENET and IPAQENET6 interfaces. The possible values and meanings are:

YES
Indicates that this interface can be used for new TCP connections to communicate with other stacks on the external data network by using SMC-R.

For an inactive interface, Yes means the interface is configured for SMC-R. An interface is configured for SMC-R when the SMCR parameter was specified on the INTERFACE statement or is in effect by default.

For an active interface, Yes means the interface is enabled for SMC-R. An interface is enabled for SMC-R when the following conditions are true:

• The SMCR parameter was specified on the INTERFACE statement or is in effect by default.
• The TCP/IP stack is enabled for SMC-R. A TCP/IP stack is enabled for SMC-R when the SMCR parameter was specified on the GLOBALCONFIG statement.
• A physical network ID value was configured in HCD for this interface.

NO
Indicates that this interface cannot be used for new TCP connections to communicate with other stacks on the external data network by using SMC-R. The NOSMCR parameter was specified on the INTERFACE statement.

Disabled (reason_text)
Indicates that this interface was configured to communicate with other stacks on the external data network by using SMC-R, but SMC-R cannot be used for new TCP connections because of one of the following reasons:

No PNetID
No physical network ID value was configured in HCD for this interface. The physical network ID is learned during interface activation so this reason text is valid only for an active interface.

GLOBALCONFIG NOSMCR
The TCP/IP stack was not enabled for SMC-R.

No Subnet Mask
No subnet mask was configured on the INTERFACE statement for this interface.

SMCD
Indicates whether this interface can be used for new TCP connections for Shared Memory Communications - Direct Memory Access (SMC-D). This value was specified on the SMCD or NOSMCD parameter on the INTERFACE statement for OSA-Express QDIO or HiperSockets interfaces. This field is significant only for IPAQENET, IPAQIDIO, IPAQENET6, and IPAQIDIO6 interfaces. The possible values and meanings are:

YES
Indicates that this interface can be used for new TCP connections to communicate with other stacks by using SMC-D.

For an inactive interface, Yes means the interface is configured for SMC-D. An interface is configured for SMC-D when the SMCD parameter was specified on the INTERFACE statement or is in effect by default.

For an active interface, Yes means the interface is enabled for SMC-D. An interface is enabled for SMC-D when the following conditions are true:

• The SMCD parameter was specified on the INTERFACE statement or is in effect by default.
• The TCP/IP stack is enabled for SMC-D. A TCP/IP stack is enabled for SMC-D when the SMCD parameter was specified on the GLOBALCONFIG statement.
• A physical network ID value was configured in HCD for this interface.

**NO**
Indicates that this interface cannot be used for new TCP connections to communicate with other stacks by using SMC-D. The NOSMCD parameter was specified on the INTERFACE statement.

**Disabled (reason_text)**
Indicates that this interface was configured to communicate with other stacks by using SMC-D, but SMC-D cannot be used for new TCP connections because of one of the following reasons:

**No PNetID**
No physical network ID value was configured in HCD for this interface. The physical network ID is learned during interface activation so this reason text is valid only for an active interface.

**GLOBALCONFIG NOSMCD**
The TCP/IP stack was not enabled for SMC-D.

**No Subnet Mask**
No subnet mask was configured on the INTERFACE statement for this interface.

**PNetID MisConfig**
The PNetID configured in HCD for this OSD interface matches the PNetID learned for a HiperSockets interface, or the PNetID configured in HCD for this HiperSockets interface matches the PNetID learned for an OSD interface. To use SMC-D, OSD interfaces must be configured on different PNetIDs from HiperSockets interfaces. The PNetID is learned during interface activation so this reason text is valid only for an active interface.

**PFID**
The Peripheral Component Interconnect Express (PCIe) function ID (PFID) value that defines a "RoCE Express" feature or an internal shared memory (ISM) device.

• For a "RoCE Express" feature, this value is specified on the SMCR PFID parameter of the GLOBALCONFIG TCP/IP profile statement. This field is significant only for RNIC interfaces that are created when an IPAQENET or IPAQENET6 interface specifies SMCR or takes SMCR as the default setting.

• For an ISM device, this value is learned dynamically during ISM device activation and is provided by VTAM to the TCP/IP stack. This field is significant only for ISM interfaces that are created when an IPAQENET, IPAQIDIO, IPAQENET6, or IPAQIDIO6 interface specifies SMCD or takes SMCD as the default setting.

**PortNum**
Specifies the port number that is used for the associated PFID.

• When PFID represents an IBM 10 GbE RoCE Express feature, the PortNum value is specified with the PFID value on the SMCR parameter of the GLOBALCONFIG statement in the TCP/IP profile.

• When PFID represents a RoCE Express2 feature, the PortNum value is the port number configured for the PFID in the Hardware Configuration Definition (HCD). The port number is learned by VTAM during activation of the PFID and might be different from the value coded for PORTNUM for this PFID on the GLOBALCONFIG SMCR statement.

**PNetID**
The physical network ID value that is configured in HCD for an interface. This field is significant only for IPAQIDIO or IPAQENET interfaces defined by using the INTERFACE statement, IPAQIDIO6 interfaces, IPAQENET6 interfaces, IPAQIQDC interfaces, IPAQIQDC6 interfaces, and active RNIC and ISM interfaces.

<table>
<thead>
<tr>
<th>Interface</th>
<th>Value</th>
</tr>
</thead>
</table>
| Active OSD interfaces | • If a physical network ID is configured in HCD for the OSD interface, the configured value is displayed.  
|                     | • If no physical network ID is configured in HCD for the OSD interface, the value "None" is displayed. If the OSD interface is configured to use SMCR, a |
Interface | Value
--- | ---
value of Disabled (No PNetID) is displayed in the SMCR field. If the OSD interface is configured to use SMCD, a value of Disabled (No PNetID) is displayed in the SMCD field.

Active OSX interfaces | The reserved value IEDN is used.

Active HiperSockets interfaces | • If a physical network ID is configured in HCD for the HiperSockets interface, the configured value is displayed.
• If no physical network ID is configured in HCD for the HiperSockets interface, the value *None* is displayed. If the HiperSockets interface is configured to use SMCD, a value of Disabled (No PNetID) is displayed in the SMCD field.

Active ISM interfaces | The value that is configured in HCD for the ISM interface is displayed. If no value is configured in HCD, activation of the ISM interface fails.

Active RNIC interfaces | The value that is configured in HCD for the RNIC interface is displayed. If no value is configured in HCD, activation of the RNIC interface fails.

TRLE
The name of the TRLE that is associated with this interface. This field is significant only for MPCPTP6, IPAQIDIO, IPAQIDIO6, IPAAQENET, IPAQENET6, IPAQIQDC, IPAQIQDC6, ISM and RNIC interfaces.

For MPCPTP6 interfaces
This value was specified on the TRLE parameter of the INTERFACE statement for predefined MPC interfaces or is the value obtained from VTAM for MPC interfaces that are created by dynamic XCF definitions.

For IPAQIDIO or IPAQIDIO6 interfaces
This value is obtained from VTAM for IPAQIDIO, IPAQIDIO6, IPAAQENET, or IPAQENET6 interfaces that INTERFACE definitions create. This value is displayed for active interfaces only.

For IPAAQENET and IPAAQENET6 interfaces
This value is the name of the TRLE that was statically defined to be used for this interface.

For IPAQIQDC and IPAQIQDC6 interfaces
This value is obtained from VTAM for IQDC interfaces that are created dynamically during activation of IPAAQENET or IPAAQENET6 interfaces when AUTOIQDC is specified. This value is displayed for active interfaces only.

For ISM interfaces
This value is obtained from VTAM for ISM interfaces that are created dynamically during activation of IPAAQENET, IPAQIDIO, IPAQENET6, or IPAQIDIO6 interfaces that specify SMCD or take SMCD as the default setting when SMC-D is enabled. This value is displayed only when the PFIDStatus value of the interface is Starting or Ready.

For RNIC interfaces
This value is obtained from VTAM for RNIC interfaces that are created for PFIDs configured on the GLOBALCONFIG statement when SMC-R is enabled. This value is displayed only when the PFIDStatus value of the interface is Starting or Ready.

PFIDStatus
This field is the RNIC or ISM interface PFID status. The following list describes several status values:

<table>
<thead>
<tr>
<th>PFID status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ready</td>
<td>The initialization sequence with the PFID is complete. The PFID is ready.</td>
</tr>
<tr>
<td>Not Active</td>
<td>The PFID is not active. The PFID has never been started, or has been stopped after having been started.</td>
</tr>
</tbody>
</table>
### PFID status

<table>
<thead>
<tr>
<th>PFID status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starting</td>
<td>A START command of the PFID has been issued, and TCP/IP has sent an Activation request to the Data Link Control (DLC) layer.</td>
</tr>
<tr>
<td>Deactivating</td>
<td>DLC has performed the first stage of an orderly PFID deactivation.</td>
</tr>
</tbody>
</table>

### GidAddr

The group identifier (GID) value that is associated with the RNIC or ISM interface.

- When SMC-R is enabled, this value is obtained from VTAM for RNIC interfaces that are created for PFIDs configured on the GLOBALCONFIG statement when SMC-R is enabled. This value is displayed for active RNIC interfaces only.
- When SMC-D is enabled, this value is obtained from VTAM for ISM interfaces that are created for SMC-D processing. This value is displayed for active ISM interfaces only.

### NetNum

The adapter number that was specified on the LINK statement. This field is significant only for CTC and LCS links.

### QueSize

The queue size represents the number of outbound packets for this link or interface that are queued and waiting for ARP or neighbor resolution. This field is significant only for links on ATM and LCS devices and for IPAQENET6 interfaces.

### Speed

Indicates the interface speed (in million bits per second) that is reported by the device. This field is significant only for IPAQENET links or interfaces, ATM and IPAQTR links, IPAQENET6 interfaces, and RNIC interfaces, and only if the link or interface is active.

### Gen

Indicates the generation level for the “RoCE Express” feature, and is significant only if the interface is active. Possible values are:

- **RoCE Express**
  - The feature is an IBM 10 GbE RoCE Express feature.
- **RoCE Express2**
  - The feature is a RoCE Express2 feature.

### MAC address order (MacAddrOrder)

Indicates the canonical option (CANON/NONCANON) that is specified on the LINK statement. This field is significant only for token-ring links.

### SrBridgingCapability

Indicates whether the link supports source route bridging. This field is significant only for token-ring links.

### IpBroadcastCapability

Indicates whether the link is broadcast capable. This field is significant only for links on LCS and MPCIPA devices and IPAQENET interfaces.

### ArpBroadcastType

Indicates the ARP broadcast option (ALLRINGSBCAST/LOCALBCAST) that is specified on the LINK statement. This field is significant only for token-ring links.

### ArpOffload

Indicates whether ARP processing is being offloaded to the adapter. This field is significant only for active links that support ARP offload.

### ArpOffloadInfo

Indicates whether the adapter reports ARP offload data to TCP/IP. If so, then the ARP cache data can be displayed with the Netstat ARP/-R report even though the ARP function is being offloaded. This field is significant only for active links that support ARP offload.
Routing Parameters
This section displays routing information for IPv4 links that are defined with the DEVICE and LINK profile statements.

MTU Size
This value is determined in one of the following ways:

- If you are using OMPROUTE and the link is defined to OMPROUTE, the value might have been specified on the MTU parameter on the OSPF_INTERFACE, RIP_INTERFACE, or INTERFACE statement for the link. If one of these OMPROUTE statements was specified for the link but the MTU parameter was not specified, OMPROUTE sets the MTU Size value to 576.
- If you are using OMPROUTE, the link is not defined to OMPROUTE, and OMPROUTE is not configured to ignore undefined links, OMPROUTE sets the MTU Size value to 576.
- If you are not using OMPROUTE (or if the link is not defined to OMPROUTE), OMPROUTE is configured to ignore undefined links, and a BSDROUTINGPARMS profile statement was specified for the link, then the MTU Size value is configured using the BSDROUTINGPARMS profile statement MTU parameter.
- If none of the previously described methods provides an MTU Size value or if the MTU Size parameter does not apply to this link, then the value n/a is displayed.

To determine the MTU Size value that is being used by the stack for a link, see the ActMtu field for the link. To determine the MTU Size value that is being used for a route over this link, see the MTU field on the Netstat ROUTe/-r report.

Metric
The routing metric that is associated with the link. This value is determined in one of the following ways:

- If you use OMPROUTE and the link is defined to OMPROUTE using the OSPF_INTERFACE statement, then the Metric value is configured using the Cost0 parameter on the OSPF_INTERFACE statement. If the Cost0 parameter is not specified, then OMPROUTE sets the value to 1.
- If you use OMPROUTE and the link is defined to OMPROUTE using the RIP_INTERFACE statement, then the Metric value is configured using the In_Metric parameter on the RIP_INTERFACE statement. If the In_Metric parameter is not specified, then OMPROUTE sets the value to 1.
- If you use OMPROUTE and the link is defined to OMPROUTE using the INTERFACE statement or if the link is not defined to OMPROUTE and OMPROUTE is not configured to ignore undefined links, then OMPROUTE sets the Metric value to 0.
- If you are not using OMPROUTE (or if the link is not defined to OMPROUTE) and OMPROUTE is configured to ignore undefined links, the Metric value is configured in one of the following ways:
  - For dynamic XCF links, the Metric value is configured using the cost_metric value of the DYNAMICXCF parameter on the IPCONFIG profile statement.
  - If a BSDROUTINGPARMS profile statement was specified for the link, the Metric value is configured using the cost Metric parameter of BSDROUTINGPARMS profile statement.
- If none of the previously described methods provided a Metric value, the stack sets the value to 0

DestAddr
The destination address applies to point-to-point links only and is the IP Address of the other side of the point-to-point link. This value is determined in one of the following ways:

- If you are using OMPROUTE and the link is defined to OMPROUTE, then the value is configured using the Destination_Addr parameter on the OSPF_INTERFACE, RIP_INTERFACE, or INTERFACE statement. If the Destination_Addr parameter is not specified, then OMPROUTE sets the value to 0.
- If you are using OMPROUTE but the link is not defined to OMPROUTE and OMPROUTE is not configured to ignore undefined links, then OMPROUTE sets the value to 0.
• If you are not using OMPROUTE (or if the link is not defined to OMPROUTE), OMPROUTE is configured to ignore undefined links, and a BSDROUTINGPARMS profile statement was specified for the link, then the value is configured using the dest_addr parameter for this statement.

• If none of these methods has provided a destination address value, then the stack sets a default value in one of the following ways:
  – For links other than point-to-point links, the value is set to 0.
  – For point-to-point links, the value is set as follows:
    - If routes are defined over the link, then the stack sets the value using the gateway address of an indirect route or the destination address of a direct host route.
    - If no routes are defined over the link, then the value is set to 0.

**SubnetMask**

The subnet mask that is associated with the link. This value is determined in one of the following ways:

• If you are using OMPROUTE and the link is defined to OMPROUTE, then the value is configured using the Subnet_Mask parameter on the OSPF_INTERFACE, RIP_INTERFACE, or INTERFACE statement.

• If you are using OMPROUTE, the link is not defined to OMPROUTE, and OMPROUTE is not configured to ignore undefined links, then OMPROUTE assigns a value based on the IP address that is assigned to the link.

• If you are not using OMPROUTE (or if the link is not defined to OMPROUTE) and OMPROUTE is configured to ignore undefined links, then the value is assigned in one of the following ways:
  – For dynamic XCF links, the value is configured using the subnet_mask or num_mask_bits value of the DYNAMICXCF parameter on the IPCONFIG profile statement.
  – For dynamic VIPA links, the value is configured using the address_mask parameter on the VIPADEFINE, VIPABACKUP, or the VIPARANGE profile statement.
  – If a BSDROUTINGPARMS profile statement was specified for the link, the value is configured using the subnet_mask parameter for the BSDROUTINGPARMS profile statement.

• If none of the previously described methods provides a subnet mask value, then the stack assigns a value based on the IP address that is assigned to the link.

**Packet trace settings**

Use the PKTTRACE statement to control the packet tracing facility in TCP/IP. You can use this statement to select IP packets as candidates for tracing and subsequent analysis. An IP packet must meet all of the conditions specified on the statement for it to be traced.

**Protocol**

The protocol number from the PROT keyword of the PKTTRACE command or * if not specified.

**TrRecCnt**

The number of packets traced for this PKTTRACE command.

**PckLength**

The value of the ABBREV keyword of the PKTTRACE command or FULL to capture the entire packet.

**SrcPort**

The port number from the SRCPORT parameter of the PKTTRACE command or profile statement. If an asterisk (*) is displayed, then either a port number was not specified for the SRCPORT parameter, or the PORTNUM parameter was also specified. If both the SrcPort and PortNum fields contain a value *, then the IP packets are not being filtered by the source port.

**DestPort**

The port number from the DESTPORT parameter of the PKTTRACE command or profile statement. If an asterisk (*) is displayed, then either a port number was not specified for the DESTPORT parameter, or the PORTNUM parameter was also specified. If both the DestPort and PortNum fields contain an asterisk (*), then the IP packets are not being filtered by destination port.
**PortNum**
The port number from the PORTNUM parameter of the PKTTRACE command or profile statement. If an asterisk (*) is displayed, then either a port number was not specified for the PORTNUM parameter, or the DESTPORT or SRCPORT parameters were also specified. If the PortNum, SrcPort, and DestPort fields all contain an asterisk (*), then the IP packets are not being filtered by port.

**Discard**
The value specified for the PKTTRACE DISCARD parameter. A numerical value is a discard reason code. The value NONE, which is the default, indicates that only packets that were delivered are being traced. The value ALL indicates that only discarded IP packets are being traced. The value asterisk (*) indicates that discarded IP packets and delivered IP packets are being traced.

**IpAddr**
The IP address from the IPADDR keyword of the PKTTRACE command or asterisk (*) if not specified.

**SubNet**
The IP subnet mask from the SUBNET keyword of the PKTTRACE command or asterisk (*) if not specified.

**ATM Specific**
This section contains information about ATM links:

**ATM PortName**
The PORTNAME value specified on the DEVICE statement.

For an ATM link configured as a Permanent Virtual Circuit (PVC), the following additional fields are displayed:

**ATM PVC Name**
The name of the PVC specified on the ATMPVC statement.

**PVC Status**
This field can have the following values:

<table>
<thead>
<tr>
<th>ATM PVC status</th>
<th>Description</th>
</tr>
</thead>
</table>
| Not Active       | The PVC is not active. There is no command to start a PVC; PVC activation is normally attempted during START device processing. A PVC is marked Not Active when:  
|                  | • The device has not yet been started.  
|                  | • The remote side of the PVC is not active.  
|                  | • A failure has been encountered during the PVC activation phase.  
|                  | (Such a failure produces an error message to the operator.)  |
| Ready            | The initialization sequence for the PVC is complete. The PVC is now ready for use.                                                         |

For an ATM link configured as a Switched Virtual Circuit (SVC), the following additional fields are displayed:

**ATM LIS Name**
The name of the ATM Logical IP Subnet (LIS) specified on the ATMLIS statement.

**SubnetValue**
The subnet_value specified on the ATMLIS statement.

**SubnetMask**
The subnet_mask specified on the ATMLIS statement.

**DefaultMTU**
The DFLTMTU value specified on the ATMLIS statement.
InactvTimeOut
The INACTVTO value specified on the ATMLIS statement.

MinHoldTime
The MINHOLD value specified on the ATMLIS statement.

MaxCalls
The maximum number of SVCs that can be active for this ATMLIS.

CachEntryAge
The CEAGE value specified on the ATMLIS statement.

ATMArpReTry
The ARPRETRIES value specified on the ATMLIS statement.

ATMArpTimeOut
The ARPTO value specified on the ATMLIS statement.

PeakCellRate
The PEAKCR value specified on the ATMLIS statement.

NumOfSVCs
The number of currently active SVCs for this ATMLIS.

BearerClass
The BEARERCLASS value specified on the ATMLIS statement.

For an ATM SVC link that is configured with an ATM ARP server, the following additional fields are displayed:

ATMARPSV Name
The name of the ATM ARP server specified on the ATMARPSV statement.

VcType
Indicates whether the ATM ARP server connection is a PVC or an SVC. This value comes from the ATMARPSV statement.

ATMaddrType
The ATM address type specified on the ATMARPSV statement. The only supported value is NSAP.

ATMaddr
The ATM address of the ATM ARP server. If the connection to the ATM ARP server is an SVC, then this is the physical_addr value specified on the ATMARPSV statement. For a PVC connection to the ATM ARP server, this is the remote ATM address learned by TCP/IP when the PVC was activated.

IpAddr
The IP address of the ATM ARP server. If the connection to the ATM ARP server is an SVC, then this is the ip_addr value specified on the ATMARPSV statement. For a PVC connection to the ATM ARP server, this is the remote IP address learned by TCP/IP when the PVC was activated.

Multicast Specific
This section displays multicast information for the link or interface.

Multicast Capability
Indicates whether the link or interface is multicast capable.

• For point-to-point interfaces, the value of this field is always Yes.
• For LCS and MPCIIPA links and IPAQENET, IPAQENET6, IPAQIDIO, and IPAQIDIO6 interfaces, the multicast capability is known only after the link or interface is active. If the link or interface is not active, the multicast capability value is Unknown.
• For IPAQIQDX6 interfaces, the value of this field is always ND only, the interface is multicast capable but multicast processing is used only for neighbor discovery.

If the link or interface is multicast capable then the following additional fields are displayed for each multicast group for which the link or interface is receiving data. There is no limit to the number of multicast groups for which a link or interface can receive data. For IPAQIQDX6 interfaces, the multicast groups indicate only neighbor discovery processing.
Group
The multicast group address for which this link or interface is receiving data.

RefCnt
The number of applications that are receiving data for this multicast group.

SrcFltMd
The source filter mode indicates the type of multicast source IP address filtering that has been configured at the interface. Source IP address filtering can be done by either an IGMPv3 or MLDv2-capable multicast router on a per interface basis or by the host on a per socket basis. The host provides its source filter mode and source IP address filter list for each multicast group that an application has joined on the interface with any IGMPv3 and MLDv2-capable multicast routers that are connected to the interface. This permits IGMPv3-capable and MLDv2-capable multicast routers to send only multicast packets that have been requested by at least one host on the subnet to which the interface is connected. If the multicast packets are not filtered by an IGMPv3-capable or MLDv2-capable multicast router (for example the router does not support IGMPv3 or MLDv2), or if there are multiple hosts on the local area network that have either a different source filter mode or a different source IP address filter list for a given multicast group, the host uses the source IP address filter information to ensure that each application receives only packets that it has requested.

The value is either Include or Exclude. A source filter applies only to incoming multicast data. The source filter applies to all the IP addresses in the SrcAddr fields for the associated multicast group address and the link or the interface. The source filter mode and the corresponding source filter IP addresses are configured by applications for their UDP or RAW sockets that have joined the multicast group for this interface. See the information about Designing multicast programs in the z/OS Communications Server: IP Sockets Application Programming Interface Guide and Reference for details about how applications configure these values for a socket.

Include
Indicates that the interface or link receives only multicast datagrams that have a source IP address that matches an IP address indicated in the SrcAddr field.

Exclude
Indicates either that the source filter function is not active or that the interface or link receives only multicast datagrams that have a source IP address that does not match an IP address indicated in the SrcAddr field. If the source filter function is not active or if the source filter function is active but no SrcAddr value is set, the SrcAddr field contains the value None.

SrcAddr
Source address information for the socket.

ipaddr
The source IP address that is used in conjunction with the SrcFltMd value to determine which incoming multicast datagrams are received by the interface.

None
This value is displayed only when the source filter function is not configured for the interface or when the source filter mode is Exclude but there was no intersection of excluded source IP addresses among the sockets for the same multicast group address and interface.

Source VIPA interface (SrcVipaIntf)
The name of the VIPA that is used for this interface if source VIPA is in effect. This is the value that was specified on the SOURCEVIPAINTEGER parameter on the INTERFACE statement. This field is significant only for IPAQENET, IPAQENET6, IPAQIDIO6, and MPCPTP6 interfaces.

Duplicate address detection (DupAddrDet)
The DUPADDRDET value specified on the INTERFACE statement. This field is significant only for IPAQENET6 interfaces.

Interface ID (IntfID)
The INTFID value specified on the INTERFACE statement. This field is significant only for IPAQENET6, IPAQIDIO6, and MPCPTP6 interfaces.
**MAC address (MacAddress)**
The local hardware address for this link or interface. This field is significant only for links on LCS devices and for IPAQENET6 interfaces. This field is displayed only if the link or interface is active and if virtual MAC (VMAC) is not configured.

**Router Hop Limit (RtrHopLimit)**
The value that is placed in the Hop Count field of the IP header for outgoing IP packets. This value was obtained from a received router advertisement and is significant only for IPAQENET6 interfaces. This field is displayed only when a nonzero hop limit value was received in a router advertisement over this interface and IGNOREROUTERHOPLIMIT is not configured on the IPCONFIG6 profile statement.

**CfgMtu**
The MTU value that was configured on the INTERFACE statement (or None if an MTU value was not configured). This field is significant only for IPAQNET, IPAQENET6, or IPAQIDIO interfaces.

**ActMtu**
The largest MTU that is supported by an active link or interface. If the link or interface is inactive, then this field displays Unknown. This field is significant for all links and interfaces except virtual ones.

**VLANid**
This field is significant only for IPAQENET links or interfaces, IPAQIDIO links, or IPAQENET6 and IPAQIDIO6 interfaces. This field indicates whether a virtual LAN ID was configured on the VLANID parameter on the LINK or INTERFACE profile statement. The following values can be displayed in this field:

- **None**
  This value indicates that the VLANID parameter was not specified on the LINK or INTERFACE profile statement for the interface. For an IPAQIDIO link or IPAQIDIO6 interface that is dynamically generated as part of dynamic XCF HiperSockets processing, this value indicates that the IQDVLANID parameter was not specified on the GLOBALCONFIG profile statement.

- **n/a**
  This value indicates that the VLANID parameter was specified on the LINK or INTERFACE profile statement, but the interface does not support VLAN IDs.

- **vlanid**
  If an OSA-Express device is active and supports virtual LAN IDs, this field indicates that all IP packets through this OSA-Express link or interface from this stack are being tagged with this VLAN ID. For an active HiperSockets link or interface that supports virtual LAN IDs, this field indicates that all IP packets through this HiperSockets link or interface from this stack are associated with this VLAN ID.

**VLANpriority**
This field is significant only for active IPAQENET links or interfaces or IPAQENET6 interfaces. This field indicates whether all IP packets through this OSA-Express link or interface from this stack are being tagged with a VLAN priority. The possible values are:

- **Enabled**
  Indicates that all IP packets through this OSA-Express link or interface are being tagged with a VLAN priority. See z/OS Communications Server: IP Configuration Reference for information about the SetSubnetPrioTosMask statement and details about how to configure VLAN priorities.

- **Disabled**
  Indicates that the OSA-Express link or interface supports VLAN priority, but currently no VLAN priority values are defined. If the VLANid field displays None or n/a, all IP packets through this OSA-Express link or interface are not VLAN tagged. All other values indicate that all IP packets are VLAN tagged, but only with VLAN IDs, not with VLAN priority.

- **Unknown**
  Indicates that the VLAN priority tagging support for the OSA-Express is unknown because the link or interface is not yet active.
DynVLANRegCfg
This field is significant only for IPAQENET links or interfaces and IPAQENET6 interfaces. This field is displayed only under the following conditions:

• The link or interface is not yet active and a VLAN ID was specified.
• The link or interface is active, a VLAN ID value was specified, and the OSA-Express feature has accepted the VLAN ID value.

This field indicates whether dynamic VLAN ID registration was configured on the LINK or INTERFACE statement. The possible values are:

Yes
Indicates that the DYNVLANREG parameter was specified on the LINK or INTERFACE statement.

No
Indicates that the NODYNVLANREG parameter was specified on the LINK or INTERFACE statement or is in effect by default.

DynVLANRegCap
This field indicates whether the OSA-Express feature that is represented by the LINK or INTERFACE statement is capable of supporting dynamic VLAN ID registration.

This field is significant only for IPAQENET links or interfaces and IPAQENET6 interfaces. This field is displayed only under the following conditions:

• The link or interface is not yet active and a VLAN ID was specified.
• The link or interface is active, a VLAN ID value was specified, and the OSA-Express feature has accepted the VLAN ID value.

The possible values are:

Yes
Indicates that the OSA-Express feature is capable of supporting dynamic VLAN ID registration.

No
Indicates that the OSA-Express feature is not capable of supporting dynamic VLAN ID registration.

Unknown
Indicates that the dynamic VLAN ID registration capability of the OSA-Express feature is unknown because the link or interface is not yet active.

ChecksumOffload
This field is significant only for active IPAQENET and IPAQENET6 links or interfaces. This field indicates whether the checksum offload support is in effect and is displayed only when the link or interface is active. The possible values are:

Yes
Indicates that the checksum offload function is enabled on the adapter for this interface.

No
Indicates that the checksum offload function is not enabled on the adapter for this interface.

Unsupported
Indicates that the checksum offload function is not supported on the adapter for this interface.

SegmentationOffload
This field is significant only for active IPAQENET and IPAQENET6 links or interfaces. This field indicates whether the TCP segmentation offload support is in effect and is displayed only when the link or interface is active. Possible values are:

Yes
Indicates that the segmentation offload function is enabled on the adapter for this interface.

No
Indicates that the segmentation offload function is not enabled on the adapter for this interface.
Unsupported
Indicates that the segmentation offload function is not supported on the adapter for this interface.

SecClass
This field identifies the security class value for IP filtering. This field applies to all IPv4 and IPv6 interfaces except virtual and loopback, but the value is in effect only if the IPSec function is active for the applicable IP version. You can use the Netstat CONFIG/-f command to determine whether IPSec is active. Valid security class values are in the range 1 - 255. The displayed value was defined by one of the following methods:

- By the SECCLASS parameter on the LINK or INTERFACE profile statement
- For dynamic XCF interfaces, by the DYNAMICXCF SECCLASS subparameter on the IPCONFIG or IPCONFIG6 profile statement
- For OSM interfaces, by the TCP/IP stack's automatic configuration of the interface, or by the IPSECURITY OSMSECCLASS subparameter on the IPCONFIG6 profile statement

MonSysplex
Indicates whether the status of this link or interface is being monitored by Sysplex Autonomics. This field is significant for all IPv4 links or interfaces except virtual, loopback, and all dynamically configured links, and for all IPv6 interfaces except virtual, loopback, and all dynamically configured interfaces.

Yes
Indicates that the status of this link or interface is being monitored by Sysplex Autonomics. It is configured by specifying the MONSYSPLEX keyword on the LINK or INTERFACE profile statement and specifying the MONINTERFACE keyword for the SYSPLEXMONITOR parameter on the GLOBALCONFIG profile statement. If DYNROUTE keyword is also coded on the GLOBALCONFIG SYSPLEXMONITOR profile statement, then the presence of dynamic routes over this link or interface is also monitored.

Configured
Indicates that this link or interface was configured to be monitored by Sysplex Autonomics. It was configured by specifying the MONSYSPLEX keyword on the LINK or INTERFACE profile statement, but the link or interface is not currently being monitored because the MONINTERFACE keyword was not specified on the SYSPLEXMONITOR parameter on the GLOBALCONFIG profile statement.

No
Indicates that the status of this link or interface is not being monitored by Sysplex Autonomics because the MONSYSPLEX keyword was not specified on the LINK or INTERFACE profile statement.

Isolate
This field is significant only for IPAQENET interfaces (defined using the INTERFACE statement) and for IPAQENET6 interfaces. This field indicates whether the OSA-Express device is prevented from routing packets directly to another stack that is sharing the OSA-Express connection. For more details, see OSA-Express connection isolation information in z/OS Communications Server: IP Configuration Guide.

No
Indicates that this interface is eligible for OSA-Express direct routing. Therefore, the OSA-Express device can route packets directly to another stack that is sharing the OSA-Express connection (as long as the interface from the other stack is also eligible for direct routing).

Yes
Indicates that this interface is not eligible for OSA-Express direct routing. Therefore, the OSA-Express device cannot routing packets directly to another stack that is sharing the OSA-Express connection.

OptLatencyMode
This field is significant only for IPAQENET interfaces (defined using the INTERFACE statement) and for IPAQENET6 interfaces. The field indicates whether optimized latency mode (OLM) was configured for this OSA-Express interface. For more information about optimized latency mode, see optimized
latency mode information in z/OS Communications Server: IP Configuration Guide. Possible values are:

No
Indicates that the OSA-Express interface is not configured with optimized latency mode.

Yes
Indicates that the OSA-Express interface is configured with optimized latency mode. Optimized latency mode optimizes interrupt processing for both inbound and outbound data.

Disabled
Indicates that the OSA-Express interface was configured with optimized latency mode, but the function could not be enabled when the interface was activated. The most likely reason is that the OSA-Express interface does not support this function.

IQDMultiWrite
This field is significant only for active HiperSockets devices or interfaces. This field indicates whether the HiperSockets multiple write facility is currently being used for the device or interface. To configure the stack to use the HiperSockets multiple write facility, specify the IQDMULTIWRITE parameter on the GLOBALCONFIG profile statement. The possible values are:

Enabled
Indicates that the HiperSockets multiple write facility is currently being used for the device or interface.

Enabled (ZIIP)
Indicates that the HiperSockets multiple write facility is currently being used for the device or interface. Additionally, CPU cycles that are associated with the HiperSockets multiple write facility are to be displaced to an available zIIP.

Disabled
Indicates that the HiperSockets multiple write facility is not currently being used for the device or interface.

Unsupported
Indicates that the IBM Z® environment does not support the HiperSockets multiple write facility.

ReadStorage
This field is significant only for active IPAQNET and IPAQIDIO links or interfaces, IPAQTR links, and for IPAQIDIO6 and IPAQNET6 interfaces. This field indicates the amount of storage (in kilobytes) that is being used for read processing.

InbPerf
This field is significant only for IPAQNET links or interfaces, IPAQTR links, and IPAQNET6 interfaces. This field indicates how frequently the adapter interrupts the host. This field indicates how the processing of inbound traffic is performed. If the interface is not active, then this field shows the configured value. If the interface is active, then this field shows the value that is in effect. The possible values are:

Balanced
Indicates that the adapter is to use a static interrupt-timing value that strikes a balance between MinCPU and MinLatency.

Dynamic
This setting is significant only for IPAQNET links, and IPAQNET and IPAQNET6 interfaces. It indicates that the stack and the adapter are to dynamically update the frequency with which the adapter interrupts the host for inbound traffic.

WorkloadQueueing
This field is displayed only for IPAQNET and IPAQNET6 interfaces. It indicates whether QDIO inbound workload queueing is enabled. Possible values are:

Yes
QDIO inbound workload queueing is in effect. The QDIO interface is defined using the INTERFACE statement with INBPERF DYNAMIC WORKLOADQ specified.
No

QDIO inbound workload queueing is not in effect. The QDIO interface is defined using the INTERFACE statement with INBPERF DYNAMIC or INBPERF DYNAMIC NOWORKLOADQ specified.

Unsupported

QDIO inbound workload queueing was requested on the INTERFACE statement but the OSA-Express interface does not support it. QDIO inbound workload queueing is supported on OSA-Express3 or later features on an IBM System z10 GA3 or later CPC.

MinCPU

Indicates that the adapter is to use a static interrupt-timing value that minimizes host interrupts, and therefore minimizes host CPU consumption.

MinLatency

Indicates that the adapter is to use a static interrupt-timing value that minimizes latency delay by more aggressively presenting received packets to the host.

TempPrefix

This field is significant only for IPAQENET6 interfaces with stateless address autoconfiguration enabled. One or more TempPrefix fields are displayed. Together the TempPrefix fields indicate the set of prefixes for which temporary IPv6 addresses can be generated, if temporary addresses are enabled on the IPCONFIG6 statement. The set of prefixes is specified on the TEMPPREFIX parameter on the INTERFACE statement. The possible values displayed are:

All
IPv6 temporary addresses are generated for all prefixes that are learned from a router advertisement over this interface. This is the default.

Disabled
Autoconfiguration of temporary addresses for the interface is disabled because duplicate addresses were detected. Temporary addresses are not generated for this interface.

None
Temporary addresses are not generated for this interface.

IPv6 prefix/prefix length
IPv6 temporary addresses are generated for all prefixes that are learned from a router advertisement over this interface and that are included in one of the prefixes in this prefix list.

Link/Interface Statistics

This section is significant for all links and interfaces except virtual ones. The following statistical information is displayed:

BytesIn
Number of bytes received over an interface.

Inbound Packets
The number of unicast inbound packets received over an interface. This value applies to all links and interfaces except for RNIC and ISM interfaces.

Inbound Packets In Error
Number of inbound packets discarded because of an error validating the packet. This value applies to all links and interfaces except for RNIC and ISM interfaces.

Inbound Packets Discarded
Number of inbound packets discarded because of an out-of-storage condition. This value applies to all links and interfaces except for RNIC and ISM interfaces.

Inbound Packets With No Protocol
Number of inbound packets discarded because of an unknown protocol type. This value applies to all links and interfaces except for RNIC and ISM interfaces.

BytesOut
Number of bytes transmitted over an interface.
Outbound Packets
The number of unicast outbound packets transmitted over an interface. This value applies to all links and interfaces except for RNIC and ISM interfaces.

Outbound Packets In Error
Number of outbound packets discarded because of errors other than an out-of-storage condition. This value applies to all links and interfaces except for RNIC and ISM interfaces.

Outbound Packets Discarded
Number of outbound packets discarded because of an out-of-storage condition. This value applies to all links and interfaces except for RNIC and ISM interfaces.

Inbound Operations
• For RNIC interfaces, this is the number of Remote Direct Memory Access (RDMA) inbound operations processed across this interface.
• For ISM interfaces, this is the number of Internal Shared Memory inbound operations processed across this interface.

Outbound Operations
• For RNIC interfaces, this is the number of RDMA outbound operations processed across this interface.
• For ISM interfaces, this is the number of Internal Shared Memory outbound operations processed across this interface.

SMC Links
• For RNIC interfaces, this is the current number of SMC-R links between this stack and other stacks across this interface.
• For ISM interfaces, this is the current number of SMC-D links between this stack and other stacks across this interface.

TCP Connections
• For RNIC interfaces, this is the number of TCP connections across all the SMC-R links that are associated with this interface. One or more TCP connections can use the same SMC-R link.
• For ISM interfaces, this is the current number of TCP connections across all the SMC-D links that are associated with this interface. One or more TCP connections can use the same SMC-D link.

Intf Receive Buffer Inuse
• For RNIC interfaces, this is the amount of RMB storage in use by the TCP connections that are using SMC-R links associated with this interface.
• For ISM interfaces, this is the amount of DMB storage in use by the TCP connections that are using SMC-D links associated with this interface.

Device Interrupts
The number of real program controlled interrupts (PCI’s) that the VTAM device interrupt exit fields for the ISM device. A real PCI is a dispatch of the device interrupt exit as a result of a call from the system interrupt handler.

Rule: This value is reset to 0 each time when the interface is deactivated.

IPv4 LAN Group Summary
The IPv4 LAN group summary lists links or interfaces that are takeover candidates for each other. The stack creates a LAN group when it detects redundant connectivity to a LAN. For each link or interface in the LAN group, this summary displays which link or interface owns ARP responsibility for that link or interface. The summary also displays which link or interface owns the ARP responsibility in the LAN group for any VIPAs.

IPv6 LAN Group Summary
The IPv6 LAN group summary lists interfaces that are takeover candidates for each other. The stack creates a LAN group when it detects redundant connectivity to a LAN. For each interface in the LAN
group, this summary displays which interface owns neighbor discovery (ND) address resolution responsibility for that interface. The summary also displays which interface owns the ND Address Resolution responsibility in the LAN group for any VIPAs.

**LanGroup**
- Identifies the LAN group. This identifier is assigned by the stack and represents a group of interfaces on the same LAN. This identifier is not a VLAN ID.

**Name**
- The link name configured on the LINK statement or the interface name configured on the INTERFACE statement.

**Status**
- The link or interface status. Valid values are Active or Not Active.

**ArpOwner**
- The link or interface name that owns ARP responsibility for this link or interface in the LAN group. An active link or interface owns its ARP responsibility.

**NDOwner**
- The interface name that owns neighbor discovery (ND) responsibility for this interface in the LAN group. An active interface owns its ND responsibility.

**VipaOwner**
- Indicates whether the link or interface owns the ARP or ND responsibility for the VIPAs in the LAN group.

**Associated IQDC Interface**
- The name of the HiperSockets Converged Interface (IQDC) that is associated with this OSD interface. This section is significant for OSD interfaces that use an IQDC interface. The following information is displayed:

  **IQDC Status**
  - The status of the IQDC interface. See the description of the LnkStatus/IntfStatus field for the possible interface status values.

  **BytesIn**
  - The number of bytes that have been received over the associated IQDC interface.

  **Inbound Packets**
  - The number of unicast inbound packets that have been received over the associated IQDC interface.

  **BytesOut**
  - The number of bytes that have been transmitted over the associated IQDC interface.

  **Outbound Packets**
  - The number of unicast outbound packets that have been transmitted over the associated IQDC interface.

**Associated IQDX Interface**
- The name of the Internal Queued Direct I/O extensions function (IQDX) interface that is associated with this OSX interface. This section is significant for OSX interfaces that use an IQDX interface for intraensemble data network (IEDN) connectivity. The following information is displayed:

  **IQDX Status**
  - The status of the IQDX interface. See the description of the LnkStatus/IntfStatus field for the possible interface status values.

  **BytesIn**
  - The number of bytes that have been received over the associated IQDX interface.

  **Inbound Packets**
  - The number of unicast inbound packets that have been received over the associated IQDX interface.

  **BytesOut**
  - The number of bytes that have been transmitted over the associated IQDX interface.
Outbound Packets
The number of unicast outbound packets that have been transmitted over the associated IQDX interface.

Associated RNIC Interface
The dynamic interface name that is generated for "RoCE Express" interface that this stack uses for SMC-R communications. This field is significant only for active IPAQENET and IPAQENET6 interfaces that specify SMCR or take SMCR as the default value.

Associated ISM Interface
The dynamic interface name that is generated for ISM interface that this stack uses for SMC-D communications. This field is significant only for active IPAQENET, IPAQIDIO, IPAQENET6, and IPAQIDIO6 interfaces that specify SMCD or take SMCD as the default value.

SMCR Link Information | SMCD Link Information
The SMCR link information for an RNIC interface or the SMCD link information for an ISM interface. This section is displayed for each RNIC and ISM interface only when the SMC modifier or the SMCID/-U filter is specified. The following fields and statistics are displayed.

Guidelines:
- An SMC-R link is uniquely identified by the combination of the VLAN number, local GID, local VMAC address, local QP number, remote GID, remote VMAC address, and remote QP number.
- An SMC-D link is uniquely identified by the combination of local GID, remote GID, and VLAN number.

LocalSMCLinkId
The SMC-R or SMC-D link identifier that this TCP/IP stack dynamically creates to represent the link.

RemoteSMCLinkId
The SMC-R or SMC-D link identifier that the remote peer uses to represent the link. The value is provided to this TCP/IP stack during link activation.

SMCLinkGroupId
The group identifier that this TCP/IP stack dynamically creates to represent the SMC-R link group that includes this individual link. This value applies to RNIC interfaces only.

VLANId
The virtual LAN ID for this SMC-R or SMC-D link. The value None is displayed if a virtual LAN ID has not been configured.

MTU
The negotiated MTU size that is used for this SMC-R link. This value applies to RNIC interfaces only.

LocalGid
The local GID value that is associated with this SMC-R or SMC-D link. This is the same information that is displayed in the GidAddr field.

LocalMACAddr
The local virtual MAC address that is associated with this SMC-R link. This value applies to RNIC interfaces only.

LocalQP
The local queue pair (QP) value that is associated with this SMC-R link. This value applies to RNIC interfaces only.

RemoteGid
The peer GID value that is associated with this SMC-R or SMC-D link.

RemoteMACAddr
The peer virtual MAC address that is associated with this SMC-R link. This value applies to RNIC interfaces only.

RemoteQP
The peer QP value that is associated with this SMC-R link. This value applies to RNIC interfaces only.
SMCLinkBytesIn
Number of inbound data bytes transferred across this SMC-R or SMC-D link.

SMCLinkInOperations
Number of ISM inbound operations processed across this SMC-D link, or number of Remote Direct Memory Access (RDMA) inbound operations processed across this SMC-R link.

SMCLinkBytesOut
Number of outbound data bytes transferred across this SMC-R or SMC-D link.

SMCLinkOutOperations
Number of RDMA outbound operations processed across this SMC-R link, or number of ISM outbound operations processed across this SMC-D link.

TCP Connections
Number of TCP connections across this SMC-R or SMC-D link.

Link Receive Buffer Inuse
Amount of memory buffer storage in use by the active TCP connections that are associated with this SMC-R or SMC-D link.

32K Buffer Inuse
Amount of 32K memory buffer storage in use by the active TCP connections that are associated with this SMC-R link. This field only applies to SMC-R links.

64K Buffer Inuse
Amount of 64K memory buffer storage in use by the active TCP connections that are associated with this SMC-R or SMC-D link.

128K Buffer Inuse
Amount of 128K memory buffer storage in use by the active TCP connections that are associated with this SMC-R or SMC-D link.

256K Buffer Inuse
Amount of 256K memory buffer storage in use by the active TCP connections that are associated with this SMC-R or SMC-D link.

Other Buffer Inuse
For memory buffer storage that is allocated as buffers larger than 256K, the amount of these other buffers that are in use by the active TCP connections that are associated with this SMC-R or SMC-D link. If no buffers larger than 256K are allocated, this information is not displayed.

Guidelines:
1. The LOOPBACK device and link are displayed. The LOOPBACK6 interface is displayed if the stack is enabled for IPv6.
2. The byte counts for number of bytes received and number of bytes transmitted are always 0 for VIPA links and interfaces.
3. If an MTU was configured on the INTERFACE statement, then the actual MTU is the minimum of the configured MTU and the physical MTU value supported by the interface.

Restrictions:
1. No link-related information, packet trace settings, or BSD parameters are displayed for a device that has no link defined.
2. The packet trace setting is displayed only when it is defined and set to ON.
3. ATM specific information is displayed only for ATM devices that have links defined.

OSA-Express Network Traffic Analyzer Information
This section displays all currently defined OSA interfaces that are dynamically created by VARY TCPIP, OSAENTA commands or OSAENTA PROFILE statements.

OSA PortName
The port name value of the OSA that is currently defined for performing the OSA-Express network traffic analyzer (OSAENTA) function. This value was specified on the PORTNAME parameter of a
VARY TCPIP,,OSAENTA command or on an OSAENTA PROFILE statement. The following information is specific to this PortName value.

**OSA DevStatus**
The device status. The following list shows the possible values:

**Starting**
An OSAENTA ON command or statement has been processed and TCP/IP has sent an activation request to the data link control (DLC) layer.

**Sent SETUP**
DLC has acknowledged the TCP/IP activation request and TCP/IP has requested that DLC perform the initial I/O sequence with the device.

**Enabling**
DLC has acknowledged the TCP/IP activation request and TCP/IP has requested that DLC allow data connections to be established for the device.

**Connecting**
DLC has accepted the initial I/O sequence request.

**Negotiating**
The initial I/O sequence with the device is complete and TCP/IP is performing additional link-layer initialization.

**Ready**
The initialization sequence with the device is complete. The device is now ready.

**Deactivating**
DLC has performed the first stage of an orderly device deactivation.

**Not Active**
The device is not active. (The device has never been started or has been stopped after having been started.)

**OSA IntfName**
The name of the interface that is dynamically created to communicate with the OSA Express2 adapter.

**OSA IntfStatus**
The trace collection interface status. The following list shows the possible values:

**Ready**
The OSA interface used for OSAENTA is accepting all trace requests from the host.

**Not Active**
The OSA interface that is used for OSAENTA is not active. Either trace collection is disabled or else an error occurred during activation of the OSA interface that is to be used for trace collection. Such an error condition generates an error message on the operator console.

**OSA Speed**
The speed reported by the interface (in millions of bits per second).

**OSA Authorization**
The value of the OSA HMC authorization parameter. Possible values are Disabled, Logical Partition, PORT, CHPID, or UNKNOWN. The value is set to UNKNOWN until the first OSAENTA ON command has completed.

**Disabled**
The OSA does not allow the NTA function to trace any frames for the OSA.

**Logical Partition**
The OSA allows the NTA function to trace frames only for the current logical partition.

**PORT**
The OSA allows the NTA function to trace frames for all stacks that share this OSA port.

**CHPID**
The OSA allows the NTA function to trace frames for all stacks that share the OSA.
**UNKNOWN**
The NTA trace interface has not been activated.

**OSAENTA Cumulative Trace Statistics**
Statistics accumulated for all frames that have been traced since the OSAENTA interface was first activated. These values are not reset by the OSAENTA ON command or statement.

**DataMegs**
The number of bytes of trace data (in megabytes) that have been received.

**Frames**
The total number of frames that have been traced.

**DataBytes**
The number of bytes of trace data that have been received.

**FramesDiscarded**
The number of frames that were traced but that the OSA device was not able to either forward to a host image or deliver outbound. These packets are available for formatting in the CTRACE SYSTCPOT component, but have not been delivered to any user.

**FramesLost**
The number of frames that could not be recorded by TCP/IP in the SYSTCPOT buffers.

**OSAENTA Active Trace Statistics**
Statistics that have accumulated since the OSAENTA ON command or statement was last issued.

**DataMegs**
The number of bytes of trace data (in megabytes) that have been collected.

**Frames**
The total number of frames that have been collected.

**DataBytes**
The number of bytes of trace data that have been collected.

**FramesDiscarded**
The number of frames that were collected but that the OSA device was not able to either forward to a host image or deliver outbound. These packets are available for formatting in the CTRACE SYSTCPOT component, but have not been delivered to any user.

**FramesLost**
The number of frames that were not collected by TCP/IP in the SYSTCPOT buffers.

**TimeActive**
The number of minutes that have elapsed since the last OSAENTA ON command or statement.

**OSAENTA Trace Settings**
The current trace settings that are in effect for this OSAENTA interface.

**Status**
The current trace status. Possible values are:

**ON**
Tracing is enabled.

**OFF**
Tracing is disabled.

**DataMegsLimit**
The amount of data (in megabytes) to be collected before the trace is automatically stopped. This value was specified on the DATA parameter.

**FramesLimit**
The number of frames to be collected before the trace is automatically stopped. This value was specified on the FRAMES parameter.

**TimeLimit**
The amount of time (in minutes) that data is collected before the trace is automatically stopped. This value was specified on the TIME parameter.
Abbrev
The size limit for the frames (in bytes) that are to be traced. This value was specified on the ABBREV parameter. This value can be modified to reflect the size limit set by the OSA.

Discard
Identifies which frames being discarded by the OSA-Express device are to be traced. This value was specified on the DISCARD parameter. Possible values are:

All
All frames discarded by the OSA-Express device are traced.

Exception
Frames discarded by the OSA-Express device for exception conditions are traced.

None
No discarded frames are traced.

list
A list of from one to eight values, that indicate the type of discarded frames that are to be traced by the OSA-Express device. This list includes decimal discard codes and the keyword parameter EXCEPTION.

OSAENTA Trace Filters
The values of the current accumulated filter variables from OSAENTA commands or statements for this OSA. If a filter variable has not been specified using OSAENTA commands or statements, then an asterisk is shown.

Nofilter
The filtering behavior when all filters (DEVICEID, MAC, ETHTYPE, VLANID, IPADDR, PROTOCOL, and PORTNUM) have been cleared or are inactive. This behavior applies when no filters have been specified, if the CLEARFILTER parameter is specified, or when the current setting for every filter is an asterisk (*). This filtering behavior applies only to packets that were not discarded by the OSA-Express device. This value was specified on the NOFILTER parameter. Possible values are:

All
All frames are traced.

None
No frames are traced.

DeviceID
Up to eight hexadecimal device identifiers that are specified on the DEVICEID keyword of an OSAENTA command or statement. The value is an asterisk (*) if no device identifiers were specified.

Mac
Up to eight hexadecimal MAC addresses that are specified on the MAC keyword of an OSAENTA command or statement. The value is an asterisk (*) if no MAC addresses were specified.

VLANid
Up to eight decimal VLAN identifiers that are specified on the VLANID keyword of an OSAENTA command or statement. The value is an asterisk (*) if no VLAN identifiers were specified.

ETHType
Up to eight hexadecimal Ethernet types that are specified on the ETHTYPE keyword of an OSAENTA command or statement. The value is an asterisk (*) if no Ethernet types were specified. The name of the Ethernet type filter is displayed for commonly used Ethernet types, such as ARP, IPv4, IPv6, and SNA.

IPAddr
Up to eight dotted decimal IPv4 IP addresses and up to eight colon hexadecimal IPv6 IP addresses that are specified on the IPADDR keyword of an OSAENTA command or statement. The value is an asterisk (*) if no IP addresses were specified.
Protocol
Up to eight decimal protocol identifiers that are specified on the PROTOCOL keyword of an OSAENTA command or statement. The value is an asterisk (*) if no protocol identifiers were specified. The name of the protocol filter is displayed for commonly used protocols, while the protocol number is displayed for all others.

PORTNum
Up to eight decimal port numbers that are specified on the PORTNUM keyword of an OSAENTA command or statement. The value is an asterisk (*) if no port numbers were specified.

SMCR Link Group Information
The information of the SMC link group. This section is displayed for each RNIC interface only when the SMC modifier or the SMCID/-U filter is specified. The following fields are displayed:

SMCLinkGroupId
The group identifier that this TCP/IP stack dynamically creates to represent the SMC-R link group that includes this individual link.

PNetID
The physical network ID value that is configured in HCD for this SMC-R link group.

Redundancy
The recovery and load balancing capabilities of the link group. The following list shows the possible values:

Full
The link group has redundant active SMC-R links. Both the local and remote stacks have full failover capability. The z/OS server performs load balancing of TCP connections across the SMC-R links that are members of the link group.

Partial (Single local internal path)
The link group has redundant active SMC-R links. Both the local and remote stacks have failover capability. The z/OS server performs load balancing of TCP connections across the SMC-R links that are members of the link group. However, the links on the local stack have the same internal path.

Partial (Single local PCHID, unique ports)
The link group has redundant active SMC-R links. Both the local and remote stacks have failover capability. The z/OS server performs load balancing of TCP connections across the SMC-R links that are members of the link group. However, the links on the local stack have the same PCHID with unique ports.

Partial (Single local PCHID and port)
The link group has redundant active SMC-R links. Both the local and remote stacks have failover capability. The z/OS server performs load balancing of TCP connections across the SMC-R links that are members of the link group. However, the links on the local stack have the same PCHID and port.

Partial (Single local RNIC)
The link group has multiple active SMC-R links and the remote stack has full failover capability, but the local stack has no failover capability. The z/OS server does not perform load balancing of TCP connections.

Partial (Single remote RNIC)
The link group has multiple active SMC-R links and the local stack has full failover capability, but the remote stack has no failover capability. The z/OS server does not perform load balancing of TCP connections.

None (Single local and remote RNIC)
The link group has a single active SMC-R link. Neither the local stack nor the remote stack has failover capability. The z/OS server cannot perform load balancing of TCP connections.

Link Group Receive Buffer Total
Amount of remote memory buffer (RMB) storage that is assigned to this SMC-R link group.
32K Buffer Total
Amount of 32K RMB storage that is assigned to this SMC-R link group.

64K Buffer Total
Amount of 64K RMB storage that is assigned to this SMC-R link group.

128K Buffer Total
Amount of 128K RMB storage that is assigned to this SMC-R link group.

256K Buffer Total
Amount of 256K RMB storage that is assigned to this SMC-R link group.

Other Buffer Total
For RMB storage that is allocated as buffers larger than 256K, the amount of these other buffers that are assigned to this SMC-R link group. If no buffers larger than 256K are allocated, this information is not displayed.

LocalSMCLinkId
The link identifier this TCP/IP stack dynamically creates to represent the SMC-R link in this SMC-R link group.

RemoteSMCLinkId
The SMC-R link identifier that the remote peer uses to represent the link in this SMC-R link group. The value is provided to this TCP/IP stack during link activation.

PNETID Report Specific Information

Associated
This field is displayed only for IPAQIQDC, IPAQIQDC6, ISM, and RNIC interfaces. It indicates whether the interface is currently used for SMC or IQDC communications for the PNETID value that is associated with the interface. The following values are valid:

Yes
The interface is currently used for SMC or IQDC communications for this PNETID.

• If IntfType is RNIC, the interface is used for SMC-R communications. At most two RNIC interfaces can actively be used for a given PNETID.

• If IntfType is ISM, the interface is used for SMC-D communications. The value of Associated is always YES for ISM interfaces.

• If IntfType is IPAQIQDC and IPAQIQDC6, the interface is used for IQDC communications. The value of Associated is always YES for IQDC interfaces.

No
The interface is currently not used for SMC-R communications for this PNETID.

PChid
The CHPID value that is associated with this interface.

VChid
The virtual channel ID value that is associated with this interface.

Netstat DRop/-D command
You can terminate a specific TCP/IP socket endpoint using the Netstat DRop/-D command.

When a DRop command is issued against a socket endpoint, any outstanding or following socket calls that refer to the socket that is being dropped terminate with a negative return code.

The socket endpoint that you drop can be a listening TCP server socket endpoint, a fully connected TCP socket (either server or client connection endpoint), or a UDP socket endpoint. When you drop a TCP connection or UDP endpoint, the associated socket does not close. The application that owns the associated socket is responsible for closing the socket.

The DRop/-D command terminates the socket endpoint that is identified by the connection number n. You can determine the connection number from the Conn column in the Netstat COnn/-c or Netstat TELnet/-t display.
You can use this parameter only if the MVS.VARY.TCPIP.DROP security product resource is defined and the user ID that is associated with the DROP command is permitted to this resource.

Use the DRop/-D command to terminate an individual TCP connection when you do not want to terminate the server itself, but want only to drop an individual connection with that server.

Use the DROP/-D command to terminate old TCP connections if they prevent a server from being restarted. This is sometimes necessary when the server does not enable the SO_REUSEADDR socket option before binding to its well-known port.

If you want to terminate all socket activity from a specific sockets application, terminate the application using the appropriate mechanism that is provided by the application. The DRop/-D command can have unpredictable results when issued against a listening socket or UDP socket. Some applications might not handle the subsequent socket errors as expected.

**Restriction:** The Netstat DRop/-D command supports dropping only one TCP connection per command invocation. The VARY TCPIP,,DROP command provides the ability to drop all TCP connections that are associated with a server. See “VARY TCPIP,,DROP” on page 213 for more information.

**TSO syntax**

```plaintext
NETSTAT DRop n
-TCp tcpname
```

**z/OS UNIX syntax**

```plaintext
netstat -D n
-p tcpname
```

**Tcp/-p tcpname**

Executes the command against a specific TCP/IP address space. The tcpname is an 8-byte procedure name that is used to start the TCP/IP. When the S member.identifier method of starting TCP/IP is used, the value specified for identifier must be used as tcpname.

**n**

The connection number that is a unique number assigned by the TCP/IP stack to uniquely identify a socket entity.

**Command syntax examples**

**From TSO environment**

```
NETSTAT DROP n
Drop the connection n from the default TCP/IP stack.
NETSTAT DROP m TCP TCPCS6
Drop the connection m from TCPCS6 stack.
```

**From UNIX shell environment**

```
netstat -D n
netstat -D m -p tcpcs6
```

**Report examples**

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.
Netstat Gate/-g report

Displays the IPv4 routing information that this stack uses when it determines what addresses it can communicate with and over which links and first hops the communication takes place. The routes in the stack routing table can be static routes (those defined in the TCP/IP profile), routes learned from routing daemons, and routes learned by other ICMP information, such as redirects. If there is not a route that covers the destination IP address and if there is no DEFAULT route defined, then this stack cannot communicate with that destination. Multiple routes to the same destination, referred to as multipath routes, are also displayed. If multipath is not enabled on the IPCONFIG statement, then the first active route to the destination is always used.

**TSO syntax**

<table>
<thead>
<tr>
<th>Modifier</th>
<th>Target</th>
<th>Output</th>
<th>(Filter)</th>
</tr>
</thead>
<tbody>
<tr>
<td>DETAIL</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Modifier**

**DETAIL**

Displays the general IPv4 routing information, the metric or cost of use for the route, and the MVS specific configured parameters for each route.

**Target**

Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**

The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**Filter**

---

Monitoring the TCP/IP network 441
**z/OS UNIX syntax**

```
netstat -g  Modifier  Target  Output  Filter
```

**Modifier**

- **DETAIL**

  Displays the general IPv4 routing information, plus the metric or cost of use for the route, and the MVS specific configured parameters for each route.

**Target**

Provide the report for a specific TCP/IP address space by using `-p tcpname`. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

**Filter**

```
-I ipaddr/ipaddr/subnetmask
```

**Filter description**

**IPAddr/-I ipaddripaddr/subnetmask**

Filter the report output using the specified IP address `ipaddr` or `ipaddr/subnetmask`. You can enter up to six filter values. Each specified IPv4 `ipaddr` value can be up to 15 characters in length.

- **ipaddr**
  
  Filter the output of the Gate/-g report using the specified IP address `ipaddr`. The default subnet mask is 255.255.255.255.

- **ipaddr/subnetmask**
  
  Filter the output of the Gate/-g report using the specified IP address and subnet mask `ipaddr/subnetmask`.

The IPAddr/-I filter value can be a complete string or a partial string using wildcard characters. A wildcard character can be an asterisk (*), which matches a null string or any character or character string, at the same position. A wildcard character can be a question mark (?), which matches any single character at the same position. For example, a string "searchee" matches with "*ar?he*", but the string "searhee" does not match with "*ar?he*". If you want to use the wildcard character on the IPAddr/-I filter, you must specify the value in the `ipaddr` format. The wildcard character is not accepted for the `ipaddr/subnetmask` format of IPAddr/-I values.

When you use z/OS UNIX `netstat/onetstat` command in a z/OS UNIX shell environment, take care if you use a z/OS UNIX MVS special character in a character string. It might cause an unpredictable result. To be safe, if you want to use a z/OS UNIX MVS special character in a character string, surround the character string with single ('') or double (") quotation marks. For example, to use an asterisk (*) in the IP address, 10.*.0.0 for the -I filter, issue the command as: netstat `-g -I '10.*.0.0'` or `netstat -g -I "10.*.0.0"`.

**Note:**

1. The filter value `ipaddr` is the destination IP address; it is not the destination network address.
2. When filtering Gate/-g responses on a specified IP address, the DEFAULT and DEFAULTNET routes are not displayed.

**Command syntax examples**

**From TSO environment**

**Report field descriptions**

**NetAddress**

The address of the network. This is the network portion of the destination address of the route. If the route is for a Class A address, then this field contains only the first portion of the address because the class A net mask is 255.0.0.0. If the route is for a Class B address, then this field contains the first half of the address because the class B net mask is 255.255.0.0. If the route is for a Class C route, then this field contains the first 3 parts of the address because the class C net mask is 255.255.255.0.

**FirstHop**

The first hop address used to send packets to the destination. If <direct>, then the destination is directly reachable without needing to go through a gateway.
Link
The link or interface name for the route.

Restriction: Only the first eight characters of the link or interface name are displayed by this command. Issue the NETSTAT ROUTE command to display more than eight characters of the link or interface name.

Pkt Sz
This value is the largest packet size that can be sent using this route. If the packet is larger than this size, the packet will have to be fragmented if fragmentation is permitted. If fragmentation is not permitted, the packet would be dropped and an ICMP error would be returned to the originator of the packet.

Subnet Mask
The subnet mask of the network. This is the subnet-only mask for the route. It does not include the class net mask. For example, if the route was for 9.67.114.0 with a net mask of 255.255.255.0 the subnet mask would be 0.255.255.0 because you would not include the class A net mask. Valid values for this field include:

Dotted Decimal Value
This is the subnet-only portion of the net mask. If you take the route's net mask and remove the class mask from it, you are left with the subnet-only portion of the displayed net mask. If you combine the class mask with this field you get the complete net mask for this route entry.

<none>
If this field contains <none>, then this is a network route and the net mask is the class mask for the route destination.

REDIRECT_HOST
This means that this route is for a HOST entry and was learned by an ICMP redirect. The subnet mask would be 255.255.255.255.

HOST
This means that this route is for a HOST entry. The subnet mask would be 255.255.255.255.

Subnet Value
The subnet value of the network. This is the subnet portion of the route's destination address. It does not contain the network portion that was displayed in the Address of the network. Valid values for this field include:

Dotted Decimal Value
This is the subnet/host portion of the route's destination address. If you combine this field with the value in Address of the network, you get the complete route destination address.

blank
If this field is blank, then this is a network route and the subnet/host portion of the route destination address is zero.

Metric
This value displays the metric of the route. For static routes, all direct routes will have a metric of 0 and indirect routes will have a metric of 1. If the routes were learned from a routing daemon, then the metric displayed would be the metric set by the routing daemon. Once the routes are in the stack routing table, the metric field is not used. The routing daemons use metrics to compare routes and inform the stack only of the route or routes that have the best metric.

Flags
Identifies the state of the route and can have the following values:

U
The route is up.

H
The route is to a host rather than to a network.

G
The route uses a gateway.
The following flags are mutually exclusive:

**C**
The route was created by a connection (not using a definition or a routing protocol). Routes to subnets or point-to-point destinations using interfaces over which OMPROUTE is active but has not yet established a routing protocol are considered connection routes.

**D**
The route was created dynamically by ICMP processing.

**O**
The route was created by OSPF (includes OSPF external routes).

**R**
The route was created by RIP.

**S**
The route is a static route not replaceable by a routing daemon.

**Z**
The route is a static route replaceable by dynamic routes learned by OMPROUTE.

**Maximum retransmit time**
The TCP retransmission interval for this route. If this parameter was not specified, the default value of 120 seconds is displayed. This parameter does not affect initial connection retransmission.

**Minimum retransmit time**
The minimum retransmit interval for this route. If this parameter was not specified, the default value of 0.5 (500 milliseconds) second is displayed.

**Round trip gain**
This value is the percentage of the latest round trip time (RTT) to be applied to the smoothed RTT average. The higher this value is, the more influence the latest packet RTT has on the average. If this parameter was not specified, the default value of 0.125 is displayed. This parameter does not affect initial connection retransmission.

**Variance gain**
This value is the percentage of the latest RTT variance from the RTT average to be applied to the RTT variance average. The higher this value is, the more influence the latest packet’s RTT has on the variance average. If this parameter was not specified, the default value of 0.25 is displayed. This parameter does not affect initial connection retransmission.

**Variance multiplier**
This value is multiplied against the RTT variance in calculating the retransmission interval. The higher this value is, the more effect variation in RTT has on calculating the retransmission interval. If this parameter was not specified, the default value of 2 is displayed. This parameter does not affect initial connection retransmission.

**Netstat HELP/? report**
Displays help information for Netstat parameters.

**TSO syntax**

```
NETSTAT HELP
```

**z/OS UNIX syntax**

```
netstat -?
```

**Command syntax examples**
From TSO environment

NETSTAT HELP or NETSTAT ?

From UNIX shell environment

netstat -?

Report examples

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

| NETSTAT HELP or NETSTAT ? | Usage: NETSTAT <Report option | Command> <Target> <Output> <(Filter> |
|---------------------------|-----------------------------------|
| Report option:            |                                    |
| ALL                      | Display detailed information about TCP connection and UDP sockets |
| ALLConn                  | Display information for all TCP connections and UDP sockets, including some recently closed ones |
| ARP                      | Query ARP table or entry information (IPv4 only) |
| BYTEinfo                 | Display the byte-count information for each active TCP connection and UDP socket |
| CACHinfo                 | Display information about TCP connections utilizing the Cache Accelerator |
| Clients                  | Display information about local users of TCP/IP services (jobnames) |
| CONFIG                   | Display the TCP/IP configuration information |
| Conn                     | Display information about each active TCP connection and UDP socket (Default option) |
| DEFADORT                 | Display the policy table for IPv6 default address selection |
| DEvlinks                 | Display information about devices and defined interfaces or links |
| Gate                     | Display information about the stack routing table for IPv4 destinations |
| Help or ?                | Display Netstat parameters list |
| Home                     | Display information about each home IP address and its associated link or interface name |
| IDS                      | Display information about Intrusion Detection Services |
| ND                       | Display the IPv6 Neighbor cache entries |
| PORTList                 | Display port reservation list |
| RESCache                 | Display resolver cache information |
| ROUTe                    | Display stack routing information |
| SLAP                     | Display QoS policy statistics |
| SOCKets                  | Display information about each client using a socket application programming interface |
| SRCIP                    | Displays information for all job-specific source VIPA IP address associations |
| STATS                    | Display TCP/IP statistics |
| TTLS                     | Display Application Transparent Transport Layer Security (AT-TLS) information |
| TELnet                   | Display TN3270 Telnet server connections |
| Up                       | Date and time tcpip was last started |
| VCRT                     | Display the dynamic VIPA Connection Routing Table |
| VDPF                     | Display the dynamic VIPA Destination Port Table |
| VIPADCFG                 | Display the dynamic VIPA configuration information |
| VIPADyn                  | Display the current dynamic VIPA and VIPAROUTE information |

Target:
TCP - Display detailed information about the specified TCPIP address space

Output:
FORMAT - Display Netstat report in a given format
REPORT - Netstat information written to dataset name
tsoprefix.NETSTAT.option or specified with DSN/HLQ
STACK - Netstat information written to a TSO data stack

- N - Filter the output of -t report using the specified application name
- P - Filter the output of -A, -a, -c, -s, -t, -O, -o, and -V reports using the specified port
- Q - Filter the output of -q report using the specified DNS IP address.
- T - Filter the output of -A, -a, -b, -c, -e, and -s reports excluding TN3270 server connections
- U - Filter the output of -A, -a, -c, and -d reports using the specified SMC-D link, or SMC-R link or SMC-R link group identifier
- X - Filter the output of -a, and -c reports using the specified connection type
- Y - Filter the output of -j report using the specified policy name
Command:
- D - Terminates the socket end-point that is identified by the specified connection number

448 z/OS Communications Server: IP System Administrator's Commands
**Netstat HOME/-h report**

Displays information about each home IP address and its associated link or interface name.

For more information about the home list, see the z/OS Communications Server: IP Configuration Reference.

**TSO syntax**

```plaintext
NETSTAT HOME Target Output [Filter]
```

**Target**

Provide the report for a specific TCP/IP address space by using TCp `tcpname`. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**

The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**Filter**

```plaintext
INTFName intfname
```

**z/OS UNIX syntax**

```plaintext
netstat -h Target Output [Filter]
```

**Target**

Provide the report for a specific TCP/IP address space by using `-p tcpname`. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

**Filter**

```plaintext
-K intfname
```

**Filter description**

**INTFName/-K intfname**

Filter the output of the HOME/-h report using the specified interface name `intfname`. You can enter one filter value at a time and the specified value can be up to 16 characters long.

The INTFName filter value `intfname` can be one of the following names:

- The network interface name that was displayed in the LnkName/LinkName or INTFName field in the report (this option selects one interface).
- The port name of an OSA-Express feature in QDIO mode, where the port name value is the name that is specified on the PORTNAME keyword in the TRLE (this option selects all interfaces that are associated with the OSA-Express port).
- The name of a HiperSockets TRLE. This option selects all interfaces that are associated with the HiperSockets TRLE.

**Restriction:** The INTFName/-K filter value does not support wildcard characters.
**Command syntax examples**

**From TSO environment**

```
NETSTAT HOME
Display the home list information for the default stack. If the stack is IPv6-enabled, then both IPv4 and IPv6 home list information are displayed.
```

```
NETSTAT HOME TCP TCPCS6
Display the home list information for the TCPCS6 stack. If the TCPCS6 stack is IPv6-enabled, then both IPv4 and IPv6 home list information are displayed.
```

```
NETSTAT HOME TCP TCPCS8 (INTFNAME OSAQDIOLINK
Display the home list information for the OSAQDIOLINK in the TCPCS8 TCP/IP address space.
```

**From UNIX shell environment**

```
netstat -h
netstat -h -p tcpcs6
netstat -h -p tcpcs8 -K
```

**Report examples**

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

**Not IPv6 enabled (SHORT format)**

Unavailable IPv6 Home addresses:
- IntfName: OSAQDIIO26
  - Address: 2001:0db8::9:67:115:66
  - Type: Global
  - Reason: Duplicate address detection pending start of interface
- Address: 2001:0db8::/64
  - Type: Global
  - Reason: Interface ID not yet known
Report field descriptions

For a SHORT format report

Address
IPv4 address for this home entry.

Link
Link name for this home entry.

Flg
Flags, which include the following values:

- P
  Primary interface.

- I
  One of the following flags:
  - An internally generated dynamic VIPA that is not advertised to routing daemons or an interface that is defined with the TEMPIP keyword. This flag is displayed for the following VIPAs or interfaces:
    - Dynamic VIPAs that are created on target stacks for the sysplex distributor
    - Dynamic VIPAs on stacks that are the endpoint for connections where the dynamic VIPA has moved to another stack
    - IPAQENET interfaces that are defined with the TEMPIP keyword
  - An interface that is defined with the TEMPIP keyword. This flag is displayed for IPAQENET interfaces that are defined with the TEMPIP keyword.

For a LONG format report

For an IPv4 home list entry:

Address
IPv4 address for this home entry.

LinkName
Link name for this home entry.

Flags

- Primary
  Primary interface.

- Internal
  One of the following flags:
  - An internally generated dynamic VIPA that is not advertised to routing daemons or an interface that is defined with the TEMPIP keyword. This flag is displayed for the following dynamic VIPAs or interfaces:
    - Dynamic VIPAs that are created on target stacks for the sysplex distributor
- Dynamic VIPAs on stacks that are the endpoint for connections where the dynamic VIPA has moved to another stack
- IPAQENET interfaces that are defined with the TEMPIP keyword
- An interface that is defined with the TEMPIP keyword. This flag is displayed for IPAQENET interfaces that are defined with the TEMPIP keyword.

For an IPv6 home list entry:

**IntfName**
Interface name for this home entry.

**Address**
IPv6 address for this home entry.

**Type**
Address type that can be Global, Loopback, or Link_Local.

**Flags**

- **Autoconfigured**
  The IP address was built from prefix information supplied by the router.

- **Deprecated**
  The preferred lifetime of the autoconfigured address has expired.

- **Internal**
  An internally generated VIPA that is not advertised to routing daemons.

- **Temporary**
  A temporary IP address that was built from prefix information that was supplied by the router, and a randomly generated interface ID.

**ValidLifetimeExp**
The time at which the IPv6 temporary autoconfigured address will be deleted. This valid lifetime can be extended by router-supplied information. This field is displayed only for a temporary IP address.

For an IPv6-enabled stack, the unavailable IPv6 home addresses are also displayed, which contain the following information for each entry in the list:

**IntfName**
Interface name for this home entry.

**Address**
IPv6 address for this home entry.

**Type**
Address type including Global, Loopback, or Link_Local.

**Reason**
Reason the IP address is unavailable:

- **Duplicate address detection in progress**
  Duplicate address detection is in progress to determine if another node is currently using the IP address. The IP address is made available if it is determined to be unique on the local link.

- **Duplicate address detected**
  Duplicate address detection was previously done for this IP address and the IP address was in use elsewhere.

- **Duplicate address detection pending start of interface**
  Duplicate address detection has been requested for the interface but the interface has not been started. The interface must be started before duplicate address detection can be done and this IP address made available.

- **Duplicate address detection prevented by IPSec**
  Duplicate address detection has been requested for the interface, but the outbound Neighbor Solicitation packet has been denied by IPSec policy.
**Interface ID not yet known**
This reason applies to interfaces for which duplicate address detection will not be performed (for example, where a value of 0 was configured for the DUPADDRDET parameter) and where an IP address prefix was configured. An interface ID is required to append to the prefix to create the full IP address. The interface ID is not available until the interface is successfully started.

**Netstat IDS/-k report**
Displays information about intrusion detection services.

**TSO syntax**

```
NETSTAT IDS Modifier Target Output
```

**Modifier**

```
SUMmary
PROTOCOL protocol
```

**SUMmary**
Displays summary information about intrusion detection services.

**PROTOCOL protocol**
Displays information about intrusion detection services for the specified protocol. The valid protocols are TCP and UDP.

**Target**
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**
The default output option displays the output on the user’s terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**z/OS UNIX syntax**

```
netstat -k Modifier Target Output
```

**Modifier**

```
SUMmary
PROTOCOL protocol
```

**SUMmary**
Displays summary information about intrusion detection services.

**PROTOCOL protocol**
Displays information about intrusion detection services for the specified protocol. The valid protocols are TCP and UDP.

**Target**
Provide the report for a specific TCP/IP address space by using -p tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.
Output

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

Report field descriptions

**SUMmary**

Display summary information about intrusion detection services. The following describes the information displayed by the SUMmary option.
• **For Scan Detection:**
  This section displays the following scan detection information. See Intrusion detection services in z/OS Communications Server: IP Configuration Guide for detailed information about IDS scan support.

  **GlobRuleName**
  The Global Scan rule name or *NONE* if scan detection is not active.

  **IcmpRuleName**
  The Scan ICMP rule name or *NONE* if ICMP scan event policy is not active.

  **Icmpv6RuleName**
  The Scan ICMPv6 rule name or *NONE* if ICMPv6 scan event policy is not active.

  **TotDetected**
  The number of scans detected since the TCP stack was started.

  **DetCurrPlc**
  The number of scans detected since the last Scan Global policy change.

  **DetCurrInt**
  The number of scans detected in the current scan interval.

  **Interval**
  The length of the internal scan interval used to detect scans. This value is either 30 seconds or 60 seconds depending on the fast scan interval specified in the policy.

  **SrcIPsTrkd**
  The number of source IP addresses currently being monitored by scan detection.

  **StrgLev**
  The amount of private storage, in megabytes, that scan detection is using. This value is calculated at each internal interval. If 0 is shown, this indicates that no storage is currently in use for scan detection. 0M indicates that less than 1 MB of storage is in use.

• **For Attack Detection:**
  This section displays the following information for each attack type. See Intrusion Detection Services in z/OS Communications Server: IP Configuration Guide for detailed information about IDS attack support.

  **PlcRuleName**
  The attack rule name or *NONE* if no policy is active for the attack type.

  **TotDetected**
  The number of attacks detected since the TCP stack was started.

  **DetCurrPlc**
  The number of attacks detected since the last policy change.

  **DetCurrInt**
  The number of attacks detected in the current statistics interval. If statistics is not specified in the policy, the value of this field is 0.

  **Interval**
  The current statistics interval or 0 if statistics is not specified in the policy.

• **For Traffic Regulation:**
  This section displays the following TCP and UDP traffic regulation information. See Intrusion detection services in z/OS Communications Server: IP Configuration Guide for detailed information about IDS traffic regulation support.

  **ConnRejected**
  The number of TCP connections rejected by Traffic Regulation since the TCP/IP stack was started.
**PckDiscarded**  
The number of UDP packets discarded by Traffic Regulation since the TCP/IP stack was started.

**PlcActive**  
- Y  
  Indicates that TR policy is active for at least one port in the respective protocol.
- N  
  Indicates that Traffic Regulation is not active for any ports in the respective protocol.

**For Active Global Conditions:**

Displays the following global state information related to IDS and attack protection.

**ServersInConnFlood**  
The number of TCP servers that are currently under a potential connection flood attack. A server is considered under a potential connection flood attack when backlog queue expansion is required to handle the incoming connection requests. When more than 25 servers are under a potential connection flood attack, no server's backlog queue will be allowed to expand. This is an action taken to protect TCP/IP stack resources. There is no IDS configuration associated with this protection.

**TCPStalledConns**  
The number of TCP connections whose send data flow is currently stalled. The send data flow is considered stalled if one or more of the following conditions are true:
- The TCP send window size is less than 256 or is less than the smaller of the largest send window that has been seen for the connection and the default MTU. The TCP send window size is set based on values provided by the TCP peer. The default MTU for IPv4 is 576. The default MTU for IPv6 is 1280.
- The TCP send queue is full and the data is not being retransmitted.

**TCPStalledConnsPct**  
The percentage of active TCP connections whose send data flow is currently stalled. If IDS attack type Global TCP Stall is configured, a global TCP stall condition is detected when the send data flow of at least 50% of the active TCP connections is stalled and at least 1000 TCP connections are active.

**For Active Interface Floods:**

This section is displayed only if there is one or more interface floods in progress. Interface flood discard counts and rates are updated at one-minute intervals.

**Intfname**  
The name of the interface that is currently experiencing an interface flood condition.

**DiscardCnt**  
The number of inbound packets discarded or not processed since the interface flood was detected.

**DiscardRate**  
The percentage of discarded packets detected on the interface since the interface flood was detected.

**Duration**  
The number of seconds since the start of the interface flood was detected.

**PROTOcol protocol**  
Display information about intrusion detection services for the specified protocol. The valid protocols are TCP and UDP.

The following describes the information displayed by the PROTOcol selected. The information is displayed by destination IP address and port. This information is displayed only for the applications with IDS related information, such as if Traffic Regulation or Scan Detection policy is active for the application. For TCP, the data is also shown if the application is currently experiencing a SYN flood.
TcpListeningSocket
The destination IP address and port.

ScStat
ScRuleName currency, can have the following values:

C
Indicates ScRuleName shows the most recent Scan event rule for this application.

S
Indicates policy has changed and ScRuleName might not yet reflect the change.

ScRuleName
The Scan Event rule associated with this application or *NONE*.

TrStat
TrRuleName currency, can have the following values:

C
Indicates TrRuleName shows the most recent Traffic Regulation rule for this application.

S
Indicates policy has changed and TrRuleName might not yet reflect the change.

TrRuleName
The Traffic Regulation rule associated with this application or *NONE*.

TrPortInst
If TrRuleName is shown:

Y
Indicates that TCP traffic regulation was configured to limit by each socket (also known as limit by port instance). This data applies only to this application.

N
Indicates that TCP traffic regulation was not configured to limit by each socket. The MxApp and MxHst information applies to all applications using this port that do not have a separate rule that was configured to limit by each socket.

TrCorr
The traffic regulation constrained state correlator. A value of 0 indicates the application is not constrained.

MxHst
The number of connections rejected since the last policy change due to a source IP exceeding the percentage of available connections allowed for a single source IP.

MxApp
The number of connections rejected since the last policy change because the total number of connections was exceeded.

SynFlood
Indicates if the application is currently experiencing a SYN flood. A server is considered under a SYN flood attack when connection requests are being discarded because the backlog queue is full and cannot be expanded any further.

Y
Indicates a SYN flood is in progress.

N
Indicates a SYN flood is not in progress.

ConnFlood
Indicates if the application is currently experiencing a potential connection flood. A server is considered under a potential connection flood attack when backlog queue expansion is required to handle the incoming connection requests. The point where a potential connection flood attack is detected is based on the initial size of the backlog queue. A small initial backlog queue (for example, 10 entries) is allowed to expand twice before the server is considered under attack,
while a server with a large initial backlog queue (for example, 500 entries) can expand once, up to a maximum of 768 entries, before it is considered under attack.

Y
Indicates a potential connection flood is in progress.

N
Indicates a potential connection flood is not in progress.

**UdpDestSocket**
The destination IP address and port.

**Discarded**
The total number of packets discarded since the last policy change because the queue size configured for UDP traffic regulation was exceeded.

**Netstat ND/-n report**
Displays the IPv6 Neighbor cache entries.

**Tip:** This report can also be used to display all IPv6 addresses on the HiperSockets internal LAN to which the stack has a route over this interface.

**Guideline:** For HiperSockets interfaces, the stack requests this data from the appropriate device. If a device does not return this data in a timely fashion, then Netstat will not display data for that interface.

**TSO syntax**

```
NETSTAT ND Target Output (Filter)
```

**Target**
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**
The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**Filter**

```
IPAddr ipaddr ipaddr/prefixLen
```

**z/OS UNIX syntax**

```
netstat -n Target Output Filter
```

**Target**
Provide the report for a specific TCP/IP address space by using -p tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**
The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.
Filter

Filter description

**IPAddr/-I ipaddr**
- IPAddr/-I ipaddr/prefixLen

Filter the report output using the specified IP address `ipaddr` or `ipaddr/prefixlength`. You can enter up to six filter values. Each specified `ipaddr` value must be an IPv6 address that can be up to 45 characters in length.

**ipaddr**
- Filter the output of the ND/-n report using the specified IP address `ipaddr`. The default `prefixlength` is 128.

**ipaddr/prefixlength**
- Filter the output of the ND/-n report using the specified IP address and prefix length `ipaddr/prefixlength`. For an IPv6 address, the prefix length range is 1 – 128.

Restrictions:
1. The filter value for an IPv6 address does not support wildcard characters.
2. For the ND/-n report, an IPv4 `ipaddr` value is not accepted.
3. For an IPv6-enabled stack, an IPv4-mapped IPv6 address is accepted and is treated as an IPv6 address. If an IPv4-mapped IPv6 address is entered as an IPAddr/-I value, there is no matching entry found.

Command syntax examples

From TSO environment

```bash
NETSTAT ND
```

From UNIX shell environment

```bash
netstat -n
```

Report examples

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.
NETSTAT ND

Report field descriptions

Neighbor's IP address

IntfName
Interface name where the neighbor cache entry exists.

IntfType
Interface type.

OSX
For HiperSockets interfaces that use the Internal Queued Direct I/O extensions function (IQDX), this field indicates the associated OSX interface.

IQC
For OSD interfaces with an associated HiperSockets Converged Interface (IQDC), this field indicates the associated IQDC interface.

LinkLayerAddr
Neighbor's link layer address (MAC address).

State
Reachability state of the neighbor as defined in RFC 2461. Possible values include:

Incomplete
Address resolution has not been completed.

Reachable
Confirmation of neighbor's reachability received recently (within ReachableTime as defined by RFC 2461).

Stale
Reachability confirmation not recent.
Delay
Reconfirmation of reachability can be done after a short delay.

Probe
In process of reconfirming neighbor's reachability.

Type
Neighbor type is either Host or Router.

AdvDfltRtr
Whether the neighbor advertised itself as a default router.

Y
Indicates the neighbor advertised itself as a default router.

N
Indicates the neighbor did not advertise itself as a default router.

Netstat PORTList/-o report
Displays the list of reserved ports and the port access control configuration for unreserved ports. To configure port access control for unreserved ports, replace the port number value with the keyword UNRSV. For more information about port access control see the port access control information in z/OS Communications Server: IP Configuration Guide. For ports that are reserved by the PORTRANGE profile statement, only one output line is displayed for each range. For ephemeral port specifications, see the Netstat CONFIG/-f report description.

TSO syntax

![TSO syntax diagram]

Target
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

Output
The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

Filter

![Filter diagram]

z/OS UNIX syntax

![z/OS UNIX syntax diagram]

Target
Provide the report for a specific TCP/IP address space by using -p tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

Output
The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.
**Filter**

**Filter description**

POrt/-P portnum

Filter the output of the PORTList/-O report using the specified port number `portnum` or the keyword UNRSV. You can enter up to six filter values. The port number range is 1-65535.

**Restriction:** For a UDP endpoint socket, the filter value only applies to the local or source port.

**Command syntax examples**

**From TSO environment**

```plaintext
NETSTAT PORTLIST
Display the port reservation list in the default TCP/IP stack.
NETSTAT PORTLIST TCP TCPCS6
Display the port reservation list in the TCPCS6 stack.
```

**From UNIX shell environment**

```plaintext
netstat -o
netstat -o -p tcpcs6
```

**Report examples**

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX `netstat` command displays the data in the same format as the TSO NETSTAT command.

Report field descriptions

Display the following port reservation information defined in the PORT or PORTRANGE profile statements. For more information about each field, see the PORT or PORTRANGE profile statements in the z/OS Communications Server: IP Configuration Reference.

Port#

\[nnnn\]

For ports reserved by the PORT profile statement, this value is the number of the port that was reserved. For ports that are reserved by the PORTRANGE profile statement, this value is the number of the first port in the range. Valid values are in the range 1 – 65535.

UNRSV

Indicates any unreserved port; that is, any port number in the range 1-65535 that has not been reserved by a PORT or PORTRANGE statement. For applications that explicitly bind to an unreserved port and match the protocol and jobname value on this PORT statement, permission to access the unreserved port is controlled according to the value of the flags for that entry. However, when the RESTRICTLOWPORTS parameter is configured on the TCPCONFIG or UDPCONFIG profile statement, access only to unreserved ports with port numbers greater than 1023 is controlled by the PORT UNRSV statements.

Prot

The protocol that was specified in the PORT profile statement. The valid protocol values are TCP and UDP.

User

The MVS job name that can use the port, as specified on the TCP/IP stack PORT or PORTRANGE profile statement.

Flags

The flags represent parameter values defined on the PORT or PORTRANGE profile statement.

**A**

Autolog

**B**

Bind
D  
DelayAcks

F  
SAF

I  
WhenBind

L  
WhenListen

M  
Port is explicitly enabled for SMC. For more information about SMC support, see Shared Memory Communications in z/OS Communications Server: IP Configuration Guide.

N  
Port is explicitly disabled for SMC. For more information about SMC support, see Shared Memory Communications in z/OS Communications Server: IP Configuration Guide.

R  
Port is reserved by range.

S  
Share port

U  
Reuse port. This flag is set for TCP sockets when the BIND keyword is specified (both B and U are set).

W  
Share port with WLM server-specific weights is being used.

X  
Deny

Range  
This field is significant only for port entry reserved by the PORTRANGE profile statement (flag R in the Flags field).

IP address or BindSpecific  
This field is significant only for port entries with the BIND parameter specified on the PORT profile statement.

SAF Name  
The final qualifier of a security product resource name.

Netstat RESCache/-q report  
Displays system-wide resolver cache information. This information is not specific to the TCP/IP stack whose name was specified on the TCP/-p target parameter or to the default TCP/IP stack. Statistical information, such as number of record entries or number of cache queries, can be retrieved, or detailed information about some or all of the cache entries can be retrieved. Resolver caching is configured using resolver configuration statements in the resolver setup file. For more information about resolver caching, see details about resolver caching in z/OS Communications Server: IP Configuration Guide.

TSO syntax

NETSTAT RESCache  Modifier Target Output [Filter]
**Modifier**

**SUMmary**

**DETAIL**

Display detailed information for all unexpired entries that are currently in the resolver cache. It includes the following information:

- Host-name-to-IP-address entries from resolver forward lookups.
- IP-address-to-host-name entries from resolver reverse lookups.
- Negative entries that are included in both forward and reverse lookup tables.

**NEGative**

Display detailed information for all negative cache entries in the resolver cache.

**SUMmary**

Display general system statistics for resolver cache operations. This is the default report for the RESCACHE report option.

**DNS**

Display general system statistics for resolver cache operations, plus individual statistics for each DNS name server that has provided information currently stored in the cache.

**Target**

Provide the report for a specific TCP/IP address space by using the TCp tcpname option. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**

The default output option displays the output on the user terminal. For other options, see “Netstat command output” on page 287.

**Filter**

**Z/OS UNIX syntax**

```bash
netstat -q Modifier Target Output Filter
```
**Modifier**

- **SUMmary**
  - **DETAIL**
  - **NEGative**

**DETAIL**
Display detailed information for all unexpired entries that are currently in the resolver cache. See the following entries:
- Host-name-to-IP-address entries from resolver forward lookups.
- IP-address-to-host-name entries from resolver reverse lookups.
- Negative entries that are included in both forward and reverse lookup tables.

**NEGative**
Display detailed information for all negative cache entries that are in the resolver cache.

**SUMmary**
Display general system statistics for resolver cache operations. This is the default report for the RESCACHE report option.

**DNS**
Display general system statistics for resolver cache operations, plus individual statistics for each DNS name server that has provided information currently stored in the cache.

**Target**
Provide the report for a specific TCP/IP address space by using the TCP tcpname option. See “The Netstat command target” on page 287 for more information about the -p parameter.

**Output**
The default output option displays the output on the user terminal. For other options, see “Netstat command output” on page 287.

**Filter**

- **-H hostname**
- **-I ipaddr**
- **-Q dnsaddr**

**Filter description**

**DNSAddr/-Q dnsaddr**
Filter the output of the RESCache/-q report using the specified DNS IP address dnsaddr. You can enter one filter value at a time. The specified IPv4 dnsaddr value can be up to 15 characters in length; the specified IPv6 dnsaddr value can be up to 45 characters in length.

**Restriction:** The filter value does not support wildcard characters.

**HOSTName/-H hostname**
Filter the output of the RESCache/-q report using the specified host name value hostname. You can enter one filter value at a time. The specified value can be up to 255 characters in length.

**Restriction:** The HOSTName/-H filter applies only to the IPAddress to HostName translation portion of the report.
The filter value for HOSTName/-H can be a complete string or a partial string that can use wildcard characters. A wildcard character can be an asterisk (*), which matches a null string or any character or character string, in the same position. A wildcard character can also be a question mark (?), which matches any single character in the same position. For example, the string searchee matches with the search value *ar?he*, but the string searhee does not match with the search value *ar?he*.

In addition to the asterisk (*) and question mark (?) wildcard characters, the HOSTName/-H filter also supports implicit wildcards. Implicit wildcards are handled similarly to the way resolver queries handle host names. For example, if you specify the filter value host21, the query returns resolver cache information for the following cache entries:

- host21
- host21.ibm.com
- host21.raleigh.ibm.com
- Any entry that has host21 as the value that precedes the first period in the fully-qualified domain name

However, if you specify the filter value host21. the query matches only the entry host21.

Tip: The filter value host21 is equal to host21.* but host21 is not equal to host21* because host21* also matches cache entries such as host211.ibm.com and host2134.ibm.com.

When you use the z/OS UNIX netstat/onetstat command in a z/OS UNIX shell environment, using a z/OS UNIX MVS special character in a character string might cause an unpredictable result. If you want to use a z/OS UNIX MVS special character in a character string, surround the character string with single quotation marks (') or quotation marks (" ). For example, to use an asterisk (*) in the host name, cat.* for the -H filter, issue the command as: netstat -q -H 'cat.*' or netstat -q -H "cat.*".

**IPAddr/-I ipaddr**

Filter the output of the RESCache/-q report using the specified IP address ipaddr. You can enter one filter value at a time. The specified IPv4 ipaddr value can be up to 15 characters in length; the specified IPv6 ipaddr value can be up to 45 characters in length.

**Restrictions:**
- The filter value does not support wildcard characters.
- The IPAddr/-I filter applies only to the IPAddress to HostName translation portion of the report.

Use the RESCache/-q filters only when you use the DETAIL modifier. Specifying a filter with the SUMMARY modifier does not affect the report output.

**Command syntax examples**

*From TSO environment*

<table>
<thead>
<tr>
<th>Command Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NETSTAT RESCACHE SUMMARY</td>
<td>Display general system statistics for resolver cache operations</td>
</tr>
<tr>
<td>NETSTAT RESCACHE SUMMARY DNS</td>
<td>Display general system statistics for resolver cache operations, plus individual statistics for each DNS name server that has provided information currently stored in the cache.</td>
</tr>
<tr>
<td>NETSTAT RESCACHE DETAIL</td>
<td>Display detailed information for all unexpired entries that are currently in the resolver cache.</td>
</tr>
<tr>
<td>NETSTAT RESCACHE DETAIL (DNSADDR 10.7.7.7)</td>
<td>Display detailed information for all unexpired entries that are currently in the resolver cache that were provided by the DNS name server at IP address 10.7.7.7</td>
</tr>
<tr>
<td>NETSTAT RESCACHE DETAIL (HOSTName hostname.domain)</td>
<td>Display detailed information for all HostName to IPAddress resolution cache entries currently in the resolver cache that were acquired using host name hostname.domain as the target resource for the resolver query.</td>
</tr>
<tr>
<td>NETSTAT RESCACHE DETAIL (HOSTName hostname.*)</td>
<td>Display detailed information for all HostName to IPAddress resolution cache entries currently in the resolver cache that were acquired using a host name matching</td>
</tr>
</tbody>
</table>

Monitoring the TCP/IP network 475
the hostname.* pattern string as the target resource for the resolver query.

**NETSTAT RESCACHE DETAIL** (IPAddr 10.9.9.9)
Display detailed information for all IPAddress to HostName resolution
    cache entries currently in the resolver cache that were acquired using IP address
10.9.9.9 as the target resource for the resolver
query. 7

**NETSTAT RESCACHE DETAIL NEGATIVE**
Display detailed information for all negative cache entries in the resolver cache

**From UNIX shell environment**

```
netstat -q SUMMARY
netstat -q SUMMARY DNS
netstat -q DETAIL
netstat -q DETAIL -Q 10.7.7.7
netstat -q DETAIL -H hostname.domain
netstat -q DETAIL -H `hostname.*`
netstat -q DETAIL -I 10.9.9.9
netstat -q DETAIL NEGATIVE
```

**Report examples**

The following examples are generated by using the TSO NETSTAT command. Using the z/OS UNIX
netstat command displays the data in the same format as the TSO NETSTAT command.

**NETSTAT RESCACHE** or **NETSTAT RESCACHE SUMMARY**

```

Report field descriptions
**SUMMARY or SUMMARY DNS reports**

**Storage Usage**
Displays information about the overall storage usage for resolver caching. This storage represents 64-bit private storage in the resolver address space.

**Maximum**
Displays the maximum amount of storage that the resolver can allocate to manage cache records. This value was defined using the CACHESIZE resolver setup statement. This value can be displayed as a number followed by the letter \( M \).

**Current**
Displays the current amount of storage that the resolver has allocated to manage cache records. This value can be displayed in the following forms:
- If the value is less than 1 MB, then it is displayed as a number followed by the letter \( K \).
- If the value is 1 MB or greater, it is displayed as a number followed by the letter \( M \).

**MaxUsed**
Displays the greatest amount of storage that the resolver has ever allocated for managing cache records. This value can be displayed in the following forms:
- If the value is less than 1 MB, then it is displayed as a number followed by the letter \( K \).
- If the value is 1 MB or greater, it is displayed as a number followed by the letter \( M \).

**Cache Usage**
Displays information about the number and the makeup of the records that are currently in the resolver cache. This value includes both NX (negative cache entries) and non-NX entries.

**Total number of entries**
Displays the total number of A, AAAA, and PTR cache entries that are currently in the resolver cache. This value includes both NX (negative cache entries) and non-NX entries.

**Non-NX entries**
Displays the total number of A, AAAA, and PTR cache entries that represent successful name or address resolution attempts, that are in the resolver cache. An individual cache entry represents one of the following case:
- A host-name-to-IPv4-address resolver query to a specific name server, for which the name server returned at least one IPv4 address.
- A host-name-to-IPv6-address resolver query to a specific name server, for which the name server returned at least one IPv6 address.
- An IP-address-to-host-name resolver query to a specific name server, for which the name server returned a host name.

**A**
Displays the total number of A cache entries that are currently in the resolver cache that were created as a result of a successful resolution attempt. An individual A cache entry contains the results of one host-name-to-IPv4-address resolver query to a specific name server, even if multiple IPv4 addresses were returned by the name server for the target host name.

**AAAA**
Displays the total number of AAAA cache entries that are currently in the resolver cache that were created as a result of a successful resolution attempt. An individual AAAA cache entry contains the results of one host-name-to-IPv6-address resolver query to a specific name server, even if multiple IPv6 addresses were returned by the name server for the target host name.

**PTR**
Displays the total number of PTR cache entries that are currently in the resolver cache that were created as a result of a successful resolution attempt. An individual PTR cache entry

Monitoring the TCP/IP network 479
contains the results of one IP-address-to-host-name resolver query to a specific name server. The target IP address can be either an IPv4 address or an IPv6 address.

**NX entries**
Displays the total number of A, AAAA, and PTR negative cache entries that are in the resolver cache. An individual negative cache entry represents one of the following results:

- A host-name-to-IPv4-address resolver query to a specific name server, in which the name server indicated that the target host name does not have associated IPv4 addresses.
- A host-name-to-IPv6-address resolver query to a specific name server, in which the name server indicated that the target host name does not have associated IPv6 addresses.
- An IP-address-to-host-name resolver query to a specific name server, in which the name server indicated that the target IP address does not have associated host name value. The IP address can be either an IPv4 address or an IPv6 address.

**A**
Displays the total number of A negative cache entries that are currently in the resolver cache that were created as a result of host-name-to-IPv4-address resolver queries that did not return any IPv4 addresses. An individual A negative cache entry contains the results of one host-name-to-IPv4-address resolver query to a specific name server.

**AAAA**
Displays the total number of AAAA negative cache entries that are currently in the resolver cache that were created as a result of host-name-to-IPv6-address resolver queries that did not return any IPv6 addresses. An individual AAAA negative cache entry contains the results of one host-name-to-IPv6-address resolver query to a specific name server.

**PTR**
Displays the total number of PTR negative cache entries that are currently in the resolver cache that were created as a result of IP-address-to-host-name resolver queries that did not return a host name. An individual PTR negative cache entry contains the results of one IP-address-to-host-name resolver query to a specific name server. The target IP address can be either an IPv4 address or an IPv6 address.

**Queries**
Displays the total number of instances in which a query to the resolver cache services was attempted.

**Guideline:** A single resolver API call, for example, Getaddrinfo, might result in multiple queries to the resolver cache. Separate cache queries are attempted for IPv4 and IPv6 information. Separate cache queries are also attempted for different domains if the SEARCH resolver configuration statement specifies that different domains should be appended to the input host name value for search purposes.

**Hits**
Displays the total number of instances in which a query of the resolver cache provided response information about the target resource. The response information represents either DNS reply information that had been cached, or it represents an indication that negative cache information existed for the target resource.

**SuccessRatio**
Displays the percentage of cache queries that successfully provided response information. This value is equal to the number of hits divided by the number of queries.

**DNS address**
Displays information about the number and the makeup of the records that are currently in the resolver cache that are associated with replies from the name server at the displayed IP address.

**Total number of entries**
Displays the total number of A, AAAA, and PTR cache entries that are currently in the resolver cache that were created as a result of DNS response information from this specific name server. This value includes both NX (negative cache) entries and non-NX entries.
Non-NX entries
Displays the total number of A, AAAA, and PTR cache entries that represent successful name or address resolution attempts, in the resolver cache as a result of DNS response information from this specific name server. An individual cache entry contains one of the following results:

- A host-name-to-IPv4-address resolver query to a specific name server, for which the name server returned at least one IPv4 address.
- A host-name-to-IPv6-address resolver query to a specific name server, for which the name server returned at least one IPv6 address.
- An IP-address-to-host-name resolver query to a specific name server, for which the name server returned a host name.

A
Displays the total number of A cache entries that are currently in the resolver cache that were created as a result of a successful resolution attempt directed to this specific name server. An individual A cache entry contains the results of one host-name-to-IPv4-address resolver query, even if multiple IPv4 addresses were returned by the name server for the target host name.

AAAA
Displays the total number of AAAA cache entries that are currently in the resolver cache that were created as a result of a successful resolution attempt directed to this specific name server. An individual AAAA cache entry contains the results of one host-name-to-IPv6-address resolver query, even if multiple IPv6 addresses were returned by the name server for the target host name.

PTR
Displays the total number of PTR cache entries that are currently in the resolver cache that were created as a result of a successful resolution attempt directed to this specific name server. An individual PTR cache entry contains the results of one IP-address-to-host-name resolver query. The target IP address can be either an IPv4 address or an IPv6 address.

NX entries
Displays the total number of A, AAAA, and PTR negative cache entries in the resolver cache that were created as a result of DNS response information from this specific name server. An individual negative cache entry can contain any of the following results:

- A host-name-to-IPv4-address resolver query to which the name server responded that the target host name has no associated IPv4 addresses.
- A host-name-to-IPv6-address resolver query to which the name server responded that the target host name has no associated IPv6 addresses.
- An IP-address-to-host-name resolver query to which the name server responded that the target IP address has no associated host name value. The IP address can be either IPv4 addresses or IPv6 addresses.

A
Displays the total number of A negative cache entries that are currently in the resolver cache that were created as a result of host-name-to-IPv4-address resolver queries to this specific name server that did not return any IPv4 addresses. An individual A negative cache entry contains the results of one host-name-to-IPv4-address resolver query.

AAAA
Displays the total number of AAAA negative cache entries that are currently in the resolver cache that were created as a result of host-name-to-IPv6-address resolver queries to this specific name server that did not return any IPv6 addresses. An individual AAAA negative cache entry contains the results of one host-name-to-IPv6-address resolver query.

PTR
Displays the total number of PTR negative cache entries that are currently in the resolver cache that were created as a result of IP-address-to-host-name resolver queries to this specific name server that did not return any host name. An individual PTR negative cache entry contains the results of one IP-address-to-host-name resolver query.
entry contains the results of one IP-address-to-host-name resolver query. The target IP address can be either an IPv4 address or an IPv6 address.

References
Displays the total number of instances in which a query of the resolver cache examined the collection of cache entries that represents DNS response information from the name server that was specified by the DNS address in an attempt to find response information about the target resource.

Guideline: A single cache query attempt might result in multiple queries of different collections of information provided by the name server. You can use the NSINTERADDR resolver configuration statement to specify which name servers should be queried to obtain information about the target resource, and in which order they should be queried. The resolver cache uses the same NSINTERADDR list to determine which collections of information provided by the name server to examine for a specific cache query. If no response information is found in the collection of information that is provided by the first name server in the NSINTERADDR list, the collection of information that is provided by the second name server in the list is checked, and so on.

If the first name server in the NSINTERADDR list is the primary name server for the installation, the number of references for that name server should be much higher than the number of references for the other name servers in the list. Most of the resolver queries should, during normal operation, be directed to the primary name server, and therefore most information in the resolver cache should be provided by the primary name server. A comparatively small number of references for the primary name server, compared to the secondary name servers, suggests that the primary name server might not be active all the time, or that most of the cache queries are not successful, because the resolver cache is examining more than just the primary name server’s collection of responses as part of a single cache query.

Hits
Displays the total number of instances in which a query of the resolver cache provided response information about the target resource that was created as a result of DNS response information from the name server that was specified by the DNS address. The response information represents either DNS reply information that had been cached, or it is an indication that negative cache information existed for the target resource.

DETAIL or DETAIL NEGATIVE reports

HostName to IPAddress translation
This banner indicates that the next set of cache entries that is being reported contains the results of resolver queries, such as Getaddrinfo and Gethostbyname, to translate a host name into one or more IP addresses.

HostName
Displays the host name that is used as the target resource to acquire the cache information that is in this entry.

DNS IPAddress
Displays the IP address of the name server that provided the response information about the host name that is contained in this cache entry.

DNS Record Type
Displays the record type of this cache entry. See the following possible values:

T_A
Indicates the result of an attempt to resolve a host name to an IPv4 address.

T_AAAA
Indicates the result of an attempt to resolve a host name to an IPv6 address.

Canonical Name
Displays the official DNS name for the host name. The name is provided as part of the DNS response in the form of a T_CNAME resource record. If this entry represents negative cache information, then the value *** NA *** is displayed.
Cache Time
Displays the time and date when the cache entry was created.

Expired Time
Displays the time and date after which the cache entry is no longer valid. A time-to-live (TTL) value is provided as part of the DNS response data, and that value indicates how long the response data can be trusted.

Depending on the type of cache entry, you can change the TTL value that is returned by DNS using the MAXTTL or MAXNEGTTL resolver setup statements. See MAXTTL statement and MAXNEGTTL statement in z/OS Communications Server: IP Configuration Reference for details.

Guideline: The resolver cache logic does not automatically delete cache entries when the TTL time expires. The cache entries are deleted when a subsequent query for the host name is received or they are deleted as part of periodic storage cleanup processing.

Hits
Displays the number of times that the information in this cache entry was used to respond to a cache query.

IPAddress
Displays one or more IP addresses that are associated with the host name. One cache entry is used to contain IPv4 addresses that are associated with a given host name, and a second entry is used to contain IPv6 addresses that are associated with a given host name. All of the addresses displayed for a host name are either all IPv4 addresses, or all IPv6 addresses, but never a mixture of both types of addresses. If this entry represents negative cache information, then the value *** NA *** is displayed instead of an IP address.

IPAddress to HostName translation
This banner indicates that the next set of cache entries that is being reported displays the results of resolver queries, such as Getnameinfo and Gethostbyaddr, to translate an IP address into a host name.

IPAddress
Displays the IP address that is used as the target resource to acquire the cache information in this entry.

DNS IPAddress
Displays the IP address of the name server that provided the response information about the IP address that is contained in this cache entry.

DNS Record Type
Displays the record type of this cache entry. The possible value is:

T_PTR
Indicates the result of an attempt to resolve an IP address to a host name.

Cache Time
Displays the time and date when the cache entry was created.

Expired Time
Displays the time and date when the cache entry is longer valid. A time-to-live (TTL) value is provided as part of the DNS response data; that value indicates how long the response data can be trusted.

Depending on the type of cache entry, you can change the TTL value that is returned by DNS using the MAXTTL or MAXNEGTTL resolver setup statements. See MAXTTL statement and MAXNEGTTL statement in z/OS Communications Server: IP Configuration Reference for details.

Guideline: The resolver cache logic does not automatically delete cache entries when the TTL time expires. The cache entries are deleted when a subsequent query for the IP address is received, or they are deleted as part of periodic storage cleanup processing.

Hits
Displays the number of times that the information in this cache entry was used to respond to a cache query.
**HostName**
Displays the host name that is associated with the IP address.

If this entry represents negative cache information, then the value ***NA*** is displayed instead of an IP address.

**Netstat ROUTe/-r report**
Displays the routing information that this stack uses when it determines what addresses it can communicate with and over which links or interfaces and first hops the communication takes place. The routes in the stack main routing table can be displayed, as well as the routes in the stack policy-based routing tables. These routes can be static routes (those defined in the TCP/IP profile for the main route table and those defined to the Policy Agent for policy-based route tables), routes learned from routing daemons, and routes learned by other ICMP or ICMPv6 information, such as redirects. If there is no route that covers the destination IP address and if there is no default route defined, then this stack cannot communicate with that destination. Multiple routes to the same destination, referred to as multipath routes, are also displayed. If multipath is not enabled (on the IPCONFIG or IPCONFIG6 statement for the main route table and on the RouteTable policy statement for policy-based route tables), then the first active route to the destination is always used.

**Tip:** Static routes over deleted interfaces are removed from the main routing table and therefore do not appear in reports that are generated for the main routing table. Loopback routes are displayed as well as implicit (HOME list) routes.

**TSO syntax**

```
NETSTAT ROUTe Modifier Target Output (Filter)
```

**Modifier**

```
ADDRTYPE IPV4 | IPV6
DETAIL
IQDIO
PR
ALL prname
QDIOACCEL
RADV
RSTAT
```

**ADDRTYPE IPV4 | IPV6**
Display the specified IP type routing information.

**IPV4**
Display IPv4 routing information. This parameter is mutually exclusive with the RADV parameter.

**IPV6**
Display IPv6 routing information.

**DETAIL**
Displays additional details such as the metric or cost of use for the route, MTU size if it is an IPv4 route, and the MVS specific configured parameters for each route.

This parameter is mutually exclusive with the QDIOACCEL and IQDIO parameters.
PR
Displays policy-based routing tables. This parameter is mutually exclusive with the QDIOACCEL and IQDIO parameters.

ALL
Displays all policy-based routing tables.

prname
Displays the policy-based routing table that has the name prname.

Restriction: The Netstat ROUTe command displays only active policy-based route tables. A policy-based route table is active if it is referenced by an active routing rule and its associated action. You can display active and inactive policy-based route tables with the pasearch command. For more information, see “The z/OS UNIX pasearch command: Display policies” on page 749.

QDIOACCEL
IQDIO
Displays the routes that are eligible for accelerated routing using QDIO Accelerator or HiperSockets Accelerator. See the QDIO Accelerator information and the information about efficient routing using HiperSockets Accelerator in z/OS Communications Server: IP Configuration Guide for more details. This parameter is mutually exclusive with the DETAIL, RADV, PR, and RSTAT parameters.

RADV
Displays all of the IPv6 routes that are added based on information received in router advertisement messages. All IPv6 router advertisement routes are displayed whether or not they are currently used for routing. The flags and reference count are not displayed on the report. This parameter is mutually exclusive with the RSTAT, QDIOACCEL, IQDIO, and ADDRTYPE IPV4 parameters.

RSTAT
Displays all of the static routes that are defined as replaceable. All defined replaceable static routes are displayed whether or not they are currently being used for routing. The flags and reference count are not displayed on the report. This parameter is mutually exclusive with the RADV, QDIOACCEL, and IQDIO parameters.

Target
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

Output
The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

Filter

z/OS UNIX syntax

netstat -r Modifier Target Output Filter
ADDRTYPE IPV4 | IPV6
Display the specified IP type routing information.

IPV4
Display IPv4 routing information. This parameter is mutually exclusive with the RADV parameter.

IPV6
Display IPv6 routing information.

DETAIL
Displays additional details such as the metric or cost of use for the route, MTU size if it is an IPv4 route, and the MVS-specific configured parameters for each route. This parameter is mutually exclusive with the QDIOACCEL and IQDIO parameters.

PR
Displays policy-based routing tables. This parameter is mutually exclusive with the QDIOACCEL and IQDIO parameters.

ALL
Displays all policy-based routing tables.

pname
Displays the policy-based routing table that has the name pname.

Restriction: The Netstat ROUTe command displays only active policy-based route tables. A policy-based route table is active if it is referenced by an active routing rule and its associated action. You can display active and inactive policy-based route tables with the pasearch command. For more information, see “The z/OS UNIX pasearch command: Display policies” on page 749.

QDIOACCEL
IQDIO
Displays the routes that are eligible for accelerated routing using QDIO Accelerator or HiperSockets Accelerator. See QDIO Accelerator information and efficient routing using HiperSockets Accelerator information in z/OS Communications Server: IP Configuration Guide for more details. This parameter is mutually exclusive with the DETAIL, RADV, PR, and RSTAT parameters.

RADV
Displays all of the IPv6 routes that are added based on information received in router advertisement messages. All IPv6 router advertisement routes are displayed whether or not they are currently used for routing. The flags and reference count are not displayed on the report. This parameter is mutually exclusive with the RSTAT, QDIOACCEL, IQDIO, and ADDRTYPE IPV4 parameters.

RSTAT
Displays all static routes that are defined as replaceable. All defined replaceable static routes are displayed without regard to whether or not they are currently being used for routing. The flags and
reference count are not displayed on the report. This parameter is mutually exclusive with the RADV, QDIOACCEL, and IQDIO parameters.

**Target**

Provide the report for a specific TCP/IP address space by using `-p tcpname`. See “The Netstat command target” on page 287 for more information about the TCP parameter.

**Output**

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

**Filter**

Filter the report output using the specified IP address `ipaddr`, `ipaddr/prefixlength`, or `ipaddr/subnetmask`. You can enter up to six filter values. Each specified IPv4 `ipaddr` value can be up to 15 characters in length and each selected IPv6 `ipaddr` value can be up to 45 characters in length.

- `-I` `ipaddr`/`prefixLength`/`subnetmask` Filter the report output using the specified IP address `ipaddr`. For IPv4 addresses, the default subnet mask of 255.255.255.255 is used. For IPv6 addresses, the default `prefixlength` of 128 is used.

- `-I` `ipaddr`/`prefixlength` Filter the output of the ROUTe/-r report using the specified IP address and prefix length `ipaddr/prefixlength`. For an IPv4 address, the prefix length range is 1 – 32. For an IPv6 address, the prefix length range is 1 – 128.

- `-I` `ipaddr`/`subnetmask` Filter the output of the ROUTe/-r report using the specified IP address and subnet mask `ipaddr/subnetmask`. The IP address `ipaddr` in this format must be an IPv4 IP address.

The IPAddr/-I filter value can be a complete string or a partial string using wildcard characters. A wildcard character can be an asterisk (*), which matches a null string or any character or character string, at the same position. A wildcard character can be a question mark (?), which matches any single character at the same position. For example, a string "searhee" matches with "*ar?he*", but the string "searchee" does not match with "*ar?he*". If you want to use the wildcard character on the IPAddr/-I filter, you must specify the value in the `ipaddr` format. The wildcard character is not accepted for the `ipaddr/prefixlen` or `ipaddr/subnetmask` format of IPAddr/-I values.

When you use z/OS UNIX `netstat/onetstat` command in a z/OS UNIX shell environment, take care if you use a z/OS UNIX MVS special character in a character string. It might cause an unpredictable result. To be safe, if you want to use a z/OS UNIX MVS special character in a character string, surround the character string with single (’) or double (") quotation marks. For example, to use an asterisk (*) in the IP address, 10.*.0.0 for the -I filter, issue the command as: `netstat -r -I '10.*.0.0'` or `netstat -r -I "10.*.0.0"`.

**Note:** When filtering ROUTe/-r responses on a specified IP address, the DEFAULT and DEFAULTNET routes are not displayed.

**Guidelines:**
1. For an IPv6-enabled stack:
   - Both IPv4 and IPv6 ipaddr values are accepted and can be mixed on the IPAddr/-I option.
   - For an IPv6-enabled stack, an IPv4-mapped IPv6 address is accepted and is treated as an IPv6 address. If an IPv4-mapped IPv6 address is entered as an IPAddr/-I value, there is no matching entry found.

Restrictions:
1. The filter value for an IPv6 address does not support wildcard characters.
2. For an IPv4-only stack, only IPv4 ipaddr values are accepted.

Command syntax examples

From TSO environment

```plaintext
NETSTAT ROUTE
Display the routing information the default stack will use when it determines what addresses it can communicate with and over which links/interfaces and first hops the communication will take place. If the stack is IPv6-enabled, then both IPv4 and IPv6 routing information are displayed.

NETSTAT ROUTE TCP TCPCS6
Display the routing information the TCPCS6 stack will use when it determines what addresses it can communicate with and over which links/interfaces and first hops the communication will take place. If the TCPCS6 stack is IPv6-enabled, then both IPv4 and IPv6 routing information are displayed.

NETSTAT ROUTE TCP TCPCS8 (IPADDR 9.43.1.1 9.43.2.2
Display the routing information in the TCPCS8 stack whose destination address match the specified filter IP address values.

NETSTAT ROUTE ADDRTYPE IPV4
Display the IPv4 routing information the default stack will use when it determines what addresses it can communicate with and over which links/interfaces and first hops the communication will take place.
```

From UNIX shell environment

```plaintext
netstat -r
netstat -r -p tcpcs6
netstat -r -p tcpcs8 -I 9.43.1.1 9.43.2.2
netstat -r ADDRTYPE IPV4
```

Report examples

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

Not IPv6 enabled (SHORT format)

```plaintext
NETSTAT ROUTE or NETSTAT ROUTE ADDRTYPE IPV4
```

- VarianceMultiplier: 2.000

**Report field descriptions**

**Destination or DestIP**
The address of a destination host or network, followed by a slash and the net mask.

**Gateway or Gw**
The gateway used to send packets to the destination. If the value is 0.0.0.0 for an IPv4 entry or :: for an IPv6 entry, then the destination is directly reachable without needing to go through a gateway.

**GwReachable**
Indicates whether IPv6 neighbor unreachability detection has detected that the gateway is reachable.
- The gateway is the router that originates the router advertisement message containing the route.
- **Yes** Indicates that the gateway is reachable.
**No**
Indicates that the gateway is unreachable. When the gateway is unreachable, the route is not
being used for routing. If an alternate route is available, this route is not installed in the routing
table.

**N/A**
The value is displayed for direct prefix router advertisement routes. These routes do not have an
associated gateway.

**Flags or Flgs**
The state of the route, which can have the following values:

**G**
The route uses a gateway.

**H**
The route is to a host rather than to a network.

**I**
The static route in a policy-based routing table is not valid because it is configured to use a link that is
not defined in the stack for the same IP version as the route.

**U**
The route is up.

The following flags are mutually exclusive:

**C**
The route was created by a connection (not using a definition or a routing protocol). Routes to subnets
or point-to-point destinations using interfaces over which OMPROUTE is active but has not yet
established a routing protocol are considered connection routes.

**D**
The route was created dynamically by ICMP processing or router advertisements (IPv6).

**O**
The route was created by OSPF (includes OSPF external routes).

**R**
The route was created by RIP.

**S**
The route is a static route not replaceable by a routing daemon or router advertisements (IPv6).

**Z**
The route is a static route replaceable by dynamic routes learned by OMPROUTE or from router
advertisements (IPv6).

**Interface or Intf**
The link or interface name for the route.

**IntfActive**
Indicates whether the interface for the route is active.

**Yes**
Indicates that the interface is active.

**No**
Indicates that the interface is not active. When the interface is not active, the route is not being
used for routing. If an alternate route is available, this route is not installed in the routing table.

**LifetimeExp**
The time at which the IPv6 router advertisement route will be deleted. This lifetime can be extended
by router-supplied information. The N/A value is displayed for routes that are advertised with an
infinite lifetime.

**MTU**
The value of the maximum transmission unit (MTU). The value can be one of the following depending
on the modifier with which the report that contains the MTU value is displayed:
• In a report that is displayed by using neither the RADV modifier nor the RSTAT modifier:
  – If the route is active, this MTU value is the largest packet size that can be sent by using this route. If the packet is larger than the MTU value, the packet must be fragmented if fragmentation is permitted. If fragmentation is not permitted, the packet is dropped and an ICMP error is returned to the originator of the packet.
  – If the route is inactive and was configured by using the BEGINROUTES or RouteTable statement, this MTU value is the same as the MTU value that was configured for the route.
  – If the route is inactive and was not configured by using the BEGINROUTES or RouteTable statement, this MTU value is either the link MTU value that is received in a router advertisement message for IPv6 routes only or 0.
• In a report that is displayed by using the RADV modifier, this MTU value is the link MTU value that is received in a router advertisement message or 0 if no link MTU value was received.
• In a report that is displayed by using the RSTAT modifier, this MTU value is the MTU value that was configured for the route by using the BEGINROUTES or RouteTable statement.

Metric
Displays the metric of the route. For static routes, direct routes have a metric of 0 and indirect routes have a metric of 1. If a route was learned from a routing daemon, the displayed metric is the metric that is set by the routing daemon. If a route was learned from an IPv6 router advertisement, the metric value is one of the following values:

1
  When the router advertisement indicates a high preference.

2
  When the router advertisement indicates a medium preference.

3
  When the router advertisement indicates a low preference.

After the routes are in the stack routing table, the Metric field is not used. The routing daemons use metrics to compare routes and to inform the stack only of the routes that have the best metric.

Maximum retransmit time (MaxReTransmitTime)
The TCP retransmission interval in seconds for this route. If this parameter was not defined for the route, the default value of 120 seconds is displayed. This parameter does not affect initial connection retransmission.

Minimum retransmit time (MinReTransmitTime)
The minimum retransmit interval in seconds for this route. If this parameter was not defined for the route, the default value 0.5 (500 milliseconds) seconds is displayed.

Reference count (RefCnt)
The current number of active users for the route.

Round trip gain (RoundTripGain)
The percentage of the latest round trip time (RTT) to be applied to the smoothed RTT average. The higher this value, the more influence the latest packet RTT has on the average. If this parameter was not defined for the route, the default value 0.125 is displayed. This parameter does not affect initial connection retransmission.

Variance gain (VarianceGain)
The percentage of the latest RTT variance from the RTT average to be applied to the RTT variance average. The higher this value, the more influence the latest packet's RTT has on the variance average. If this parameter was not defined for the route, the default value 0.25 is displayed. This parameter does not affect initial connection retransmission.

Variance multiplier (VarianceMultiplier)
This value is multiplied against the RTT variance in calculating the retransmission interval. [The higher this value, the more effect variation in RTT has on calculating the retransmission interval.] If this parameter was not defined for the route, the default value 2 is displayed. This parameter does not affect initial connection retransmission.
DelayAcks
Indicates whether the DELAYACKS option is enabled or disabled. The value Yes indicates that acknowledgments are delayed when a packet is received (the DELAYACKS parameter was defined for the route). The value No indicates that acknowledgements are not delayed when a packet is received (the NODELAYACKS parameter was defined for the route).

Policy Routing Table
The name of the policy-based routing table being displayed.

IgnorePathMtuUpdate
IPv4
Indicates whether IPv4 ICMP Fragmentation Needed messages are ignored for this routing table. See the IgnorePathMtuUpdate parameter on the RouteTable statement in the z/OS Communications Server: IP Configuration Reference for more information. This field can have the following values:

Yes
IPv4 ICMP Fragmentation Needed messages are ignored for this routing table.

No
IPv4 ICMP Fragmentation Needed messages are processed for this routing table.

N/A
This value is displayed when either the routing table is not configured for IPv4 routing or only IPv6 routing information is being displayed for the table.

IPv6
Indicates whether IPv6 ICMP Packet Too Big messages are ignored for this routing table. See the IgnorePathMtuUpdate6 parameter on the RouteTable statement in the z/OS Communications Server: IP Configuration Reference for more information. This field can have the following values:

Yes
IPv6 ICMP Packet Too Big messages are ignored for this routing table.

No
IPv6 ICMP Packet Too Big messages are processed for this routing table.

N/A
This value is displayed when either the routing table is not configured for IPv6 routing or only IPv4 routing information is being displayed for the table.

MultiPath
IPv4
The information in this field is divided into two parts. The value before the parentheses indicates whether the multipath routing selection algorithm for outbound IPv4 traffic is enabled for this policy-based routing table. See the multipath parameter on the RouteTable statement in the z/OS Communications Server: IP Configuration Reference for more information. The possible values for the MultiPath field are:

Pkt
Indicates that outbound IPv4 traffic uses the round-robin distribution method to use multipath routes for each outbound packet.

Conn
Indicates that outbound IPv4 traffic uses the round-robin distribution method to use multipath routes for each outbound connection request.

No
Indicates that outbound IPv4 traffic always uses the first active route in a multipath group.

N/A
This value is displayed when either the routing table is not configured for IPv4 routing or only IPv6 routing information is being displayed for the table.
The value inside the parentheses identifies where the multipath value was obtained. The possible values are:

**Profile**
Indicates that the value UseGlobal has been coded on the Multipath parameter on the RouteTable statement; the value was obtained from the IPCONFIG statement.

**Policy**
Indicates that the multipath value was obtained from the Multipath parameter of the RouteTable statement.

**Tip:** If IPSECURITY is coded on the IPCONFIG statement and Multipath PerPacket is specified on a RouteTable statement, the Multipath PerPacket option is disabled. The value No(Policy) is displayed on the report. For more information, see the RouteTable statement information in the z/OS Communications Server: IP Configuration Reference.

**IPv6**
The information in this field is divided into two parts. The value before the parentheses indicates whether the multipath routing selection algorithm for outbound IPv6 traffic is enabled for this policy-based routing table. See the Multipath6 parameter on the RouteTable statement in the z/OS Communications Server: IP Configuration Reference for more information. The possible values for the MultiPath6 field are:

**Pkt**
Indicates that outbound IPv6 traffic uses the round-robin distribution method to use multipath routes for each outbound packet.

**Conn**
Indicates that outbound IPv6 traffic uses the round-robin distribution method to use multipath routes for each outbound connection request.

**No**
Indicates that outbound IPv6 traffic always uses the first active route in a multipath group.

**N/A**
This value is displayed when either the routing table is not configured for IPv6 routing or only IPv4 routing information is being displayed for the table.

The value inside the parentheses identifies where the multipath value was obtained. The possible values are:

**Profile**
Indicates that the value UseGlobal has been coded on the Multipath6 parameter on the RouteTable statement; the value was obtained from the IPCONFIG6 statement.

**Policy**
Indicates that the multipath value was obtained from the Multipath6 parameter of the RouteTable statement.

**Tip:** If IPSECURITY is coded on the IPCONFIG6 statement and Multipath6 PerPacket is specified on a RouteTable statement, the Multipath6 PerPacket option is disabled. The value No(Policy) is displayed on the report. For more information, see the RouteTable statement information in the z/OS Communications Server: IP Configuration Reference.

**DynamicXCFRoutes**

**IPv4**
Indicates whether direct routes to the IPv4 dynamic XCF addresses on other TCP/IP stacks are added to the policy-based routing table when the dynamic XCF links to those stacks are active. These are the same routes that are automatically generated in the main routing table when the IPv4 dynamic XCF links are active. See Dynamic XCF in the z/OS Communications Server: IP Configuration Guide for information about the dynamic XCF function and the definitions that are automatically generated when IPCONFIG DYNAMICXCF is specified in the TCP/IP profile. This field can have the following values:
Yes
Direct routes to the IPv4 dynamic XCF addresses on other TCP/IP stacks are added to the policy-based routing table when the dynamic XCF links to those stacks are active.

No
Direct routes to the IPv4 dynamic XCF addresses on other TCP/IP stacks are not added to the policy-based routing table when the dynamic XCF links to those stacks are active.

N/A
This value is displayed when either the routing table is not configured for IPv4 routing or only IPv6 routing information is being displayed for the table.

IPv6
Indicates whether direct routes to the IPv6 dynamic XCF addresses on other TCP/IP stacks are added to the policy-based routing table when the dynamic XCF links to those stacks are active. These are the same routes that are automatically generated in the main routing table when the IPv6 dynamic XCF links are active. See Dynamic XCF in the z/OS Communications Server: IP Configuration Guide for information about the dynamic XCF function and the definitions that are automatically generated when IPCONFIG6 DYNAMICXCF is specified in the TCP/IP profile. This field can have the following values:

Yes
Direct routes to the IPv6 dynamic XCF addresses on other TCP/IP stacks are added to the policy-based routing table when the dynamic XCF links to those stacks are active.

No
Direct routes to the IPv6 dynamic XCF addresses on other TCP/IP stacks are not added to the policy-based routing table when the dynamic XCF links to those stacks are active.

N/A
This value is displayed when either the routing table is not configured for IPv6 routing or only IPv4 routing information is being displayed for the table.

Interface
The name of the interface that is specified in a dynamic routing parameter for the policy-based routing table. If the interface is not currently defined to the TCP/IP stack for the same IP version as the dynamic routing parameter or the interface is inactive on the TCP/IP stack, the name is preceded by an asterisk (*).

NextHop
The next-hop router IP address that is specified in a dynamic routing parameter for the policy-based routing table. The value Any is displayed when no next-hop router IP address is specified for the dynamic routing parameter.

Netstat SLAP/-j report
Displays QoS Policy statistics. By default, all of the QoS policy statistics are displayed. The SUMMARY parameter can be specified to limit the display to summary statistics. Or you can use the POLICYN/-Y filter to display only statistics for a specific policy.

TSO syntax
NETSTAT SLAP [Modifier] [Target] [Output] [Filter]

Modifier
ACTIVE
Display QoS policy information only for the activated policies.
**SUMmary**
Display a summary of QoS policy information.

**Target**
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**
The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**Filter**

<table>
<thead>
<tr>
<th>Modifier</th>
<th>Target</th>
<th>Output</th>
<th>Filter</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE</td>
<td>SUMmary</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**z/OS UNIX syntax**

```bash
netstat -j Modifier Target Output Filter
```

**Modifier**

- **ACTIVE**
  Display QoS policy information only for the activated policies.
- **SUMmary**
  Display a summary of QoS policy information.

**Target**
Provide the report for a specific TCP/IP address space by using -p tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**
The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

**Filter**

<table>
<thead>
<tr>
<th>Modifier</th>
<th>Target</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Y</td>
<td>policyname</td>
</tr>
</tbody>
</table>

**Filter description**

**POLicyn/-Y policyname**
Filter the output of the SLAP/-j report using the specified policy rule name policyname. You can enter one filter value at a time and the specified value can be up to 48 characters long.

The POLicyn/-Y filter value can be a complete string or a partial string using wildcard characters. A wildcard character can be an asterisk (*), which matches a null string or any character or character string, at the same position. A wildcard character can be a question mark (?), which matches any single character at the same position. For example, a string "searchee" matches with "*ar?he*", but the string "searhee" does not match with "*ar?he*".

When you use z/OS UNIX netstat/onetstat command in a z/OS UNIX shell environment, take care if you use a z/OS UNIX MVS special character in a character string. It might cause an unpredictable
result. To be safe, if you want to use a z/OS UNIX MVS special character in a character string, surround the character string with single quotation marks. For example, to use an asterisk (*) in the policy name, pgnt*rl for the -Y filter, issue the command as: netstat -j -Y 'pgnt*rl'.

**Command syntax examples**

*From TSO environment*

```
NETSTAT SLAP
NETSTAT SLAP SUMMARY
```

*From UNIX shell environment*

```
netstat -j
netstat -j SUMMARY
```

**Report examples**

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

**Tip:** The Netstat SLAP/ -j reports are not affected by the IPv6 enablement and format request.

```
NETSTAT SLAP

```
Report field descriptions

PolicyRuleName
The unique name that identifies the policy rule.

FirstActTime
The time stamp for when the policy rule was first activated.

LastMapTime
The time stamp for when the policy rule was last used.

TotalBytesIn
The number of bytes received by IP for the policy rule.

TotalBytesOut
The number of bytes transmitted by IP for the policy rule.

TotalInPackets
The number of inbound packets received from IP for the policy rule.

TotalOutPackets
The number of outbound packets sent by IP for the policy rule.

OutBytesInProf
This counter counts the number of outbound octets that are determined to be within profile.

OutPacksInProf
This counter counts the number of outbound packets that are determined to be within profile.

TotalBytesReTrn
The number of bytes retransmitted by IP for the policy rule.

TotalPacksReTrn
The number of packets retransmitted by IP for the policy rule.

RetrTimeouts
The number of retransmission timeouts for the policy rule.

AcceptConn
This counter is incremented when a policy action (service class) Permission value is set to Allowed and a session (TCP connection) is accepted. It will also be incremented if the policy rule Permission attribute is used.

DeniedConn
This counter is incremented when a policy action Permission value is set to Blocked and a session (TCP connection) is denied, or when a session is rejected due to a policy's connection limit (MaxConnLimit). It will not be incremented if the policy rule Permission attribute is used.

ActConnMap
The number of active TCP connections that are affected by the policy rule.

Status
Displays the status of the policy rule. Valid values are Active and Pending Delete. Active indicates that the policy rule is currently in effect. Pending Delete indicates that the policy rule has been marked for deletion but is currently in use. The policy rule is deleted when the rule is no longer in use.
**SmoothRTTAvg**
The average TCP round trip time for all TCP traffic affected by this policy rule, smoothed over several sampling intervals to reduce large momentary variations.

**SmoothRTTMdev**
Mean deviation of the TCP round-trip time, smoothed over several sampling intervals to reduce large momentary variations. This value is a computationally less expensive approximation of the standard deviation for this quantity.

**SmoothConnDlyAvg**
The average connection delay, smoothed over several sampling intervals to reduce large momentary variations. This is the delay between receipt of the first TCP SYN request and the time that the first data packet is returned by the application.

**SmoothConnDlyMdev**
Mean deviation of the connection delay, smoothed over several sampling intervals to reduce large momentary variations. This value is a computationally less expensive approximation of the standard deviation for this quantity.

**AcceptQDelayAvg**
The average accept queue delay. This is the delay between the sending of the TCP SYN ACK for the connection request and the time that the application accepts the connection request.

**AcceptQDelayMdev**
Mean deviation of the accept queue delay. This value is a computationally less expensive approximation of the standard deviation for this quantity.

**Tip:** The time displayed in the header of the report is local time. The FirstActTime and LastmapTime fields displayed in the report are Coordinated Universal Time (UTC).

**Netstat SOCKets/-s report**
Displays information for open TCP and/or UDP sockets associated with a client name.

**Restriction:** This command displays socket information only for sockets that are bound to a port or an IP address. TCP connections that have been shutdown or aborted are not displayed.

**TSO syntax**

```
NETSTAT SOCKets Target Output (Filter)
```

**Target**
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**
The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.
Filter

| CLIent | clientname |
| HOSTName | hostname |
| IPAddr | ipaddr |
| | ipaddr/prefixLen |
| | ipaddr/subnetmask |
| IPPort | ipaddr+portnum |
| NOTN3270 | |
| POrt | portnum |

**z/OS UNIX syntax**

```
netstat -s Target Output Filter
```

**Target**

Provide the report for a specific TCP/IP address space by using `-p tcpname`. See “The Netstat command target” on page 287 for more information about the TCP parameter.

**Output**

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

Filter

```
-B ipaddr+portnum
```

- `B` 
- `ipaddr+portnum`
Filter description

CLIENT/-E clientname
Filter the output of the SOCKets/-s report using the specified client name clientname. You can enter up to six filter values and each specified value can be up to eight characters long.

HOSTName/-H hostname
Filter the output of the SOCKets/-s report using the specified host name hostname. You can enter one filter value at a time and the specified value can be up to 255 characters long.

Result: At the end of the report, Netstat will display the host name that the resolver used for the resolution and the list of IP addresses returned from the resolver that it used as filters.

Restrictions:
1. The HOSTName/-H filter does not support wildcard characters.
2. Using the HOSTName/-H filter might cause delays in the output due to resolution of the hostname value, depending upon resolver and DNS configuration.

IPAddr/-I ipaddr
Filter the output of the SOCKets/-s report using the specified IP address ipaddr. For IPv4 addresses, the default subnet mask of 255.255.255.255 is used. For IPv6 addresses, the default prefixlength of 128 is used.

Guidelines:
1. The filter value ipaddr can be an address to which the socket is bound or connected.
2. For an IPv6-enabled stack:
   - Both IPv4 and IPv6 ipaddr values are accepted and can be mixed on the IPAddr/-I option.
   - An IPv4-mapped IPv6 address is accepted as a valid ipaddr value and will usually provide the same result as its IPv4 address does.

Restrictions:
1. The filter value for an IPv6 address does not support wildcard characters.
2. For an IPv4-only stack, only IPv4 ipaddr values are accepted.
3. For a UDP endpoint socket, the filter value applies only to the local or source IP address.

IPPort/-B ipaddr+portnum
Filter the report output of the SOCKets/-s report using the specified IP address and port number. You can enter up to six filter values. Each specified IPv4 ipaddr value can be up to 15 characters in length, denoting a single IPv4 IP address; each specified IPv6 ipaddr value can be up to 45 characters in length, denoting a single IPv6 IP address. Valid portnum values are in the range 0 – 65535. The filter values ipaddr and portnum will match any combination of the local and remote IP address and local and remote port.

Guidelines:
- The filter value ipaddr can be either the local or remote IP address.
• For an IPv6-enabled stack, the following apply:
  – Both IPv4 and IPv6 ipaddr values are accepted and can be mixed on the IPPort/-B option.
  – An IPv4-mapped IPv6 address is accepted as a valid ipaddr value and usually provides the same result as the IPv4 address.

Restrictions:
• The ipaddr value in the IPPort/-B filter does not support wildcard characters.
• For an IPv4-only stack, only IPv4 ipaddr values are accepted.
• An entry is returned only when both the ipaddr and portnum values match.
• For a UDP endpoint socket, the filter value applies only to the local or source IP address and port.

NOTN3270/-T
Filter the output of the SOCKets/-s report, excluding TN3270 server connections.

PORT/-P portnum
Filter the output of the SOCKets/-s report using the specified port number portnum. You can enter up to six filter values.

Guideline: The port number can be a port to which the socket is bound or connected.

Restriction: For a UDP endpoint socket, the filter value applies only to the local or source port.

The filter value for CLIENT/-E and IPAddr/-I can be a complete string or a partial string using wildcard characters. A wildcard character can be an asterisk (*), which matches a null string or any character or character string, at the same position. A wildcard character can be a question mark (?), which matches any single character at the same position. For example, a string "searchee" matches with "*ar?he*", but the string "searhee" does not match with "*ar?he*". If you want to use the wildcard character on the IPAddr/-I filter, you must specify the value in the ipaddr format. The wildcard character is not accepted for the ipaddr/prefixlen or ipaddr/subnetmask format of IPAddr/-I values.

When you use z/OS UNIX netstat/onetstat command in a z/OS UNIX shell environment, take care if you use a z/OS UNIX MVS special character in a character string. It might cause an unpredictable result. To be safe, if you want to use a z/OS UNIX MVS special character in a character string, surround the character string with single (') or double (") quotation marks. For example, to use an asterisk (*) in the IP address, 10.*.0.0 for the -I filter, issue the command as: netstat -s -I '10.*.0.0' or netstat -s -I "10.*.0.0".

Report field descriptions

The following list shows the information displayed after invoking the SOCKets parameter:
Name
The client address space name.

Subtask
The subtask identifier indicates the task that created the socket or issued a bind socket API call for the socket. This identifier is the hexadecimal address of the Task Control Block (TCB) associated with this task. The subtask identifier is combined with the address space name to produce a unique identifier for the client.

Type
Displays the socket type and can have one of the following values:

Stream
Socket type for stream (TCP) sockets.

Dgram
Socket type for UDP sockets.

Bound to
Indicates the address and port to which the socket is bound. The output is in the format IP address..bound port where IP address is the address to which the socket is bound and bound port is the port number to which the socket is bound. Unbound TCP and UDP sockets are not displayed by NETSTAT CONN.

Connected to
Displays the address and port to which the socket is connected. For UDP sockets, the value of this field is *..* if the socket is not connected. For connected UDP sockets, this field shows the remote IP address and port specified on the connect request. When a UDP socket is connected, it accepts packets only from the specified remote IP address and port.

State
Describes the state of the TCP connection. See “TCP connection status” on page 293 for more information.

Conn
Displays the client identifier, which is a unique number assigned by the TCP/UDP stack to uniquely identify a socket entity.

Netstat SRCIP/-J report
Displays the job-specific and destination-specific information that is configured using the SRCIP profile statement. See z/OS Communications Server: IP Configuration Reference for more information about the SRCIP statement.

TSO syntax

```
NETSTAT SRCIP Target Output
```

Target
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

Output
The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

z/OS UNIX syntax

```
netstat -J Target Output
```
Target
Provide the report for a specific TCP/IP address space by using -p tcpname. See “The Netstat command target” on page 287 for more information about the -p parameter.

Output
The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

Command syntax examples

From TSO environment

```
NETSTAT SRCIP
```

From UNIX shell environment

```
netstat -J
```

Report examples
The following examples are generated using the TSO NETSTAT command. The z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

### Report field descriptions

**Destination**

A destination IP address, network address, or subnet address for which the designated source should be used to provide the source IP address for an outbound TCP connection. If a connection's destination address matches more than one Destination value, the most complete match is selected. The Destination designations are ignored if a connection's job name matches a Job Name value with at least one non-wildcard character, but a Destination match overrides a JOBNAME * match.

**Job Name**

The name of the job that matches this entry. The job name can end in an asterisk (*). Any job that is running that begins with the same characters that precede the asterisk matches this designation. If several different designations exist, then the matching entry is determined by the most complete match: either an exact match, or the entry that has the most matching characters before the asterisk in the job-specific source IP address designation. An asterisk (*) in this field indicates that all of the applications match the entry.

When an IP address or interface name is displayed in the Source column, the Job Name value is the name of the job or jobs for which the designated interface should be used as the source IP address. An asterisk (*) indicates that all applications that issue TCP connect requests are associated with the specified source IP address or interface. They override any existing TCPSTACKSOURCEVIPA specifications except for outbound connections whose destination address matches a Destination value.

When TEMPADDRS is displayed in the Source column, the Job Name value is the name of the job or jobs that should prefer a temporary IPv6 address over a public IPv6 address when the default source address selection algorithm is used to select the source IP address. When PUBLICADDRS is displayed in the Source column, the Job Name value is the name of the job or jobs that should prefer a public IPv6 address over a temporary IPv6 address when the default source address selection algorithm is used to select the source IP address. An asterisk (*) in the Job Name column indicates that all the applications match the entry. See the information about default source address selection in z/OS Communications Server: IPv6 Network and Application Design Guide.
**Type**
The address family to which this job-specific source IP address applies, either IPv4 or IPv6. An entry for which the value TEMPADDRS or PUBLICADDRS is displayed in the Source column always has the value IPv6.

**Flg**
The flags represent parameter values defined with the JOBNAME parameter on the SRCIP profile statement.

**B**
The value Both was specified for this SRCIP JOBNAME statement. This JOBNAME statement is used for both TCP client and server applications. For server applications it is applied for only servers that invoke the bind() function call with the IPv4 INADDR_ANY address or the IPv6 unspecified address (in6addr_any).

**C**
The value Client was specified for this SRCIP JOBNAME statement (or was set by default). This JOBNAME statement is used for TCP outbound (client) connections only.

**S**
The value Server was specified for this SRCIP JOBNAME statement. This JOBNAME statement is used for server applications that invoke the bind() function call with the IPv4 INADDR_ANY address or the IPv6 unspecified address (in6addr_any).

This field is blank for an entry that displays the value TEMPADDRS or PUBLICADDRS in the Source column.

**Source**

**IP address or interface name**
The interface name or IP address that is used to supply a source IP address for TCP client or server applications.

- When the source address is displayed after the destination display line, TCP client applications that have a destination IP address that matches the corresponding destination value use this source address.
- When the source address is displayed with job name values, both IPv4 and IPv6 TCP client and server applications that have a job name that matches the corresponding job name value use this source address depending on the flag field value (Both, Client only, or Server only).

**TEMPADDRS**
Indicates that a temporary IPv6 address should be preferred over a public IPv6 address when IPv6 default address selection is used to select the source IP address for the specified job.

**PUBLICADDRS**
Indicates that a public IPv6 address should be preferred over a temporary IPv6 address when IPv6 default address selection is used to select the source IP address for the specified job.

**Netstat STATS/-S report**
Displays TCP/IP statistics for IP, ICMP, TCP, and UDP protocols. You can use the PROTOCOL filter to display statistics for only a specific protocol.

**TSO syntax**

```plaintext
NETSTAT STATS [Modifier] Target Output
```

**Modifier**

```plaintext
PROTOCOL protocol
```

**PROTOCOL protocol**
Display statistics for the specified protocol. The valid protocols are IP, ICMP, TCP, and UDP.
**Result:** If you specify TCP, you get TCP, SMC-R, and SMC-D statistics. For more information about SMC support, see Shared Memory Communications in z/OS Communications Server: IP Configuration Guide.

**Target**

Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**

The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**z/OS UNIX syntax**

```
netstat -S Modifier Target Output
```

**Modifier**

```
PROTOCOL protocol
```

**PROTOCOL protocol**

Display statistics for the specified protocol. The valid protocols are IP, ICMP, TCP, and UDP.

**Result:** If you specify TCP, you get TCP, SMC-R, and SMC-D statistics. For more information about SMC support, see Shared Memory Communications in the z/OS Communications Server: IP Configuration Guide.

**Target**

Provide the report for a specific TCP/IP address space by using -p tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

**Command syntax examples**

**From TSO environment**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NETSTAT STATS</td>
<td>Provides TCP/IP statistics for IP, ICMP, TCP and UDP protocols.</td>
</tr>
<tr>
<td>NETSTAT STATS PROTOCOL IP</td>
<td>Provides TCP/IP statistics for IP protocol. If the stack is IPv6-enabled, then the statistics for IPv6 protocol are also displayed.</td>
</tr>
<tr>
<td>NETSTAT STATS PROTOCOL ICMP</td>
<td>Provides TCP/IP statistics for ICMP protocol. If the stack is IPv6-enabled, then the statistics for ICMPv6 protocol are also displayed.</td>
</tr>
<tr>
<td>NETSTAT STATS PROTOCOL TCP</td>
<td>Provides TCP/IP statistics for TCP protocol. If the stack is enabled for SMC-R, then the statistics for SMC-R are also displayed. If the stack is enabled for SMC-D, then the statistics for SMC-D are also displayed.</td>
</tr>
<tr>
<td>NETSTAT STATS PROTOCOL UDP</td>
<td>Provides TCP/IP statistics for UDP protocol.</td>
</tr>
</tbody>
</table>

**From UNIX shell environment**

- `netstat -S`
- `netstat -S PROTOCOL IP`
- `netstat -S PROTOCOL ICMP`
- `netstat -S PROTOCOL TCP`
- `netstat -S PROTOCOL UDP`
Report examples

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

Not IPv6 enabled (SHORT format)

### Report field descriptions

- The following describes the IPv4 and IPv6 statistics displayed:

  **Packets Received**
  - The total number of input datagrams received from interfaces.

  **Received Header Errors**
  - The number of input datagrams discarded due to errors in their IP headers.

  **Received Address Errors**
  - The number of input datagrams discarded because the IP address in their IP header's destination field was not valid.

  **Datagrams Forwarded**
  - The number of input datagrams forwarded to their final destination.

  **Unknown Protocols Received**
  - The number of datagrams discarded because of an unknown or unsupported protocol.

  **Received Packets Discarded**
  - The number of input datagrams that were discarded that are not accounted for in another input discard counter.

  **Received Packets Delivered**
  - The total number of input datagrams successfully delivered to IP user-protocols.
**Output Requests**
The total number of IP datagrams that local IP user-protocols supplied to IP in requests for transmission.

**Output Discards No Route**
The number of IP datagrams discarded because no route could be found to transmit them to their destination.

**Output Discards (Other)**
The number of output datagrams generated by this stack that could not be transmitted.

**Reassembly Timeouts**
The number of packets that were being held for reassembly but which were discarded due to the fact that the remaining fragments were not received within reassembly timeout.

**Reassembly Required**
The number of IP fragments received that needed to be reassembled.

**Reassembly Successful**
The number of IP datagrams successfully reassembled.

**Reassembly Failures**
The number of failures detected by the IP reassembly algorithm.

**Datagrams Successfully Fragmented**
The number of IP datagrams that have been successfully fragmented.

**Datagrams Failing Fragmentation**
The number of IP datagrams that have been discarded because they needed to be fragmented but could not be.

**Fragments Created**
The number of IP datagram fragments that have been generated as a result of fragmentation.

**Inbound Packets handled by zIIP**
The number of inbound packets that were processed by a zIIP. This counter applies only to IPSec workloads, whose CPU cycles are being displaced to a zIIP. The Packets Received counter includes the packets that are received on zIIP, so the percentage of total inbound packets that were processed by zIIP can be calculated as (Inbound Packets handled by zIIP ÷ Packets Received) × 100. Similarly, the number of inbound packets that were processed by General Purpose Processors is equal to (Packets Received - Inbound Packets handled by zIIP).

**Outbound Packets handled by zIIP**
The number of outbound packets that were processed by a zIIP. This counter applies only to IPSec workloads, whose CPU cycles are being displaced to a zIIP. The Output Requests counter includes the outbound packets processed on zIIP, so the percentage of total outbound packets that were processed by zIIP can be calculated as (Outbound Packets handled by zIIP ÷ Output Requests) × 100. Similarly, the number of outbound packets that were processed by General Purpose Processors is equal to (Output Requests - Outbound Packets handled by zIIP).

- The following describes the IP general statistics displayed. The statistic values for these counters reflect both IPv4 and IPv6 processing combined.

**Inbound Calls from Device Layer**
The number of times the inbound TCP/IP Data Path has received control from the Device Layer.

**Inbound Frame Unpacking Errors**
The number of times a received frame could not be unpacked into its constituent datagrams.

**Inbound Discards Memory Shortage**
The number of inbound packets discarded due to a CSM storage shortage condition.

**Output Discards DLC Sync Errors**
The number of outbound packets discarded due to a synchronous error in the Data Link Control.

**Output Discards DLC Async Errors**
The number of outbound packets discarded due to an asynchronous error in the Data Link Control.
Output Discards Memory Shortage
The number of outbound packets discarded due to a CSM storage shortage condition.

- The following describes the ICMP statistics displayed:

Messages
The total number of ICMP messages received and sent.

Errors
The number of ICMP messages received and sent but determined as having ICMP-specific errors.

Destination Unreachable
The number of ICMP Destination Unreachable messages received and sent.

Time Exceeded
The number of ICMP Time Exceeded messages received and sent.

Parameter Problems
The number of ICMP Parameter Problem messages received and sent.

Source Quenches
The number of ICMP Source Quench messages received and sent.

Redirects
The number of ICMP Redirect messages received and sent.

Echos
The number of ICMP Echo (request) messages received and sent.

Echo Replies
The number of ICMP Echo Reply messages received and sent.

Timestamps
The number of ICMP Timestamp (request) messages received and sent.

Timestamp Replies
The number of ICMP Timestamp Reply messages received and sent.

Address Masks
The number of ICMP Address Mask (request) messages received and sent.

Address Mask Replies
The number of ICMP Address Mask Reply messages received and sent.

- The following describes the ICMPv6 statistics displayed:

Messages
The total number of ICMPv6 messages received and sent.

Errors
The number of ICMPv6 messages received and sent but determined as having ICMPv6-specific errors.

Destination Unreachable
The number of ICMPv6 Destination Unreachable messages received and sent.

Time Exceeded
The number of ICMPv6 Time Exceeded messages received and sent.

Parameter Problems
The number of ICMPv6 Parameter Problem messages received and sent.

Redirects
The number of ICMPv6 Redirect messages received and sent.

Echos
The number of ICMPv6 Echo messages received and sent.

Echo Replies
The number of ICMPv6 Echo Reply messages received and sent.
Administratively Prohibited
The number of ICMPv6 Administratively Prohibited messages received and sent.

Packet Too Big
The number of ICMPv6 Packet Too Big messages received and sent.

Router Solicitations
The number of ICMPv6 Router Solicitation messages received and sent.

Router Advertisements
The number of ICMPv6 Router Advertisement messages received and sent.

Neighbor Solicitations
The number of ICMPv6 Neighbor Solicitation messages received and sent.

Neighbor Advertisements
The number of ICMPv6 Neighbor Advertisement messages received and sent.

Group Membership Queries
The number of ICMPv6 Group Membership Queries received and sent.

Group Membership Responses
The number of ICMPv6 Group Membership Responses received and sent.

Group Membership Reductions
The number of ICMPv6 Group Membership Reductions received and sent.

• The following describes the TCP statistics displayed:

Current® Established Connections
The number of TCP connections for which the current state is either ESTABLISHED or CLOSE-WAIT.

Guideline: This value, when displayed for TCP statistics, includes the number of TCP connections across SMC-R and SMC-D links. To determine the number of TCP connections that are not across SMC-R links, subtract the value for Current Established Connections displayed under SMCR Statistics from this value. To determine the number of TCP connections that are not across SMC-D links, subtract the value for Current Established Connections displayed under SMCD Statistics from this value.

Current Stalled Connections
The number of TCP connections whose send data flow is stalled. The send data flow is considered stalled if one or more of the following conditions are true:

– The TCP send window size is less than 256 or is less than the smaller of the largest send window that has been seen for the connection and the default MTU. The TCP send window size is set based on values provided by the TCP peer. The default MTU for IPv4 is 576. The default MTU for IPv6 is 1280.
– The TCP send queue is full and the data is not being retransmitted.

Current Servers In Connection Flood
The number of TCP servers under a potential connection flood attack. A server is considered under a potential connection flood attack when backlog queue expansion is required to handle the incoming connection requests. When more than 25 servers are under a potential connection flood attack, no server's backlog queue will be allowed to expand.

Active Connections Opened
The number of times TCP connections have made a direct transition to the SYN-SENT state from the CLOSED state.

Guideline: This value, when displayed for TCP statistics, includes the number of TCP connections across SMC-R and SMC-D links that made a direct transition to the SYN-SENT state from the CLOSED state. To determine the number of these TCP connections that are not across SMC-R links, subtract the value for Active Connections Opened displayed under SMCR Statistics from this value. To determine the number of these TCP connections that are not across SMC-D links, subtract the value for Active Connections Opened displayed under SMCD Statistics from this value.
**Passive Connections Opened**  
The number of times that TCP connections have made a direct transition to the SYN-RCVD state from the LISTEN state. This value, when displayed for TCP statistics, includes the number of TCP connections across SMC-R and SMC-D links that made a direct transition to the SYN-RCVD state from the LISTEN state. To determine the number of the TCP connections that are not across SMC-R links, subtract the value for Passive Connections Opened displayed under SMCR Statistics from this value. To determine the number of the TCP connections that are not across SMC-D links, subtract the value for Passive Connections Opened displayed under SMCD Statistics from this value.

**Connections Closed**  
Number of TCP connections that have corresponding sockets closed.  
**Guideline:** This value, when displayed for TCP statistics, includes the number of TCP connections across SMC-R and SMC-D links that have corresponding sockets closed. To determine the number of these TCP connections that are not across SMC-R links, subtract the value for Connections Closed displayed under SMCR Statistics from this value. To determine the number of these TCP connections that are not across SMC-D links, subtract the value for Connections Closed displayed under SMCD Statistics from this value.

**Established Connections Dropped**  
The number of times TCP connections made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state. This value includes the number of TCP connections across SMC-R links.

**Connection Attempts Dropped**  
The number of times TCP connections have made a direct transition to the CLOSED state from either the SYN-SENT state or the SYN-RCVD state, plus the number of times TCP connections have made a direct transition to the listen state from the SYN-RCVD state.

**Connection Attempts Discarded**  
Number of passive connection requests discarded.

**Timewait Connections Reused**  
Number of TCP connections in the TIMEWAIT state that have been reused for connections in the SYN-RCVD state.

**Segments Received**  
The total number of segments received.  
**Guideline:** This value, when displayed for TCP statistics, includes the number of Remote Direct Memory Access (RDMA) inbound operations that are processed across all SMC-R and SMC-D links. To determine the number of segments that are received on TCP connections that do not traverse SMC-R links, subtract the value for Segments Received displayed under SMCR Statistics from this value. To determine the number of segments that are received on TCP connections that do not traverse SMC-D links, subtract the value for Segments Received displayed under SMCD Statistics from this value.

**Segments Received on OSA Bulk Queues**  
The total number of segments received for all connections from the BulkData ancillary input queue (AIQ) of the OSA-Express QDIO inbound workload queueing function. For more information about QDIO inbound workload queueing, see z/OS Communications Server: IP Configuration Guide.

**Header Prediction Ok for ACK**  
Number of inbound TCP acknowledgments with successful header prediction.

**Header Prediction Ok for Data**  
Number of inbound TCP data segments with successful header prediction.

**Duplicate ACKs**  
Number of inbound duplicate TCP acknowledgments.

**Discards for Bad Checksum**  
Number of inbound TCP segments discarded due to bad checksum.
Discards for Bad Header Length
Number of inbound TCP segments discarded due to bad header length.

Discards for Data too Short
Number of inbound TCP segments discarded due to data length shorter than segment length.

Discards for Old Timestamp
Number of inbound TCP segments discarded due to old timestamp.

Segments Completely Duplicate
Number of inbound TCP segments with all data before current TCP window.

Segments Partially Duplicate
Number of inbound TCP segments with some data before current TCP window.

Segments Completely After Window
Number of inbound TCP segments with all data after current TCP window.

Segments Partially After Window
Number of inbound TCP segments with some data after current TCP window.

Segments Out of Order
Number of inbound TCP segments that did not contain the next expected sequence number.

Segments Received After Close
Number of inbound TCP segments received after corresponding sockets have been closed.

Window Probes Received
Number of inbound TCP segments processed while current receive window size is 0.

Window Updates Received
Number of inbound TCP segments that only change receive window size.

Segments Sent
The total number of segments sent.

Guideline: This value, when displayed for TCP statistics, includes the number of RDMA outbound operations that are processed across all SMC-R and SMC-D links. To determine the number of segments that were sent on TCP connections that do not traverse SMC-R links, subtract the value for Segments Sent displayed under SMCR Statistics from this value. To determine the number of segments that were sent on TCP connections that do not traverse SMC-D links, subtract the value for Segments Sent displayed under SMCD Statistics from this value.

Window Updates Sent
Number of outbound TCP segments that only change receive window size.

Delayed ACKs Sent
Number of delayed outbound TCP acknowledgments.

Resets Sent
Number of TCP segments sent containing the RST flag.

Guideline: This value, when displayed for TCP statistics, includes the number of TCP connections that were using SMC-R and SMC-D links. To determine the number of these segments that were sent for TCP connections that were not using SMC-R links, subtract the value for Resets Sent displayed under SMCR Statistics from this value. To determine the number of these segments that were sent for TCP connections that were not using SMC-D links, subtract the value for Resets Sent displayed under SMCD Statistics from this value.

Segments Retransmitted
The total number of segments retransmitted.

Retransmit Timeouts
Number of TCP retransmit timer pops.

Connections Dropped by Retransmit
Number of TCP connections dropped due to retransmit threshold exceeded.
Path MTU Discovery Retransmits
Number of outbound TCP segments retransmitted due to path MTU discovery.

Path MTU Beyond Retransmit Limit
Number of TCP connections that exceeded path MTU discovery retransmit threshold.

Window Probes Sent
Number of outbound window probe requests.

Connections Dropped during Probe
Number of TCP connections dropped due to no response while sending window probe requests.

KeepAlive Probes Sent
Number of keepalive probe requests. This value includes the number of TCP connections across SMC-R links.

Connections Dropped by KeepAlive
Number of TCP connections dropped because of no response when sending keepalive probe requests. This value includes the number of TCP connections across SMC-R links.

Connections Dropped by Finwait2
Number of TCP connections dropped because of FINWAIT2 timer expiring before receiving FIN segments. This value includes the number of TCP connections across SMC-R links.

Configured Ephemeral Ports
Number of configured ephemeral ports to be assigned for TCP applications.

Ephemeral Ports In Use
The number of ephemeral ports currently in use by TCP applications.

Ephemeral Ports Max Usage
The highest number of ephemeral ports in use by TCP applications at any time.

Ephemeral Ports Exhausted
The number of times a bind() request failed because all available ephemeral ports were in use.

• The following describes the SMC-D statistics that are displayed:

Current Established SMC Links
The current number of active SMC-D links.

Active SMC Links Opened
The number of times that an SMC-D link was established and this stack acted in the server role during link establishment.

Passive SMC Links Opened
The number of times that an SMC-D link was established and this stack acted in the client role during link establishment.

SMC Links Closed
The number of SMC-D links that were closed.

Current Established Connections
The number of TCP connections over SMC-D links for which the current state is either ESTABLISHED or CLOSE-WAIT.

Active Connection Opened
The number of times that TCP connections over SMC-D links made a direct transition to the SYN-SENT state from the CLOSED state.

Passive Connection Opened
The number of times that TCP connections over SMC-D links made a direct transition to the SYN-RCVD state from the LISTEN state.

Connections Closed
The number of TCP connections over SMC-D links that have corresponding sockets closed.

Segments Received
The number of SMC-D inbound operations that were processed across all SMC-D links.
The following describes the SMC-D statistics that are displayed:

**Segments Sent**
The number of SMC-D outbound operations that were processed across all SMC-D links.

**Resets Sent**
The number of SMC-D outbound operations that contained the abnormal close flag. This flag is set when the connection is abnormally terminated. For example, the TCP connection was Reset.

**Resets Received**
The number of SMC-D inbound operations that contained the abnormal close flag. This flag is set when the connection is abnormally terminated. For example, the TCP connection was Reset.

The following describes the SMC-R statistics that are displayed:

**Current Established SMC Links**
The current number of active SMC-R links.

**SMC Link Activation Time Outs**
The number of times that an attempt occurred to establish an SMC-R link, but the attempt failed because of timeout conditions.

**Active SMC Links Opened**
The number of times that an SMC-R link was established and this stack acted in the server role during link establishment.

**Passive SMC Links Opened**
The number of times that an SMC-R link was established and this stack acted in the client role during link establishment.

**SMC Links Closed**
The number of SMC-R links that were closed.

**Current Established Connections**
The number of TCP connections over SMC-R links for which the current state is either ESTABLISHED or CLOSE-WAIT.

**Active Connection Opened**
The number of times that TCP connections over SMC-R links made a direct transition to the SYN-SENT state from the CLOSED state.

**Passive Connection Opened**
The number of times that TCP connections over SMC-R links made a direct transition to the SYN-RCVD state from the LISTEN state.

**Connections Closed**
The number of TCP connections over SMC-R links that have corresponding sockets closed.

**Segments Received**
The number of SMC-R inbound operations that were processed across all SMC-R links.

**Segments Sent**
The number of SMC-R outbound operations that were processed across all SMC-R links.

**Resets Sent**
The number of SMC-R outbound operations that contained the abnormal close flag. This flag is set when the connection is abnormally terminated. For example, the TCP connection was Reset.

**Resets Received**
The number of SMC-R inbound operations that contained the abnormal close flag. This flag is set when the connection is abnormally terminated. For example, the TCP connection was Reset.

The following describes the UDP statistics displayed:

**Datagrams Received**
The total number of UDP datagrams delivered to UDP users.

**No Port Errors**
The total number of received UDP datagrams for which there was no application at the destination port.
Receive Errors
The number of received UDP datagrams that could not be delivered for reasons other than the lack of an application at the destination port.

Datagrams Sent
The total number of UDP datagrams sent.

Configured Ephemeral Ports
Number of configured ephemeral ports to be assigned for UDP applications.

Ephemeral Ports In Use
The number of ephemeral ports currently in use by UDP applications.

Ephemeral Ports Max Usage
The highest number of ephemeral ports in use by UDP applications at any time.

Ephemeral Ports Exhausted
The number of times a bind() request failed because all available ephemeral ports were in use.

Netstat TELnet/-t report
Displays information for TN3270E Telnet server connections.

**TSO syntax**

```
NETSTAT Telnet Modifier Target Output (Filter)
```

**Modifier**

```
DETAIL
```

**DETAIL**
Displays the logmode and Telnet protocol in use by each connection. If an application user ID was entered on the solicitor panel, it is displayed in the TnUserId field. Otherwise, the TnUserId field is blank.

**Target**
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**
The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.
Filter

Netstat -t

Modifier

DETAIL

DETAIL Displays the logmode and Telnet protocol in use by each connection. If an application user ID was entered on the solicitor panel, it is displayed in the TnUserId field. Otherwise, the TnUserId field is blank.

Target

Provide the report for a specific TCP/IP address space by using -p tcpname. See “The Netstat command target” on page 287 for more information about the TCP parameter.

Output

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.
Filter description

APPLname applname
Filter the output of the TELnet/-t report using the specified VTAM application name applname. You can enter up to six filter values and each specified value can be up to eight characters long.

CLIENT/-E clientname
Filter the output of the TELnet/-t report using the specified client name clientname. You can enter up to six filter values and each specified value can be up to eight characters long.

HOSTName/-H hostname
Filter the output of the TELnet/-t report using the specified host name hostname. You can enter one filter value at a time and the specified value can be up to 255 characters long.

Result: At the end of the report, Netstat displays the host name that the resolver used for the resolution and the list of IP addresses returned from the resolver that it used as filters.

Restrictions:
1. The HOSTName/-H filter does not support wildcard characters.
2. Using HOSTName/-H filter might cause delays in the output due to resolution of the hostname value, depending upon resolver and DNS configuration.

IPAddr/-I ipaddr/IPAddr/-I ipaddr/prefixlength/IPAddr/-I ipaddr/subnetmask
Filter the report output using the specified IP address ipaddr, ipaddr/prefixlength, or ipaddr/subnetmask. You can enter up to six filter values. Each specified IPv4 ipaddr value can be up to 15 characters in length and each selected IPv6 ipaddr value can be up to 45 characters in length.

ipaddr
Filter the output of the TELnet/-t report using the specified IP address ipaddr. For IPv4 addresses, the default subnet mask of 255.255.255.255 is used. For IPv6 addresses, the default prefixlength of 128 is used.
**ipaddr/prefixlength**
Filter the output of the TELnet/-t report using the specified IP address and prefix length `ipaddr/prefixlength`. For an IPv4 address, the prefix length range is 1 – 32. For an IPv6 address, the prefix length range is 1 – 128.

**ipaddr/subnetmask**
Filter the output of the TELnet/-t report using the specified IP address and subnet mask `ipaddr/subnetmask`. The IP address `ipaddr` in this format must be an IPv4 IP address.

**Guidelines:**
1. The filter value `ipaddr` is the remote IP address.
2. For an IPv6-enabled stack:
   - Both IPv4 and IPv6 `ipaddr` values are accepted and can be mixed on the IPAddr/-I option.
   - An IPv4-mapped IPv6 address is accepted as a valid `ipaddr` value and usually provides the same result as its IPv4 address.

**Restrictions:**
1. The filter value for an IPv6 address does not support wildcard characters.
2. For an IPv4-only stack, only IPv4 `ipaddr` values are accepted.

**IPPort/-B ipaddr+portnum**
Filter the report output of the TELnet/-t report using the specified IP address and port number. You can enter up to six filter values. Each specified IPv4 `ipaddr` value can be up to 15 characters in length, denoting a single IPv4 IP address; each specified IPv6 `ipaddr` value can be up to 45 characters in length, denoting a single IPv6 IP address. Valid `portnum` values are in the range 0 – 65 535. The filter values `ipaddr` and `portnum` will match any combination of the local and remote IP address and local and remote port.

**Guidelines:**
- The filter value `ipaddr` can be either the local or remote IP address.
- For an IPv6-enabled stack, the following apply:
  - Both IPv4 and IPv6 `ipaddr` values are accepted and can be mixed on the IPPort/-B option.
  - An IPv4-mapped IPv6 address is accepted as a valid `ipaddr` value and usually provides the same result as the IPv4 address.

**Restrictions:**
- The `ipaddr` value in the IPPort/-B filter does not support wildcard characters.
- For an IPv4-only stack, only IPv4 `ipaddr` values are accepted.
- An entry is returned only when both the `ipaddr` and `portnum` values match.

**LUName luname**
Filter the output of the TELnet/-t report using the specified LU name `luname`. You can enter up to six filter values and each specified value can be up to eight characters long.

**PORT/-P portnum**
Filter the output of the TELnet/-t report using the specified port number `portnum`. You can enter up to six filter values.

Except for PORT/-P, and HOSTname/-H, the filter value can be a complete string or a partial string using wildcard characters. A wildcard character can be an asterisk (*), which matches a null string or any character or character string, at the same position. A wildcard character can be a question mark (?), which matches any single character at the same position. For example, a string "searchee" matches with "*ar?he*", but the string "spearhee" does not match with "*ar?he*". If you want to use the wildcard character on the IPAddr/-I filter, you must specify the value in the `ipaddr` format. The wildcard character is not accepted for the `ipaddr/prefixlen` or `ipaddr/subnetmask` format of IPAddr/-I values.
When you use z/OS UNIX netstat/onnetstat command in a z/OS UNIX shell environment, take care if you use a z/OS UNIX MVS special character in a character string. It might cause an unpredictable result. To be safe, if you want to use a z/OS UNIX MVS special character in a character string, surround the character string with single quotation marks. For example, to use an asterisk (*) in the IP address, 10.*.0.0 for the -I filter, issue the command as: netstat -t -I '10.*.0.0'.

**Command syntax examples**

*From TSO environment*

```
NETSTAT TELNET
Display the status of the internal Telnet server connections in the default TCP/IP stack.
NETSTAT TELNET TCP TCPCS6
Display the status of the internal Telnet server connections in TCPCS6 stack.
NETSTAT TELNET TCP TCPC8 (IPADDR 9.43.1.1 9.43.2.2
Display the status of the internal Telnet server connections in TCPC8 stack whose foreign IP addresses match the specified filter IP address values.
NETSTAT TELNET (PORT 2222 6666 88
Display the status of the internal Telnet server connections in the default TCP/IP stack whose foreign ports match the specified filter port numbers.
```

*From UNIX shell environment*

```
netstat -t
netstat -t -p tcpcs6
netstat -t -p tcpcs6 -I 9.43.1.1 9.43.2.2
netstat -t -P 2222 6666 88
```

**Report examples**

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

**Not IPv6 enabled (SHORT format)**

```

**Note:** For NETSTAT TELnet display, the BytesOut and BytesIn counts are in two forms:

```
nnnnnnnn
Number range 0 – 99 999 999

nnnnnnnnK
Number range 100 000 000 – 4 294 967 294
where \( K = nnnnnnn \times 1000 \)
For the NETSTAT TELnet display, the BytesOut and BytesIn counts are in one of the following five forms:

- \( nnnnnnnnn \)
  A number in the range 0 – 9 999 999 999

- \( nnnnnnnnnK \)
  A number in the range 10 000 000 000 – 9 999 999 999 499 \((K = nnnnnnnnn \times 1000)\)

- \( nnnnnnnnnM \)
  A number in the range 9 999 999 999 500 – 9 999 999 999 499 999 \((M = nnnnnnnnn \times 1 000 000)\)

- \( nnnnnnnnnG \)
  A number in the range 9 999 999 999 500 000 – 9 999 999 999 499 999 999 \((G = nnnnnnnnn \times 1 000 000 000)\)

- \( nnnnnnnnnT \)
  A number in the range 9 999 999 999 500 000 000 – 9 999 999 999 499 999 999 999 \((T = nnnnnnnnn \times 1 000 000 000 000)\)

**Report field descriptions**

**Conn**

The connection ID as it is known to TCP/IP. See Client ID or Connection Number information in “Netstat report general concepts” on page 293 for a detailed description.

**Foreign Socket**

See the Foreign Socket information in “Netstat report general concepts” on page 293 for a detailed description.

**State**

The connection state as it is known to TCP/IP. See the TCP connection status information in “Netstat report general concepts” on page 293 for a detailed description.

**BytesIn**

Total bytes of data received from the client.

**BytesOut**

Total bytes of data sent to the client.
ApplName
The name of the application in session with the client.

LuName
The LU name selected by Telnet to represent the client.

ModeName
The SNA logmode used for this session.

InProto
The Telnet connection protocol used.

TN3270
The connection has negotiated to a TN3270 Telnet protocol.

TN3270E
The connection has negotiated to a TN3270E Telnet protocol.

TCLMODE
The connection has negotiated to a linemode Telnet protocol.

TnUserId
The user ID used specified on the solicitor panel in response to the Telnet request for user ID/password because of Restrictappl being coded. If an application user ID was entered on the solicitor panel, it is displayed in the TnUserId field. Otherwise, the TnUserId field is blank.

Netstat TTLS/-x report
Displays Application Transparent Transport Layer Security (AT-TLS) information. AT-TLS supports only TCP protocol connections.

**TSO syntax**

```latex
NETSTAT   TTLS [Modifier] [Target] [Output]
```

**Modifier**

**COnn connid**
Displays AT-TLS information for the specified connection. This information includes the name of the AT-TLS policy rule and the names of the associated actions. The specified `connid` value is a number assigned by the TCP/IP stack to uniquely identify a socket entity. You can determine the `connid` from the Conn column in the Netstat ALLCOnn/-a report.

**DETAIL**
Displays the AT-TLS policy rule and the associated action details for the specified connection.

**GRoup**
Displays summary information for AT-TLS groups. AT-TLS groups are defined using the policy statement TTLSGroupAction. The AT-TLS group remains active as long as the TTLSGroupAction is current or there are active connections using the group.

**DETAIL**
Displays detailed information for AT-TLS groups.
Target
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

Output
The default output option displays the output on the user’s terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

z/OS UNIX syntax

```
netstat -x [Modifier] [Target] [Output]
```

Modifier

- **GGroup**
  - Displays summary information for AT-TLS groups. AT-TLS groups are defined using the policy statement TTLSGroupAction. The AT-TLS group remains active as long as the TTLSGroupAction is current or there are active connections using the group.
  - **DETAIL**
    - Displays detailed information for AT-TLS groups.

COpp connid
Displays AT-TLS information for the specified connection. This information includes the name of the AT-TLS policy rule and the names of the associated actions. The specified connid is a number assigned by the TCP/IP stack to uniquely identify a socket entity. You can determine the connid from the Conn column in the Netstat ALLCOnn/-a report.

- **DETAIL**
  - Displays the AT-TLS policy rule and the associated action details for the specified connection.

Target
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

Output
The default output option displays the output on the user’s terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**Command syntax examples**

Monitoring the TCP/IP network 533
From TSO environment

NETSTAT TTLS  (defaults to NETSTAT TTLS GROUP)
NETSTAT TTLS CONN 1B TCP TCPCS8
  Display summary AT-TLS information for the specified connection in the TCPCS8 stack.
NETSTAT TTLS CONN 1B DETAIL TCP TCPCS8
  Display detailed AT-TLS information for the specified connection in the TCPCS8 stack.
NETSTAT TTLS GROUP
  Display summary information for active AT-TLS groups.
NETSTAT TTLS GROUP DETAIL
  Display detailed information for active AT-TLS groups.

From UNIX shell environment

netstat -x        (defaults to -x GROUP)
netstat -x CONN 1b -p tcpcs8
netstat -x CONN 1b DETAIL -p tcpcs8
netstat -x GROUP
netstat -x GROUP DETAIL

CONN report examples

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

Report field descriptions

The report fields are listed in alphabetical order. For more information about each field, see AT-TLS policy statements in z/OS Communications Server: IP Configuration Reference.

Result: A field in a policy rule or policy action is displayed only when a value was configured for that attribute or when the attribute has a default value. Fields that were left undefined and have no default value are not displayed.

3DesKeyCheck
In non-FIPS mode, this field specifies whether or not 3DES keys are required to consist of 3 unique 56-bit key values. Uniqueness is always enforced when operating in FIPS mode.

On
Indicates that check for 3 unique 3DES 56-bit key values will occur.

Off
Indicates that check for 3 unique 3DES 56-bit key values will not occur.

AIACDPPriority
The priority order that the AIA and CDP extensions are checked for revocation information.
On
Indicates that the AIA extension is processed before the CDP extension during certificate revocation checking.

Off
Indicates that the CDP extension is processed before the AIA extension.

ApplicationControlled
Indicates whether the owning application can request AT-TLS security for the connection using the SIOCTTLSCTL IOCTL call.

Result: For a particular connection, the ApplicationControlled value on the TTLSConnectionAction, if specified, overrides the ApplicationControlled value on the TTLSEnvironmentAction.

CertificateLabel
The label of the authentication key used for the connection.

Result: For a particular connection, the CertificateLabel value on the TTLSConnectionAction statement, if specified, overrides the CertificateLabel value on the TTLSEnvironmentAction statement. If a CertificateLabel value is not specified on either the TTLSConnectionAction statement or the TTLSEnvironmentAction statement, the keyring default certificate is used.

CertUserID
The user ID, if any, that is associated with the partner’s certificate. If no associated user ID is available, N/A is displayed.

CertValidationMode
The method of certificate validation that is in use for this connection. The following values are possible:

• The default value, any, means that any supported X.509 certificate validation method can be used.
• RFC2459, indicates that certificates are validated by using the method described in RFC2459.
• RFC3280, indicates that certificates are validated by using the method described in RFC3280.
• RFC5280, indicates that certificates are validated by using the method described in RFC5280.

Results: If 128-bit minimum or 192-bit minimum Suite B profiles are configured, the CertValidationMethod is ignored and the certificate validation method described in RFC 5280 and RFC 5759 is used.

Cipher
The cipher currently in use for encryption and decryption of data for the connection.

ClientAuthType
The level of Client Authentication used when the HandshakeRole is set to a value of ServerWithClientAuth. The following values are possible:

• The default value, Required, means that the client must present a certificate and that the certificate must pass verification.
• PassThru indicates that a certificate is not required and that no verification is attempted.
• Full indicates that the certificate is validated if the client presents one, but that the client is not required to present one.
• SAFCheck indicates that the client must present a certificate that must pass validation and be associated with a user ID in the security product.

ClientECurves
The list of ECDH (Elliptic curve Diffie-Hellman) curves that are supported by the client in the sequence of preference for use.

For TLS version 1.0, TLS version 1.1, and TLS version 1.2, the elliptic curve specifications are used by the client to guide the server as to which elliptical curves can be used when using cipher suites that use elliptical curve cryptography. For TLS version 1.3, the elliptic curve specifications are used by the client to guide the server as to which elliptical curves can be used and to guide group selection for encryption and decryption of handshake messages.
Both the four-character value of the elliptic curve and the constant of the elliptic curve name are shown for each member of the list. The curve name Any indicates that both Brainpool standard curves and NIST standard curves can be used.

**Restriction:** Brainpool certificates cannot be used if the selected protocol is TLS version 1.3.

**ClientEDHGroupSize**
The minimum accepted server Diffie-Hellman group size allowed for an ephemeral Diffie-Hellman key exchange message when AT-TLS is the TLS client.

**Legacy**
In non-FIPS mode, the Diffie-Hellman group size is 1024. In FIPS mode, the Diffie-Hellman group size is 2048.

**2048**
The Diffie-Hellman group size is 2048.

**ClientKeyShareGroups**
The list of key share groups supported by the client during a TLS version 1.3 handshake. During a handshake, the client sends key shares for the groups in this list in the order defined in the supported list (that is, ClientECurves). The server selects a group based on the client’s preferred order and the key share groups that it supports. The client and server use the selected group to encrypt and decrypt TLS version 1.3 handshake messages.

Both the four-character value of the group and the constant group name are shown for each member of the list.

**ClientMaxSSLFragment**
For TLSv1.0 and higher protocols, this field specifies the client level of support for client-specified SSL fragment size on the connection. The following values are possible:

- Required indicates that maximum SSL fragment size support must be accepted by the server. Connections are closed if the server does not support the maximum SSL fragment size extension.
- Optional indicates that maximum SSL fragment size support is used if the server supports the function, but connections to servers that do not support this extension are accepted.
- Off indicates that maximum SSL fragment size support is not available; the TLS extension is not enabled. If the server requires SSL fragment size support, the client will be unable to connect. This is the default.

**Result:** For a particular connection, the ClientMaxSSLFragment value on the TTLSConnectionAction statement, if specified, overrides the ClientMaxSSLFragment value on the TTLSEnvironmentAction statement.

**ClientMaxSSLFragmentLength**
For SSL clients that use TLSv1.0 or higher protocols, specifies the maximum SSL fragment size to request on the connection, in bytes. The following values are possible:

- 512
- 1024
- 2048
- 4096

**Result:** For a particular connection, the ClientMaxSSLFragmentLength value on the TTLSConnectionAction statement, if specified, overrides the ClientMaxSSLFragmentLength value on the TTLSEnvironmentAction statement.

**ClientHandshakeSNI**
For TLSv1.0 and higher protocols, this field specifies the client level of support for client-specified server names on the connection handshake. The following values are possible:

- Required indicates that client-specified server name support must be accepted by the server. Connections are closed if the server does not support the client-specified server name extension.
- **Optional** indicates that client-specified server name support is used if the server supports the function, but connections to servers that do not support this extension are accepted.
- **Off** indicates that client-specified server name support is not available; the TLS extension is not enabled. If the server requires client-specified server name support, the client is unable to connect. This is the default value.

**Result:** For a particular connection, the `ClientHandshakeSNI` value on the `TTLSConnectionAction` statement, if specified, overrides the `ClientHandshakeSNI` value on the `TTLSEnvironmentAction` statement.

**ClientHandshakeSNI**

For SSL clients using TLSv1.0 or higher protocols that might negotiate server name indication, this field specifies the level at which the client requires the client-specified server name to match a server name in the list of names that is maintained by the TLS server. The following values are possible:

- **Required** indicates that a server name in the list of server names provided by the TLS client must match a server name in the server name/certificate label list at the TLS server. The connection ends if no match can be found for the server name.
- **optional** indicates that connections are allowed to continue if no match is found for the server name. This is the default value.

**Result:** For a particular connection, the `ClientHandshakeSNI` value on the `TTLSConnectionAction` statement, if specified, overrides the `ClientHandshakeSNI` value on the `TTLSEnvironmentAction` statement.

**ClientHandshakeSNIList**

For SSL clients using TLSv1.0 or higher protocols that might negotiate server name indication, specifies a server name or names the client will pass to the server.

**Result:** For a particular connection, the `ClientHandshakeSNIList` value on the `TTLSConnectionAction` statement, if specified, overrides the `ClientHandshakeSNIList` value on the `TTLSEnvironmentAction` statement.

**ConnID**

The TCP/IP stack defined unique connection ID representing the connection.

**ConnectionUserInstance**

The instance identifier configured for the `TTLSConnectionAction` statement that is in use by the connection. The instance number can be used to signal a change without modifying other configuration statements. Valid values are in the range 0–65535.

**CRLCacheEntryMaxsize**

The maximum CRL size in bytes that is allowed to be stored in the LDAP CRL cache.

**CRLCacheExtended**

Indicates whether LDAP extended CRL cache support is in effect.

- **On** LDAP extended CRL cache support is in effect.
- **Off** LDAP basic CRL cache support is in effect.

**CRLCacheSize**

The maximum number of CRLs that are allowed to be stored in the LDAP CRL cache.

**CRLCacheTempCRL**

Indicates whether a temporary LDAP CRL cache entry is added to the LDAP CRL cache when the CRL does not reside on the LDAP server.

**CRLCacheTempCRLTimeout**

Indicates the time in hours that a temporary CRL cache entry resides in the LDAP CRL cache.
CtraceClearText
Indicates whether application data traced for the connection, using Ctrace or datatrace, is shown as unencrypted data.

**Result:** For a particular connection, the CtraceClearText value on the TTLSConnectionAction statement, if specified, overrides the CtraceClearText value on the TTLSEnvironmentAction statement which, in turn, (if specified) overrides the CtraceClearText value on the TTLSGroupAction statement.

Direction
The connection direction condition specified in the policy rule that was mapped to the connection. The following values are valid:

- *Inbound* indicates that a connection request must arrive inbound to the local host to satisfy the rule.
- *Outbound* indicates that a connection request must be initiated by the local host to satisfy the rule.
- *Both* indicates that both Inbound and Outbound connection requests will match the rule.

The connection must match this condition.

**Envfile**
The name of the file that contains environment variables that are in use by the connection’s language environment. The language environment was initialized with the CEE_ENVFILE environment variable set to this file. Environment variables such as CEE_RUNOPTS can be set in this file.

**EnvironmentUserInstance**
The instance identifier that is configured for the TTLSEnvironmentAction statement in use by the connection. The instance number can be used to signal a change without modifying other configuration statements. Valid values are in the range 0 – 65 535.

**FIPS140**
Indicates whether FIPS 140 support is enabled for the AT-TLS group to which the connection belongs.

- **Off**
  FIPS 140 is not enabled.

- **On**
  FIPS 140 is enabled and 80 bit security strength size is enforced for all operations.

- **Level 1**
  Functionally equivalent to 'On'.

- **Level 2**
  FIPS 140 is enabled for this group and 112 bit security strength size is enforced when generating new keys, digital signatures, and RSA encryption. However, when processing digital signature verification, RSA decryption and Triple DES decryption for already protected information, 80 bit security strength size is allowed.

- **Level 3**
  FIPS 140 is enabled for this group and 112 bit or higher security strength size is enforced for all operations. 80 bit security strength size is not allowed for any operation.

**GroupID**
A value generated by AT-TLS that uniquely identifies the group of AT-TLS language environments (the AT-TLS group) to which the connection belongs.

**GroupUserInstance**
The instance identifier that is configured for the TTLSGroupAction statement in use by the connection. The instance number can be used to signal a change without modifying other configuration statements. Valid values are in the range 0 – 65 535.

**GSK_CRL_CACHE_TIMEOUT**
The certificate revocation list (CRL) cache timeout for the AT-TLS environment to which the connection belongs. This is the number of hours that a cached CRL remains valid. The value 0 indicates that CRL caching is disabled. See z/OS Cryptographic Services System SSL Programming for details.
**GSK_CRL_SECURITY_LEVEL**
The certificate revocation list (CRL) security level for the AT-TLS environment to which the connection belongs. The following values are possible:

- **Low** indicates that certificate validation does not fail if the LDAP server cannot be contacted.
- **Medium** indicates that certificate validation requires the LDAP server to be contactable, but does not require a CRL to be defined. This is the default.
- **High** indicates that certificate validation requires the LDAP server to be contactable, and a CRL to be defined.

**GSK_LDAP_SERVER**
The LDAP server host names for the AT-TLS environment to which the connection belongs. Each name can contain an optional port number separated from the name by a colon. See z/OS Cryptographic Services System SSL Programming for details.

**GSK_LDAP_SERVER_PORT**
The LDAP server port for the AT-TLS environment to which the connection belongs. See z/OS Cryptographic Services System SSL Programming for details.

**GSK_LDAP_USER**
The distinguished name used when connecting to the LDAP server for the AT-TLS environment to which the connection belongs. See z/OS Cryptographic Services System SSL Programming for details.

**GSK_LDAP_USER_PW**
Indicates whether the AT-TLS environment to which the connection belongs uses a password when connecting to the LDAP server. See z/OS Cryptographic Services System SSL Programming for details.

**GSK_SESSION_TICKET_CLIENT_ENABLE**
Indicates if the client supports caching session tickets received from a server after a TLS version 1.3 handshake has completed and if it supports TLS version 1.3 session resumption attempts to the server. See z/OS Cryptographic Services System SSL Programming for details.

**GSK_SESSION_TICKET_CLIENT_MAXSIZE**
The maximum size in bytes of a session ticket that can be stored in the client session ticket cache. Valid values are in the range 0 – 214 748 3647. See z/OS Cryptographic Services System SSL Programming for details.

**GSK_SESSION_TICKET_SERVER_ALGORITHM**
The algorithm that is used by the server to encrypt and decrypt the session tickets used for TLS Version 1.3 session resumption. Valid values are AESCBC128 and AESCBC256. See z/OS Cryptographic Services System SSL Programming for details.

**GSK_SESSION_TICKET_SERVER_COUNT**
The number of TLS Version 1.3 session tickets that will be sent by the server after the initial handshake completes. Valid values are in the range 0 - 16. See z/OS Cryptographic Services System SSL Programming for details.

**GSK_SESSION_TICKET_SERVER_ENABLE**
Indicates if the server supports sending session tickets after a TLS version 1.3 handshake has completed and if it supports TLS Version 1.3 session resumption attempts from the client. See z/OS Cryptographic Services System SSL Programming for details.

**GSK_SESSION_TICKET_SERVER_KEY_REFRESH**
The key refresh interval, in seconds, of the encryption key used by the server to encrypt session tickets for TLS version 1.3 session resumption. Valid values are in the range 0 – 604 800 (7 days). See z/OS Cryptographic Services System SSL Programming for details.

**GSK_SESSION_TICKET_SERVER_TIMEOUT**
The maximum time, in seconds, that a server will accept a session resumption request from the client measured in seconds from the initial handshake. Valid values are in the range of 1 – 604 800 (7 days). See z/OS Cryptographic Services System SSL Programming for details.
GSK_SYSPLEX_SIDCACHE
Indicates whether sysplex session caching is enabled for the AT-TLS environment to which the connection belongs. See z/OS Cryptographic Services System SSL Programming for details.

GSK_V2_SESSION_TIMEOUT
The SSL version 2 session timeout for the AT-TLS environment to which the connection belongs. This is the number of seconds until a session identifier expires. See z/OS Cryptographic Services System SSL Programming for details.

GSK_V2_SIDCACHE_SIZE
The size of the SSL version 2 session identifier cache for an AT-TLS environment. See z/OS Cryptographic Services System SSL Programming for details.

GSK_V3_SESSION_TIMEOUT
The SSL version 3 or TLS version 1 session timeout for an AT-TLS environment. For SSL version 3, TLS version 1.0, TLS version 1.1, and TLS version 1.2, this is the number of seconds until a session identifier expires. For TLS version 1.3, this is the number of seconds until a session ticket expires. See z/OS Cryptographic Services System SSL Programming for details.

GSK_V3_SIDCACHE_SIZE
The size of the session cache for an AT-TLS environment used for SSL version 3, TLS version 1.0, TLS version 1.1, and TLS version 1.2 session identifiers and TLS version 1.3 session tickets. See z/OS Cryptographic Services System SSL Programming for details.

HandshakeTimeout
The number of seconds that the connection waits for the initial handshake to complete. Valid values are in the range 0 – 600.

For connections with HandshakeRole set to Client, the timer is initially set to 5 times this value, allowing for network delay and any delay on the server in processing the connection. When the initial response is received from the server, the timer is reset to this value so that the initial handshake can complete.

For connections with HandshakeRole set to Server or ServerWithClientAuth, when the server starts to process the new connection, the timer is set to this value and the server then waits for the initial request from the client. When the server sends the initial response, the timer is reset to this value so that the initial handshake can complete.

If the timer expires, the TCP connection is reset. A value of 0 indicates that the connection does not time out waiting for the initial handshake to complete.

**Result:** For a particular connection, the HandshakeTimeout value on the TTLSConnectionAction, if specified, overrides the HandshakeTimeout value on the TTLSEnvironmentAction.

HandshakeRole
The SSL handshake role for the connection. The following values are valid:

- **Client** indicates that the handshake is to be performed as a client.
- **Server** indicates that the handshake is to be performed as a server.
- **ServerWithClientAuth** indicates that the handshake is to be performed as a server requiring client authentication.

**Result:** For a particular connection, the HandshakeRole value on the TTLSConnectionAction, if specified, overrides the HandshakeRole value on the TTLSEnvironmentAction statement.

HttpCdpCacheSize
The maximum number of CRLs that are allowed to be stored in the HTTP CDP CRL cache.

HttpCdpCacheEntryMaxsize
The maximum CRL size in bytes that is allowed to be stored in the HTTP CDP CRL cache.

HttpCdpEnable
Indicates whether the HTTP URLs within the certificate's CDP extension are to be used for certificate revocation checking.
HttpCdpMaxResponseSize
The maximum size in bytes accepted as a response from an HTTP server when retrieving a CRL.

HttpCdpProxyServerName
The DNS name or IP address of the HTTP proxy server for HTTP CDP CRL retrieval.

HttpCdpProxyServerPort
The HTTP proxy server port for HTTP CDP CRL retrieval.

HttpCdpResponseTimeout
The time in seconds to wait for a complete response from the HTTP server.

JobName
When part of the ConnID section, the JobName value is the procedure name of the local application.
When part of the TTLSRule section, the JobName value is the job name condition that was specified in the policy rule that was mapped to the connection. If no JobName value is specified for a policy rule, all job names is the default. If specified, the connection must match this condition. A trailing asterisk indicates a wildcard specification.

Keyring
The path and file name of the key database z/OS UNIX file, z/OS PKCS #11 token name, or the RACF ring name for the AT-TLS environment to which the connection belongs.

KeyringPw
Indicates whether a z/OS UNIX file system key database password was configured for the AT-TLS environment to which the connection belongs.

KeyringStashFile
The path and file name of the z/OS UNIX file system key database password stash file for the AT-TLS environment to which the connection belongs.

KeyShare
The key share group used to protect the TLS V1.3 handshake for the connection. If a security level less than TLS V1.3 was used to secure the connection, this field will be N/A.

LDAPResponseTimeout
The time in seconds to wait for a response from the LDAP server.

LocalAddr
A single local IP address (or a range of local IP addresses when the range was configured using the format ipv4_addr/num_mask_bits or the format ipv6_addr/prefixLength) that is a condition specified in the policy rule that was mapped to the connection. If specified, the connection must match this condition.
- If 0.0.0.0/0 is specified, this rule applies to all IPv4 addresses.
- If ::/0 is specified, the rule applies to all IPv6 addresses.
- If All is displayed, any address matches this condition.

LocalAddrFrom/LocalAddrTo
A range of local IP addresses, when the range was configured using a start and end address pair, that is a condition specified in the policy rule that was mapped to the connection. If neither LocalAddr nor LocalAddrFrom/LocalAddrTo is specified, all addresses is the default. If specified, the connection must match this condition.

LocalPort
A single local port that is a condition specified in the policy rule that was mapped to the connection. If specified, the connection must match this condition. If All is displayed, any port matches this condition.

LocalPortFrom/LocalPortTo
A range of local ports, configured using a start and end pair, that is a condition specified in the policy rule that was mapped to the connection. If neither LocalPort nor LocalPortFrom/LocalPortTo is specified, all ports is the default. If specified, the connection must match this condition.
**LocalSocket**
The local socket of the connection. See the Local Socket information “Netstat report general concepts” on page 293 for a detailed description.

**MapType**
The mapping method used to locate this policy. The following values are valid:
- **Primary** indicates that this connection matched the rule conditions of the indicated policy rule.
- **Secondary** indicates that this connection was established between the same two IP addresses by the same process that has a connection that used the primary mapping method to locate this policy that has SecondaryMap set On.

**MaxSrcRevExtLocValues**
The maximum number of location values that are contacted per HTTP CDP or AIA extension when attempting to validate a certificate.

**MaxValidRevExtLocValues**
The maximum number of location values that are contacted when validating a certificate.

**MiddleBoxCompatMode**
Indicates whether the TLS V1.3 handshake process should use or tolerate handshake messages in a manner compliant with earlier TLS protocols to alleviate possible issues with middle boxes or proxies. Possible values are:
- **On** For a TLS V1.3 handshake, handshake messages are sent in a manner compliant with earlier TLS protocols.
- **Off** For a TLS V1.3 handshake, the TLS V1.3 handshake format is used.

**OcspAiaEnable**
Indicates whether the AIA extensions in the certificate are used for revocation checking.

**Ocsp CliCacheEntryMaxsize**
The maximum number of OCSP responses or cached certificate statuses that are allowed to be kept in the OCSP response cache for an issuing CA certificate.

**OcspClientCacheSize**
The maximum number of OCSP responses or cached certificate statuses to be kept in the OCSP response cache.

**OcspMaxResponseSize**
The maximum size in bytes allowed in a response from an OCSP responder.

**OcspNonceCheckEnable**
Indicates whether OCSP response nonce checking is on or off.

**OcspNonceGenEnable**
Indicates whether an OCSP request includes a generated nonce.

**OcspNonceSize**
The nonce size in bytes to be sent in OCSP requests.

**OcspProxyServerName**
The DNS name or IP address of the OCSP proxy server.

**OcspProxyServerPort**
The OCSP responder port for the proxy server.

**OcspRequestSigalg**
The hash and signature algorithm pair to use to sign OCSP requests. Both the 4-character value of the pair and the constant for the pair name are displayed.

**OcspRequestSigkeylabel**
The label of the key to use to sign OCSP requests.
**OcspResponseSigAlgPairs**
A preference ordered list of signature algorithm pairs to be sent on the OCSP request that may be used by the OCSP responder to select an appropriate algorithm for signing the OCSP response. The OCSP response will be rejected if OcspResponseSigAlgPairs is specified and the OCSP response is signed by a signature algorithm that was not specified in the list. Both the 4-hexadecimal character value of the signature algorithm pair and the constant of the signature algorithm pair name are shown for each member of the list.

**OcspResponseTimeout**
The time in seconds to wait for a complete response from the OCSP responder.

**OcspRetrieveViaGet**
Indicates whether the HTTP request to the OCSP responder is sent by using the HTTP Get method or the HTTP Post method.

- **On**
  Indicates that the HTTP GET method is used when sending an OCSP request whose total request size after Base64 encoding is less than 255 bytes.

- **Off**
  Indicates that the HTTP request is always sent by using the HTTP Post method.

**OcspServerStapling**
Indicates TLS server support for the inclusion of the OCSP response for the server's end entity certificate or certificate chain as a TLS extension during the TLS handshake when requested by the TLS client.

- **Off**
  Server is not enabled to contact OCSP responders to retrieve the OCSP responses for the server's end entity certificate or the server's certificate chain.

- **Any**
  Server is enabled to contact OCSP responders to retrieve the OCSP responses for the server's end entity certificate or the server's certificate chain, if the negotiated handshake protocol is TLS version 1.2 or earlier.

  If the negotiated handshake protocol is TLS version 1.3 or later, the retrieval of the OCSP responses for the server's certificate chain is not supported. The server is enabled to contact the OCSP responders to retrieve the OCSP responses for the server’s end entity certificate only.

- **EndEntity**
  Server is enabled to contact OCSP responders to retrieve the OCSP responses for the server’s end entity certificate.

**OcspUrl**
The HTTP URL of an OCSP responder.

**OcspUrlPriority**
Indicates the order of precedence for contacting OCSP responder locations if both OcspUrl and OcspAIAEnable are active.

- **On**
  Indicates that the OcspUrl defined responder is used before the responders identified in the AIA extension are used.

- **Off**
  Indicates that the responders identified in the AIA extension are used before the responder defined by the OcspUrl is used.

**PeerMinCertVersion**
Certificate validation should ensure that the partner's end-entity certificate be a minimum X.509 version.

- **Any**
  Any supported System SSL X.509 version.
The minimum X.509 version is version 3.

**Result:** If the negotiated protocol is TLS V1.3, a X.509 version 3 certificate is required. This field is not applicable.

**PeerMinDHKeySize**
The minimum allowed X.509 certificate Diffie-Hellman key size for a peer end-entity certificate. Valid values are 0 – 2048. Any value specified that does not equal a supported key size increment will set the minimum key size to the next highest increment. In FIPS mode, setting can be used to enforce stronger DH key sizes than the default defined by FIPS mode.

**PeerMinDsaKeySize**
The minimum allowed X.509 certificate DSA key size for a peer end-entity certificate. Valid values are 0 - 2048. Any value specified that does not equal a supported key size increment will set the minimum key size to the next highest increment. In FIPS mode, setting can be used to enforce stronger DSA key sizes than the default defined by FIPS mode.

**PeerMinECCKeySize**
The minimum allowed X.509 certificate ECC key size for a peer end-entity certificate. Valid values are 0 - 521. Any value specified that does not equal a supported key size increment will set the minimum key size to the next highest increment. In FIPS mode, setting can be used to enforce stronger ECC key sizes than the default defined by FIPS mode.

**PeerMinRsaKeySize**
The minimum allowed X.509 certificate RSA key size for a peer end-entity certificate. Valid values are 0 - 4096. Any value specified that does not equal a supported key size increment will set the minimum key size to the next highest increment. In FIPS mode, setting can be used to enforce stronger RSA key sizes than the default defined by FIPS mode.

**Priority**
The priority associated with the policy rule that was mapped to the connection. A higher priority value indicates a higher priority rule. Priority can be used to differentiate between rules when a connection could match more than one of the configured rules. Valid values are in the range 1–255. The default value is 0.

**RemoteAddr**
A single remote IP address (or a range of remote IP addresses when the range was configured using the format ipv4_addr/num_mask_bits or the format ipv6_addr/prefixLength) that is a condition specified in the policy rule that was mapped to the connection. If specified, the connection must match this condition.

- If 0.0.0.0/0 is specified, this rule applies to all IPv4 addresses.
- If ::/0 is specified, the rule applies to all IPv6 addresses.
- If All is displayed, any address matches this condition.

**RemoteAddrFrom/RemoteAddrTo**
A range of remote IP addresses, configured using a start and end address pair, that is a condition specified in the policy rule that was mapped to the connection. If neither RemoteAddr nor RemoteAddrFrom/RemoteAddrTo is specified, all addresses is the default. If specified, the connection must match this condition.

**RemotePort**
A single remote port that is a condition specified in the policy rule that was mapped to the connection. If specified, the connection must match this condition. If All is displayed, any port matches this condition.

**RemotePortFrom/RemotePortTo**
A range of remote ports, configured using a start and end pair, that is a condition specified in the policy rule that was mapped to the connection. If neither RemotePort nor RemotePortFrom/RemotePortTo is specified, all ports is the default. If specified, the connection must match this condition.
**RemoteSocket**
The remote socket of the connection. See the Foreign Socket information in “Netstat report general concepts” on page 293 for a detailed description.

**Renegotiation**
The type of the session key renegotiation that is allowed by server.

- **Default**
  Indicates that SSLv3 and TLS handshake renegotiation is disabled and RFC 5746 renegotiation is enabled.

- **Disable**
  Indicates that all renegotiation is disabled.

- **Abbreviated**
  Indicates that SSLv3 and TLS abbreviated handshake renegotiation only for the current session is allowed; SSLv3 and TLS full handshake renegotiation is disabled; and RFC 5746 renegotiation is allowed.

- **All**
  Indicates that all forms of renegotiation are allowed.

**Result:** If the negotiated protocol is TLS version 1.3, this field is not applicable.

**RenegotiationCertCheck**
Indicates whether the peer's certificate is checked during renegotiation to prevent change to a different certificate.

**Result:** If the negotiated protocol is TLS version 1.3, this field is not applicable.

**RenegotiationIndicator**
Indicates whether the partner must indicate the support for RFC 5746 renegotiation for initial handshake to proceed.

**Result:** If the negotiated protocol is TLS version 1.3, this field is not applicable.

**ResetCipherTimer**
The number of minutes a secure connection can be active before a new session key is generated for the connection. If not specified or specified as 0, cipher reset is not initiated by AT-TLS. Valid values are in the range 0 – 1440.

**Result:** For a particular connection the ResetCipherTimer value on the TTLSConnectionAction statement, if specified, overrides the ResetCipherTimer value on the TTLSEnvironmentAction statement.

**RevocationSecurityLevel**
The level of security to use when contacting an OCSP responder or an HTTP server specified in an HTTP URL value of the CDP extension.

- **Low**
  Certificate validation does not fail if the OCSP responder or HTTP server specified in the HTTP URL value of the CDP extension cannot be contacted.

- **Medium**
  Certificate validation requires the OCSP responder or the HTTP server in an HTTP URL value in the CDP extension to be able to be contacted.

- **High**
  Certificate validation requires revocation information to be provided by the OCSP responder or HTTP server.

**SecLevel**
The security level being used by the connection. Possible values are:

- SSL Version 2
- SSL Version 3
- TLS Version 1
• TLS Version 1.1
• TLS Version 1.2
• TLS Version 1.3

SecondaryMap
Indicates whether the application establishes secondary connections using dynamic port numbers. If so, the primary connection maps to this policy using rule conditions. Subsequent connections established by the same process between the same two IP addresses that do not map to their own policy or map to a policy with a lower priority than the primary connection are considered secondary connections. Secondary connections use the same policy as the associated primary connection.

ServerCertificateLabel
The preference ordered list of labels of the certificates for a server application that can be used to authenticate the server. There are no restrictions for defining more than one certificate that can be associated to the same cipher. The first certificate that meets the protocol/cipher criteria is chosen.

ServerEDHGroupSize
The minimum server Diffie-Hellman group size allowed for an ephemeral Diffie-Hellman key exchange message when AT-TLS is the TLS server.

Legacy
In non-FIPS mode, the Diffie-Hellman group size is 1024. In FIPS mode, the Diffie-Hellman group size is 2048.

2048
The Diffie-Hellman group size is 2048.

Match
Match the ephemeral Diffie-Hellman group to the server certificate’s key strength. If the key size is less than or equal to 1024, a Diffie-Hellman group size of 1024 will be used. If the key size is greater than 1024, then a Diffie-Hellman group size of 2048 will be used.

ServerKeyShareGroups
The list of key share groups supported by the server during a TLS version 1.3 handshake. During a handshake, the server uses the client’s preferred key share group order and selects a group that it supports (as defined by ServerKeyShareGroups). The client and server use the selected group to encrypt and decrypt TLS version 1.3 handshake messages.

Both the four-character value of the group and the constant group name are shown for each member of the list.

ServerScsv
Indicates support for honoring the Signaling Cipher Suite Value (SCSV) when included in the TLS client’s cipher list.

Off
SCSV is not supported for the TLS server.

On
SCSV is supported for the TLS server.

ServerMaxSSLFragment
For TLSv1.0 and higher protocols, this field specifies the server level of support for client-specified SSL fragment size on the connection. The following values are possible:

• Required indicates that maximum SSL fragment size support must be accepted by the client. Connections are closed if the client does not support the maximum SSL fragment size extension.
• Optional indicates that maximum SSL fragment size support is used if the client supports the function, but connections to clients that do not support this extension are accepted.
• Off indicates that maximum SSL fragment size support is not available; the TLS extension is not enabled. If the client requires SSL fragment size support, the client is unable to connect. This is the default value.
**Result:** For a particular connection, the ServerMaxSSLFragment value on the TTLSConnectionAction statement, if specified, overrides the MaximumSSLFragment value on the TTLSEnvironmentAction statement.

**ServerHandshakeSNI**
For TLSv1.0 and higher protocols, this field specifies the server level of support for client-specified server names on the connection handshake. The following values are possible:

- **Required** indicates that client-specified server name support must be accepted by the client. Connections are closed if the client does not support the client-specified server name extension.
- **Optional** indicates that client-specified server name support is used if the client supports the function, but connections to clients that do not support this extension are accepted.
- **Off** indicates that client-specified server name support is not available; the TLS extension is not enabled. If the client requires client-specified server name support, the client is unable to connect. This is the default value.

**Result:** For a particular connection, the ServerHandshakeSNI value on the TTLSConnectionAction statement, if specified, overrides the ServerHandshakeSNI value on the TTLSEnvironmentAction statement.

**ServerHandshakeSNIMatch**
For SSL servers that are using TLSv1.0 or higher protocols that might negotiate server name indication, this field specifies the level at which the server requires the client-specified server name to match a server name in the list of names that is maintained by the TLS server. The following values are possible:

- **Required** indicates that a server name in the list of server names that is provided by the TLS client must match a server name in the server name and certificate label list at the TLS server. The connection ends if no match can be found for the server name.
- **Optional** indicates that connections are allowed to continue if no match is found for the server name. This is the default.

**Result:** For a particular connection, the ServerHandshakeSNIMatch value on the TTLSConnectionAction statement, if specified, overrides the ServerHandshakeSNIMatch value on the TTLSEnvironmentAction statement.

**ServerHandshakeSNIList**
For SSL servers that use TLSv1.0 or higher protocols that might negotiate server name indication, specifies server name and certificate label pairs to be used by the server when matching a name from the client.

**Result:** For a particular connection, the ServerHandshakeSNIList value on the TTLSConnectionAction statement, if specified, overrides the ServerHandshakeSNIList value on the TTLSEnvironmentAction statement.

**SessionID**
For SSL servers using SSLv3.0 protocol and later, the session identifier (SID) that the SSL server assigns, represents a secure session between a client and a server.

**SIDReuseReq**
Indicates whether session reuse is required when TLS is used to protect the connections. The following values are valid:

- **Off** indicates that session reuse is not required. This is the default value.
- **On** indicates that session reuse is required. For FTP connections, this value is displayed only for a data connection while data transfer is in progress. This value will never be displayed for the FTP control connection.
**SignaturePairs**
The signature and hash algorithm pairs that are supported by the client or server for use in digital signatures of X.509 certificates and TLS handshake messages. These pairs are sent by either the client or server to the session partner to indicate which signature algorithm pairs are supported. This field only has relevance for sessions using TLS version 1.2 or later.

Both the four-character value of signature/hash algorithm and the constant of the signature/hash algorithm name are shown for each member of the list.

**SignaturePairsCert**
The signature and hash algorithm pairs that are supported by the client or server for use in digital signatures of X.509 certificates. These pairs are sent by either the client or server to the session partner to indicate which signature algorithm pairs are supported. The SignaturePairsCert value overrides the SignaturePairs value when checking the digital signatures of the peer’s X.509 certificates. This field only has relevance for sessions using TLS version 1.3 or later.

Both the four-character value of signature/hash algorithm and the constant of the signature/hash algorithm name are shown for each member of the list.

**SSLV2**
Indicates whether SSL version 2 protocol is acceptable for the connection.

**Result:** For a particular connection the SSLV2 value on the TTLSConnectionAction statement, if specified, overrides the SSLV2 value on the TTLSEnvironmentAction statement.

**SSLV3**
Indicates whether SSL version 3 protocol is acceptable for the connection.

**Result:** For a particular connection the SSLV3 value on the TTLSConnectionAction statement, if specified, overrides the SSLV3 value on the TTLSEnvironmentAction statement.

**SuiteBProfile**
Indicates whether a Suite B profile of cipher suites should be used.

**Off**
The use of TLS V1.2 and Suite B cipher suites is not required.

**128**
Suite B 128 bit cipher suites will be used.

**192**
Suite B 192 bit cipher suites will be used.

**All**
Both 128 bit and 192 bit Suite B cipher suites will be used.

**128Min**
AES-GCM ciphers with a minimum 128 bit strength will be used.

**192Min**
AES-GCM ciphers with a minimum 192 bit strength will be used.

**SyslogFacility**
The syslog facility name this group uses when writing records to syslogd.

**TLSV1**
Indicates whether TLS version 1.0 protocol is acceptable for the connection.

**Result:** For a particular connection, the TLSV1 value on the TTLSConnectionAction statement, if specified, overrides the TLSV1 value on the TTLSEnvironmentAction statement.

**TLSV1.1**
Indicates whether TLS version 1.1 protocol is acceptable for the connection.

**Result:** For a particular connection the TLSV1.1 value on the TTLSConnectionAction statement, if specified, overrides the TLSV1.1 value on the TTLSEnvironmentAction statement.
TLSV1.2
Indicates whether TLS version 1.2 protocol is acceptable for the connection.

**Result:** For a particular connection, the TLSV1.2 value on the TTLSConnectionAction statement, if specified, overrides the TLSV1.2 value on the TTLSEnvironmentAction statement.

TLSV1.3
Indicates whether TLS version 1.3 protocol is acceptable for the connection.

**Result:** For a particular connection, the TLSV1.3 value on the TTLSConnectionAction statement, if specified, overrides the TLSV1.3 value on the TTLSEnvironmentAction statement.

TruncatedHMAC
Indicates whether clients and servers can negotiate the use of 80-bit truncated MAC addresses. The following values are possible:

- Required indicates that 80-bit truncated MAC addresses must be accepted by both endpoints.
- Optional indicates that the use of 80-bit truncated MAC addresses is negotiated.
- Off indicates that 80-bit truncated MAC addresses are not supported. This is the default.

**Result:** For a particular connection, the TruncatedHMAC value on the TTLSConnectionAction statement, if specified, overrides the TruncatedHMAC value on the TTLSEnvironmentAction statement.

TTLSConnAction
The name of the policy action used to specify attribute differences between what is required for the connection and what is specified for the AT-TLS environment to which the connection belongs. This name was configured to Policy Agent using the TTLSConnectionAction statement. The name is followed by *(Stale)* when the action is no longer available for use by new connections.

TTLSEnabled
Indicates whether AT-TLS services are used by the connection.

TTLSEnvAction
The name of the policy action used to specify attributes for the AT-TLS environment to which the connection belongs. This name was configured to Policy Agent using the TTLSEnvironmentAction statement. The name is followed by *(Stale)* when the action is no longer available for use by new connections.

TTLSGrpAction
The name of the policy action used to specify attributes for the AT-TLS group to which the connection belongs. This name was configured to Policy Agent using the TTLSGroupAction statement.

- The name is followed by *(Stale)* when the action is no longer available for use by new connections.
- The name is followed by *(Failed)* if the group failed to initialize properly or experienced an unrecoverable abend.

TTLSRule
The name of the policy rule, configured to Policy Agent using the TTLSRule statement that was mapped to the connection. For connections that match a rule, the determination of whether to use AT-TLS for the connection and how AT-TLS attributes are set when AT-TLS is used are determined by the policy actions associated with the policy rule. The name is followed by *(Stale)* when the rule is no longer available for use by new connections.

Trace
The level of AT-TLS tracing for the connection.

**Result:** For a particular connection the Trace value on the TTLSConnectionAction, if specified, overrides the Trace value on the TTLSEnvironmentAction statement, which in turn, if specified, overrides the Trace value on the TTLSGroupAction statement.

The level of tracing is a sum of the following numbers:
No tracing is enabled.

Error - Errors are traced to the TCP/IP job log.

Error - Errors are traced to syslogd. This is the default.

Info - Tracing of when a connection is mapped to an AT-TLS rule (and when a secure connection is successfully initiated) is enabled.

Event - Tracing of major events is enabled.

Flow - Tracing of system SSL calls is enabled.

Data - Tracing of encrypted negotiation is enabled. This traces the negotiation of secure sessions.

All tracing is enabled.

**UserID**

The application user ID condition specified in the policy rule that was mapped to the connection. A trailing asterisk indicates a wildcard specification. If not specified, all user IDs is the default. If specified, the connection must match this condition.

**V2CipherSuites**

The SSL version 2 cipher suite list (also known as cipher specifications), in order of preference, to be used for the connection. See `gsk_environment_open()` in **z/OS Cryptographic Services System SSL Programming** for a list of valid cipher specifications.

**Result:** For a particular connection the V2CipherSuites value on the TTLSConnectionAction statement, if specified, overrides the V2CipherSuites value on the TTLSEnvironmentAction statement.

**V3CipherSuites**

The SSL version 3 or TLS version 1 cipher suite list (also known as cipher specifications), in order of preference, to be used for the connection. Both the four-character value of the cipher and the constant of the cipher name are shown for each member of the list. See `gsk_environment_open()` in **z/OS Cryptographic Services System SSL Programming** for a list of valid cipher specifications.

**Result:** For a particular connection, the V3CipherSuites value on the TTLSConnectionAction statement, if specified, overrides the V3CipherSuites value on the TTLSEnvironmentAction statement.

**Result:** A field in a policy rule or policy action is displayed only when a value was configured for that attribute or when the attribute has a default value. Fields that were left undefined and have no default value are not displayed.

**Group report examples**

```plaintext
NETSTAT TTLS GROUP
MVS TCP/IP NETSTAT CS V2R4  TCP/IP Name: TCPCS  12:55:20
TTLSGrpAction  Group ID  Conns
----------------------------------  --------  ----
TTLSGrpAction15 (Stale)  00000004  25
TTLSGrpAction5  00000007 (Failed)  0
```

```plaintext
NETSTAT TTLS GROUP DETAIL
MVS TCP/IP NETSTAT CS V2R4  TCP/IP Name: TCPCS  12:55:20
TTLSGrpAction: TTLSGrpAction15 (Stale)  GroupID: 00000004
                Tasks: 10  GroupConns: 25
                WorkQEElements: 7  SyslogQEElements: 1
                Env: TTLSEnvAction9  EnvConns: 25
                TTLSGrpAction: TTLSGrpAction5
```
**Report field descriptions**

**EnvConns**
The number of connections currently created within the AT-TLS environment.

**GroupConns**
The number of connections currently created within the AT-TLS group.

**GroupID**
A value generated by AT-TLS that uniquely identifies a group of AT-TLS language environments (an AT-TLS group) in a TCP/IP stack.

**SyslogQElements**
The number of AT-TLS tracing work elements waiting to be processed in the group.

**Tasks**
The number of MVS tasks currently allocated to support the AT-TLS work in the group.

**Env**
The name of a policy action used to specify attributes for an AT-TLS environment. This name was configured to Policy Agent using the TTLSEnvironmentAction statement. The name is followed by (Stale) when the action is no longer available for use by new connections.

**TTLSGrpAction**
The name of a policy action used to specify attributes for a group of AT-TLS environments. This name was configured to Policy Agent using the TTLSGroupAction statement. The name is followed by (Stale) when the action is no longer available for use by new connections.

**WorkQElements**
The number of work elements waiting to be processed in the group.

**Netstat Up/-u report**
Displays the date and time that TCP/IP was started and specifies whether it is IPv6 enabled or disabled.

**TSO syntax**

```
NETSTAT Up  [Target]  [Output]
```

**Target**
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**
The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**z/OS UNIX syntax**

```
netstat -u  [Target]  [Output]
```

**Target**
Provide the report for a specific TCP/IP address space by using -p tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.
**Output**

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

**Command syntax examples**

*From TSO environment*

```
NETSTAT UP
   Display the date and time that TCP/IP was started and specifies whether it is IPv6 enabled or disabled for the default TCP/IP stack.
NETSTAT UP TCP TCPCS6
   Display the date and time that TCP/IP was started and specifies whether it is IPv6 enabled or disabled for the TCPCS6 stack.
```

*From UNIX shell environment*

```
netstat -u
netstat -u -p tcpcs6
```

**Report examples**

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

*Not IPv6 enabled (SHORT format)*

```
NETSTAT UP
MVS TCP/IP NETSTAT CS V2R4       TCPIP Name: TCPCS           14:34:37
Tcpip started at 14:27:29 on 01/31/2002 with IPv6 disabled
```

*IPv6 enabled or request for LONG format*

```
NETSTAT UP
MVS TCP/IP NETSTAT CS V2R4       TCPIP Name: TCPCS           14:34:37
Tcpip started at 14:27:29 on 01/31/2002 with IPv6 enabled
```

**Netstat VCRT/-V report**

Displays the dynamic VIPA Connection Routing Table used for sysplex distributor and moveable dynamic VIPA support. On a sysplex distributor routing stack, it displays all connections being routed through the distributor. On a stack taking over a dynamic VIPA, it displays every connection to the dynamic VIPA. On a sysplex distributor target stack or a stack that is in the process of giving up a dynamic VIPA, the report displays every connection for which the stack is an endpoint.

**TSO syntax**

```
NETSTAT VCRT  Modifier Target Output (Filter)
```

**Modifier**

```
DETAIL
```

**DETAIL**

Displays the general dynamic VIPA Connection Routing Table information plus the following additional information for each connection:

- Policy rule and policy action.
- Timed affinity-related information.
• Indicates whether the connection is eligible for acceleration. This information is not displayed if the stack is not enabled for acceleration. For details about how to enable a stack for acceleration, see the IPConfiguration profile statement information in the z/OS Communications Server: IP Configuration Reference.

• Information about the route used by the stack which owns a dynamic VIPA to send packets to the target stack. This information is not displayed on a target stack or if no VIPAROUTE profile statements have been configured to the stack. The routing information provided describes the route used in forwarding the last packet received for this connection to the target stack.

The routing information might describe the best available route to reach the IP address, which was defined in the VIPAROUTE statement for that target stack, or it might describe the dynamic XCF route for that target stack. See VIPADYNAMIC information in the z/OS Communications Server: IP Configuration Reference for details about the VIPAROUTE statement. For more information about the use of the routing information, see route selection for distributing packets details in the z/OS Communications Server: IP Configuration Guide.

Target

Provides the report for a specific TCP/IP address space by using TCP tcpname. See “The Netstat command target” on page 287 for more information about the TCP parameter.

Output

The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

Filter

z/OS UNIX syntax

```
netstat -V Modifier Target Output Filter
```

Modifier

DETAIL

Displays the general dynamic VIPA Connection Routing Table information plus the following additional information for each connection:

• Policy rule and policy action.
• Timed affinity-related information.
• Indicates whether the connection is eligible for acceleration. This information is not displayed if the stack is not enabled for acceleration. For details about how to enable a stack for acceleration, see the IPCONFIG profile statement information in the z/OS Communications Server: IP Configuration Reference.

• Information about the route used by the stack which owns a dynamic VIPA to send packets to the target stack. This information is not displayed on a target stack or if no VIPAROUTE profile statements have been configured to the stack. The routing information provided describes the route used in forwarding the last packet received for this connection to the target stack.

The routing information might describe the best available route to reach the IP address, which was defined in the VIPAROUTE statement for that target stack, or it might describe the dynamic XCF route for that target stack. See VIPADYNAMIC details in the z/OS Communications Server: IP Configuration Reference for information about the VIPAROUTE statement. For more details about the use of the routing information, see information about route selection for distributing packets in the z/OS Communications Server: IP Configuration Guide.

Target

Provide the report for a specific TCP/IP address space by using -p tcpname. See “The Netstat command target” on page 287 for more information about the TCP parameter.

Output

The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

Filter

Filter description

HOSTName/-H hostname

Filter the output of the VCRT/-V report using the specified host name hostname. You can enter one filter value at a time and the specified value can be up to 255 characters long.

Result: At the end of the report, Netstat displays the host name that the resolver used for the resolution and the list of IP addresses returned from the resolver that it used as filters.

Restrictions:

1. The HOSTName/-H filter does not support wildcard characters.
2. Using the HOSTName/-H filter might cause delays in the output due to resolution of the hostname value, depending upon resolver and DNS configuration.
IPAddr/-I ipaddr
IPAddr/-I ipaddr/prefixlength
IPAddr/-I ipaddr/subnetmask

Filter the report output using the specified IP address `ipaddr`, `ipaddr/prefixlength`, or `ipaddr/subnetmask`. You can enter up to six filter values. Each specified IPv4 `ipaddr` value can be up to 15 characters in length and each selected IPv6 `ipaddr` value can be up to 45 characters in length.

`ipaddr`
Filter the output of the VCRT/-V report using the specified IP address `ipaddr`. For IPv4 addresses, the default subnet mask of 255.255.255.255 is used. For IPv6 addresses, the default `prefixlength` of 128 is used.

`ipaddr/prefixlength`
Filter the output of the VCRT/-V report using the specified IP address and prefix length `ipaddr/prefixlength`. For an IPv4 address, the prefix length range is 1 – 32. For an IPv6 address, the prefix length range is 1 – 128.

`ipaddr/subnetmask`
Filter the output of the VCRT/-V report using the specified IP address and subnet mask `ipaddr/subnetmask`. The IP address `ipaddr` in this format must be an IPv4 IP address.

**Guidelines:**
1. The filter value `ipaddr` can be a source IP address, a destination IP address, or a destination XCF IP address.
2. For an IPv6-enabled stack:
   - Both IPv4 and IPv6 `ipaddr` values are accepted and can be mixed on the `IPAddr/-I` option.
   - An IPv4-mapped IPv6 address is accepted as a valid `ipaddr` value and will usually provide the same result as its IPv4 address.

**Restrictions:**
1. The `IPAddr/-I` option for VCRT/-V report does not support wildcard characters.
2. For an IPv4-only stack, only IPv4 `ipaddr` values are accepted.
3. For a UDP endpoint socket, the filter value applies only to the local or source IP address.

IPPort/-B ipaddr+portnum

Filter the report output of the VCRT/-V report using the specified IP address and port number. You can enter up to six filter values. Each specified IPv4 `ipaddr` value can be up to 15 characters in length, denoting a single IPv4 IP address; each specified IPv6 `ipaddr` value can be up to 45 characters in length, denoting a single IPv6 IP address. Valid `portnum` values are in the range 0–65535. The filter values `ipaddr` and `portnum` matches any combination of the local and remote IP address and local and remote port.

**Guidelines:**
- The filter value `ipaddr` can be a source IP address, a destination IP address, or a destination XCF IP address.
- For an IPv6-enabled stack, the following apply:
  - Both IPv4 and IPv6 `ipaddr` values are accepted and can be mixed on the `IPPort/-B` option.
  - An IPv4-mapped IPv6 address is accepted as a valid `ipaddr` value and usually provides the same result as the IPv4 address.

**Restrictions:**
- The `ipaddr` value in the `IPPort/-B` filter does not support wildcard characters.
- For an IPv4-only stack, only IPv4 `ipaddr` values are accepted.
- An entry is returned only when both the `ipaddr` and `portnum` values match.
- For a UDP endpoint socket, the filter value applies only to the local or source IP address and port.
**POrt/-P portnum**
Filter the output of the VCRT/-V report using the specified port number `portnum`. You can enter up to six filter values.

**Guideline:** The port number can be either a local or remote port.

**Restriction:** For a UDP endpoint socket, the filter value applies only to the local or source port.

**Command syntax examples**

**From TSO environment**

```
NETSTAT VCRT
 Displays the dynamic VIPA Connection Routing Table information in the default TCP/IP stack.
NETSTAT VCRT TCP TCPCS6
 Displays the dynamic VIPA Connection Routing Table information in the TCPCS6 stack.
```

**From UNIX shell environment**

```
netstat -V
netstat -V -p tcpcs6
```

**Report examples**

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

**Not IPv6 enabled (SHORT format)**

```

Report field descriptions

For a SHORT format report

Dest IPaddr
The destination IP address for this connection.

DPort
The destination port for this connection.

Src IPaddr
The source IP address for this connection. If the source IP address value is 0 for an entry, then the entry does not represent an established connection. Entries with a source IP address value 0 represent an affinity between a client IP address and a dynamic VIPA destination IP address and port. Such an affinity arises from passive-mode FTP. Each affinity entry is immediately followed by all the established connection entries that are associated with the affinity.

SPort
The source port for this connection. If the source port value is 0 for an entry, then the entry does not represent an established connection. Entries with a source port value 0 represent an affinity between a client IP address and a dynamic VIPA destination IP address and port. Such an affinity might arise from passive-mode FTP or from a distributed DVIPA with a nonzero value for the TIMEDAFFINITY parameter on the VIPADISTRIBUTE profile statement. Each affinity entry is immediately followed by all the established connection entries that are associated with the affinity.
**DestXCF Addr**
The dynamic XCF address of the stack that is processing this connection. For connections to and from non-z/OS tier 1 targets, this value is the IP address of the tier 1 target.

*For a LONG format report*

**Dest**
The destination IP address and port for this connection.

**Source**
The source IP address and port for this connection. If the source IP address value is 0 for an entry, then the entry does not represent an established connection. Entries with a source IP address value of zero represent an affinity between a client IP address and a dynamic VIPA destination IP address and port. Such an affinity arises from passive-mode FTP. Each affinity entry is immediately followed by all the established connection entries that are associated with the affinity.

If the source port value is zero for an entry, then the entry does not represent an established connection. Entries with a source port value of zero represent an affinity between a client IP address and a dynamic VIPA destination IP address and port. Such an affinity might arise from passive-mode FTP or from a distributed DVIPA with a nonzero value for the TIMEDAFFINITY parameter on the VIPADISTRIBUTE profile statement. Each affinity entry is immediately followed by all the established connection entries that are associated with the affinity.

**DestXCF**
The dynamic XCF address of the stack that is processing this connection. For connections to and from non-z/OS tier 1 targets, this value is the IP address of the tier 1 target.

*For a SHORT or LONG format report*

**DETAIL**
For each entry that represents an established dynamic VIPA connection or an affinity created by the passive-mode FTP, displays the preceding information plus the following policy rule and action.

**PolicyRule**
The policy rule name configured to the Policy Agent. The PolicyRule value *NONE* indicates that the connection was not mapped to a policy rule.

**PolicyAction**
The policy action name configured to the Policy Agent. A PolicyAction value *NONE* indicates that the connection was not mapped to a policy action.

For each entry that represents an established dynamic VIPA connection on the stack which owns the dynamic VIPA (when VIPAROUTE profile statements have been configured to the stack), displays the preceding information plus the following additional routing information.

**Intf**
The name of the interface for the route being used to distribute packets to the target stack. The value *NONE* indicates that there is no route associated with this connection.

**VipaRoute**
Indicates whether the VIPAROUTE parameter is being used to route packets to the target stack for this connection:

**No**
Indicates that the dynamic XCF interface is being used to distribute packets to the target stack.

**Yes**
Indicates that the best available route, based on the VIPAROUTE parameters, is being used to distribute packets to the target stack.

**Unavail**
Indicates that the TCP/IP stack attempted to use the route based on the VIPAROUTE parameters, but an error was detected during the verification of the VIPAROUTE statement. Because of this, the dynamic XCF interface is being used to distribute packets to that target.
stack. See VIPADYNAMIC statement information in the z/OS Communications Server: IP Configuration Reference for details about the VIPAROUTE statement.

**Gw**

The gateway used to send packets to the target stack. If the value is equal to 0.0.0.0 for an IPv4 entry or :: for an IPv6 entry, then the destination is directly reachable without needing to go through a gateway.

**Accelerator**

Indicates whether this connection is eligible for the QDIO Accelerator function. To be eligible, the QDIO accelerator function must be enabled by specifying the QDIOACCELERATOR parameter on the IPCONFIG statement. The accelerator field is displayed only if QDIOACCELERATOR is specified on the IPCONFIG statement. For more information about the IPCONFIG statement, see the IPCONFIG profile statement information in z/OS Communications Server: IP Configuration Reference.

The packets that are eligible for acceleration are those that are received by the Sysplex Distributor and that are forwarded to a target stack in any of the following inbound and outbound DLC combinations:

- Inbound HiperSockets, forwarded outbound over OSA-Express QDIO connections
- Inbound OSA-Express QDIO, forwarded outbound over the dynamic XCF HiperSockets connection
- Inbound OSA-Express QDIO, forwarded outbound over OSA-Express QDIO connections
- Inbound HiperSockets, forwarded outbound over the dynamic XCF HiperSockets connection

**No**

Indicates that this connection is not eligible for the QDIOACCELERATOR function.

**Yes**

Indicates that this connection is eligible for the QDIOACCELERATOR function.

For each entry that represents an affinity created by the TIMEDAFFINITY parameter on the VIPADISTRIBUTE profile statement, displays the preceding information plus the following affinity-related information.

**CfgTimAff**

The affinity value that was defined in the TIMEDAFFINITY parameter on the VIPADISTRIBUTE profile statement.

**TimeAffCnt**

The count of currently established connections associated with this affinity.

**TimAffLft**

The number of seconds left before the affinity between the client IP address and the dynamic VIPA destination IP address and port is removed. After the last established connection is closed, the affinity will remain for the number of seconds indicated in the CfgTimAff field.

**Netstat VDPT/-O report**

This report displays the dynamic VIPA destination port table information. The command first displays information about distribution to TCP/IP stacks; this section of the report applies to Base targets, tier 1 targets that are not configured to use GRE routing, and tier 2 targets. The command then displays information about distribution to non-z/OS targets; this section of the report applies to tier 1 targets that are configured to use Generic Routing Encapsulation (GRE) routing. The destination port tables exist only on distributing stacks, which are stacks on which a VIPADISTRIBUTE DEFINE keyword was specified.

**TSO syntax**

```"NETSTAT VDPT Modifier Target Output (Filter)"```
**Modifier**

**DETAIL**
Displays the general dynamic VIPA destination port table information plus the Workload Manager weight value and QoS policy action name information as follows:

- The component values of the target server responsiveness (TSR) value
- The count of currently active connections
- The Workload Manager weight value and QoS policy action name information

**Target**
Provide the report for a specific TCP/IP address space by using TCP tcpname. See “The Netstat command target” on page 287 for more information about the TCP parameter.

**Output**
The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**Filter**

```
IPAddr    ipaddr
    ipaddr/prefixLen
    ipaddr/subnetmask
IPPOrt    ipaddr+portnum
       portnum
```

**z/OS UNIX syntax**

```
netstat -O Modifier Target Output Filter
```

**Modifier**

**DETAIL**
Displays the general dynamic VIPA destination port table information plus the Workload Manager weight value and QoS policy action name information as follows:

- The component values of the target server responsiveness (TSR) value
- The count of currently active connections
- The Workload Manager weight value and QoS policy action name information

**Target**
Provide the report for a specific TCP/IP address space by using -p tcpname. See “The Netstat command target” on page 287 for more information about the TCP parameter.
Output
The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

Filter

Filter description

**IPAddr/-I** ipaddr
- Filter the report output using the specified IP address `ipaddr`. You can enter up to six filter values. Each specified IPv4 `ipaddr` value can be up to 15 characters in length and each selected IPv6 `ipaddr` value can be up to 45 characters in length.

**ipaddr**
- Filter the output of the VDPT/-O report using the specified IP address `ipaddr`. For IPv4 addresses, the default subnet mask of 255.255.255.255 is used. For IPv6 addresses, the default `prefixlength` of 128 is used.

**ipaddr/prefixlength**
- Filter the output of the VDPT/-O report using the specified IP address and prefix length `ipaddr/prefixlength`. For an IPv4 address, the prefix length range is 1 – 32. For an IPv6 address, the prefix length range is 1 – 128.

**ipaddr/subnetmask**
- Filter the output of the VDPT/-O report using the specified IP address and subnet mask `ipaddr/subnetmask`. The IP address `ipaddr` in this format must be an IPv4 IP address.

**Guidelines:**
1. The filter value `ipaddr` can be a destination IP address, or a destination XCF IP address.
2. For an IPv6-enabled stack:
   - Both IPv4 and IPv6 `ipaddr` values are accepted and can be mixed on the IPAddr/-I option.
   - An IPv4-mapped IPv6 address is accepted as a valid `ipaddr` value and will usually provide the same result as its IPv4 address.

**Restrictions:**
1. The IPAddr/-I option for VDPT/-O report does not support wildcard characters.
2. For an IPv4-only stack, only IPv4 `ipaddr` values are accepted.
3. For a UDP endpoint socket, the filter value applies only to the local or source IP address.

**IPPort/-B** ipaddr+portnum
- Filter the report output of the VDPT/-O report using the specified IP address and port number. You can enter up to six filter values. Each specified IPv4 `ipaddr` value can be up to 15 characters in length, denoting a single IPv4 IP address; each specified IPv6 `ipaddr` value can be up to 45 characters in length.
length, denoting a single IPv6 IP address. Valid portnum values are in the range 0 – 65 535. The filter values ipaddr and portnum will match any combination of the local and remote IP address and local and remote port.

Guidelines:
• The filter value ipaddr can be a destination IP address, or a destination XCF IP address.
• For an IPv6-enabled stack, the following apply:
  – Both IPv4 and IPv6 ipaddr values are accepted and can be mixed on the IPPort/-B option.
  – An IPv4-mapped IPv6 address is accepted as a valid ipaddr value and usually provides the same result as the IPv4 address.
  – For a UDP endpoint socket, the filter value applies only to the local or source IP address and port.

Restrictions:
• The ipaddr value in the IPPort/-B filter does not support wildcard characters.
• For an IPv4-only stack, only IPv4 ipaddr values are accepted.
• An entry is returned only when both the ipaddr and portnum values match.

POrt/-P portnum
Filter the output of the VDPT/-O report using the specified port number portnum. You can enter up to six filter values.

Guideline: The port number can be either a local or remote port.

Restriction: For a UDP endpoint socket, the filter value applies only to the local or source port.

Command syntax examples

From TSO environment

NETSTAT VDPT
Displays the dynamic VIPA Destination Port Table information in the default TCP/IP stack.

NETSTAT VDPT TCP TCPCS6
Displays the dynamic VIPA Destination Port Table information in the TCPCS6 stack.

From UNIX shell environment

netstat -O
netstat -O -p tcpcs6

Report examples

The following examples are generated using the TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

**Report field descriptions for the Dynamic VIPA Destination Port Table for TCP/IP Stacks**

Displays information about distribution to TCP/IP stacks, including base targets and z/OS tier 1 and tier 2 targets.

For a SHORT format report

**Dest IPaddr**

The DVIPA address for which workload is being distributed.

**DPort**

Connections for this port are to be distributed.

**Dest XCF Addr**

The dynamic XCF address of target stack to receive connections.

**Flg**

Flags; depending on the VIPADISTRIBUTE configuration parameters, the state of the target, and the path to the target, flags can have the following values:

1. Indicates that this is a tier 1 DVIPA address.
2. Indicates that this is a tier 2 DVIPA address.

D Indicates a dynamically assigned destination/port entry.
Indicates that the data path to the target stack is inactive.

K
Indicates that this is currently a backup (hot standby) server.

L
Indicates that the target stack specified by the DestXCF Addr value is currently processing outbound connections that originated on the target stack for this destination and port pair locally.

V
Indicates that this is currently the active server.

For a LONG format report

DestIntf
The name of this IPv6 interface.

Dest
The DVIPA address and port for which workload is being distributed.

DestXCF
The dynamic XCF address of target stack to receive connections.

Flg
Flags; depending on the VIPADISTRIBUTE configuration parameters, the state of the target, and the path to the target, flags can have the following values:

Active
Indicates that this is currently the active server.

Backup
Indicates that this is currently a backup (hot standby) server.

Dynamic
Indicates a dynamically assigned destination/port entry.

Inactive
Indicates that the datapath to the XCF target is inactive.

Local
Indicates that the target stack specified by the DestXCF Addr value is currently processing outbound connections for this destination and port pair locally.

Tier1
Indicates that this is a tier 1 DVIPA address.

Tier2
Indicates that this is a tier 2 DVIPA address.

For a SHORT or LONG format report

DistMethod
The distribution method in use.

BaseWLM
Indicates that WLM system weights and policy information are used to distribute incoming connection requests.

HotStandby
Indicates that HotStandby distribution is in use.

Roundrobin
Indicates that incoming connection requests are distributed using the round-robin method.

ServerWLM
Indicates that WLM server weights and policy information are used to distribute incoming connection requests.
WLM server weights are used if SERVERWLM was specified on the VIPADISTRIBUTE statement for this DVIPA and port, and all target servers are able to provide WLM server-specific weights. Otherwise, BaseWLM is used.

**WeightedActive**
Indicates that incoming connection requests are distributed using the weighted active connections method.

**Rule:** For a short format report, you need to use the DETAIL modifier to display this field.

**Rdy**
The number of applications ready to receive connections. A count of 0 indicates that there are no applications on this target stack ready to receive new connections. Either the application has not been started on this target, or if it was started, it might have been terminated or quiesced with the Vary TCPIP,,SYSPLEX,QUIesce command.

**SrvType**
Indicates the server type when the HotStandby distribution method is configured.

**Backup**
Indicates that this is a backup target. A backup target is initially a hot standby target. Connections are not distributed to hot standby targets. If the active target becomes unavailable, the distributor switches targets and one of the hot standby targets becomes the active target.

**Preferred**
Indicates that this is the preferred target. If AUTOSWITCHBACK is configured, then the preferred target is the active target if it is available and has not had any health problems. If the active target becomes unavailable, the distributor switches to use a hot standby target; the active target becomes a hot standby target and the selected hot standby target becomes the active target.

**Rule:** For a short format report, you need to use the DETAIL modifier to display this field.

**TotalConn**
The total number of connections that have been forwarded to the stack identified by DestXCF Addr. This field will wrap.

**WLM**
When the distribution method is BASEWLM or SERVERWLM this is the Workload Manager weight value for the target listener. The weight value is either an indication of the target system’s capacity for additional work or the more granular indication of the specific server’s capacity for additional work, based on how well it is meeting its WLM policy goals (where higher numbers indicate a server with greater capacity). WLM system weights are indicated by the BaseWLM flag. WLM server-specific weights are indicated by the ServerWLM flag.

When this is a tier 1 target, the original system weight or server-specific weight might be modified by adding the weight of a tier 2 target server for the same group name that is also on this TCP/IP stack, therefore, the displayed value indicates the comparative fitness of a tier 1 target in terms of both the tier 1 and the corresponding tier 2 server capacity for additional work. The weights represent normalized weights; the original weights of the tier 1 and tier 2 server (if any) are added together and proportionally reduced for use by the distribution algorithm. Connections are distributed to these servers in a weighted distribution using the normalized weights.

The weights represent normalized weights; the original raw weights received from WLM are modified by multiplying them by the target server responsiveness (TSR) value and are proportionally reduced for use by the distribution algorithm. Thus, the displayed value indicates the comparative fitness of a server both in terms of system or server capacity and in terms of TCP connection setup responsiveness. Connections are distributed to these servers in a weighted round-robin manner using the normalized weights.

For more information about WLM, see Sysplex distributor details in the z/OS Communications Server: IP Configuration Guide.

When the distribution method is WEIGHTEDACTIVE, this value is the configured weight for the target listener. This weight is used by the distributor to determine the proportion of incoming requests to
route to this target such that the number of active connections on each target is proportionally equivalent to the configured weight for each target.

**TSR**

The target server responsiveness value for the target server.

The sysplex distributor monitors the ability of a target server to process new connections. At each interval of approximately one minute, it generates a target server responsiveness fraction percentage to indicate how well the server is accepting new TCP connection setup requests. It is not a measure of how well the server is servicing the connections.

- The value 100 indicates that the target server is successfully accepting all new TCP connection setup requests. A value of 100 is also displayed for target stacks at a pre-V1R7 z/OS level. If there is at least one target stack for this DVIPA and a port that is at a pre-V1R7 z/OS level, then no target server responsiveness calculations are applied to the WLM values.
- A value that is greater than 0 but less than 100 indicates that the server is having problems accepting some new connection requests. These problems can be due to network connectivity, server application problems, or target stack problems.
- The value 0 indicates that the target server is unable to process new connection requests. This can be due to network connectivity, server application problems, or target stack problems. No new TCP connection setup requests are distributed to a target server with a TSR value of 0.

The sysplex distributor modifies the WLM weight for each target server by the calculated target server responsiveness percentage, and, after normalizing the weights, uses these new values to weight its distribution of new connection requests to the target servers. For example, if there are three target servers for a particular DVIPA with calculated TSRs of 75, 50, and 100 percent respectively, and, after applying the TSRs to the WLM weights, the normalized weights are 7, 2, and 3, the sysplex distributor would be expected to distribute three and a half times as many new connection requests to the first target server as to the second server and one and half times as many new connection requests to the third server as to the second server.

The TSR percentage is calculated from two component values, the target connectivity success rate (TCSR) and the server accept efficiency fraction (SEF)

- The TCSR measures the percentage of connection setup requests routed from the distributor that are successfully received by the target for this server.
- The SEF measures the effectiveness of the server application in accepting new connection requests and managing its backlog queue.

The values of each of the components are displayed when DETAIL is specified on the command.

**DETAIL**

Invoking VDPT/-O DETAIL displays the VDPT information stated above and includes the following additional information:

**TCSR**

The target connectivity success rate (TCSR) is a measure of the percentage of connection setup requests routed from the distributor that are successfully received by the target for this server. It is displayed as a percentage. A value of 100 indicates that all connection setup requests routed to the target stack destined for this server are being successfully received by the target. A value of 0 indicates that no connection setup requests for this server are successfully reaching the target. This value is one component part of the target server responsiveness (TSR) value.

**CER**

The connection establishment rate (CER) is a measure of the percentage of the connection setup requests received at the target that achieve completion with the client (that is, arrive at connection established state). It is displayed as a percentage. The value 100 indicates that all new connection setup requests are resulting in established connections. The value 0 indicates that no new connection setup requests have become successfully established. This value is used for diagnosis only and is not integrated into the TSR calculation. For information about diagnosing sysplex problems, see the steps for diagnosing sysplex problems in the z/OS Communications Server: IP Diagnosis Guide.
SEF

The server accept efficiency fraction (SEF) is a measure, calculated at intervals of approximately one minute, of the efficiency of the server application in accepting new connection requests and managing its backlog queue. It is displayed as a percentage. A value of 100 indicates that the server application is successfully accepting all its new connection setup requests. A value of 0 indicates the server application is not responding to new connection setup requests. This value is one component part of the target server responsiveness (TSR) value.

Weight

The composite weight. This is the sum of the displayed modified CP, zAAP, and zIIP weights that follow.

CP

When the distribution method is BASEWLM the following apply:

• The Raw value is the WLM system general CP weight recommendation. It is based on the amount of displaceable general CPU capacity on this system as compared to the other target systems.

• The Proportional value is the Raw value modified by the expected general CP utilization proportion configured on the VIPADISTRIBUTE PROCTYPE statement for this application.

When the distribution method is SERVERWLM the following apply:

• The Raw value is the WLM server-specific general CP recommendation. This is the amount of displaceable general CPU capacity based on the application workload's importance (as defined by the WLM policy) as compared to the other target systems.

• The Proportional value is the Raw value modified by the proportion of general CP capacity that is currently being consumed by the application's workload as compared to the other processors (zAAP and zIIP)

zAAP

When the distribution method is BASEWLM the following apply:

• The Raw value is the WLM system zAAP weight recommendation. It is based on the amount of displaceable zAAP capacity on this system as compared to the other target systems.

• The Proportional value is the Raw value modified by the expected zAAP utilization proportion configured on the VIPADISTRIBUTE PROCTYPE statement for this application.

When the distribution method is SERVERWLM the following apply:

• The Raw value is the WLM server-specific zAAP recommendation, which is the amount of displaceable zAAP capacity based on the application workload's importance (as defined by the WLM policy) as compared to the other target systems.

• The Proportional value is the Raw value modified by the proportion of zAAP capacity that is currently being consumed by the application's workload as compared to the other processors (general CPU and zIIP)

zIIP

When the distribution method is BASEWLM the following apply:

• The Raw value is the WLM system zIIP weight recommendation. It is based on the amount of displaceable zIIP capacity on this system as compared to the other target systems.

• The Proportional value is the Raw value modified by the expected zIIP utilization proportion configured on the VIPADISTRIBUTE PROCTYPE statement for this application.

When the distribution method is SERVERWLM the following apply:

• The Raw value is the WLM server-specific zIIP recommendation. This is the amount of displaceable zIIP capacity based on the application workload's importance (as defined by the WLM policy) as compared to the other target systems.
• The Proportional value is the Raw value modified by the proportion of zIIP capacity that is currently being consumed by the application’s workload as compared to the other processors (general CPU and zAAP)

**ActConn**
Indicates the current number of active connections for a target TCP/IP. This count is incremented by the distributing TCP/IP when one of the following occurs:

- A connection request is forwarded by the distributing TCP/IP to that target.
- The distributing TCP/IP is informed that the target has initiated a TCP connection using this DVIPA as a source IP address.

**Abnorm**
Indicates whether the server application is experiencing conditions under which transactions are completing abnormally. It represents a rate of abnormal transaction completions per 1000 total transaction completions. It is applicable only for TCP applications that act as Subsystem Work Managers and report transaction status using Workload Management Services, such as IWMRPT. For example, a value of 100 indicates that 10% of all transactions processed by the server application are completing abnormally. Under normal conditions, this value is 0. A nonzero value indicates that the server application has reported some abnormal transactions completions to WLM and that WLM has reduced the recommendation provided to sysplex distributor for this server instance. This reduction in the WLM recommendation enables fewer new TCP connections to be directed to servers that are not experiencing problem conditions that result in abnormal transaction completions. The greater the value in the Abnorm field, the greater the reduction WLM applies to the recommendation for this target instance. For more information about the conditions that cause abnormal transaction completions for a given server application, see the documentation that was provided by the server application.

If the distribution method is not SERVERWLM, then this field is 0. For more information about workload management interfaces, see z/OS MVS Programming: Workload Management Services.

**Health**
The health indicator of the server application. This health indicator is available only for applications that provide this information to WLM using the IWM4HLTH or IWMSRSRG services. It provides a general health indication for an application or subsystem. Under normal circumstances, the value of this field is 100, which indicates that the server is 100% healthy. Any value less than 100 indicates that the server is experiencing problem conditions that are not enabling it to process new work requests successfully. A value of less than 100 also causes the WLM to reduce the recommendation provided to sysplex distributor for this server instance. This reduction in the WLM recommendation enables fewer new TCP connections to be directed to servers that are not experiencing problem conditions. The reduction in the WLM recommendation is proportional to the Health indicator value. For example, given a health value of only 20%, WLM reduces the recommendation for this server by 80%. For more information regarding the conditions that lead to a health indicator of less than 100, see the documentation for the server application.

If applications do not provide this health indicator to WLM, then this field has a value of 100. If the distribution method is not SERVERWLM, then this field has a value of 100. For more information about workload management interfaces, see z/OS MVS Programming: Workload Management Services.

**W/Q**
The Workload Manager weight value for the target server after modification using QoS information provided by the Policy Agent. QoS information is an indication of the following information:

- Network performance (TCP retransmissions and timeouts)
- Maximum connections allowed versus actual connections
- Expected overall throughput versus the actual throughput achieved

This value is used by a distributing stack to determine the quantity of connections to be forwarded to this target stack, relative to other target stacks. Note that if, for a particular incoming connection, a target server’s W/Q value for the destination address, port, and QoS policy action is
0, while the W/Q value for the destination address, port, and QoS policy action on other target servers is nonzero, no connections are forwarded to the target server with a 0 W/Q value.

**Note:** If all target servers for the destination address, port, and QoS policy action have 0 W/Q values, connection forwarding is done in a round-robin fashion, rather than based on WLM or QoS information.

**QosPlcAct**

The QoS policy action name configured to the Policy Agent. If multiple QoS policy actions are configured for a single destination address and port, each policy action name is displayed along with its associated WLM and W/Q values. A QosPolicyAction of *Default* indicates the WLM and W/Q values used when there is no QosPolicyAction that applies to an incoming connection.

**Report field descriptions for the Dynamic VIPA Destination Port Table for non-z/OS targets**

Displays information about distribution to non-z/OS targets. This includes tier 1 targets.

**For a SHORT format report**

**Dest IPaddr**

The DVIPA address for which workload is being distributed.

**DPort**

Connections for this port that are to be distributed.

**Target Addr**

The IP Address of a non-z/OS target that is to receive connections. This is a tier 1 target (for example, a DataPower® appliance).

**Flg**

Flags; can have one of the following values:

- **A** Indicates that incoming connection requests are distributed by the weighted active connections method.
- **I** Indicates that the data path to the target is inactive.
- **R** Indicates that incoming connection requests are distributed by the round-robin method.
- **T** Indicates that incoming connection requests are distributed using weights that are provided by the tier 1 targets.

**For a LONG format report**

**DestIntf**

The name of this IPv6 interface.

**Dest**

The DVIPA address and port for which workload is being distributed.

**Target Addr**

The IP address of a non-z/OS target that is to receive connections. This is a tier 1 target (for example, a DataPower appliance).

**Flg**

Flags; can have one of the following values:

- **Inactive** Indicates that the datapath to the target is inactive.
- **Roundrobin** Indicates that incoming connection requests are distributed by the round-robin method.
**TargetCtrl**
Indicates that incoming connection requests are distributed using weights provided by the tier 1 targets.

**WeightedActive**
Indicates that incoming connection requests are distributed by the weighted active connections method.

*For a SHORT or LONG format report*

**Rdy**
This field indicates whether there are applications ready to receive connections. The value 0 indicates that there are no application on this target that is ready to receive new connections. The value 1 indicates that there is an application on this target that is ready to receive new connections.

**TotalConn**
The total number of connections that have been forwarded to the target identified by Target Addr. This field will wrap.

**Wt**
The composite weight of the target. The following distribution methods are supported:

**TARGCONTROLLED**
The weights represent normalized weights; the original weights received from the tier 1 targets (if any) might be modified by multiplying them by the central processor complex (CPC) weight (CWt) value and are proportionally reduced for use by the distribution algorithm. The displayed value indicates the comparative fitness of a target both in terms of target capacity and in terms of the CPC availability of the associated tier 2 target servers. Connections are distributed to these servers in a weighted distribution using the normalized weights.

**WEIGHTEDACTIVE**
The CPC weight 0 affects weighted active distribution. If at least one nonzero CPC weight has been received for a group of associated tier 2 target servers, then the following occurs:

- If the associated CPC weight is 0, then the normalized weight is set to 0 for this target.
- If the CPC weight is not 0, then normalization uses the weight that is configured.

**ROUNDROBIN**
The CPC weight 0 affects round-robin distribution. If at least one nonzero CPC weight has been received for a group of associated tier 2 target servers, then the following occurs:

- If the associated CPC weight is 0, then the normalized weight is set to 0 for this target.
- If the CPC weight is not 0, the normalized weight for this target is set to 1.

**CWt**
A value that represents the combined weights of the tier 2 target servers on the stacks that are on the same central processor complex (CPC) as the tier 1 target. These applications are the tier 2 targets of connection requests from the tier 1 target. This value can be used to modify the weight value that is provided by the tier 1 target. See *z/OS Communications Server: IP Configuration Guide* for more details.

**DETAL**
Details include the following fields:

**T1Wt**
The weight that is received from the tier 1 target.

**ActConn**
Indicates the current number of active connections for this target. This count is incremented by the distributing TCP/IP when a connection request is forwarded by the distributing TCP/IP to that target.
**Netstat VIPADCFG/-F report**
Displays the dynamic VIPA configuration for a local host.

**TSO syntax**

```
NETSTAT VIPADCFG Modifier Target Output (Filter)

**Modifier**

```
DETAIL
```

**DETAIL**
Displays the general dynamic VIPA configuration information, along with the following information:
- The OPTLOCAL value.
- If the distribution method is WeightedActive, displays the configured active connection weight.
- If the distribution method is BASEWLM, displays the PROCTYPE parameters.
- If the distribution method is SERVERWLM, displays the PROXCOST and ILWEIGHTING parameters.

**Target**
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**
The default output option displays the output on the user’s terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**Filter**

```
IPAddr IPAddr/prefixLen IPAddr/subnetmask
```

**z/OS UNIX syntax**

```
netstat -F Modifier Target Output (Filter)
```

**Modifier**

```
DETAIL
```

**DETAIL**
Displays the general dynamic VIPA configuration information and the OPTLOCAL value.

**Target**
Provide the report for a specific TCP/IP address space by using -p tcpname. See “The Netstat command target” on page 287 for more information about the TCp parameter.

**Output**
The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.
Filter

Filter description

IPAddr/-I ipaddrIPAddr/-I ipaddr/prefixLengthIPAddr/-I ipaddr/subnetmask
Filter the report output using the specified IP address ipaddr, ipaddr/prefixLength, or ipaddr/subnetmask. You can enter up to six filter values. Each specified IPv4 ipaddr value can be up to 15 characters in length and each selected IPv6 ipaddr value can be up to 45 characters in length.

ipaddr
Filter the output of the VIPADCFG/-F report using the specified IP address ipaddr. For IPv4 addresses, the default subnet mask of 255.255.255.255 is used. For IPv6 addresses, the default prefixLength of 128 is used.

ipaddr/prefixLength
Filter the output of the VIPADCFG/-F report using the specified IP address and prefix length ipaddr/prefixLength. For an IPv4 address, the prefix length range is 1 – 32. For an IPv6 address, the prefix length range is 1 – 128.

ipaddr/subnetmask
Filter the output of the VIPADCFG/-F report using the specified IP address and subnet mask ipaddr/subnetmask. The IP address ipaddr in this format must be an IPv4 IP address.

Guidelines:
1. The filter value ipaddr can be a dynamic VIPA address, a destination IP address, or a destination XCF IP address.
2. For an IPv6-enabled stack the following apply:
   • Both IPv4 and IPv6 ipaddr values are accepted and can be mixed on the IPAddr/-I option.
   • An IPv4-mapped IPv6 address is accepted as a valid ipaddr value and usually provides the same result as its IPv4 address.

Restrictions:
1. The IPAddr/-I option for the VIPADCFG/-F report does not support wildcard characters.
2. For an IPv4-only stack, only IPv4 ipaddr values are accepted.

Command syntax examples

From TSO environment

```
NETSTAT VIPADCFG
Display the dynamic VIPA configuration for the default TCP/IP stack.
NETSTAT VIPADCFG TCP TCPCS6
Display the dynamic VIPA configuration for the TCPCS6 stack.
```

From UNIX shell environment

```
netstat -F
netstat -F -p tcpcs6
```
**Report examples**

The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

If the TCP/IP stack is not currently in the sysplex group, two messages will precede the report, one indicating that the TCP/IP stack is not a member of the sysplex group and the other indicating that all dynamic VIPA configuration for the TCP/IP stack is currently inactive. See z/OS Communications Server: IP Messages Volume 4 (EZZ, SNM), messages EZZ2502I and EZZ2503I respectively, for detailed information about these messages.

If the stack is delaying sysplex profile processing because VTAM or OMPROUTE is not initialized, VIPADYNAMIC configuration information is not available and message EZZ2505I precedes the report heading. See z/OS Communications Server: IP Messages Volume 4 (EZZ, SNM) for more information.

Report field descriptions
Displays the following dynamic VIPA information defined in the VIPADYNAMIC profile statement. For more information about each field, see the VIPADYNAMIC profile statements in the z/OS Communications Server: IP Configuration Reference.

VIPA Backup
Displays the following configured dynamic VIPA backup information:

For a SHORT format report:

IP Address
The IP address for this DVIPA.

AddressMask
The net mask that determines how many of the bits of the IP address determine the net. This field is blank if Moveable and AddressMask were not specified on the VIPABACKUP statement or if another stack initially activated the DVIPA.

For a LONG format report:

IntfName
The name of this IPv6 interface. This name will match the interface name defined on the Primary stack that is being backed up.

IpAddr/PrefixLen
The IP address and prefix length for this DVIPA. For an IPv4 address, the prefix length range is 1 - 32. For an IPv6 address, the prefix length range is 1 – 128.

For a SHORT or LONG format report:
Rank
The relative position of this stack in the list of stacks that can activate (takeover) the DVIPA in case of failure. The stack with the highest ranked backup DVIPA will do the takeover.

Moveable
Indicates the conditions under which the active DVIPA can be moved to another stack. This field is blank if Moveable and AddressMask were not specified on the VIPABACKUP statement, or if another stack initially activated the DVIPA.

WhenIdle
Indicates that this DVIPA can be moved to another stack when there are no connections for this DVIPA on the current stack. If there are connections on the current stack at the time another stack issues a VIPADEFINE for the same DVIPA, the DVIPA remains active on this stack until the last connection on this stack ends.

Immediate
Indicates that this DVIPA can be moved to another stack as soon as the other stack requests ownership by executing a VIPADEFINE for the same DVIPA. Existing connections on the current stack are maintained by the new owning stack.

SrvMgr
Indicates whether sysplex distributor performs Multinode Load Balancing (MNLB) by functioning as a Service Manager (in place of Cisco's LocalDirector) for this DVIPA. This field for an IPv4 entry is blank if Moveable and AddressMask were not specified on the VIPABACKUP statement or if another stack initially activated the DVIPA. This field for an IPv6 entry will always display n/a as it is not applicable for IPv6.

Flg
The following values can be displayed in the Flg field:

1
Indicates that this DVIPA is used to distribute incoming requests to z/OS or non-z/OS targets (for example, DataPower appliances).

2
Indicates that this DVIPA is used to distribute incoming requests from tier 1 targets to the group of server applications.

C
Indicates that this DVIPA is specific to the central processor complex (CPC) that it is defined on and that it cannot be moved to or taken over by a TCP/IP stack on a different CPC. This DVIPA can serve as a default route from DataPower appliances that are associated with this CPC. When used with the tier 2 flag (see Flg value 2), this value indicates that all of the tier 2 target applications are on TCP/IP stacks on the same CPC.

VIPA Define
Displays the configured dynamic VIPA define information.

For a SHORT format report:

IP Address
The IP address for this DVIPA.

AddressMask
The net mask that determines how many of the bits of the IP address determine the net.

For a LONG format report:

IntfName
The name of this IPv6 interface.

IpAddr/PrefixLen
The IP address and prefix length for this DVIPA. For an IPv4 address, the prefix length range is 1 – 32. For an IPv6 address, the prefix length range is 1 – 128.

For a SHORT or LONG format report:
Moveable
Indicates the conditions under which the DVIPA can be moved to another stack.

WhenIdle
Indicates that this DVIPA can be moved to another stack when there are no connections for this DVIPA on the current stack. If there are connections on the current stack at the time another stack issues a VIPADEFINE for the same DVIPA, the DVIPA remains active on this stack until the last connection on this stack ends.

Immediate
Indicates that this DVIPA can be moved to another stack as soon as the other stack requests ownership by executing a VIPADEFINE for the same DVIPA. Existing connections on the current stack are maintained by the new owning stack.

SrvMgr
Indicates whether sysplex distributor performs Multinode Load Balancing (MNLB) by functioning as a Service Manager (in place of Cisco’s LocalDirector) for this DVIPA. This field for an IPv6 entry always displays n/a as it is not applicable for IPv6.

Flg
The following values can be displayed in the Flg field:

1
Indicates that this DVIPA is used to distribute incoming requests to the z/OS targets or non-z/OS targets (for example, DataPower appliances).

2
Indicates that this DVIPA is used to distribute incoming requests from tier 1 targets to the group of server applications.

C
Indicates that this DVIPA is specific to the central processor complex (CPC) that it is defined on and that it cannot be moved to or taken over by a TCP/IP stack on a different CPC. This DVIPA can serve as a default route from DataPower appliances that are associated with this CPC. When used with the tier 2 flag (see Flg value 2), this value indicates that all of the tier 2 target applications are on TCP/IP stacks on the same CPC.

VIPA Range
Displays the configured dynamic VIPA range information.

For a SHORT format report:

AddressMask
The net mask that determines how many bits of the IP address determine the net.

IP Address
An IP address that determines a VIPARANGE net value when ANDed with the specified address mask. DVIPAs that fall within the range can be created by BIND or SIOCSVIPA ioctl.

SAFName
The final qualifier of a System Authorization Facility (SAF) resource name. The maximum length is 8 characters.

Flg
The following value can be displayed in the Flg field:

C
Indicates this VIPARANGE was defined with the ZCX keyword and is intended for use by the z/OS Container Extensions function.

For a LONG format report:

IntfName
The name of this IPv6 interface.
**IpAddr/PrefixLen**
The IP address and prefix length for this DVIPA. For an IPv4 address, the prefix length range is 1 – 32. For an IPv6 address, the prefix length range is 1 – 128.

**SAFName**
The final qualifier of a System Authorization Facility (SAF) resource name. The maximum length is 8 characters.

**For a SHORT or LONG format report:**

**Moveable**
Indicates the conditions under which DVIPAs created within this VIPARANGE can be moved to another stack.

**Disrupt**
Indicates that nondisruptive movement will not occur for DVIPAs created within this VIPARANGE on this stack. In the case of a BIND-created DVIPA, a subsequent BIND for the same DVIPA will not move the DVIPA and the subsequent BIND will fail. In the case of an ioctl-created DVIPA, a subsequent ioctl request for the same DVIPA moves the DVIPA to the new stack, but connections on that DVIPA on the first stack are broken.

**NonDisr**
Indicates immediate nondisruptive movement for DVIPAs within this VIPARANGE created on this stack by SIOCSVIPA ioctl (or BIND) when the same DVIPA is requested by subsequent net mask (or subsequent BIND) on another stack. Any existing connections on the original owning stack are maintained by the new owning stack.

**VIPA Distribute**
Displays the configured dynamic VIPA define information.

**For a SHORT format report:**

**IP Address**
The specific IP address for which incoming connections are to be distributed.

**Port**
The specific port for which incoming connections are to be distributed. A port value of n/a indicates that the PORT parameter was not specified on the VIPADISTRIBUTE profile statement.

**Result:** If multiple ports were specified individually or in a range on a VIPADISTRIBUTE statement, one entry is displayed for each address and port combination.

**XCF Address**
The dynamic XCF address (IPCONFIG DYNAMICXCF) of a target stack for incoming connections to the DVIPA and port.

If the Flg field value 1 is displayed and RtgType GRE is displayed when the DETAIL keyword is used, then this field represents the IP address of the tier 1 target for incoming connections to the DVIPA.

**Weight**
The configured distribution method is WEIGHTEDActive. This is the configured active connection weight that is used when incoming connections are distributed to this target stack.

**Flg**
Flags including the following values:

1. Indicates that the DVIPA is used to distribute incoming requests to tier 1 targets.

2. Indicates that the DVIPA is used to distribute incoming requests from tier 1 targets to a group of tier 2 server applications.
O
Indicates that the OPTLOCAL keyword was defined on the VIPADISTRIBUTE profile statement.
To see the OPTLOCAL value currently in effect, issue the Netstat VIPADCFG/-F command with the DETAIL keyword.

For a LONG format report:

DestIntf
The name of this IPv6 interface.

Dest
The specific IP address and port for which incoming connections are to be distributed. A port value of n/a indicates that the PORT parameter was not specified on the VIPADISTRIBUTE profile statement.

Result: If multiple ports were specified individually or in a range on a VIPADISTRIBUTE statement, one entry is displayed for each address and port combination.

DestXCF
The dynamic XCF address (IPCONFIG6 DYNAMICXCF) of a target stack for incoming connections to the DVIPA and port.

If the Flg field value 1 is displayed and the RtgType field value GRE or ENCAP is displayed when the DETAIL keyword is used, then this field represents the IP address of the tier 1 target for incoming connections to the DVIPA.

Flg
Flags including the following values:

OptLocal
Indicates that the OPTLOCAL keyword was defined on the VIPADISTRIBUTE profile statement. To see the OPTLOCAL value currently in effect, issue the Netstat VIPADCFG/-F command with the DETAIL keyword.

Tier1
Indicates that the DVIPA is used to distribute incoming requests to tier 1 targets.

Tier2
Indicates that the DVIPA is used to distribute incoming requests from tier 1 targets to a group of tier 2 server applications.

For a SHORT or LONG format report:

DistMethod
The distribution method in use.

BaseWLM
Indicates that WLM system weights and policy information are used to distribute incoming connection requests.

HotStandby
Indicates that HotStandby distribution is in use.

Roundrobin
Indicates that incoming connection requests are distributed using the round-robin method.

ServerWLM
Indicates that WLM server weights and policy information are used to distribute incoming connection requests.

WLM server weights are used if SERVERWLM was specified on the VIPADISTRIBUTE statement for this DVIPA and port, and all target servers are able to provide WLM server-specific weights. Otherwise, BaseWLM is used.

WeightedActive
Indicates that incoming connection requests are distributed using the weighted active connections method.
**Rule:** For a short format report, you need to use the DETAIL modifier to display this field.

**SrvType**
Indicates the server type when the HotStandby distribution method is configured.

**Backup**
Indicates that this is a backup target. A backup target is initially a hot standby target. Connections are not distributed to hot standby targets. If the active target becomes unavailable, the distributor switches targets and one of the hot standby targets becomes the active target.

When the server type is backup, the rank of the backup is displayed:

**Rank**
Used to determine which target is selected if the preferred target is unavailable. The highest ranked available backup is used.

**Preferred**
Indicates that this is the preferred target. If AUTOSWITCHBACK is configured, then the preferred target is the active target if it is available and has not had any health problems. If the active target becomes unavailable, the distributor switches to use a hot standby target; the active target becomes a hot standby target and the selected hot standby target becomes the active target.

**Rule:** For a short format report, you need to use the DETAIL modifier to display this field.

**SysPt**
Indicates whether coordinated Sysplex-wide ephemeral port assignment is activated for this distributed DVIPA.

**TimAff**
The value that was defined in the TIMEDAFFINITY parameter on the VIPADISTRIBUTE profile statement. The value No indicates that TIMEDAFFINITY is not specified or is set to zero.

**DETAIL**
Displays the general dynamic VIPA configuration information and the OPTLOCAL value.

If the distribution method is WEIGHTEDActive, then the configured active connection weight is displayed.

If the distribution method is HotStandby, then the AUTOSWITCHBACK and HEALTHSWITCH information is displayed.

If the DVIPA value TIER1 or TIER2 was specified, the name of the targeted server application group is displayed.

**AUTOSWITCHBACK**
Indicates whether the distributor automatically switches distribution back to the preferred target when it is available and healthy.

If the preferred target becomes a standby target because it is no longer available and later becomes available and healthy, the value Yes indicates that the distributor automatically switches back to using the preferred target as the active target. This is the default value.

The value No indicates that the distributor does not automatically switch back to the preferred target.

**HEALTHSWITCH**
Indicates whether the distributor automatically switches from the active target if the active target is not healthy.

The value Yes indicates that the distributor does switch from the active target when it is not healthy. This is the default.

The value No indicates that the distributor ignores health metrics. The distributor switches from the active target only if the target is not ready or if the distributor does not have an active route to the target.
OPTLOCAL
A value of 0 indicates that connections originating from a target stack within the sysplex should always bypass sending the connection request to the sysplex distributor. The relative capacity of the WLM weights for servers on other target stacks within the sysplex are not considered when determining whether the connection should remain local.

A value of 1 indicates that connections originating from a target stack within the sysplex should always bypass sending the connection request to the sysplex distributor as long as the WLM weight for the server on the local target stack's WLM weight is not 0. This is the default value if the OPTLOCAL field is specified without a value.

If a value in the range 2 – 16 is specified, this value is used as a multiplier against the raw WLM weight of the server on the local target stack to cause this server to be favored over the servers on other target stacks. The relative capacity of the WLM weights of the servers on the other target stacks within the sysplex is considered when determining which stack should process the connection. The greater the value specified, the more likely that the local stack is favored over other target stacks.

Regardless of the value that is specified on the OPTLOCAL statement, if one of the following conditions exists, connections are sent to the distributing stack:
- No local server is available
- The SEF value has fallen below 75
- The number of abnormal transaction completions has exceeded 250
- The health indicator is less than 75

Weight
The configured distribution method is WEIGHTEDActive. This is the configured active connection weight that is used when incoming connections are distributed to this target stack.

PROCTYPE
The expected utilization proportion of each type of processor (CP, zAAP, and zIIP) that an application's workload will consume. This field is displayed only when the configured distribution method is BASEWLM.

CP
The expected utilization proportion of general CPU processor capacity.

zAAP
The expected utilization proportion of zAAP processor capacity.

zIIP
The expected utilization proportion of zIIP processor capacity.

ProcXCost
The crossover cost that is applied to the workload that was targeted to a zAAP or zIIP processor but that ran on the conventional processor when the composite SERVERWLM weight is determined. The weight 1 indicates that crossover cost is not considered when the composite SERVERWLM weight is determined. This parameter is displayed only when the distribution method is SERVERWLM.

zAAP
The crossover cost of running a workload that was targeted to a zAAP processor on a general CPU instead of on the zAAP processor.

zIIP
The crossover cost of running a workload that was targeted to a zIIP processor on a general CPU instead of on the zIIP processor.

ILWeighting
The configured importance level weighting factor. This field is displayed only when the configured distribution method is SERVERWLM. See the following possible values:
Indicates that systems that have displaceable capacity at low importance levels are not favored over systems that have displaceable capacity at high importance levels.

Indicates that WLM should weight displaceable capacity at each successively lower importance level slightly higher than the capacity that is at the preceding higher importance level. The weighting increases proportionally to the square root of the difference between the importance level values plus 1. This ILWeighting value provides a moderate bias when you compare displaceable capacity at different importance levels.

Indicates that WLM should weight displaceable capacity at each successively lower importance level significantly higher than the capacity that is at the preceding higher importance level. The weighting increases proportionally to the difference between the importance level values plus 1. This ILWeighting value provides an aggressive bias when you compare displaceable capacity at different importance levels.

Indicates that WLM should weight displaceable capacity at each successively lower importance level significantly higher than the capacity that is at the preceding higher importance level. The weighting grows proportionally to the square of the difference between the importance level values plus 1. This ILWeighting value provides an exceptionally aggressive bias when you compare displaceable capacity at different importance levels.

**GrpName**
The name of the targeted server application group, if TIER1 or TIER2 was specified for this DVIPA. This name is used to correlate the two tiers of sysplex distribution to and from tier 1 targets.

**RtgType**
Indicates the protocol that is used when requests are routed to the tier 1 targets.

**GRE**
Indicates that IPv4 Generic Routing Encapsulation (GRE) is used to forward requests.

**ENCAP**
Indicates that IPv6 encapsulation is used to forward requests.

**CtrlPort**
Specifies the port number to be used for the control connection with the tier 1 target.

**VIPA Service Manager**
Displays the configured dynamic VIPA service manager information.

**McastGroup**
The multicast address used for communications between the sysplex distributor and the Cisco routers acting as forwarding agents.

**Port**
The UDP port used for communications between the sysplex distributor and Cisco forwarding agents.

**PWD**
Indicates whether the SMPASSWORD was specified.

**VIPA Route**
Displays the configured route information defined by the VIPAROUTE statement.

**For a SHORT format report:**

**XCF Address**
The dynamic XCF address (IPCONFIG DYNAMICXCF) of a target stack.
**TargetIp**
The IP address in the HOME list of the target stack that should be used to obtain the best available route from the sysplex distributor to that target.

**For a LONG format report:**

**DestXCF**
The dynamic XCF address (IPCONFIG DYNAMICXCF or IPCONFIG6 DYNAMICXCF) of a target stack.

**TargetIp**
The IP address in the HOME list of the target stack that should be used to obtain the best available route from the sysplex distributor to that target.

**Deactivated Dynamic VIPA Information**
Displays the configured VIPABACKUP, VIPADEfine, and VIPADISTriBUTE definitions that have been deactivated by the VARY TCPIP,,SYSPLEX,DEACTIVATE,DVIPA= command. See “VARY TCPIP,,SYSPLEX” on page 245 for more information about the command.

**Netstat VIPADyn/-v report**
Displays the current dynamic VIPA and VIPAROUTE information for a local host.

**TSO syntax**

```
★ NETSTAT VIPADyn Modifier Target Output ★
```

**Modifier**

- **DVIPA**
  - Displays the current dynamic VIPA information only.

- **VIPAROUTE**
  - Displays the current VIPAROUTE information only.

**Target**
Provide the report for a specific TCP/IP address space by using TCp tcpname. See “The Netstat command target” on page 287 for more information about the Tcp parameter.

**Output**
The default output option displays the output on the user's terminal. For other options, see “The TSO NETSTAT command syntax” on page 276 or “Netstat command output” on page 287.

**z/OS UNIX syntax**

```
★ netstat -v Modifier Target Output ★
```

**Modifier**

- **DVIPA**
  - Displays the current dynamic VIPA information only.
**VIPAROUTE**
Displays the current VIPAROUTE information only.

**Target**
Provide the report for a specific TCP/IP address space by using `-p tcpname`. See “The Netstat command target” on page 287 for more information about the TCP parameter.

**Output**
The default output option displays the output to z/OS UNIX shell stdout. For other options, see “The z/OS UNIX netstat command syntax” on page 281 or “Netstat command output” on page 287.

**Command syntax examples**

**From TSO environment**

```plaintext
NETSTAT VIPADYN
   Display the current dynamic VIPA and VIPAROUTE information for a local host in the default TCP/IP stack.
NETSTAT VIPADYN DVIPA
   Display the current dynamic VIPA information for a local host in the default TCP/IP stack.
NETSTAT VIPADYN VIPAROUTE
   Display the current VIPAROUTE information for a local host in the default TCP/IP stack.
NETSTAT VIPADYN VIPAROUTE TCPCS6
   Display the current dynamic VIPA and VIPAROUTE information for a local host in the TCPCS6 stack.
```

**From UNIX shell environment**

```plaintext
netstat -v
netstat -v DVIPA
netstat -v VIPAROUTE
netstat -v -p tcpcs6
```

**Report examples**
The following examples are generated by using TSO NETSTAT command. Using the z/OS UNIX netstat command displays the data in the same format as the TSO NETSTAT command.

Report field descriptions

For a SHORT format report

**IP Address**
The IP address for this DVIPA.

**AddressMask**
The net mask that determines how many of the bits of the IP address determine the net.

For a LONG format report

**IntName**
The name of this IPv6 interface.

**IpAddr/PrefixLen**
The IP address and prefix length for this DVIPA. For an IPv4 address, the prefix length range is 1 – 32. For an IPv6 address, the prefix length range is 1 – 128.
Dynamic VIPA
Displays the current dynamic VIPA information.

Status
The state of the DVIPA on this stack. It can be any one of the following value:

Active
The DVIPA is active on this stack.

Backup
This stack is eligible to activate the DVIPA if the stack where the DVIPA is currently active goes down or deletes the DVIPA.

Tip: If the DistStat value is equal to Dest, then the DVIPA is currently a target for distribution.

Moving
The DVIPA was active on this stack and has been moved to another stack. The DVIPA remains in 'Moving' status no established connections exist. Connections on this stack for this DVIPA that were established before the move are being serviced. If new connections on this stack use the DVIPA, they are also serviced.

Quiescing
The DVIPA was either a target for distribution and has been removed as a target or a DVIPA that was deactivated. However, connections for this DVIPA are still being serviced. The target for distribution DVIPA is removed from this stack when all connections complete. The deactivated DVIPA is kept in Quiescing status until the last connection completes.

Origin
Indicates how the DVIPA was created. It can be one of the following value:

VIPABackup
The DVIPA was created with a VIPABACKUP profile statement.

VIPADefine
The DVIPA was created with a VIPADEFINE profile statement.

VIPARange Bind
The DVIPA was created when a socket did an explicit bind to an IP address that fell with a range of IP addresses configured on a VIPARANGE profile statement.

VIPARange ioctl
The DVIPA was created when an application, or the MODDVIPA utility, issued an SIOCSVIPA or SIOCSVIPA6 ioctl to create a DVIPA that was within a range of IP addresses configured on a VIPARANGE profile statement.

Blank
The DVIPA was not explicitly created on this stack. It was dynamically created when another stack processed a VIPADISTRIBUTE statement that specified this stack to be a target for connections to this DVIPA.

DistStat
Indicates that the distribution status for this DVIPA. It can be one of the following value:

Dist
This stack is distributing incoming connections for the DVIPA to one or more other stacks in the sysplex.

Dist/Dest
This stack is distributing incoming connections for this DVIPA to one or more stacks in the sysplex and this stack is also a target for the distribution.

Dest
The DVIPA was activated on this stack because this stack is a target for distributed connections to this DVIPA.
Blank

The DVIPA is neither being distributed by this stack, nor a target of distribution from another stack.

Rule: DistStat is not used if the Origin is VIPARANGE.

Affinity

Indicates whether a DVIPA with an origin of VIPARANGE IOCTL was created with affinity. A connection request for a DVIPA that was created with affinity is sent to a TCP listener if its bind() call was issued by the application instance that created the DVIPA. If no matching listener is found, a TCP listener is selected by using normal shareport load balancing.

No

A DVIPA was not created with affinity.

Yes

A DVIPA was created with affinity.

ActTime

The time when this DVIPA was activated on the local stack, either because it is the owner of the DVIPA or because it is a target for this DVIPA, specified as Coordinated Universal Time (UTC).

The value n/a indicates that this DVIPA was not owned by this stack or that this stack is not the target for distributed connections to this DVIPA.

JobName

The job name of either the application or the MODDVIPA utility that enabled creation of this DVIPA. This field is significant only when this DVIPA was created with one of the following methods:

• A socket performed an explicit bind to an IP address that fell within a range of IP addresses configured on a VIPARANGE profile statement.
• An application or the MODDVIPA utility issued an SIOCSVIPA or SIOCSVIPA6 ioctl call to create a DVIPA that fell within a range of IP addresses configured on a VIPARANGE profile statement.

The environment in which the application runs determines the job name that is to be associated with a particular client or server application. The following list explains how to determine the JobName value, given the environment in which the application is run:

• Applications submitted as batch jobs use the batch job name.
• The job name associated with applications that are started from the MVS operator console using the START command is determined as follows:
  – If the START command is issued with the name of a member in a cataloged procedure library (for example, S APP1), then the job name is the member name (for example, APP1).
  – If the member name on the START command is qualified by a started task identifier (for example, S APP1.ABC), then the job name is the started task identifier (for example, ABC).

The JOBNAME parameter can also be used on the START command to identify the job name (for example, S APP1,JOBNAME=XYZ).

• The JOBNAME value can also be included on the JOB card.
• Applications that are run from a TSO user ID use the TSO user ID as the job name.
• Applications that run from the z/OS shell usually have a job name that is the logged on user ID plus a 1-character suffix.
• Authorized users can run applications from the z/OS shell and use the _BPX_JOBNAME environment variable to set the job name. In this case, the value specified for the environment variable is used as the job name.
• z/OS UNIX applications started by INETD typically use the job name of the INETD server plus a 1-character suffix.
ZCX
Indicates whether a DVIPA with an origin of VIPARANGE IOCTL was created for z/OS Container Extensions. For more information about z/OS Container Extensions, see z/OS Communications Server: IP Configuration Guide.

No
The DVIPA was not created by z/OS Container Extensions.

Yes
The DVIPA was created by z/OS Container Extensions.

VIPA Route
Displays the current VIPAROUTE information.

XCF Address or DestXCF
The dynamic XCF address (IPCONFIG DYNAMICXCF or IPCONFIG6 DYNAMICXCF) of a target stack.

TargetIp
The IP address in the HOME list of the target stack that should be used to obtain the best available route from the sysplex distributor to that target.

RtStatus
Indicates the status of the route entry. Can have the following values:

Active
Indicates that the target stack identified by XCF Address or DestXCF is active, that TargetIp is defined at that target stack, and at least one route is available to TargetIp. The local stack will forward DVIPA packets to the target stack using normal IP routing table to determine the best available route.

Defined
Indicates that the target stack identified by XCF Address or DestXCF is not active or that the target stack is the same as the stack on which the VIPAROUTE is defined.

Inactive
Indicates that the target stack identified by XCF Address or DestXCF is active and that TargetIp is defined at that target stack; however no route is available to TargetIp. As a result, the local stack cannot forward any DVIPA packets to the target stack. For more information, see the steps for diagnosing sysplex routing problems in the z/OS Communications Server: IP Diagnosis Guide.

Unavail
Indicates that the target stack identified by XCF Address or DestXCF is active, but that TargetIp is not defined at that target stack. The local stack will forward DVIPA packets to the target stack using dynamic XCF interfaces. Message EZD1173I is issued when the routing stack detects this condition.

To correct the problem take the following actions:

1. Verify that the VIPAROUTE statement specifies the correct dynamic XCF address and target IP address for the required target stack.
2. Verify that the target IP address is correctly defined in the HOME list of the target stack.

z/OS UNIX and TSO Netstat option comparison
The following table shows the equivalent z/OS UNIX and TSO command formats.

<table>
<thead>
<tr>
<th>TSO option</th>
<th>z/OS UNIX option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>-A</td>
<td>Displays detailed information about TCP connections and UDP sockets, including some recently closed ones.</td>
</tr>
<tr>
<td>TSO option</td>
<td>z/OS UNIX option</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------</td>
<td>-------------</td>
</tr>
<tr>
<td>ALLConn</td>
<td>-a</td>
<td>Displays information for all TCP connections and UDP sockets, including some recently closed ones.</td>
</tr>
<tr>
<td>ARp</td>
<td>-R</td>
<td>Displays ARP cache information.</td>
</tr>
<tr>
<td>BYTEinfo</td>
<td>-b</td>
<td>Displays the byte-count information for each active TCP connection and UDP socket.</td>
</tr>
<tr>
<td>CACHinfo</td>
<td>-C</td>
<td>Displays statistics for TCP listening sockets using the Fast Response Cache Accelerator (FRCA).</td>
</tr>
<tr>
<td>CLients</td>
<td>-e</td>
<td>Displays information about local users of TCP/IP services (jobnames).</td>
</tr>
<tr>
<td>CONFIG</td>
<td>-f</td>
<td>Displays the TCP/IP configuration information.</td>
</tr>
<tr>
<td>CONn</td>
<td>-c</td>
<td>Displays the information about each active TCP connection and UDP socket.</td>
</tr>
<tr>
<td>DEFADDRT</td>
<td>-l</td>
<td>Displays the policy table for IPv6 default address selection.</td>
</tr>
<tr>
<td>DEvlinks</td>
<td>-d</td>
<td>Displays information about interfaces that are defined to the TCP/IP stack.</td>
</tr>
<tr>
<td>Gate</td>
<td>-g</td>
<td>Displays information about the stack routing table for IPv4 destinations.</td>
</tr>
<tr>
<td>HElp</td>
<td>-?</td>
<td>Displays help information for Netstat parameters.</td>
</tr>
<tr>
<td>Home</td>
<td>-h</td>
<td>Displays information about each home IP address and its associated link or interface name.</td>
</tr>
<tr>
<td>IDS</td>
<td>-k</td>
<td>Displays information about Intrusion Detection Services. Displays Neighbor Discovery cache information (IPv6 only).</td>
</tr>
<tr>
<td>ND</td>
<td>-n</td>
<td>Displays Neighbor Discovery cache information (IPv6 only).</td>
</tr>
<tr>
<td>PORTList</td>
<td>-o</td>
<td>Displays the reserved port list.</td>
</tr>
<tr>
<td>RESCACHE</td>
<td>-q</td>
<td>Displays resolver cache information.</td>
</tr>
<tr>
<td>ROUTe</td>
<td>-r</td>
<td>Displays information about the stack routing table for IPv4 destinations and IPv6 destinations if stack is IPv6 enabled.</td>
</tr>
<tr>
<td>SLAP</td>
<td>-j</td>
<td>Displays QoS Policy statistics.</td>
</tr>
<tr>
<td>SOCKets</td>
<td>-s</td>
<td>Displays the information about each client using a socket application programming interface.</td>
</tr>
<tr>
<td>SRCIP</td>
<td>-J</td>
<td>Displays the configured information for all job-specific, source IP address designations on the target TCP/IP.</td>
</tr>
<tr>
<td>STATS</td>
<td>-S</td>
<td>Displays TCP/IP statistics for IP, ICMP, TCP and UDP protocols.</td>
</tr>
<tr>
<td>TELnet</td>
<td>-t</td>
<td>Displays information for TN3270 Telnet server connections.</td>
</tr>
<tr>
<td>TTLS</td>
<td>-x</td>
<td>Displays Application Transparent Transport Layer Security (AT-TLS) information.</td>
</tr>
<tr>
<td>Up</td>
<td>-u</td>
<td>Displays the date and time that TCP/IP was started and specifies whether it is IPv6 enabled or disabled.</td>
</tr>
<tr>
<td>VCRT</td>
<td>-V</td>
<td>Displays the dynamic VIPA Connection Routing Table used for sysplex distributor and moveable dynamic VIPA support.</td>
</tr>
<tr>
<td>TSO option</td>
<td>z/OS UNIX option</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>VDPT</td>

<td>Filter the output of the ALL/-A, ALLConn/-a, CONn/-c, and DEvlkns/-d reports using the specified SMC-R link, SMC-R link group, or SMC-D link identifier.</td>
</tr>
</tbody>
</table>

Command

DRop       | -D              | Terminates the socket end-point that is identified by the specified connection number. |

Ping

The TSO PING and z/OS UNIX ping commands determine the accessibility of a foreign node.

The TSO PING command: Send an echo request

The TSO PING command sends an echo request to a foreign node (remote host) to determine whether the node is accessible.

When a response to a Ping command is received, the elapsed time is displayed. The time does not include the time spent communicating between the user and the TCP/IP address space.

For information about the remote Ping function, which enables a user at one host to determine the response time between two remote hosts using SNMP, see Chapter 6, “Managing TCP/IP network resources with SNMP,” on page 871.

Format:

```
PING host_name [Option] [Help] [Option]
```

Option
Note: The minimum abbreviation for each parameter is shown in uppercase letters.

Parameters:

**host_name**

Specifies the host to which you want to send the echo request. This must be an IP address or a host name that can be resolved. IPv4-mapped IPv6 addresses are not supported.

If the **host_name** value is specified as a host name (not an IP address) the command invokes the resolver to obtain an IP address for the host name. The command uses the first IP address that is returned by the resolver. The ADDRTYPE option can be used to determine whether the command requests only IPv4 or only IPv6 IP addresses from the resolver. If the ADDRTYPE option is not specified, the INTF and SRCIP options can also be used to determine whether the command requests only IPv4 or only IPv6 IP addresses from the resolver. If ADDRTYPE, INTF, or SRCIP are not specified, then the command does not request a specific type of IP address from the resolver, so both IPv4 and IPv6 IP addresses can be returned by the resolver.

When using IPv6 link-local addresses, you can provide scope information with the IP address or host name. To specify scope information, add a percent character (%) after the **host_name** value, followed by the scope information (usually an interface name). The examples that follow include an example of using the command with scope information. For a more complete explanation about the use of scope information, see the support for scope information in the **z/OS Communications Server: IPv6 Network and Application Design Guide**.

Guidelines:

- When you are running multiple TCP/IP stacks on the same MVS image and the interface name that is used as the scope information has been defined to multiple TCP/IP stacks, you must specify the TCP parameter to ensure that the correct stack is used to send the command's packets.
- Providing scope information on the **host_name** option has the same effect as specifying the local interface using the INTF option, although the INTF option covers a wider range of situations (scope
information applies only to IPv6 link-local addresses). If both methods of providing scope
information are used on the same command, the values provided for scope information on the
host_name option and for the INTF interface option must represent the same local interface,
otherwise the command fails.

Addrtype ipv4 | ipv6
Specifies the IP address type that the Resolver returns when resolving the host name to an IP
address. The values for this option are not case sensitive.

ipv6
Specifies that only IPv6 IP addresses are returned from the Resolver when resolving the host
name to an IP address.

ipv4
Specifies that only IPv4 IP addresses are returned from the Resolver when resolving the host
name to an IP address.

If the ADDRTYPE option is not specified, see the description of the host_name parameter for
information on how the host_name value is resolved to an IP address.

Count echo
Sets the number of echo requests that are sent to the host. If you do not specify the Count parameter,
the default value 1 is used, unless the Verbose parameter is specified. When the Verbose parameter is
specified but the Count parameter is not specified, the default value is 3.

If echo is not specified, an error occurs. The echo value must be in the range 0 - 2³¹ minus 1, which is
2147483647. If echo is 0, the Ping command sends echo requests continually. To stop the Ping
command, press PA1.

Restriction: If you specify the Verbose parameter, you cannot specify the value 0 for the Count
parameter.

Intf interface
Specifies the local interface, interface, over which the packets are sent. The interface is either a name
with a maximum of 16 bytes from a LINK or INTERFACE profile statement, or the IP address of a local
interface. IPv4-mapped IPv6 addresses are not supported. Local VIPA or LOOPBACK interfaces are
not valid.

If the destination host is specified as a host name and the ADDRTYPE option is not specified, the
address type of the interface value is used to determine whether the host name is resolved to an IPv4
or IPv6 IP address.

When this parameter is specified, Ping establishes affinity to either the default TCP/IP stack or the
stack specified on the TCP parameter. The specified interface must be defined to the stack to which
Ping establishes affinity. You must also ensure that a route exists to the destination using the
specified interface. This can be any kind of route, including a default route. This parameter is
independent of the SRCIP parameter used as the source IP address in the outbound packets.

Note: As a diagnostics aid in analyzing response times and path availability using a particular route,
this parameter routes packets over specified interfaces regardless of the multipath settings in the
IPCONFIG MULTIPATH or IPCONFIG6 MULTIPATH profile statement by bypassing the outbound path
selection algorithm for the packets.

Restriction:
• You cannot specify scope information for the interface value.
• To specify an OSM interface for the parameter, the user ID must have RACF authority to use the
  interface. For more information about OSM interface authorization, see OSM Access Control in z/OS
  Communications Server: IP Configuration Guide.

Length bytes
Sets the number of data bytes for the echo request. If a bytes value is not specified, an error occurs. If
you do not specify the Length parameter, the default value 256 is used. The number of bytes must be
in the range 8 - 65 487. A minimum of 8 data bytes is needed for a time stamp value, which the Ping command uses to correlate echo requests to echo replies.

For IPv4 destinations, the total length of the outbound echo request packet includes the length of an IPv4 IP header (20 bytes), the length of an ICMP header (8 bytes), and the data length specified by the Length parameter. Depending on your TCP/IP stack configuration, the TCP/IP stack might add additional IP header options to the IP header created by the Ping command before the echo request packet is sent.

For IPv6 destinations, the total length of the outbound echo request packet includes the length of an IPv6 IP header (40 bytes), the length of an ICMPv6 header (8 bytes), and the data length specified by the Length parameter. Depending on your TCP/IP stack configuration, the TCP/IP stack might add additional IPv6 extension headers to the packet that is created by the Ping command, before the echo request packet is sent.

**NOName**

Specifies that the Ping command should not resolve IP addresses to host names for ICMP/ICMPv6 messages received because of path MTU problems. This parameter is in effect only if the PMTU parameter was also specified; otherwise it is ignored. Specifying this parameter results in the Ping command displaying only the IP address of the host where fragmentation is needed. For example:

```
Ping #n needs fragmentation at: ipaddress
```

**PMTU yes | ignore**

This parameter can be used for diagnosing path maximum transmission unit (MTU) problems in the network. It prevents the outbound echo request packets from being fragmented and specifies what kind of path MTU discovery support should be used with the Ping command. For IPv4, path MTU discovery support is enabled by specifying the PATHMTUDISCOVERY parameter on the IPCONFIG profile statement. For IPv6, path MTU discovery support is enabled by default. The values for this option are not case sensitive.

If the echo request packets need to be fragmented at the local host or in the network, the Ping command displays the host name and IP address of the host where fragmentation is required.

**yes**

Specifies that the outbound echo request packets are not fragmented at the local host or in the network and that the MTU value, determined by path MTU discovery for the destination, is used.

- If path MTU discovery is enabled and has already determined an MTU value for the destination, and the length of the Ping echo request packet is larger than this MTU size, then the local TCP/IP stack does not send out the packet. In this case, The Ping command displays one of the local stack's IP addresses as the host address where fragmentation is needed, and the next-hop MTU value displayed by the Ping command is the current path MTU value to the destination. For Ping commands to IPv4 destinations, the Ping command processing itself does not cause path MTU discovery support to be triggered for the destination. For IPv4, only TCP processing causes path MTU discovery support to be triggered.

- If path MTU discovery is not enabled or has not already determined a path MTU value for the destination, and the Ping echo request packet exceeds the configured route MTU selected for this packet, then the local TCP/IP stack does not send out the packet. In this case, the Ping command displays one of the local stack's IP addresses as the address of the host where fragmentation is needed, and the next-hop MTU value displayed by the Ping command is that of the route selected for the Ping packet.

- If the Ping request fails because the echo request packet requires fragmentation at some point in the network, the Ping command displays the IP address where fragmentation is required and displays the next-hop MTU value, if it was provided.

**ignore**

Specifies that the outbound echo request packets are not fragmented at the local host or in the network, and that any MTU values determined by path MTU discovery for the destination, are ignored.
If path MTU discovery determines an MTU value for the destination, and the length of the Ping echo request packet is larger than this MTU size, specifying the value `ignore` causes the TCP/IP stack to ignore the path MTU value and attempt to send out the packet. As long as the echo request packet length does not exceed the configured route MTU that is selected for this packet, you can use the `ignore` value to determine where in the network the original MTU problem occurred. In this case, the Ping command displays the IP address where fragmentation needs to occur and displays the path MTU value, if it was provided.

If the Ping echo request packet exceeds the configured route MTU selected for this packet, then the local TCP/IP stack does not send out the packet. In this case, the Ping command displays one of the local stack's IP addresses as the address of the host where fragmentation is needed and the next-hop MTU value displayed by the Ping command is that of the route selected for the Ping packet.

If the Ping command receives an ICMP/ICMPv6 error message indicating that an echo request packet requires fragmentation, the Ping command displays the following output based on this message:

```
Ping #n needs fragmentation at: host_name (ipaddress)
```

If the host name resolution fails, the Ping command displays the following output:

```
Ping #n needs fragmentation at: ipaddress (ipaddress)
```

You can use the NOName parameter to request that the Ping command display only the host IP address, without resolving it to a host name.

If the host returned the next-hop MTU size in the ICMP/ICMPv6 message, then this MTU size is also displayed:

```
Next-hop MTU size is nnnnn
```

If the MTU size is not displayed, you can use the Length parameter to vary the size of the echo request packet, to determine the MTU of the network.

**MULTIPATH PERPACKET considerations:** When the MULTIPATH PERPACKET parameter is in effect and equal-cost routes are configured to the Ping destination host, the smallest MTU value of all the equal-cost routes is used as the largest packet size that can be sent, even if some of the equal-cost routes could support a larger packet size.

**Srcip srcip**

Specifies the source IP address, `srcip`. You must specify this as an IP address and not a host name. IPv4-mapped IPv6 addresses are not supported. On hosts with more than one IP address, you can set the source address to the IP address for another one of the stack's interfaces. This can be a VIPA address.

If the destination host is specified as a host name and the ADDRTYPE option is not specified, the address type of the `srcip` value is used to determine whether the host name is resolved to an IPv4 or IPv6 IP address.

**Restriction:** You cannot specify scope information for the source IP address.

**TCP tcpname**

Specifies the name of the TCP/IP stack that is to be used.

The `tcpname` is an 8-byte procedure name that is used to start the TCP/IP stack. When the `S member.identifier` method of starting TCP/IP is used, the value specified for identifier must be used as `tcpname`. When this option is not specified and z/OS UNIX is configured for CINET, the CINET Prerouter selects the TCP/IP stack to which the request is routed.

**Timeout seconds**

Sets the number of seconds that the Ping command waits for a response. If you do not specify the Timeout parameter, the default of 10 seconds is used. If a `seconds` value is not specified, an error occurs. The number of seconds must be in the range 1 - 100.
**Verbose**

Provides additional details about the received echo replies and a statistics summary.

If you do not specify the Verbose and Count parameters, then the default count of echo requests is 1. If you specify the Verbose parameter without the Count parameter, then the default value is 3. If you specify both the Verbose and Count parameters, then the number of echo requests is the value that is specified in the Count parameter.

**Restriction:** If you specify the value 0 for the Count parameter, you cannot specify the Verbose parameter.

See the examples that follow for the format of the Ping output when the Verbose parameter is specified. See the response descriptions that follow for the explanation of the fields that are used in the verbose information.

**Help or question mark (?)**

Provides help information about the Ping command. You cannot place the HELP parameter on the Ping command line with other parameters.

**Usage:**

• To stop or interrupt the Ping command, press the **PA1** or **ATTN** key.

• You can place more than one parameter on the Ping command line; however, the HELP parameter is an exception and cannot be placed on the Ping command line with other parameters.

• To authorize the Ping command to use RAW sockets, add the command name, PING, to the AUTHCMD NAMES section of the member IKJTSOxx of SYS1.PARMLIB. TSO user IDs with UNIX System Services superuser authority are able to execute the command even without this SYS1.PARMLIB modification. If Ping is not authorized to use RAW sockets, Ping will fail with message EZZ3115I Unable to open RAW socket: EDC5139I Operation not permitted. For other authorization considerations, see MVS-related considerations information in the z/OS Communications Server: IP Configuration Guide.

**Restrictions:**

• Ping commands to a remote host might fail if there is a firewall between the two systems, even if the host is reachable using other commands.

• Ping commands to a remote host might be unable to detect path MTU information if there is an IPSec tunnel at any point between the two systems, even if the host is reachable using other commands. For more information about Ping PMTU interactions with IPSec tunnels, see “Resolving TSO PING and z/OS UNIX ping command problems” on page 623.

**Examples:**

• IPv4

```plaintext
ping mvs098
CS V2R4: Pinging host MVS098 (9.67.113.11)
Ping #1 response took 0.002 seconds.
```

• IPv6

```plaintext
ping linuxipv62.tcp
Ping #1 response took 0.002 seconds.
```

• IPv4 with the value ignore specified for the PMTU parameter and fragmentation needed out in the network. The hosts in this IPv4 network do not provide a next-hop MTU value when sending the ICMP error message. This example represents a network where there are multiple network paths to the destination.

```plaintext
ping hosta (count 4 pmtu ignore length 2500)
CS V2R4: Pinging host hosta.test.ibm.com (9.56.99.99)
Ping #1 needs fragmentation at:hoste.test.ibm.com 9.56.22.22
Ping #2 response took 0.002 seconds.
```
Ping #3 response took 0.001 seconds.
Pong  #4 needs fragmentation at: hoste.test.ibm.com 9.56.22.22

- IPv4 with the value ignore specified for the PMTU parameter, the NOName parameter specified, and fragmentation needed out in the network. The hosts in this IPv4 network do not provide a next-hop MTU value when sending the ICMP error message.

```
ping hosta (count 4 pmtu ignore noname length 2500
CS V2R4: Pinging host hosta.test.ibm.com (9.56.99.99)
Ping #1 needs fragmentation at: (9.56.22.22)
Ping #2 response took 0.002 seconds.
Ping #3 response took 0.001 seconds.
Ping #4 needs fragmentation at: (9.56.33.33)
```

- IPv4 with the Verbose parameter specified.

```
ping hosta (verbose
CS V2R4: Pinging host hosta.test.ibm.com (9.56.99.99)
with 256 bytes of ICMP data
Ping #1 from 9.56.99.99: bytes=264 seq=1 ttl=51 time=1.08 ms
Ping #2 from 9.56.99.99: bytes=264 seq=2 ttl=51 time=1.35 ms
Ping #3 from 9.56.99.99: bytes=264 seq=3 ttl=51 time=1.58 ms
```

IPv4 with the parameters Verbose, Length, and PMTU specified with the value ignore but with the Ping failures (timeout and fragmentation needed errors)

```
ping hosta (verbose length 2500 PMTU ignores
CS V2R4: Pinging host hosta.test.ibm.com (9.56.99.99)
with 2500 bytes of ICMP data
Ping #1 needs fragmentation at: hoste.test.ibm.com (9.56.22.22)
Ping #2 timed out
Ping #3 timed out
```

IPv6 with the value ignore specified for the PMTU parameter, the NOName parameter specified, and fragmentation needed out in the network.

```
ping hostipv6 (count 4 pmtu ignore noname length 3000
CS V2R4: Pinging host hostipv6.raleigh.ibm.com
at IPv6 address 50c9:c2d4:0:5:9:6b00:111a:1
Ping #1 needs fragmentation at: 50c9:c2d4:0:3:9:6b00:111a:250e
Next-hop MTU size is 1500
Ping #2 response took 0.002 seconds.
Ping #3 response took 0.001 seconds.
Ping #4 needs fragmentation at: 50c9:c2d4:0:3:9:6b00:111a:250e
Next-hop MTU size is 1500
```

IPv6 with the value yes specified for the PMTU parameter. Fragmentation needed, first out in the network, and then at the local TCP/IP stack because of Path MTU Discovery.

```
ping hostipv6 (count 4 pmtu yes length 3000
CS V2R4: Pinging host hostipv6.raleigh.ibm.com
at IPv6 address 50c9:c2d4:0:5:9:6b00:111a:1
Ping #1 needs fragmentation at: hoste.test.ibm.com (50c9:c2d4:0:3:9:6b00:111a:250e)
Next-hop MTU size is 1500
Ping #2 needs fragmentation at: local.host (50c9:c2d4:0:6:1:6b00:111a:0001)
Next-hop MTU size is 1500
Ping #3 needs fragmentation at: local.host (50c9:c2d4:0:6:1:6b00:111a:0001)
Next-hop MTU size is 1500
Ping #4 needs fragmentation at: local.host (50c9:c2d4:0:6:1:6b00:111a:0001)
Next-hop MTU size is 1500
```

IPv6 with the Count, Length, and Verbose parameters specified.

```
ping hostipv6 (count 5 length 8944 verbose
CS V2R4: Pinging host hostipv6.raleigh.ibm.com
at IPv6 address 50c9:c2d4:0:5:9:6b00:111a:1
```

Monitoring the TCP/IP network 613
IPv6 with the Count, Length, and Verbose parameters specified, but with mixed Ping results (success and failure).

```
ping hostipv6 (count 5 length 8944 verbose
CS V2R4: Pinging host hostipv6.raleigh.ibm.com
at IPv6 address 50c9:c2d4:0:5:9:6b00:111a:1
with 8944 bytes of ICMP data
Ping #1 timed out
Ping #2 from 50c9:c2d4:0:5:9:6b00:111a:1: bytes=8952 seq=2 hoplimit=51 time=1.51 ms
Ping #3 from 50c9:c2d4:0:5:9:6b00:111a:1: bytes=8952 seq=3 hoplimit=51 time=1.68 ms
Ping #4 timed out
Ping #5 from 50c9:c2d4:0:5:9:6b00:111a:1: bytes=8952 seq=4 hoplimit=51 time=1.51 ms
```

Response description:
The Ping command displays one response output line for every echo request packet that is sent. The default response output line displays the number of elapsed seconds for the echo reply that was received and the number of bytes that were sent for the data portion of the echo request packet.

When the Verbose parameter is specified, the following information is displayed:

**Echo reply details**

- **Ping #n from address**
  - Echo reply process counter and IP address of the echo reply sender.

- **bytes=nn**
  - The number of bytes for the ICMP packet (ICMP header and data portions) from the echo reply.

- **seq=nn**
  - ICMP sequence number of the echo reply.

- **ttl=nn (for IPv4)**
  - Time-to-live value for the echo reply.

- **hoplim=nn (for IPv6)**
  - Hop limit value for the echo reply.

- **time=nn ms**
  - Round-trip time (RTT), in milliseconds.

**Ping statistics summary**

- **Sent**
  - Total number of echo request packets sent.

- **Received**
  - Total number of echo reply packets received.
Lost (n% loss)
Total number of lost echo packets (echo reply packets that were not received) and the percentage of packets that were lost.

Approximate round trip times (RTT) in milliseconds

Minimum
Minimum RTT value of Ping requests that were sent.

Maximum
Maximum RTT value of Ping requests that were sent.

Average
Average RTT value of Ping requests that were sent.

StdDev
Standard deviation of all RTT values of Ping requests that were sent.

The z/OS UNIX ping command: Send an echo request

The z/OS UNIX ping command sends an echo request to a foreign node (remote host) to determine whether the node is accessible.

When a response to a Ping command is received, the elapsed time is displayed. The time does not include the time spent communicating between the user and the TCP/IP address space.

Note: ping is a synonym for the oping command in the z/OS UNIX shell. The oping command syntax is the same as that for the ping command.

Format

```
ping host_name
```

Option
Parameters
This section describes parameters.

**host_name**
Specifies the host to which you want to send the echo request. This must be an IP address or a host name that can be resolved. IPv4-mapped IPv6 addresses are not supported.

If the `host_name` value is specified as a host name (not an IP address), the command invokes the resolver to obtain an IP address for the host name. The command uses the first IP address that is returned by the resolver. Use the `-A` option to specify whether the command requests only IPv4 or only IPv6 IP addresses from the resolver. If you do not specify the `-A` option, the `-i` and `-s` options can also be used to determine whether the command requests only IPv4 or only IPv6 IP addresses from the resolver. If neither `-A`, `-i`, or `-s` options are specified, the command does not request a specific type of IP address from the resolver and IPv4 and IPv6 IP addresses can be returned by the resolver.

When using IPv6 link-local addresses, you can provide scope information with the IP address or host name. To specify scope information, add a percent character (%) after the `host_name` value, followed by the scope information (usually an interface name). See the examples that follow for an example of using the command with scope information. For a more complete explanation about the use of scope information, see the support for scope information in the z/OS Communications Server: IPv6 Network and Application Design Guide.

**Guidelines:**
- When you are running multiple TCP/IP stacks on the same MVS image and the interface name that is used as the scope information has been defined to more than one TCP/IP stack, you must specify the `-p` parameter to ensure that the correct stack is used to send the command's packets.
- Providing scope information on the `host_name` option has the same effect as specifying the local interface using the INTF option, although the `-i` option covers a wider range of situations (scope information applies only to IPv6 link-local addresses). If both methods of providing scope information are used on the same command, the values provided for scope information on the
host_name option and for the -i interface option must represent the same local interface, otherwise the command fails.

-A ipv4 | ipv6
Specifies the IP address type that the Resolver returns when resolving the host name to an IP address. The values for this option are not case sensitive.

ipv6
Specifies that only IPv6 IP addresses are returned from the Resolver when resolving the host name to an IP address.

ipv4
Specifies that only IPv4 IP addresses are returned from the Resolver when resolving the host name to an IP address.

If the -A option is not specified see the description of the host_name parameter for information on how the host_name value is resolved to an IP address.

c echo
Sets the number of echo requests that are sent to the host. If you do not specify the -c parameter, the default value 1 is used unless the -v parameter is specified. When the -v parameter is specified but the -c parameter is not specified, the default value is 3. If an echo value is not specified, an error occurs. The echo value must be in the range 0 - 2^31 minus 1, which is 2147483647. If echo is 0, the Ping command sends echo requests continually. To stop the Ping command, see “Usage” on page 620.

Restriction: If you specify the -v parameter, you cannot specify the value 0 for the -c parameter.

-h or -question mark (?)
Provides help information about the Ping command. You cannot place the -h or -? parameter on the Ping command line with other parameters.

-i interface
Specifies the local interface, interface, over which the packets are sent. The interface is either a maximum 16-byte name from a LINK or INTERFACE profile statement, or the IP address of a local interface. IPv4-mapped IPv6 addresses are not supported. Local VIPA or LOOPBACK interfaces are not valid.

If the destination host is specified as a host name and the -A option is not specified, the address type of the interface value is used to determine whether the host name is resolved to an IPv4 or IPv6 IP address.

When this parameter is specified, Ping establishes affinity to either the default TCP/IP stack or the stack specified on the -p parameter. The specified interface must be defined to the stack to which Ping establishes affinity. You must also ensure that a route exists to the destination using the specified interface. This can be any kind of route, including a default route. This parameter is independent of the -s parameter used as the source IP address in the outbound packets.

Note: As a diagnostics aid in analyzing response times and path availability using a particular route, this parameter routes packets over specified interfaces, regardless of the multipath settings in the IPCONFIG MULTIPATH or IPCONFIG6 MULTIPATH profile statement, by bypassing the outbound path selection algorithm for the packets.

Restriction:
- You cannot specify scope information for the interface value.
- To specify an OSM interface for the parameter, the user ID must have RACF authority to use the interface. For more information about OSM interface authorization, see OSM Access Control in z/OS Communications Server: IP Configuration Guide.

Restriction:

-l bytes
Sets the number of data bytes for the echo request. If a bytes value is not specified, an error occurs. If you do not specify the -l parameter, the default value 256 is used. The number of bytes must be in
the range 8 - 65 487. A minimum of 8 data bytes is needed for a time stamp value, which Ping uses to correlate echo requests to echo replies.

- For IPv4 destinations, the total length of the outbound echo request packet includes the length of an IPv4 IP header (20 bytes), the length of an ICMP header (8 bytes), and the data length specified by the -l parameter. Depending on your TCP/IP stack configuration, the TCP/IP stack might add additional IP header options to the IP header created by the Ping command, before the echo request packet is sent.

- For IPv6 destinations, the total length of the outbound echo request packet includes the length of an IPv6 IP header (40 bytes), the length of an ICMPv6 header (8 bytes), and the data length specified by the -l parameter. Depending on your TCP/IP stack configuration, the TCP/IP stack might add additional IPv6 extension headers to the packet created by the Ping command, before the echo request packet is sent.

-n
Specifies that the Ping command should not resolve IP addresses to host names for ICMP/ICMPv6 messages received due to Path MTU problems. This parameter is in effect only if the -P parameter was also specified, otherwise it is ignored. Specifying this parameter results in the Ping command displaying only the IP address of the host where fragmentation is needed. For example:

```
Ping #n needs fragmentation at: ipaddress
```

-P yes | ignore
This parameter can be used for diagnosing Path Maximum Transmission Unit (MTU) problems in the network. It prevents the outbound echo request packets from being fragmented and specifies what kind of Path MTU Discovery support should be used with the Ping command. For IPv4, Path MTU Discovery support is enabled by specifying the PATHMTUDISCOVERY parameter on the IPCONFIG profile statement. For IPv6, Path MTU Discovery support is enabled by default. The values for this option are not case sensitive.

-yes
Specifies that the outbound echo request packets are not fragmented at the local host or in the network and that the MTU value, determined by path MTU discovery for the destination, are used.

- If path MTU discovery has already determined an MTU value for the destination and the length of the Ping echo request packet is larger than this MTU size, then the local TCP/IP stack does not send out the packet. In this case, the Ping command displays one of the local stack's IP addresses as the address of the host where fragmentation is needed and the next-hop MTU value displayed by the Ping command is the current path MTU value to the destination. For Ping commands to IPv4 destinations, the Ping command processing itself does not cause path MTU discovery support to be triggered for the destination. For IPv4, only TCP processing causes path MTU discovery support to be triggered.

- If path MTU discovery is not active, or has not already determined a path MTU value for the destination, and the Ping echo request packet exceeds the configured route MTU selected for this packet, then the local TCP/IP stack does not send out the packet. In this case, the Ping command displays one of the local stack's IP addresses as the address of the host where fragmentation is needed, and the next-hop MTU value that is displayed by the Ping command is that of the route selected for the Ping packet.

- If the Ping request fails because the echo request packet needs to be fragmented at some point in the network, the Ping command displays the IP address where fragmentation needs to occur and displays the next-hop MTU value, if it was provided.

-ignore
Specifies that the outbound echo request packets are not fragmented at the local host or in the network, and that any MTU values determined by path MTU discovery for the destination, are ignored.

- If path MTU discovery had determined an MTU value for the destination, and the length of the Ping echo request packet is larger than this MTU size, specifying a value of ignore enables the Ping echo request to be sent out by the local TCP/IP stack, to determine where in the network
the original MTU problem occurred. In this case, the Ping command displays the IP address
where fragmentation needs to occur and displays the path MTU value, if it was provided.

- If the Ping echo request packet exceeds the configured route MTU selected for this packet, then
the local TCP/IP stack does not send out the packet. In this case, the Ping command displays
one of the local stack's IP addresses as the address of the host where fragmentation is needed.
The next-hop MTU value displayed by the Ping command is that of the route selected for the
Ping packet.

If the Ping command receives an ICMP/ICMPv6 error message indicating that an echo request packet
needed to be fragmented, the Ping command displays the following output based on this message:

```
Ping #n needs fragmentation at: host_name (ipaddress)
```

If the host name resolution fails, the Ping command displays the following output:

```
Ping #n needs fragmentation at: ipaddress (ipaddress)
```

You can use the -n parameter to request that the Ping command display only the host name and its IP
address of the host, without resolving it to a host name.

- If the host returned the next-hop MTU size in the ICMP/ICMPv6 message, then this MTU size is also
displayed: Next-hop MTU size is nnnnn

- If the MTU size is not displayed, you can use the Length parameter to vary the size of the echo request
packet, in order to determine the MTU of the network.

MULTIPATH PERPACKET considerations: When the MULTIPATH PERPACKET option is in effect and
equal-cost routes are configured to the Ping destination host, the smallest MTU value of all the equal-
cost routes is used as the largest packet size that can be sent, even if some of the equal-cost routes
could support a larger packet size.

- **-p tcpname**
  Specifies the name of the TCP/IP stack to be used.

  The tcpname is an 8-byte procedure name that is used to start the TCP/IP. When the S
  member.identifier method of starting TCP/IP is used, the value specified for identifier must be
  used as tcpname. When this option is not specified and z/OS UNIX is configured for CINET, the CINET
  Prerouter selects the TCP/IP stack to which the request is routed.

- **-s srcip**
  Specifies the source IP address, srcip. You must specify this as an IP address and not a host name.
  IPv4-mapped IPv6 addresses are not supported. On hosts with more than one IP address, you can set
  the source address to the IP address for another one of the stack's interfaces. This can be a VIPA
  address.

  If the destination host is specified as a host name and the -A option is not specified, the address type
  of the srcip value is used to determine whether the host name should be resolved to an IPv4 or IPv6
  IP address.

  **Restriction:** You cannot specify scope information for the source IP address.

- **-t seconds**
  Sets the number of seconds that the Ping command waits for a response. If you do not specify the -t
  parameter, the default of 10 seconds is used. If the seconds value is not specified, an error occurs.
  The number of seconds specified must be in the range 1 - 100.

- **-v**
  Provides additional details about the received echo replies and a statistics summary.

  If you do not specify the -v and -c parameters, then the default count of echo requests is 1. If you
  specify the -v parameter without the -c parameter, then the default value is 3. If you specify both the
  -v and -c parameters, then the number of echo requests is the value specified in the -c parameter.

  **Restriction:** If you specify the value 0 for the -c parameter, you cannot specify the -v parameter.

Monitoring the TCP/IP network 619
See the examples that follow for the format of Ping command output when the -v parameter is specified. See the responses that follow for an explanation of the fields that are used in the verbose information.

Usage
This section describes usage.

• To stop or interrupt the Ping command, press Ctrl c. The interrupt key can be changed by using the OMVS ESCAPE command in the z/OS UNIX shell, or the stty command for the RAW shell. For more information about OMVS and stty commands, see the z/OS UNIX System Services Command Reference.

• You can place more than one parameter on the Ping command line; however, the -h and -? parameters are exceptions and cannot be placed on the Ping command line with other parameters.

Restrictions:
• Ping commands to a remote host might fail if there is a firewall between the two systems, even if the host is reachable using other commands.

• Ping commands to a remote host might be unable to detect path MTU information if there is an IPSec tunnel at any point between the two systems, even if the host is reachable using other commands. For more information about Ping -P interactions with IPSec tunnels, see “Resolving TSO PING and z/OS UNIX ping command problems” on page 623.

Examples
This section describes examples.

• IPv4

```
ping mvs098
CS V2R4: Pinging host mvs098 (9.67.113.11)
Ping #1 response took 0.002 seconds.
```

• IPv6

```
ping linuxipv62.tcp
CS V2R4: Pinging host linuxipv62.tcp.raleigh.ibm.com
at IPv6 address 2001:0db8::1:9:67:114:44
Ping #1 response took 0.002 seconds.
```

• IPv4 with the value ignore specified for the -P parameter and fragmentation needed out in the network. The hosts in this IPv4 network do not provide a next-hop MTU value when sending the ICMP error message. This example represents a network where there are multiple network paths to the destination.

```
ping -c 4 -l 2500 -P ignore hosta
CS V2R4: Pinging host hosta.test.ibm.com (9.42.99.99)
Ping #1 needs fragmentation at: hoste.test.ibm.com 9.42.22.22
Ping #2 response took 0.002 seconds.
Ping #3 response took 0.001 seconds.
Ping #4 needs fragmentation at: hoste.test.ibm.com 9.42.22.22
```

• IPv4 with the -v parameter specified.

```
ping -v hosta
CS V2R4: Pinging host hosta.test.ibm.com (9.56.99.99) with 256 bytes of ICMP data
Ping #1 from 9.56.99.99: bytes=264 seq=1 ttl=51 time=1.08 ms
Ping #2 from 9.56.99.99: bytes=264 seq=2 ttl=51 time=1.35 ms
Ping #3 from 9.56.99.99: bytes=264 seq=3 ttl=51 time=1.58 ms

Ping statistics for hosta.test.ibm.com (9.56.99.99)
 Packets: Sent=3, Received=3, Lost=0 (0% loss)
 Approximate round trip times in milliseconds:
 Minimum=1.08 ms, Maximum=1.58 ms, Average=1.34 ms, StdDev=0.26 ms
```
IPv4 with the parameters -v, -l, and -P with value of ignore but with the Ping failures (timeout and fragmentation needed errors)

```
ping -v -l 2500 -P ignore hosta
CS V2R4: Pinging host hosta.test.ibm.com (9.56.99.99) with 2500 bytes of ICMP data
Ping #1 needs fragmentation at: hoste.test.ibm.com (9.56.22.22)
Ping #2 timed out
Ping #3 timed out

Ping statistics for hosta.test.ibm.com (9.56.99.99)
  Packets: Sent=3, Received=0, Lost=3 (100% loss)
```

- IPv6 with the value ignore specified for the -P parameter and fragmentation needed out in the network.

```
ping -c 4 -l 3000 -P ignore -n hostipv6
CS V2R4: Pinging host hostipv6.raleigh.ibm.com at IPv6 address 50c9:c2d4:0:5:9:6b00:111a:1
Ping #1 needs fragmentation at: 50c9:c2d4:0:3:9:6b00:111a:250e
  Next-hop MTU size is 1500
Ping #2 response took 0.002 seconds.
Ping #3 response took 0.001 seconds.
Ping #4 needs fragmentation at: 50c9:c2d4:0:3:9:6b00:111a:250e
  Next-hop MTU size is 1500
```

- IPv6 with the value yes specified for the -P parameter and the -n parameter specified. Fragmentation needed first out in the network and then at the local TCP/IP stack because of path MTU discovery.

```
ping -c 4 -l 3000 -P yes -n hostipv6
CS V2R4: Pinging host hostipv6.raleigh.ibm.com at IPv6 address 50c9:c2d4:0:5:9:6b00:111a:1
Ping #1 needs fragmentation at: hoste.test.ibm.com (50c9:c2d4:0:3:9:6b00:111a:250e)
  Next-hop MTU size is 1500
Ping #2 needs fragmentation at: local.host (50c9:c2d4:0:6:1:6b00:111a:0001)
  Next-hop MTU size is 1500
Ping #3 needs fragmentation at: local.host (50c9:c2d4:0:6:1:6b00:111a:0001)
  Next-hop MTU size is 1500
Ping #4 needs fragmentation at: local.host (50c9:c2d4:0:6:1:6b00:111a:0001)
  Next-hop MTU size is 1500
```

- IPv6 with the -c, -l, and -v parameters specified.

```
ping -c 5 -l 8944 -v hostipv6
CS V2R4: Pinging host hostipv6.raleigh.ibm.com at IPv6 address 50c9:c2d4:0:5:9:6b00:111a:1
with 8944 bytes of ICMP data
Ping #1 from 50c9:c2d4:0:5:9:6b00:111a:1: bytes=8952 seq=1 hoplim=51 time=1.71 ms
Ping #2 from 50c9:c2d4:0:5:9:6b00:111a:1: bytes=8952 seq=2 hoplim=51 time=1.52 ms
Ping #3 from 50c9:c2d4:0:5:9:6b00:111a:1: bytes=8952 seq=3 hoplim=51 time=1.78 ms
Ping #4 from 50c9:c2d4:0:5:9:6b00:111a:1: bytes=8952 seq=4 hoplim=51 time=1.88 ms
Ping #5 from 50c9:c2d4:0:5:9:6b00:111a:1: bytes=8952 seq=5 hoplim=51 time=2.25 ms

Ping statistics for hostipv6.raleigh.ibm.com
at IPv6 address 50c9:c2d4:0:5:9:6b00:111a:1
  Packets: Sent=5, Received=5, Lost=0 (0% loss)
  Approximate round trip times in milliseconds:
    Minimum=1.52 ms, Maximum=2.25 ms, Average=1.83 ms, StdDev=0.24 ms
```

IPv6 with the -c, -l, and -v parameters specified, but with mixed Ping results (success and failure).

```
ping -c 5 -l 8944 -v hostipv6
CS V2R4: Pinging host hostipv6.raleigh.ibm.com at IPv6 address 50c9:c2d4:0:5:9:6b00:111a:1
with 8944 bytes of ICMP data
Ping #1 timed out
Ping #2 from 50c9:c2d4:0:5:9:6b00:111a:1: bytes=8952 seq=2 hoplim=51 time=1.51 ms
Ping #3 from 50c9:c2d4:0:5:9:6b00:111a:1: bytes=8952 seq=3 hoplim=51 time=1.68 ms
Ping #4 timed out
Ping #5 from 50c9:c2d4:0:5:9:6b00:111a:1: bytes=8952 seq=5 hoplim=51 time=1.64 ms

Ping statistics for hostipv6.raleigh.ibm.com
at IPv6 address 50c9:c2d4:0:5:9:6b00:111a:1
  Packets: Sent=5, Received=3, Lost=2 (40% loss)
```
Approximate round trip times in milliseconds:
Minimum=1.51 ms, Maximum=1.68 ms, Average=1.61 ms, StdDev=0.10 ms

• IPv6 link-local with scope information.

ping fe80::12:1:2%mpc6221
CS V2R4: Pinging host FE80::12:1:2%MPC6221
at IPv6 address fe80::12:1:2
Ping #1 response took 0.001 seconds.

Response description:
The Ping command displays one response output line for every echo request packet that is sent. The
default response output line displays the number of elapsed seconds for the echo reply that was received
and the number of bytes that were sent for the data portion of the echo request packet.

When the -v parameter is specified, the following information is displayed:

Echo reply details

Ping #n from address
Processing echo reply counter and IP address of the echo reply sender.

bytes=nn
Number of bytes for the ICMP packet (ICMP header and data portions) from the echo reply.

seq=nn
ICMP sequence number of the echo reply.

ttl=nn (for IPv4)
Time-to-live value for the echo reply.

hoplim=nn (for IPv6)
Hop limit value for the echo reply.

time=nn ms
Round-trip time (RTT), in milliseconds.

Ping statistics summary

Sent
Total number of echo request packets sent.

Received
Total number of echo reply packets received.

Lost (n% loss)
Total number of lost echo packets (echo reply packets not received) and the percentage loss.

Approximate round trip times (RTT) in milliseconds

Minimum
Minimum RTT value of Ping requests that were sent.

Maximum
Maximum RTT value of Ping requests that were sent.

Average
Average RTT value of Ping requests that were sent.

StdDev
Standard deviation of all RTT values of Ping requests that were sent.

TSO PING and z/OS UNIX ping command return codes
The following list shows the return codes that are generated by the TSO PING and z/OS UNIX ping
commands:

Code
Description
When a response to a TSO PING or z/OS UNIX ping command is received, the elapsed time is displayed. The time does not include the time spent communicating between the user and TCP/IP address space.

**Resolving TSO PING and z/OS UNIX ping command problems**

A host might fail to respond even after several Ping commands for any of the following reasons:

- The host is not listening to the network.
- The host is inoperative, or some network or gateway leading from the user to the host is inoperative.
- The host is slow because of activity.
- The packet is too large for the host.

The echo request sent by the Ping command does not guarantee delivery. Send more than one Ping command before you assume that a communication failure has occurred.

Use additional Ping commands to communicate with other hosts in the network to determine the condition that is causing the communication failure. However, you need to know the network topology to determine the location of the failure. Issue the Ping commands in the following order until the failure is located.

1. Send a Ping command to your local host.
   - A successful Ping command sent to a different host on the same network as the original host suggests that the original host is down, or is not listening to the network.

2. Send a Ping command to a host other than your local host on your local network.

3. Send a Ping command to each intermediate node that leads from your local host to the remote host, starting with the node closest to your local host.
   - If you cannot get echoes from any host on that network, the trouble is usually somewhere along the path to the remote hosts. Direct a Ping command to the gateway leading to the network in question. If the Ping command fails, continue to test along the network from the target, until you find the point of the communication breakdown.

The following IPSec tunnel considerations apply when using the Ping command to determine the path MTU information:

- Returned path MTU information displays the tunnel endpoint as the address of the host where fragmentation is needed, not the address of the host within the tunnel where fragmentation was required. If the tunnel originates on the local TCP/IP stack, one of the local stack’s IP addresses is displayed.
- The returned next-hop MTU size reflects the size of a packet prior to encapsulation. The size of the IPSec encapsulation overhead has been subtracted from the MTU size.
- In an IPv6 network, a minimum MTU size of 1280 must be supported. If subtracting IPSec encapsulation overhead would cause the MTU size to be less than the minimum MTU value of 1280, the packet is fragmented after encapsulation. This should be rare, occurring only in an IPv6 network with very small MTU values (for example, MTU < 1500).
For more information about IPSec tunnels, see the IP security information in the z/OS Communications Server: IP Configuration Guide.

**Rpcinfo**

The TSO RPCINFO and z/OS UNIX \(\text{rpcinfo}\) commands display the servers that are registered and operational with any portmapper or rcpbind servers on your network that use RPC binding protocol Version 2.

**The TSO RPCINFO command: Display server information**

Use the RPCINFO command to display the servers that are registered and operational with any portmapper or rcpbind servers on your network. The RPCINFO command makes a remote procedure call (RPC) to an RPC server and displays the results.

**Tip:**
- You can also use z/OS RPCINFO with rcpbind servers that support RPC binding protocol Version 2, such as the z/OS rcpbind server. RPC binding protocol Version 2 is the binding protocol used by the portmapper.
- All IPv4 applications can use RPC binding protocol Version 2 to register with rcpbind servers; some applications might register with rcpbind servers using other binding protocols.
- You can use RPCINFO from another platform to query z/OS rcpbind servers for information about servers that register with a binding protocol other than Version 2.

**Restriction:**
- IPv6 applications cannot register with rcpbind using RPC binding protocol Version 2.
- The RPCINFO command can query only hosts that resolve to valid IPv4 addresses.
- When an rcpbind server is used in place of portmapper, the RPCINFO command can display information only for servers that registered with an rcpbind server using Version 2 binding protocol.

**Format:**

```
RPCINFO -p host
-u host prognum versnum
-t host prognum versnum
-n portnum
-b prognum versnum
```

**Parameters:**

**-p host**
Queries the portmapper on the specified host and prints a list of all registered RPC programs. If `host` is not specified, the system defaults to the local host name. For more information about how the local host name is defined, see the z/OS Communications Server: IP Configuration Reference.

**-u host prognum versnum**
Sends an RPC call to procedure zero of `prognum` on the specified host using UDP, and reports whether a response is received. The variable `prognum` is the name or number of the RPC program.

**-n portnum**
Specifies the port number to be used for the `-t` and `-u` options in place of the port number that is given by the portmapper.
-t host prognum versnum
  Sends an RPC call to procedure zero of prognum on the specified host using TCP, and reports whether a response is received.

-b prognum versnum
  Sends an RPC broadcast to procedure zero of the specified prognum and versnum using UDP, and reports all hosts that respond.

Usage:
- The versnum value is the version of the prognum value; it is not the RPC protocol version number.
- The version number is required for the -b parameter. If a version is specified, the RPCINFO command attempts to call that version of the specified program. If a version is not specified, RPCINFO prints error information. For example, if -u is specified without a version number, then the RPC program reports the versions of its program that it supports.
- You can also use z/OS RPCINFO with rpcbind servers that support RPC binding protocol Version 2, such as the z/OS rpcbind server. RPC binding protocol Version 2 is the binding protocol used by the portmapper.
- All IPv4 applications can use RPC binding protocol Version 2 to register with an rpcbind server; some applications might register with an rpcbind server using other binding protocols.
- You can use the RPCINFO command from another platform to query z/OS rpcbind servers for information about servers that register with a binding protocol other than Version 2.

Restrictions:
- The RPCINFO -b command (broadcast) displays only information within the same network. The broadcast packets do not pass through gateways.
- The RPCINFO -b command (broadcast) works only for the UDP transport services and does not find any TCP-based services.
- IPv6 applications cannot use the RPC binding protocol Version 2 to register with rpcbind servers.
- The RPCINFO command can query only hosts that resolve to valid IPv4 addresses.
- When an rpcbind server is used in place of portmapper, the RPCINFO command can display information only for servers that registered with the rpcbind server using the Version 2 binding protocol.

Examples:
In the following example, the RPCINFO command is used to query the portmapper on host mvsx. The RPCINFO command displays the list of registered programs reported by the portmapper on mvsx.
The z/OS UNIX orpcinfo/rpcinfo command: Display server information

Use the `orpcinfo` command to display the servers that are registered and operational with any portmapper on your network. The `orpcinfo` command makes a remote procedure call (RPC) to an RPC server and displays the results.

RPCINFO can query only hosts that resolve to valid IPv4 addresses.

Tips:

• `rpcinfo` is a synonym for the `orpcinfo` command in the z/OS UNIX shell. `rpcinfo` command syntax is the same as that for the `orpcinfo` command.

• You can use the `rpcinfo` command from another platform to query z/OS rpcbind servers for information about servers that register with a binding protocol other than Version 2.

• You can also use the z/OS `rpcinfo` command with rpcbind servers that support RPC binding protocol Version 2, such as the z/OS rpcbind server. RPC binding protocol Version 2 is the binding protocol used by the portmapper.

• All IPv4 applications can use RPC binding protocol Version 2 to register with an rpcbind server; some applications might register with an rpcbind server using other binding protocols.

Format

```
rpcinfo - p host
        - u host prognum versnum
        - t host prognum versnum
        - n portnum
        - b prognum versnum
        - d prognum versnum
        - ?
```

Parameters

-p host
Queries the portmapper on the specified host and prints a list of all registered RPC programs. If `host` is not specified, the system defaults to the local host name. For more information about how the local host name is defined, see the z/OS Communications Server: IP Configuration Reference.

-u host prognum versnum
Sends an RPC call to procedure zero of `prognum` on the specified host using UDP, and reports whether a response is received. The variable `prognum` is the name or number of the RPC program.

-n portnum
Specifies the port number to be used for the `-t` and `-u` options in place of the port number that is given by the portmapper.

-t host prognum versnum
Sends an RPC call to procedure zero of `prognum` on the specified host using TCP, and reports whether a response is received.

-b prognum versnum
Sends an RPC broadcast to procedure zero of the specified `prognum` and `versnum` using UDP, and reports all hosts that respond.

-d prognum versnum
Deletes the registration for the RPC service specified by the `prognum` and `versnum` values.

-?
Specifies the command help.
**Tip:** The versnum value is the version of the prognum value; it is not the RPC protocol version number.

**Requirement:** The version number is required for the `-b` parameter. If a version is specified, the `rpcinfo` command attempts to call that version of the specified program. If a version is not specified, the `rpcinfo` command prints error information. For example, if `-u` is specified without a versnum value, the RPC program reports the versions of its program that it supports.

**Restrictions:**
- z/OS UNIX `orpcinfo -b` (broadcast) displays information with the same network only. The broadcast packets do not pass through gateways.
- z/OS UNIX `orpcinfo -b` (broadcast) works only for the UDP transport services and does not find any TCP-based services.
- Only a superuser can use the `-d` option.
- IPv6 applications cannot use RPC binding protocol Version 2 to register with rpcbind.
- RPCINFO can query only hosts that resolve to valid IPv4 addresses.
- When rpcbind is used in place of the portmapper, rpcinfo can display information only for servers that registered with rpcbind using the Version 2 binding protocol.

**Examples**
In the following example, the `orpcinfo` command invokes the nullproc procedure of program 100003 on host mvsx using the TCP protocol. The `orpcinfo` command invokes the nullproc procedure on all versions of 100003 on host mvsx and reports the result.

```
# orpcinfo -t mvsx 100003
EZA4328I program 100003 version 2 ready and waiting
EZA4328I program 100003 version 3 ready and waiting
```

**Provide security product access to rpcbind server registrations**

When you invoke the `rpcinfo` command with the `-d` option, a registration from the portmapper or rpcbind server list of registered applications is deleted. You can define the following security product resource profile in the SERVAUTH class to control the ability of a user to delete registrations from the rpcbind list of registered services:

```
EBZ.RPCBIND.sysname.rpcbindname.REGISTRY
```

See the sample EZARACF member for examples of the security product commands that you can use to create the resource profile.

**Rules:**
- If the SERVAUTH class is not active or if the security product resource profile is not defined, only UID(0) users can use the `-d` option to delete registrations from the rpcbind list of registered servers.
- In a multilevel secure environment, only users permitted to the resource profile can delete registrations from the rpcbind list of registered servers. If the SERVAUTH class is not active or if the security product resource profile is not defined, no users can delete registrations from the rpcbind list of registered servers.

**Restriction:** This profile does not control the ability of a user to delete registrations from the portmapper list of registered servers.

**Provide security product access to rpcbind server target assistance procedures**

When you invoke the `rpcinfo` command with the `-b` option, a target assistance RPC is sent to all portmapper or rpcbind servers that are in its subnet. When the rpcbind server host is multilevel secure,
you can define the following security product resource profile in the FACILITY class to control the ability of a user to run this target assistance procedure on your rpcbind host.

```
BPX.POE
```

If the FACILITY class is not active or if the security product resource profile is not defined, all users can use the -b option to execute the target assistance RPC.

**Restrictions:**
- This profile does not control the ability of a user to run target assistance RPCs on a portmapper host.
- This profile applies only to rpcbind servers on multilevel secure hosts.

---

**Traceroute**

The TSO TRACERTE and z/OS UNIX traceroute/otracet commands help you debug network problems.

**The TSO TRACERTE command: Debug network problems**

The TSO TRACERTE command is useful for debugging various network problems. The Tracerte command sends UDP requests with varying TTL (time-to-live) or hop count values and then waits for the routers between the local and remote hosts to send TTL-exceeded messages.

**Format:**

```
TRACERTE host_name packetSize (Options)
```

**Options**
Note: The minimum abbreviation for each parameter is shown as uppercase letters in the syntax diagram above.

Parameters:

?  Specifies the command help.

host_name
Specifies the destination host. This must be an IP address, or a host name that can be resolved. IPv4-mapped IPv6 addresses are not supported.

If the host_name value is specified as a host name (not an IP address), the command invokes the resolver to obtain an IP address for the host_name value. The command uses the first IP address that is returned by the resolver. You can use the ADDRTYPE option to determine whether the command requests only IPv4 or only IPv6 IP addresses from the resolver. If you do not specify the ADDRTYPE option, the INTF and SRCIP options can also be used to determine whether the command requests only IPv4 or only IPv6 IP addresses from the resolver. If neither ADDRTYPE, INTF, or SRCIP are specified, then the command does not request a specific type of IP address from the resolver; IPv4 and IPv6 IP addresses can be returned by the resolver.

When using IPv6 link-local addresses, you can provide scope information with the IP address or host name. To specify scope information, add a percent character (%) after the host_name value, followed
by the scope information (usually an interface name). See the examples that follow for an example of using the command with scope information. For a more complete explanation about the use of scope information, see the support for scope information in the z/OS Communications Server: IPv6 Network and Application Design Guide.

Guidelines:

- When you are running multiple TCP/IP stacks on the same MVS image and the interface name used as the scope information has been defined to multiple TCP/IP stacks, you must specify the TCP parameter to ensure that the correct stack is used to send the command's packets.

- Providing scope information on the host_name option has the same effect as specifying the local interface using the INTF option, although the INTF option covers a wider range of situations (scope information applies only to IPv6 link-local addresses). If both methods of providing scope information are used on the same command, the values provided for scope information on the host_name option and for the INTF interface option must represent the same local interface, otherwise the command fails.

packetSize

Optional parameter that can be used to change the size of a probe packet. The probe size might affect the route of a probe. The value specified is added to the default probe packet size up to a maximum of 65535 bytes.

For IPv4 destinations, the packet size value must be between 1 and 65495 bytes. The 65495 value is the maximum IP packet size (65535) minus the default probe packet size (40). The default probe packet size includes the IP header, UDP header, and default UDP data.

For IPv6 destinations, the packet size value must be between 1 and 65515 bytes. The 65515 value is the maximum UDP data size (65535) minus the default UDP probe packet size (20). The default probe packet size includes the UDP header, and default UDP data. The IPv6 IP header is added later, before the packet is sent and its size is not included in the packetSize value.

If additional IP headers are dynamically added later to the outbound probe packet then the actual size of the packet is increased.

ADDRTYPE

Specifies the IP address type that the Resolver returns when resolving the host name to an IP address. The values for this option are not case sensitive.

ipv6

Specifies that only IPv6 IP addresses are returned from the Resolver when resolving the host name to an IP address.

ipv4

Specifies that only IPv4 IP addresses are returned from the Resolver when resolving the host name to an IP address.

If the ADDRTYPE option is not specified, see the description of the host_name parameter for information on how the host_name value is resolved to an IP address.

DEBUG

Specifies that extra messages are to be printed.

INTF interface

Specifies the local interface, interface, over which the packets are sent. The interface is either a maximum 16-byte name from a LINK or INTERFACE profile statement, or the IP address of a local interface. IPv4-mapped IPv6 addresses are not supported. Local VIPA or LOOPBACK interfaces are not valid.

If the destination host is specified as a host name and the ADDRTYPE option is not specified, the address type of the INTF value is used to determine whether the host name is resolved to an IPv4 or IPv6 IP address.

When this parameter is specified, the Traceroute command establishes affinity to either the default TCP/IP stack or to the stack that is specified on the TCP parameter. The specified interface must be defined to the stack to which the Traceroute command establishes affinity. You must also ensure that
a route exists to the destination using the specified interface. This can be any kind of route, including a
default route. This parameter is independent of the SRCIP parameter used as the source IP address in
the outbound packets.

**Note:** As a diagnostics aid in analyzing response times and path availability using a particular route,
this parameter routes packets over specified interfaces regardless of the multipath settings in the
IPCONFIG/IPCONFIG6 MULTIPATH profile statements by bypassing the outbound path selection
algorithm for the packets.

**Restriction:**
- You cannot specify scope information for the *interface* value.
- To specify an OSM interface for the parameter, the user ID must have RACF authority to use the
  interface. For more information about OSM interface authorization, see OSM Access Control in *z/OS
  Communications Server: IP Configuration Guide.*

**LIMDISP**
Displays the hop limit value from each received packet. This value can be used to help detect
asymmetric routing.

**MAX hop**
Specifies the maximum time to live (TTL) or hop limit. The range for valid values is 1 - 255. The default
is 30.

**NONAME**
Specifies to print the hop IP address without resolving it to a host name. This address is numeric and
saves a name server address-to-name lookup for each gateway on the path.

**NOROUTE**
Sends information directly to a host in an attached network. If the selected route indicates that the
host is not in an adjacent network, an error is returned.

**PORT num**
Specifies the source port number and the starting destination port number. The range for valid values
is 2048 - 60 000. The default is 33 434.

For example, in the default case, the source port number is 33 434. The destination port number in
the first outbound probe packet is the default port value of 33 434 plus one, or 33 435. The
destination port number is incremented by 1 for each subsequent outbound probe packet.

**SRCIP srcAddr**
Specifies the source IP address, *srcAddr*. You must specify this as an IP address and not a host name.
IPv4-mapped IPv6 addresses are not supported. On hosts with more than one IP address, you can set
the source address to the IP address for another one of the stack’s interfaces. This can be a VIPA
address.

If the destination host is specified as a host name and the ADDRTYPE option is not specified,
the address type of the SRCIP value is used to determine whether the host name should be resolved to an
IPv4 or IPv6 IP address.

**Restriction:** You cannot specify scope information for the source IP address.

**TCP tcpname**
Specifies the name, *tcpname*, of the TCP/IP stack to be used to send the probe packets. The *tcpname*
is an 8-byte procedure name that is used to start TCP/IP. When the *member. identifier* method of
starting TCP/IP is used, the value specified for *identifier* must be used as *tcpname*. When this option is
not specified and z/OS UNIX is configured for CINET, the CINET Prerouter selects the TCP/IP stack to
which the request is routed.

**TOS tos**
Specifies the Type of Service value (*tos*) in the probe packets. The range for valid values is 0 - 255. The
default is 0. This parameter applies only to IPv4 destinations and is ignored for IPv6 destinations.

**TRY attempts**
Specifies the number of attempts. The range for valid values is 1 - 20. The default is 3.
**VERBOSE**

Specifies that additional information is to be displayed. The information currently displayed is the number of bytes of the ICMP response and the IP address to which the response was sent.

**WAIT seconds**

Specifies how long to wait for a response. The range for valid values is 1 - 255. The default is 5 seconds.

**Results:**

The Traceroute command displays one line of output for every TTL or hop limit value for which it sent a UDP probe packet. The format of the output is as follows:

```
HOP NAME (IP_ADDRESS) NUM ms !FLAG
```

The values displayed are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOP</td>
<td>The hop limit value used in the outbound probe packets.</td>
</tr>
<tr>
<td>NAME</td>
<td>If the source IP address in the received Internet Control Message Protocol (ICMP) response can be found in the host site tables, NAME displays the name associated with the source IP address. The host name displayed might include scope information representing the interface over which the ICMP response was received.</td>
</tr>
<tr>
<td>IP_ADDRESS</td>
<td>The source IP address from the received ICMP response.</td>
</tr>
<tr>
<td>NUM</td>
<td>The elapsed time between when the probe packet was sent out and when the ICMP response to that probe packet was received.</td>
</tr>
<tr>
<td>!</td>
<td>An exclamation point without one of the FLAG values below indicates that the received hop limit was less than or equal to 1. Otherwise, an exclamation point is followed by one of the values below.</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>FLAG</td>
<td>This is an optional field. It is present only if one of the following events occurs. Unless otherwise indicated the flags apply to both IPv4 and IPv6 destinations.</td>
</tr>
<tr>
<td>Flag</td>
<td>Indicates</td>
</tr>
<tr>
<td>*</td>
<td>No datagram was received before your request timed out. The hop might not respond with ICMP or, the NETACCESS configuration might prohibit the response packets from being received by the command because of the security product user ID associated with the user who invoked the command.</td>
</tr>
<tr>
<td>A</td>
<td>Administratively prohibited (IPv6 only).</td>
</tr>
<tr>
<td>B</td>
<td>Destination is beyond scope of source address (IPv6 only).</td>
</tr>
<tr>
<td>C</td>
<td>Precedence cutoff in effect (IPv4 only).</td>
</tr>
<tr>
<td>D</td>
<td>Destination Host unknown (IPv4 only).</td>
</tr>
<tr>
<td>F</td>
<td>The packet needs to be fragmented.</td>
</tr>
<tr>
<td>H</td>
<td>The destination host is unreachable.</td>
</tr>
<tr>
<td>N</td>
<td>The destination network is unreachable (IPv4 only).</td>
</tr>
<tr>
<td>P</td>
<td>The destination protocol is unreachable (IPv4 only).</td>
</tr>
<tr>
<td>Q</td>
<td>The destination host is reachable, but cannot accept the packet because the queue is full (IPv4 only).</td>
</tr>
<tr>
<td>R</td>
<td>No route to destination (IPv6 only).</td>
</tr>
<tr>
<td>S</td>
<td>The route supplied for the message was incorrect (IPv4 only).</td>
</tr>
<tr>
<td>T</td>
<td>Network unreachable for TOS or host unreachable for TOS (IPv4 only).</td>
</tr>
<tr>
<td>U</td>
<td>Address is unreachable (IPv6 only).</td>
</tr>
<tr>
<td>V</td>
<td>Host precedence violation (IPv4 only).</td>
</tr>
<tr>
<td>X</td>
<td>Communication administratively prohibited by filtering (IPv4 only). Firewall configuration is the most common reason for this code being returned to Traceroute.</td>
</tr>
<tr>
<td>num</td>
<td>Unknown ICMP Unreachable code (IPv4 only).</td>
</tr>
</tbody>
</table>

For a list of the ICMP types associated with the preceding Flags, see Appendix F, “ICMP/ICMPv6 types and codes,” on page 1115.

**Examples:**
Note: In these examples, an asterisk (*) represents a lost packet.

- The second hop in this example does not send TTL-exceeded messages.

```
tracerte cyst.watson.ibm.com
CS V2R4: Traceroute to CYST.WATSON.IBM.COM (9.2.91.34)

2 BUZZ (9.67.60.84) 55 ms 56 ms 54 ms
3 EVANS (9.67.30.25) 67 ms 64 ms 65 ms
```

- Successful Traceroute to an IPv6 destination:

```
tracerte linuxipv62.tcp
CS V2R4: Traceroute to LINUXIPV62.TCP.raleigh.ibm.com
at IPv6 address: 2001:0DB8::1:9:67:114:44
1 2001:0DB8::206:2aff:fe66:c800 (2001:0DB8::206:2aff:fe66:c800) 2 ms 3 ms *
```

- Successful Traceroute to an IPv6 link-local destination:

```
tracerte fe80::12:1:2%mpc6221
CS V2R4: Traceroute to FE80::12:1:2
at IPv6 address: fe80::12:1:2
1 fe80::12:1:2%MPC6221 (fe80::12:1:2) 62 ms 1 ms 0 ms
```

- Using an unknown IPv6 IP address results in a flag indicating that there is no route to the destination.
Usage:

• To authorize the TSO Traceroute command to use RAW sockets, add the command name, TRACERTE, to the AUTHCMD NAMES section of the member IKJTSOxx of SYS1.PARMLIB. TSO user IDs with UNIX System Services Superuser authority are able to execute the command even without this SYS1.PARMLIB modification. For other authorization considerations, see MVS-related considerations information in the z/OS Communications Server: IP Configuration Guide.

• The range of port numbers that the Traceroute command uses are typically not valid but you can change the range if the target host is using a nonstandard UDP port.

• To interrupt Traceroute command processing, use the PA1 or ATTN key.

Restrictions:

• If IPv4 tunnels exist on the path to the IPv6 destination host, the IPv4 routers in the tunnel are not counted in the hop count. For a more complete description of tunnels, see the z/OS Communications Server: IPv6 Network and Application Design Guide.

• Traceroute commands to a remote host might be unable to detect TTL or hop limit exceeded messages if there is an IPSec tunnel at any point between the two systems, even if the host is reachable using other commands.

The z/OS UNIX traceroute command: Debug network problems

This command is useful for debugging various network problems. This command sends UDP requests with varying TTL (time to live) or hop limit values and then waits for the routers between the local and remote hosts to send time-exceeded messages.

Note: The otracert command is a synonym for the traceroute command in the z/OS UNIX shell. The otracert command syntax is the same as that for the traceroute command.

Format:

```
traceroute [options] [host_name] [packetSize]
```

Options
Parameters:

-?
  Specifies the command help.

*host_name*
  Specifies the destination host. This must be an IP address or a host name that can be resolved. IPv4-mapped IPv6 addresses are not supported.

If the *host_name* value is specified as a host name (not an IP address), the command invokes the resolver to obtain an IP address for the *host_name* value. The command uses the first IP address that is returned by the resolver. The -A option can be used to determine whether the command requests only IPv4 or only IPv6 IP addresses from the resolver. If the -A option is not specified, the -i and -s options can also be used to determine whether the command requests only IPv4 or only IPv6 IP addresses from the resolver. If neither the -A, -i, or -s options are specified, then the command does not request a specific type of IP address from the resolver, so both IPv4 and IPv6 IP addresses can be returned by the resolver.

When using IPv6 link-local addresses, you can provide scope information with the IP address or host name. To specify scope information, add a percent character (%) after the *host_name* value, followed by the scope information (usually an interface name). An example follows that uses the command with scope information. For a more complete explanation about the use of scope information, see the

---

636 z/OS Communications Server: IP System Administrator's Commands
support for scope information in the z/OS Communications Server: IPv6 Network and Application Design Guide.

Guidelines:

• When you are running multiple TCP/IP stacks on the same MVS image and the interface name used as the scope information has been defined to more than one TCP/IP stack, you must specify the -a parameter to ensure that the correct stack is used to send the command’s packets.

• Providing scope information on the host_name option has the same effect as specifying the local interface using the INTF option, although the -i option covers a wider range of situations (scope information applies only to IPv6 link-local addresses). If both methods of providing scope information are used on the same command, the values provided for scope information on the host_name option and for the -i interface option must represent the same local interface, otherwise the command fails.

packetSize
Optional parameter that can be used to change the size of a probe packet. The probe size might affect the route of a probe. The value specified is added to the default probe packet size up to a maximum of 65 535 bytes.

For IPv4 destinations, the packet size value must be between 1 and 65 495 bytes. The 65 495 value is the maximum IP packet size (65 535) minus the default probe packet size (40). The default probe packet size includes the IP header, UDP header, and default UDP data.

For IPv6 destinations, the packet size value must be between 1 and 65 515 bytes. The 65 515 value is the maximum UDP data size (65 535) minus the default UDP probe packet size (20). The default probe packet size includes the UDP header, and default UDP data. The IPv6 IP header is added later, before the packet is sent and its size is not included in the packetSize value.

If additional IP headers are dynamically added later to the outbound probe packet then the actual size of the packet is increased.

-a tcpname
Specifies the name of the TCP/IP stack to be used to send the probe packets. The tcpname is an 8-byte procedure name that is used to start TCP/IP. When the S member.identifier method of starting TCP/IP is used, the value specified for identifier must be used as the tcpname value.

When the -a option is not specified and z/OS UNIX is configured for CINET, the CINET Prerouter selects the TCP/IP stack to which the request is routed.

-d
Specifies that extra messages and other debugging information are to be displayed.

-i interface
Specifies the local interface over which the packets is sent. The interface is either a maximum 16-byte name from a LINK or INTERFACE profile statement, or it is the IP address of the local interface. IPv4-mapped IPv6 addresses are not supported. Local VIPA or LOOPBACK interfaces are not valid.

If the destination host is specified as a host name and the -A option is not specified, the address type of the -i value is used to determine whether the host name is resolved to an IPv4 or IPv6 IP address.
When this parameter is specified, the command establishes affinity to either the default TCP/IP stack or the stack specified on the -a parameter. The specified interface must be defined to the stack to which the command establishes affinity. You must also ensure that a route exists to the destination using the specified interface. This can be any kind of route, including a default route. This parameter is independent of the -s parameter used as the source IP address in the outbound packets.

**Note:** As a diagnostics aid in analyzing response times and path availability using a particular route, this parameter routes packets over specified interfaces regardless of the multipath settings in the IPCONFIG/IPCONFIG6 MULTIPATH profile statement by bypassing the outbound path selection algorithm for the packets.

**Restriction:**
- You cannot specify scope information for the interface value.
- To specify an OSM interface for the parameter, the user ID must have RACF authority to use the interface. For more information about OSM interface authorization, see OSM Access Control in z/OS Communications Server: IP Configuration Guide.

- **-l**  
  Displays the time-to-live or hop limit value from each received packet. This value can be used to help detect asymmetric routing.

- **-m hop**  
  Specifies the maximum time to live or hop limit. The range for valid values is 1 - 255. The default is 30.

- **-n**  
  Specifies to print the hop IP address without resolving it to a host name. This address is numeric and saves a name server address-to-name lookup for each gateway on the path.

- **-p num**  
  Specifies the starting destination port number. This parameter does not affect the value of the source port number used. The range of valid values is 2048 - 60 000. The default is 33 434.
  
  For example, in the default case, the destination port number in the first outbound probe packet is the default port value of 33 434 plus 1, or 33 435. The destination port number is incremented by 1 for each subsequent outbound probe packet.

- **-q attempts**  
  Specifies the number of times that a probe is sent with the same time-to-live/hop limit value. This number reflects the total probe transmission (success or failure) per time-to-live/hop limit increment. The range is 1 - 20. The default is 3.

- **-r**  
  Sends information directly to a host in an attached network. If the selected route indicates that the host is not in an adjacent network, an error is returned.

- **-s scrAddr**  
  Specifies the source IP address. You must specify this address as an IP number and not a host name. IPv4-mapped IPv6 addresses are not supported. On hosts with more than one IP address, you can set the source address to the IP address for another one of the stack's interfaces. This can be a VIPA address.
  
  If the destination host is specified as a host name and the -A option is not specified, the address type of the -s value is used to determine whether the host name should be resolved to an IPv4 or IPv6 IP address.

**Restriction:** You cannot specify scope information for the source IP address.

- **-t tos**  
  Specifies the Type of Service value (tos) in the probe packets. The range for valid values is 0 - 255. The default is 0. This parameter applies only to IPv4 destinations and is ignored for IPv6 destinations.

- **-v**  
  Specifies that additional information is to be displayed. The information currently displayed is the number of bytes of the ICMP response and the IP address to which the response was sent.
-w seconds
   Specifies how long to wait for a response. The range for valid values is 1 - 255. The default is 5 seconds.

Results:

The traceroute command displays one line of output for every TTL value for which it sent a UDP probe packet. The format of the output is as follows:

HOP  NAME  (IP_ADDRESS) NUM  ms  FLAG

The values displayed are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOP</td>
<td>The hop limit value used in the outbound probe packets.</td>
</tr>

</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>FLAG</td>
<td>This is an optional field. It is present only if one of the following events occurs. Unless otherwise indicated the flags apply to both IPv4 and IPv6 destinations.</td>
</tr>
</tbody>
</table>

**Flag Indicates**

- **A**: Administratively prohibited (IPv6 only).
- **B**: Destination is beyond scope of source address (IPv6 only).
- **C**: Precedence cutoff in effect (IPv4 only).
- **D**: Destination Host unknown (IPv4 only).
- **F**: The packet needs to be fragmented.
- **H**: The destination host is unreachable.
- **N**: The destination network is unreachable (IPv4 only).
- **P**: The destination protocol is unreachable (IPv4 only).
- **Q**: The destination host is reachable, but cannot accept the packet because the queue is full (IPv4 only).
- **R**: No route to destination (IPv6 only).
- **S**: The route supplied for the message was incorrect (IPv4 only).
- **T**: Network unreachable for TOS or host unreachable for TOS (IPv4 only).
- **U**: Address is unreachable (IPv6 only).
- **V**: Host precedence violation (IPv4 only).
- **X**: Communication administratively prohibited by filtering (IPv4 only). Firewall configuration is the most common reason for this code being returned to Traceroute.

**num**: Unknown ICMP Unreachable code (IPv4 only).

For a list of the ICMP types associated with the preceding Flags, see Appendix F, “ICMP/ICMPv6 types and codes,” on page 1115.

**Examples:**
In these examples, an asterisk (*) represents a lost packet.

- The second hop in this example does not send TTL-exceeded messages.

(2001:0DB8::206:2aff:fe66:c800)  3 ms !R  2 ms !R

Usage:

• The range of port numbers the traceroute command uses is normally not valid but can be changed if the
target host is using nonstandard UDP port.

• To interrupt traceroute command processing, enter the ESC character plus the letter C or c. For
example, if the ESC character for the UNIX shell is $, enter $c or $C.

Restrictions:

• If IPv4 tunnels exist on the path to the IPv6 destination host, the IPv4 routers in the tunnel are not
counted in the hop count. For a more complete description of tunnels, see the z/OS Communications

• Traceroute commands to a remote host might be unable to detect TTL or hop limit exceeded messages
if there is an IPSec tunnel at any point between the two systems, even if the host is reachable using
other commands.
Chapter 3. Managing network security

This topic describes the following commands that are used to manage network security:

• “ipsec command” on page 643
• “nssctl command” on page 739
• “certbundle command” on page 745

For additional information that is useful for managing security, see the following topics:

• “MODIFY command: Network security services server ” on page 171
• “MODIFY command: IKE server” on page 169
• “MODIFY command: Defense Manager daemon” on page 164
• “The z/OS UNIX pasearch command: Display policies” on page 749
• “Netstat CONFIG/-f report” on page 353 shows the IPSECURITY setting defined on the IPCONFIG and IPCONFIG6 TCP/IP statements
• “Netstat DEvlinks/-d report” on page 392 shows the IPSec security class value as specified on the LINK or INTERFACE TCP/IP statements

ipsec command

The z/OS UNIX ipsec command displays and modifies IP security information for a local TCP/IP stack and the IKE daemon or for a network security services (NSS) IPSec client that uses the IPSec network management service of the local NSS server. You can configure a TCP/IP stack as an NSS IPSec client by adding a NssStackConfig statement to the configuration file of the stack’s IKE daemon. See z/OS Communications Server: IP Configuration Guide for details. The NSS client can reside on the local z/OS system or on a different z/OS system.

You can also use the ipsec command to display, add, and manage defensive filters in the TCP/IP stack and the Defense Manager daemon (DMD). An external security information and event manager typically adds defensive filters in response to a detected intrusion. See defensive filtering information in z/OS Communications Server: IP Configuration Guide for more information about the defensive filters and the DMD. The ipsec command displays and modifies defensive filter information for a local TCP/IP stack or for all stacks on a local z/OS image for which the DMD is managing defensive filters.

IP security is implemented through a set of entities that is shared between the TCP/IP stack and the IKE daemon. For a description of the terms and concepts that are used, see IP security information in the z/OS Communications Server: IP Configuration Guide.

You can use the ipsec command for the following IP security management activities:

• Display the default or current filter rules and change the filter rule set that the stack is using
• Activate, deactivate, display, and refresh manual and dynamic IPSec tunnels
• Deactivate, display, and refresh IKE tunnels
• Display stack interfaces, including their security class and DVIPA status
• For a particular type of data traffic between two specific endpoints, display which filter rules apply, including both defensive filters and IP security filters
• Display information about the active NSS IPSec client configuration
• Display information maintained by the NSS server for each NSS IPSec client

The ipsec command is also used to display and manage defensive filters on the local host system.

Restriction: You cannot display and manage defensive filters for an NSS IPSec client.
You can use the **ipsec** command for the following defensive filter management activities:

- Add a defensive filter to a specific stack or globally to all eligible stacks. (An eligible stack is a stack on the local z/OS image that is enabled for IP security and that is included in the Defense Manager daemon (DMD) configuration file and has the mode active or simulate.)
- Display defensive filters that are installed in a specific stack.
- Display global defensive filters.
- Delete a defensive filter from a specific stack or globally from all eligible stacks.
- Update a defensive filter that is installed in a specific stack or globally in all eligible stacks.
- For a particular type of data traffic between two specific endpoints, display which filter rules apply, including both defensive filters and IP security filters.

**Tips:**

- Use Secure Shell (SSH) from remote machines to issue secure **ipsec** commands.
- The DMD supports up to 10 concurrent **ipsec** command connections. Automated solutions should issue the **ipsec** commands serially to ensure that each **ipsec** command invocation can open a successful connection to the Defense Manager daemon (DMD).

As new functionality is added to the z/OS Communications Server, the **ipsec** command input options and display output might change. Programs that post process the output of the **ipsec** command might be affected by the introduction of z/OS Communications Server maintenance or the installation of a later release. The z/OS Release Upgrade Reference Summary includes information about changes to **ipsec** command reports.

**ipsec command security**

The **ipsec** command is an APF-authorized application. Users of the **ipsec** command must also be authorized through the security access facility (SAF). This information assumes that the SAF is RACF. Authorization is managed with the SERVAUTH profile and is described in “**ipsec** command SERVAUTH profile” on page 644. For the **ipsec -f default** and **ipsec -f reload** command, file system access is also required. You do not need root authority to use the **ipsec** command, but for filter rule set control on a local stack, the administrator must provide you with some file access capability. For more information about granting group access control, see “Group access control for local host stacks” on page 646.

**ipsec command SERVAUTH profile**

Security product authorization (for example, RACF) is required to use the **ipsec** command. You must define a profile in the SERVAUTH class to enable control over the **ipsec** command function. You can define separate profiles during installation to control access to different aspects of the **ipsec** command. The format of the profile when accessing a local stack is as follows:

```
EZB.IPSECCMD.sysname.stackname.command_type
```

Where:

**sysname**
The name of the system on which the **ipsec** command is allowed to run.

**stackname**
The tcpprocname value of the local TCP/IP stack for which the **ipsec** command is authorized. Specify the stackname value DMD_GLOBAL to authorize the use of the global defensive filter option (-G). The wildcard value asterisk (*) authorizes the use of the global defensive filter option and authorizes all stacks.

**command_type**
The **ipsec** command type; either DISPLAY or CONTROL.
Table 15. ipsec command SERVAUTH class resource names

<table>
<thead>
<tr>
<th>Resource names in SERVAUTH class</th>
<th>ipsec options</th>
</tr>
</thead>
<tbody>
<tr>
<td>EZB.IPSECCMD.sysname.stackname.*</td>
<td>All ipsec options</td>
</tr>
<tr>
<td>EZB.IPSECCMD.sysname.stackname.DISPLAY</td>
<td>-f display, -F display, -m display, -k display, -y display, -t, -i, -o</td>
</tr>
<tr>
<td>EZB.IPSECCMD.sysname.stackname.CONTROL</td>
<td>-f default, -f reload, -F add, -F delete, -F update, -m activate, -m deactivate, -k deactivate, -k refresh, -y activate, -y deactivate, -y refresh</td>
</tr>
<tr>
<td>EZB.IPSECCMD.sysname.DMD_GLOBAL.DISPLAY</td>
<td>-F display -G</td>
</tr>
<tr>
<td>EZB.IPSECCMD.sysname.DMD_GLOBAL.CONTROL</td>
<td>-F add -G, -F delete -G, -F update -G</td>
</tr>
<tr>
<td>EZB.IPSECCMD.sysname.stackname.CONTROL (for each stack to which the global command applies)</td>
<td>-F add -G, -F delete -G, -F update -G</td>
</tr>
</tbody>
</table>

When accessing a remote stack using the NSS server, the following format applies:

EZB.NETMGMT.sysname.clientname.IPSEC.command_type

Where:

**sysname**
The system name on which the **ipsec** command is allowed to run.

**clientname**
The name of an NSS client.

**command_type**
The **ipsec** command type; either DISPLAY or CONTROL.

**Requirement**: You must define these profiles on the system where the NSS server and the **ipsec** command are running.
<table>
<thead>
<tr>
<th>Resource names in SERVAUTH class</th>
<th>ipsec options</th>
</tr>
</thead>
<tbody>
<tr>
<td>EZB.NETMGMT.sysname.clientname.IPSEC.DISPLAY</td>
<td>-f display&lt;br&gt;-m display&lt;br&gt;-k display&lt;br&gt;-y display&lt;br&gt;-t&lt;br&gt;-i&lt;br&gt;-o</td>
</tr>
<tr>
<td>EZB.NETMGMT.sysname.clientname.IPSEC.CONTROL</td>
<td>-f default&lt;br&gt;-f reload&lt;br&gt;-m activate&lt;br&gt;-m deactivate&lt;br&gt;-k deactivate&lt;br&gt;-k refresh&lt;br&gt;-y activate&lt;br&gt;-y deactivate&lt;br&gt;-y refresh</td>
</tr>
</tbody>
</table>

**Restriction:** You cannot display and manage defensive filters for an NSS client that is managed by the NSS server.

Use the following format when querying IKED for NSS configuration information using the `ipsec -w` command:

```
EZB.NETMGMT.sysname.sysname.IKED.DISPLAY
```

Where:

**sysname**
- The name of the system on which the `ipsec` command is allowed to run.

**Requirement:** This profile must be defined on the system where IKED and the `ipsec` command are running.

The format of the profile when accessing the NSS server using the `ipsec -x` command is:

```
EZB.NETMGMT.sysname.sysname.NSS.DISPLAY
```

Where:

**sysname**
- The name of the system on which the `ipsec` command is allowed to run.

**Requirement:** This profile must be defined on the system where the NSS server and the `ipsec` command are running.

If the security product is RACF, you can use the control statements in the sample JCL job that is provided in SEZAINST(EZARACF) to define these authorizations. If the SERVAUTH class is not active or if a matching SERVAUTH policy is not found, the `ipsec` request is rejected.

**Tip:** Authorization is not required for the help option (`ipsec -?`).

**Group access control for local host stacks**

A user does not require root authority to use the `ipsec` command, but to avoid erroneous or malicious manipulations of files that are used by the `ipsec` command, the administrator must perform the following steps to require group access control. Group access control is required for the following commands:

- To change filter sets in the stack on the local system (`ipsec -f default` or `reload`), the `ipsec` command creates or deletes a specific marker file that the stack accesses.
To activate, delete, display, or refresh tunnels (any `ipsec -k` or `ipsec -y`), the `ipsec` command uses an AF_UNIX socket file to communicate with the IKE daemon.

**Steps for creating group access control over the path for the ipsec command**

1. Create a supplementary RACF group, assign it a group ID (`gid`), and ensure that the primary administrator is a member of the group.

   ```
   ADDGROUP IKE OMVS(GID(931))
   CONNECT user-special GROUP(IKE) UACC(READ)
   ```

2. Issue the following UNIX System Services commands to set file management at the group level. The path for the `ipsec` command files is `/var/ike`.

   ```
   chgrp IKE /var/ike
   chmod 2770 /var/ike
   ```

3. Use RACF commands to control which users can manipulate files.

   ```
   CONNECT USER5 GROUP(IKE) UACC(READ)
   REMOVE USER5 GROUP(IKE)
   ```

The **z/OS UNIX ipsec command syntax**

Use the z/OS UNIX `ipsec` command to display and modify IP security information and defensive filter information on the host z/OS system. With the `-z` option or the `-x` primary option specified, the `ipsec` command displays and modifies IP security information for NSS IPSec clients using the IPSec network management service.

**Restriction:** When you use the `ipsec` command to interface with the NSS IPSec network management service, you must issue the `ipsec` command on the same host z/OS system on which the NSS server is running.

To display and modify IP security information, the `ipsec` command interacts with both the IKE daemon and a TCP/IP communications stack. One or more stacks can be running concurrently on the host z/OS system. While there is at most one IKE daemon, its data is managed on a per stack basis. The `ipsec` command reports IKED NSS IPSec client information using the `-w` primary option for multiple stacks. It reports NSS server information using the `-x` primary option for multiple NSS IPSec clients. For the other `ipsec` command primary options, the `ipsec` command is always specified for a single stack (using the `-p` option) or NSS IPSec client (using the `-z` option). If the `-p` option and the `-z` option are not specified, the command is directed to the default stack on the local system. The default stack refers to the default TCP/IP address space that is specified on the TCPIPJOBNAME statement in the resolver configuration data set.

To display and modify defensive filter information, the `ipsec` command interacts with both the Defense Manager daemon (DMD) and a TCP/IP communications stack. One or more stacks can be running concurrently on the host z/OS system. Only one DMD can be running on the system. Direct the `ipsec` command `-F` primary option to the DMD by specifying the `-G` (global scope) option. If the `-G` option is not specified, the `ipsec` command `-F` option is directed to a single stack. This can be the stack that is specified with the `-p` option or the default stack. The default stack is the default TCP/IP address space that is specified on the TCPIPJOBNAME statement in the resolver configuration data set.

**Restriction:** You cannot display and manage defensive filters for an NSS IPSec client using the `-z` option.

The actual configuration of IP security entities is managed through Policy Agent policy file specifications. In the policy file definition, network resources and collections of network resources receive names that assist in the management process. Use `ipsec` command options `-n`, `-g`, and `-l` to identify resources by their policy specification name.
Defensive filters are not configured in Policy Agent policy files. You can add defensive filters to the TCP/IP stack in response to a detected intrusion with the `ipsec` command defensive filter add command. The defensive filter’s name is assigned on the add action. Use the `ipsec` command option `-N` to identify a defensive filter by its name.

**Rule:** All policy names and defensive filter names are case sensitive.

**Tip:** Use spaces or commas as valid delimiters to separate `ipsec` command parameter values.

Additionally, as tunnels are initiated and established, they also receive a system-assigned name, known as a tunnel ID. System-assigned tunnel IDs take the form of an integer prefixed with a single letter that identifies the tunnel type. The prefix can be M (manual), K (Internet Key Exchange), or Y (dynamic). The integer is based on a 32-bit counter that is incremented at each assignment and wraps at 4,294,967,295. Remember that tunnel IDs are arbitrary and transitory strings. Manual tunnel IDs are assigned when a manual tunnel is installed in the stack by the Policy Agent. A change in the manual tunnel policy definition results in assignment of a new manual tunnel ID. Dynamic and IKE tunnel IDs are assigned when a tunnel is established. They remain consistent for the life of the stack and the life of the IKE daemon. Use the `-a` option to identify resources by their tunnel ID.

In addition to the brief help (`ipsec -?`), a man page describes the command syntax and options in detail (`man ipsec`). The `ipsec` command options are discussed in the following sections.

**Format:**

```
ipsec Primary Option Global Option
```

**Primary Option**

```
+f IP Filter Option Stackname Option
-F Defensive Filter Option Target Option
-m Manual Tunnel Option Stackname Option
-k IKE Tunnel Option Stackname Option
-y Dynamic Tunnel Option Stackname Option
-i Interface Option Stackname Option
-t IP Traffic Test Option Stackname Option
-o NATT Port Translation Option Stackname Option
-w IKED Network Security Option
-x Network Security Server Option -z nsclientname
```

**Global Option**

```
-d 3 debuglevel
```

**Stackname Option**

```
-p stackname
-z nsclientname
```

The z/OS UNIX ipsec command parameter descriptions

The following topics describe the individual parameter items that appear in the syntax diagram.

Rules:
- All options are case sensitive.
- Option values that are keywords are not case sensitive and can be shortened to the first three characters of the keyword, for example -f default can be specified as -f DEF.
- Option values for -n, -g, -l, and -N specify a name and are case sensitive.
- Option values for -p and -z specify a name and are not case sensitive.
- On the ipsec -F add command and ipsec -F update command, the associated values are not case sensitive. For example, ipsec -F add srcip 10.1.1.1 dir inbound can be specified as ipsec -F add SRCIP 10.1.1.1 DIR INBOUND. The associated values cannot be shortened.

The z/OS UNIX ipsec command primary options

-`f`
  Display or modify IP filter information.

-`F`
  Display or modify defensive filter information.

-`m`
  Display or modify manual tunnel information.

-`k`
  Display or modify IKE tunnel information.

-`y`
  Display or modify dynamic tunnel information.

-`i`
  Display interface information that is defined to the specified TCP/IP stack.

-`t`
  Locate and display active filter rules matching particular data traffic that match the selection input.

-`o`
  Display NAT remote port translation table information.

-`w`
  Display IKE NSS client information. The Stackname options -p and -z do not apply with the -w option.

-`x`
  Display NSS server information. The Stackname option -p does not apply with the -x option.

-`?`
  Display command help.
The z/OS UNIX ipsec command global options

-d
Generates debug information during command execution. You can specify an optional debuglevel value when you use the -d option. Debug output is sent to stderr or to stdout, determined by the debug level. Debug information accumulates with the higher levels (for example debug level 3 also includes the information from level 1 and level 2).

ddebuglevel
The following debug levels are available:

1
Generate functional level debug information in stdout in a formatted form.
The functional level debug can be specified with any option. If there is functional level debug information for that report, it is displayed in addition to the base report (such as -o report). If not, only the base report is displayed.

2
Generate general debug information in stderr in an unformatted form for criteria that was specified when the command was issued.
You can specify the selective level debug with any option. Selective debug information is available only for -i, -F, -m, -y (without -b), and -o reports. For other reports, only the base report is displayed.

3
Generate operational level debug information in stderr in an unformatted form. This is the default debug level.

The z/OS UNIX ipsec command stackname options

-p stackname
Selects a local stack. The stackname parameter specifies the name of the TCP/IP address space. If the -p option is not specified, the default stack is selected. The default stack refers to the default TCP/IP address space that is specified on the TCPIPJOBNAME statement in the resolver configuration data set.

-z nsclientname
Selects a NSS client. The nsclientname parameter specifies the name of a NSS client as specified on the ClientName parameter for the NssStackConfig statement in the IKED.CONF file on the client system. If not specified on the NssStackConfig statement, it defaults to the form of systemname_stackname. To produce a list of available NSS clients, issue the ipsec -x command. There is no default for this parameter.

The z/OS UNIX ipsec command target options

-p stackname
Indicates that the defensive filter or filters are stack-specific filters that are associated with the local TCP/IP stack specified by the stackname value. The stackname parameter specifies the name of the TCP/IP address space. If neither the -p nor the -G is specified, the default stack is selected. The default stack is the default TCP/IP address space that is specified on the TCPIPJOBNAME statement in the resolver configuration data set.

Results: To successfully add a stack-specific defensive filter, the following conditions must be met:
• There must be a DmStackConfig statement for stack stackname in the DMD configuration file with a mode of Active or Simulate.
• The stack must support IP security.

-G
Indicates that the defensive filter or filters are global filters that apply to all TCP/IP stacks that are listed in the DMD configuration file and that support IP security on the local system.

Results:
When you add a global defensive filter, the DMD maintains a copy of the global filter. A stack-specific copy is generated from the global filter and installed in each local TCP/IP stack that is listed in the DMD configuration file and that supports IP security.

When you display global defensive filters, the global copy of the defensive filters is displayed. The global copy of the filter does not contain any accumulated counts that are kept by each TCP/IP stack. Issue the command with the -p stackname option to display the accumulated counts for a specific stack.

When you update a global defensive filter, the update is applied to the global filter and to each of the generated stack-specific copies.

When you delete global defensive filters, the global filter or filters and each of the stack-specific copies that are generated are deleted.

When a stack-specific copy of a global filter is updated with -p (stack specific) option, only that copy of the filter is updated. If you make a subsequent update to the global filter with the -G option, all copies of the filter are updated, including the one that was previously updated with the -p stackname option. The last update always remains in effect.

When you delete a stack-specific copy of a global filter or it expires, that copy is no longer affected by updates to the global filter.

When a global filter expires before one or more of its stack-specific copies expires, you can still perform global update and delete operations. The expired global filter is retained to allow the global update and delete operations. Stack-specific copies of the expired global filter are not installed in new stacks that start up. The expired global copy is removed completely when all stack-specific copies expire or are deleted.

An expired global filter is displayed with the State value Pending Inactive and the LifetimeExpires value Expired while one or more of its stack-specific copies is still active.

The z/OS UNIX ipsec command IP filter (-f) option

z/OS UNIX ipsec command IP filter (-f) option parameters
display
Displays the selected IP filters. If no filters are selected, then all filter rules (with respect to the display scope) are displayed.

-r format
Displays IP filter information in a given format. The default format is detail. See “The ipsec command general report concepts” on page 668 for a description of the different report formats.

-c scope
Displays the scope. The default scope is current.

current
Display filter rules that are current and that are in use by the stack. IP security filter rules that are inactive because of time conditions are not included. If any defensive filter rules are in use by the stack, they are included.

policy
Displays filter rules that are configured from the policy definition. Filter rules that are inactive because of time conditions are not included. The filter rules that are displayed using this option might or might not be current at the stack. This option also displays global policy settings. Defensive filter rules are not included.

profile
Displays filter rules that are configured as default filter rules from the IPSEC statement on the TCPIP profile. The filter rules that are displayed using this option might or might not be current at the stack. Defensive filter rules are not included.

-a Mn or -a Yn
Displays the IP security filters that are associated with the specified tunnel IDs. The tunnel IDs must have an M (manual) prefix or a Y (dynamic) prefix.
For manual tunnels, multiple filter rules might be associated with a manual tunnel ID. There is a one-to-one correspondence between a manual tunnel ID and an IpManVpnAction definition. If multiple active filter rules reference an IpManVpnAction, they are all displayed. Filter rules that are inactive because of time conditions are not included.

**Tip:** To display all of the statically defined dynamic anchor filters, specify `-a Y0`.

- `h`
  For any displayed NAT Traversal (NATT) anchor filter, the associated NAT resolution filters (NRFs) are also displayed.

- `-n IpFilterRuleName`
  Specifies one or more IP security filters to be selected. The names used must correspond to either IpFilterRule names that are specified in a Policy Agent configuration file or to the stack-generated names assigned to the default rules in the TCP/IP profile. The IpFilterRule base name might refer to more than one filter rule in the selected stack. In this case, the base name has an appended number that uniquely identifies the generated rules. These names have the following format:

  name:index

  name
    The base name.

  index
    An integer that is assigned with the filter rule. The integer corresponds to the order in which the filter rule was generated from its base IpFilterRule statement.

  For the command `ipsec -f display -n IpFilterRuleName`, all IpFilterRule statements (with respect to the display scope) with a base name that matches the `IpFilterRuleName` value are displayed.

- `-N DefensiveFilterName`
  Specifies one or more defensive filters to be selected. The names used must correspond to defensive filter rule names that are specified when the defensive filters are added.

  **Tip:** The DefensiveFilter base name might refer to more than one filter rule in a stack. In this case, the base name has an appended number that uniquely identifies the generated defensive filter. These names have the following format:

  name
    The base name.

  index
    An integer that is assigned to the filter rule.

  For the command `ipsec -f display -N DefensiveFilterName`, all defensive filters (with respect to the display scope) with a base name that matches the `DefensiveFilterName` value are displayed.

- `-g IpFilterGroupName`
  Specifies one or more IP security filter groups that are to be displayed. The names that are specified must correspond to the IpFilterGroup names that are specified in a Policy Agent configuration file.

  `default`
  Causes the stack to use the default IP security filter rules. Default IP filter rules consist of the IP filter rules that are specified by the TCPIP profile, if any, and an implicit DENY-ALL filter rule. If other IP filters were in use as generated from a policy configuration file (policy IP filters), those IP filters remain intact, but are not used by the stack. While the profile IP filters are in effect, manual, dynamic, and IKE tunnels still exist, but they are not used. These tunnels might expire or be deactivated, but cannot cleanly terminate with the peer. Tunnel refreshes might not occur, and new dynamic tunnels might not be activated. If present, defensive filters remain in use by the stack along with the default IP security filter rules.

  **Note:** The request to switch to the default profile IP filters is remembered across activations of the stack and system IPLs.
Causes the stack to use the policy IP security filter rules that are supplied from a policy configuration file. If no policy IP filters were previously defined to the stack, the stack continues to use the default IP filter rules until the policy configuration file is installed by the Policy Agent. If policy IP filter rules were previously defined to the stack, those policy IP filters become effective again. Tunnel activity resumes, including refreshes and new activations. If the IKE daemon is active, it attempts to perform all automatic activations that are configured. If present, defensive filters remain in use by the stack along with the policy IP security filter rules.

**Note:** The request to switch to the policy IP filter rules is remembered across activations of the stack and system IPLs.

**Tip:** Displays of IP filter rules indicate whether the IP security rules originate as default profile rules or as policy rules.

See also “IP filter (-f) primary option” on page 681 for report details and examples.

### The z/OS UNIX ipsec command defensive filter (-F) option

The following parameters can be used with the z/OS UNIX ipsec command defensive filter (-F) option.

#### z/OS UNIX ipsec command defensive filter (-F) option parameters

**display**

Displays the selected defensive filters. If no filters are selected, then all defensive filter rules are displayed.

**-r format**

Displays defensive filter information in a given format. The default format is detail. See “The ipsec command general report concepts” on page 668 for a description of the different report formats.

**-N DefensiveFilterName**

Specifies one or more defensive filters to be selected. The names used must correspond to defensive filter rule names that are specified when the defensive filters are added.

**Tip:** The DefensiveFilter base name can refer to more than one filter rule in a stack. In this case, the base name has an appended number that uniquely identifies the defensive filter that is generated. These names have the following format:

- **name**
  - The base name.

- **index**
  - An integer that is assigned to the filter rule.

The command `ipsec -F display -N DefensiveFilterName` displays all defensive filters with a base name that matches the `DefensiveFilterName` value.

**add**

Adds a defensive filter to the top of the defensive filters search list. You cannot add an IP security filter with this option; it must be configured in the TCPIP profile or in a policy configuration file. The following add parameters determine the characteristics of the added defensive filter:

**srcip**

A source IP address specification. Possible values are:

- **ipaddress**
  - A single IP address. This value indicates the source address that must be contained in an IP packet for the packet to match this filter rule.

- **ipaddress/prefixLength**
  - A prefix address specification that indicates the applicable source IP addresses that can be contained in an IP packet for the packet to match this filter rule. The `prefixLength` value is the number of unmasked leading bits in the `ipaddress` value. The `prefixLength` value can be in the range 0-32 for IPv4 addresses and in the range 0-128 for IPv6 addresses. An IP packet
matches this condition if the unmasked bits of its source address are identical to the defined unmasked bits.

**all**

Indicates that the filter rule applies to any source IP address. This is the default value.

**Rule:** If both the srcip and destip parameters are specified, the IP addresses must be in the same family (IPv4 or IPv6).

**destip**

A destination IP address specification. Possible values are:

**ipaddress**

A single IP address. This value indicates the destination address that must be contained in an IP packet for the packet to match this filter rule.

**ipaddress/prefixLength**

A prefix address specification that indicates the applicable destination IP addresses that can be contained in an IP packet for the packet to match this filter rule. The prefixLength value is the number of unmasked leading bits in the ipaddress value. The prefixLength value can be in the range 0-32 for IPv4 addresses and in the range 0-128 for IPv6 addresses. An IP packet matches this condition if the unmasked bits of its destination address are identical to the defined unmasked bits.

**all**

Indicates that the filter rule applies to any destination IP address. This is the default value.

**Rule:** If both the srcip and destip parameters are specified, the IP addresses must be in the same family (IPv4 or IPv6).

**prot**

The IP protocol that must be contained in an IP packet for the packet to match this filter rule. If an n value is specified, it identifies a protocol number. The value for n can be in the range 0-255. If the value all is specified, then the filter rule applies to any protocol. The default value is all.

The protocol specification Opaque matches any IPv6 packet for which the upper-layer protocol is not known because of fragmentation. This specification always matches non-initial fragments, and it also matches initial fragments if the upper-layer protocol value is not included in the first fragment. Use of the Opaque protocol specification is applicable only to routed fragments because, for all local traffic, the stack applies IP filter rules only to fully assembled packets.

**Rule:** The protocol specification Opaque can be used only for IPv6 addresses.

**srcport**

If the protocol TCP or UDP is specified, then you can specify a srcport value. The srcport value indicates the source ports that must be contained in an IP packet for the packet to match this filter rule.

Valid values for n are in the range 1-65535. If an m value is specified, it must be greater than or equal to the n value and less than 65536. If the value all is specified, then the filter rule applies to any source port. The default value is all.

**Restriction:** If the Routing parameter value is Routed or Either, you must use either the default srcport value or the value all.

**destport**

If the protocol TCP or UDP is specified, then you can specify a destport value. The destport value indicates the destination ports that must be contained in an IP packet for the packet to match this filter rule.

Valid values for n are in the range 1-65535. If an m value is specified, it must be greater than or equal to the n value and less than 65536. If the value all is specified, then the filter rule applies to any destination port. The default value is all.

**Restriction:** If the Routing parameter value is Routed or Either, you must use either the default destport value or the value all.
**type**

If the protocol ICMP or ICMPv6 is specified, then you can specify a type value. The type value indicates the ICMP type that must be contained in an IPv4 ICMP packet or an IPv6 ICMPv6 packet for the packet to match this filter rule. Valid values for n are in the range 0-255. If the value all is specified, then the filter rule applies to any ICMP type. The default value is all.

**Restriction:** If the Routing parameter value is Routed or Either, you must use either the default type value or the value all.

**code**

If the protocol ICMP or ICMPv6 is specified, then you can specify a code value. The code value indicates the ICMP code that must be contained in an IPv4 ICMP packet or an IPv6 ICMPv6 packet for the packet to match this filter rule. Valid values for n are in the range 0-255. If you specify the value all, then the filter rule applies to any ICMP code. The default value is all.

**Restriction:** If the Routing parameter value is Routed or Either, you must use either the default code value or the value all.

**dir**

The direction a packet must take for the packet to match this filter rule. Valid values are:

- **inbound**
  - Indicates that this filter rule applies to inbound packets. This is the default.

- **outbound**
  - Indicates that this filter rule applies to outbound packets.

**routingsonly**

The routing characteristics that a packet must have for the packet to match this filter rule. Valid values are:

- **local**
  - Indicates that this filter rule applies to packets that are destined for this stack or that originate from this stack. This is the default.

- **routed**
  - Indicates that this filter rule applies to packets that are being forwarded by this stack.

- **either**
  - Indicates that this filter rule applies to forwarded and non-forwarded packets.

**fragmentsonly**

When set to Yes, this filter rule matches only fragmented packets. When set to No, this filter rule matches both fragmented packets and non-fragmented packets. Fragments are matched only in routed traffic, because the TCP/IP stack applies IP filter rules for local traffic only to fully reassembled packets.

**Tip:** Use this keyword to block all fragmented traffic.

**mode**

The defensive filter mode. The default value is block.

- **block**
  - Indicates that the defensive filter blocks or denies packets that match the characteristics of the filter.

- **simulate**
  - Indicates that the defensive filter simulates a block. If a packet matches a defensive filter with the mode value simulate, a log record is written to syslog indicating that the packet would have been denied by this filter. The packet is not denied and IP filtering continues.

**Rule:** If the mode value Simulate is configured for a TCP/IP stack in the DMD configuration file, that value overrides the individual defensive filter mode setting. For example, if a defensive filter with the mode value block is added to a stack and the DmStackConfig statement for that stack has a configured mode of Simulate, a packet that matches the defensive filter is not blocked. Instead, a block is simulated. The defensive filter retains the block mode. If the mode value in a
DmStackConfig statement for the stack is updated to Active, a packet that matches the defensive filter is blocked.

**log**
The logging action for a defensive filter.

- **yes**
  A log record is written when a packet matches this filter rule. This is the default.

- **no**
  A log record is not written when a packet matches this filter rule.

**Restriction:** If the mode parameter value is simulate, the log parameter must be set to the value yes.

**loglimit**
The log limit for a defensive filter. The loglimit value is used to enable or disable the limiting of defensive filter match messages (EZD1721I and EZD1722I) written to syslogd. For more information, see filter-match logging in z/OS Communications Server: IP Configuration Guide.

- **0**
  Disables the limiting of defensive filter match messages written to syslogd. If logging is being done for this defensive filter, a message is generated for each packet that matches the defensive filter.

- **n**
  Enables the limiting of defensive filter-match messages written to syslogd. Valid values are in the range 1 - 9999. The value specifies the limit of the average rate of filter-match messages generated in a 5-minute interval for a defensive filter. For example, a value of 100 limits the average rate of filter-match messages to 100 messages per 5-minute interval. A burst of up to 100 messages is allowed while maintaining the long-term average of 100 messages per 5-minute interval.

**Result:** If loglimit is not specified, the default value is the DefaultLogLimit value specified in the DMD configuration file. See z/OS Communications Server: IP Configuration Reference for more information about the DefaultLogLimit keyword.

**lifetime**
The length of time, in minutes, that the defensive filter remains in use. Valid values are in the range 1-20160. The default value is 30 minutes.

**Tip:** If the lifetime value exceeds the maximum lifetime value that is configured for a stack, the defensive filter's lifetime value is set to the maximum allowed lifetime value. The maximum lifetime value is configured with the MaxLifetime keyword in the DMD configuration file. See z/OS Communications Server: IP Configuration Reference for more information about the MaxLifetime keyword.

**Results:**

- If you specified the value all (or is in effect by default) for both the srcip and destip parameters, a defensive filter is added to match any IPv4 source and destination address. If a stack supports IP security for IPv6, a defensive filter is also added to match any IPv6 source and destination address. If both an IPv4 and IPv6 filter are installed, the base name is the name that was specified when the filter was added. Different index values are assigned to each filter rule by the DMD.

- If you specified the value all for either the srcip or destip parameter and a specific address family is specified for the other parameter, a defensive filter is added for the specific address family. For example, srcip all and destip 10.1.1.1 result in a defensive filter being added to match any IPv4 source address and a destination address of 10.1.1.1.

- If both an IPv4 and IPv6 filter are installed and the protocol value is icmp or 1, type and code values are relevant only for the IPv4 filter. The IPv6 filter does not use the type and code values to determine whether an IPv6 packet matches the filter.
• If both an IPv4 and IPv6 filter are installed and the protocol value is icmpv6 or 58, type and code values are relevant only in the IPv6 filter. The IPv4 filter does not use the type and code values to determine whether an IPv4 packet matches the filter.

• If both an IPv4 and IPv6 filter are installed, the loglimit is applied both to the IPv4 filter and to the IPv6 filter.

• If a defensive filter add specifies IPv6 addresses, the filter is added only to a stack that supports IP security for IPv6.

-N DefensiveFilterName
A string 1-32 characters in length that specifies the name of the defensive filter that is being added. The name cannot start with a dash (-). The name also cannot contain any commas (,). A comma is treated as delimiter by the ipsec command and it is therefore ignored.

Tip: Global and stack-specific defensive filters share the same name space; therefore, a filter name cannot be used for both a global filter and a stack-specific filter. If you are manually creating defensive filters, avoid conflicts between global and stack-specific filter names by selecting a distinct naming convention for each. For example, start all global filter names with the letter G.

update
Updates a defensive filter's characteristics. You cannot update an IP security filter with this option. You must update the IP security filter in the TCPIP profile or in a policy configuration file. You can modify the following defensive filter characteristics:

mode
The defensive filter mode. Valid values are:

block
Indicates that the defensive filter blocks or denies packets that match the characteristics of the filter.

simulate
Indicates that the defensive filter simulates a block. If a packet matches a defensive filter with the mode simulate, a log record is written to syslog indicating that the packet would have been denied by this filter. The packet is not denied and IP filtering continues.

Rule: If the mode value Simulate is configured for a TCP/IP stack in the DMD configuration file, it overrides the individual defensive filter's mode setting. For example, if a defensive filter is updated to be in block mode and the DmStackConfig statement for the stack where the filter is installed has a configured mode of Simulate, a packet that matches the defensive filter is not blocked. Instead, a block is simulated. The defensive filter retains the block mode. If the DmStackConfig statement for the stack is updated to be in Active mode, a packet that matches the defensive filter is blocked.

log
The logging action for a defensive filter.

yes
A log record is written when a packet matches this filter rule.

no
A log record is not written when a packet matches this filter rule.

Restrictions:

• If the mode value is simulate and the log parameter is specified, the log value must be configured as yes.

• If the mode parameter is not specified and the filter's mode is simulate, the log value (if it is specified) must be configured as yes.

Result: If mode is simulate and log is not specified, the log value is set to yes in the filter.
loglimit
The log limit for a defensive filter. The loglimit value is used to enable or disable the limiting of defensive filter match messages (EZD1721I and EZD1722I) written to syslogd. For more information, see filter-match logging in z/OS Communications Server: IP Configuration Guide.

0
Disables the limiting of defensive filter match messages written to syslogd. If logging is being done for this defensive filter, a message is generated for each packet that matches the defensive filter.

n
Enables the limiting of defensive filter-match messages written to syslogd. Valid values are in the range 1 - 9999. The value specifies the limit of the average rate of filter-match messages generated in a 5-minute interval for a defensive filter. For example, a value of 100 limits the average rate of filter-match messages to 100 messages per 5-minute interval. A burst of up to 100 messages is allowed while maintaining the long-term average of 100 messages per 5-minute interval.

lifetime
The additional time (in minutes) that the defensive filter remains in use from the time the update command is processed.

-N DefensiveFilterName
Specifies the name of the defensive filter that is to be updated. The name must correspond to the defensive filter rule name that was specified when the defensive filter was added.

delete
Deletes one or more defensive filters. You cannot delete an IP security filter with this option. You must remove IP security filters from the TCPIP profile or the policy configuration file.

-N DefensiveFilterName
Specifies one or more defensive filters that are to be deleted. The names must correspond to defensive filter rule names that were specified when the defensive filters were added.

-N all
Specifies that all defensive filters are deleted on the target stack (-p) or deleted globally (-G).

The z/OS UNIX ipsec command manual tunnel (-m) option

z/OS UNIX ipsec command manual tunnel (-m) option parameters
display
Displays the selected manual tunnels. Manual tunnels that are inactive because of time conditions are not available for display by ipsec. The pasearch command can be used to display configured manual tunnels with their time conditions.

All manual tunnels that are installed in the stack are displayed. For a tunnel to be in use protecting IP traffic, the following must be true:

• The current filter set must be the policy set.
• An active filter must reference the tunnel (IpManVpnAction).
• The tunnel state must be active.

To determine whether the manual tunnel is in use, issue the ipsec -f display -a Mxx command, where Mxx is the manual tunnel ID from the tunnel display.

-r format
Displays IP security information in a given format. The default format is detail. See “The ipsec command general report concepts” on page 668 for a description of the different report formats.

activate
Activates the selected manual tunnels. If no manual tunnels are selected, then all manual tunnels are activated. IP traffic is protected by the algorithms that are defined by the manual tunnels. If the default filter set (defined in the TCPIP stack profile) is active, then the tunnel state cannot be changed and the activate is rejected.
**deactivate**
Deactivates the selected manual tunnels. The result is that IP traffic that would have used the manual tunnel is discarded while the manual tunnel is inactive.

**-a Mnn or -a all**
Selects one or more manual tunnels that are associated with the specified tunnel ID. The tunnel IDs must have an M (manual) prefix.

**-a all** option is valid only with the **deactivate** parameter and indicates that all manual tunnels are to be deactivated.

**-n IpManVpnActionName**
Specifies one or more manual tunnels to be selected. The names that are used must correspond to IpManVpnAction names that are specified in a Policy Agent configuration file.

See also “Manual tunnel (-m) primary option” on page 700 for report details and examples.

**The z/OS UNIX ipsec command IKE tunnel (-k) option**

**z/OS UNIX ipsec command IKE tunnel (-k) option parameters**

**display**
Displays security association (SA) data associated with the selected IKE tunnels.

**-r format**
Displays IP security information in a given format. The default format is **detail**. See “The ipsec command general report concepts” on page 668 for a description of the different report formats.

**-c scope**
Selects the scope of information displayed. The default scope is **current**.

**current**
Displays IKE tunnel information about current IKE SAs only. When the selection criteria specifies a name (KeyExchangeRuleName), multiple current SAs can correspond to the specified name.

**all**
Displays IKE tunnel information about SAs, including SAs that might no longer be in use. This includes SAs that have expired and have not been garbage collected. It also includes SAs that have not yet expired but that have been superseded by a refresh.

**-e**
Use this (cascade) option to additionally display the dynamic SAs that are associated with the specified IKE SAs. When the cascade option is used, dynamic SA information is obtained from the IKE server (and not from the stack). The display scope does not apply to the dynamic SAs that are reported as a result of the cascade option.

**deactivate**
Deactivates the selected IKE tunnels. The IKE tunnel is terminated for subsequent negotiations. To indicate all IKE tunnels, specify **-a all** on the command. New IKE SAs can be established as needed (for example, to support on demand or command requests).

**Note:**
1. All dynamic tunnels that are associated with deactivated IKE tunnels are also deactivated as part of this request.
2. If **-a K0** is specified with **-k deactivate**, all IKE tunnels with the tunnel ID K0 (which indicates an IKE tunnel with a current state not equal to Active) are deactivated.

**Restriction:** Use this option only if there is concern that the cryptographic keys in use on a current SA have been compromised. Reactivating IKE tunnels is a processor-intensive operation. If the scope of a deactivate request is large, then overall system performance could be affected.
refresh
Refreshes the cryptographic keys for the selected IKE tunnels by performing a reauthentication operation to negotiate a new IKE tunnel. Configuration options typically cause a refresh (and therefore a new set of cryptographic keys) on a lifetime or lifesize basis.

Restriction: Do not use this refresh option unless the IKE tunnel appears to be in a state that keeps it from being used. Refreshing IKE tunnels is a processor-intensive operation. If the scope of a refresh request is large, then overall system performance could be affected.

-a Knn or -a all
Selects one or more IKE tunnel IDs. The tunnel IDs must have a K (IKE) prefix. The -a all option is valid only with the deactivate parameter and indicates that all IKE tunnels are to be deactivated.

-n KeyExchangeRuleName
Specifies one or more IKE tunnels to be selected. The names that are specified must correspond to KeyExchangeRule statements that are specified in a Policy Agent configuration file.

See also “IKE tunnel (-k) primary option ” on page 702 for report details and examples.

The z/OS UNIX ipsec command dynamic tunnel (-y) option

z/OS UNIX ipsec command dynamic tunnel (-y) option parameters

display
Displays the security association (SA) data that is associated with the selected dynamic tunnels. The display reflects information from the SA and is not about specific systems or resources that are being protected by the SA. More information about the resources being protected can be determined by displaying the filter rules in place that correspond to a specific dynamic tunnel (ipsec -f display -a Ynn). Unless the -b option is specified, the dynamic SA information is obtained from the stack. Shadow tunnels are displayed only when the -s option is specified.

-r format
Display IP Security information in a given format. The default format is detail. See “The ipsec command general report concepts” on page 668 for a description of the different report formats.

-c scope
Displays the scope. The default scope is current.

current
Displays dynamic SA information about current SAs only. When selection criteria specifies a name (LocalDynVpnRuleName or IpDynVpnActionName), multiple current SAs can correspond to the specified name.

-all
Displays dynamic SA information about SAs, including SAs that might no longer be in use. This includes SAs that have been superseded by a refresh.

-b
Dynamic tunnel information for display comes from the specified stack, unless this option is also specified. With this option, the dynamic tunnel information for display comes from the IKE daemon.

-n IPDynVpnActionName
Specifies one or more dynamic tunnels that are to be selected. The names that are specified must correspond to IpDynVpnAction names that are specified in a Policy Agent configuration file.

-s
Displays shadow dynamic tunnel SAs from the stack. Shadow security associations are used by the sysplex-wide security associations (SWSA) function to distribute security associations to target stacks of distributed DVIPAs. See the considerations for sysplex-wide security associations information in the z/OS Communications Server: IP Configuration Guide for details.

activate
Activates one or more dynamic tunnels identified in a LocalDynVpnRule that is defined by a Policy Agent.
Rule: On the activate option you cannot specify an IpDynVpnAction name or tunnel ID.

deactivate
Deactivates the selected dynamic tunnels. To indicate all dynamic tunnels, specify -a all on the command. The dynamic tunnel becomes unavailable for IP traffic. New dynamic SAs can be established as needed (for example, on-demand or command requests).

Note: If -a Y0 is specified with -y deactivate, all dynamic tunnels with the tunnel ID Y0 (which indicates a dynamic tunnel with a current state not equal to DONE) are deactivated.

Restriction: Use this option only if there is concern that the cryptographic keys that are in use on the current SA have been compromised. Reactivating dynamic tunnels is a processor-intensive operation. If the scope of a deactivate request is large, then overall system performance can be affected.

refresh
Refreshes the cryptographic keys for the selected dynamic tunnels. Configuration options typically cause a refresh (and therefore a new set of cryptographic keys) on a lifetime or lifesize basis.

Restriction: Do not use this refresh option unless the current dynamic SA appears to be in a state that keeps it from being used for IP traffic. Refreshing dynamic tunnels is a processor intensive operation. If the scope of a refresh request is large, then overall system performance can be affected.

-a Ynn or -a all
Selects one or more dynamic tunnel IDs. The tunnel IDs must have a Y (dynamic) prefix.

Rule: The -a all option is valid only with the deactivate parameter and indicates that all dynamic tunnels are to be deactivated.

-l LocalDynVpnRuleName
Specifies one or more startable resource specifications for which dynamic SAs are to be established. The names that are specified must correspond to the LocalDynVpnRule names that are specified in a Policy Agent configuration file. A LocalDynVpnRule name becomes associated with a dynamic tunnel only through an ipsec command activation request or through autoactivation. Only those dynamic tunnels can be referenced with a LocalDynVpnRule name. Dynamic tunnels that were started by other means (for example, on-demand activation or as responder) have no LocalDynVpnRule name association and cannot be referenced with the -l option.

See also “Dynamic tunnel (-y) primary option” on page 709 for report details and examples.

The z/OS UNIX ipsec command interface (-i) option

z/OS UNIX ipsec command interface (-i) option parameters

display
Displays interface information that is defined to the specified TCP/IP stack.

-r format
Displays IP security information in a given format. The default format is detail. See “The ipsec command general report concepts” on page 668 for a description of the different report formats.

See also “Interface (-i) primary option” on page 724 for report details and examples.

The z/OS UNIX ipsec command IP traffic test (-t) option

z/OS UNIX ipsec command IP traffic test (-t) option parameters

SrcIpAddr
The source IP address of the traffic to be tested or protected.

DestIpAddr
The destination IP address of the traffic to be tested or protected.

Protocol Specification
A protocol keyword can be selected from those shown in the syntax diagram, or a protocol number of the traffic to be tested. The IP traffic test matches on protocol when the IP filter contains the same protocol number or when the IP filter applies to all protocols.
**SrcPortDestPort**

If the TCP or UDP protocol keywords are specified, then source and destination port numbers must be supplied. Port number 0 indicates to match any port.

For traffic that traverses a NAT, an internal remote port translation function is used in some cases to increase usability. Remote port translation is applicable only to ephemeral ports (ports in the range 1024 - 65 535). If the remote port translation function is being used, then there is both an original remote port value and a translated remote port value. The traffic test treats the input remote port (source port for an inbound packet, destination port for an outbound packet) as the original port value. In most cases when remote port translation is performed, the specific port value is not known and the value 0 should be specified on input to the traffic test. For more details about NAT traversal and remote port translation, see the remote port translation information in the z/OS Communications Server: IP Configuration Guide.

**Direction Specification**

The traffic direction can be specified as in or out. If the traffic direction keyword is not specified, then both in and out directions are used.

**SecurityClass**

If the traffic direction keyword in is specified, then a security class must be supplied. A SecurityClass value of 0 indicates to match any security class.

**-r format**

Displays IP Security information in a given format. The default format is detail. See “The ipsec command general report concepts” on page 668 for a description of the different report formats.

See also “IP traffic test (-t) primary option ” on page 725 for report details and examples.

**The z/OS UNIX ipsec command NATT port translation (-o) option**

**z/OS UNIX ipsec command NATT port translation (-o) option parameters**

**display**

Display the selected NAT traversal remote port translations. If no selected remote IP addresses are specified, all of the NAT traversal remote port translations are displayed by default. If there is a selected remote IP address (using the -q option), or if there is a selected remote IP address with one or more ports (using the -q -u options), then the selected NAT Traversal remote port translation information is displayed.

**-r**

Displays IP Security information in a given format. The default format is detail. See “The ipsec command general report concepts” on page 668 for a description of the different report formats.

**-q rmtIpAddr**

Displays the NAT traversal remote port translation information associated with the given remote IP addresses.

**-u rmtPort**

Displays the NAT traversal remote port translation information associated with the given remote ports. Valid values for rmtPort are in the range 1 - 65 535. The specified port value is matched against both the original port value and the translated port value.

See also “NATT port translation (-o) primary option ” on page 733 for report details and examples.

**The z/OS UNIX ipsec command IKED network security (-w) option**

**z/OS UNIX ipsec command IKED network security (-w) option parameters**

**display**

Display network security configuration information for the active stacks on the local system.

**-r format**

Display network security information in a given format. The default format is detail. See “The ipsec command general report concepts” on page 668 for a description of the different report formats.
The z/OS UNIX ipsec command network security server (-x) option

z/OS UNIX ipsec command network security server (-x) option parameters

**display**
Display information for each NSS IPSec client that is currently connected to the NSS server. When the -z option is specified, only information for the requested client is returned; otherwise, information is returned for each IPSec client that is connected to the server.

**-r format**
Display network security information in a given format. The default format is detail. See “The ipsec command general report concepts” on page 668 for a description of the different report formats.

The ipsec command report details and examples

This material contains descriptive information about the formatting and contents of ipsec reports, including examples.

The ipsec command general report concepts

In order to fully understand the following concepts and fields, you need some general knowledge of IP security. See IP security in z/OS Communications Server: IP Configuration Guide for more information about IP security. Also, see defensive filtering information in z/OS Communications Server: IP Configuration Guide for details about defensive filters.

The ipsec command report format

The -r option controls the output format of any display report: short, detail (default), and wide. The reported data is the same for all three report formats with the difference being the layout of the field headings and field values.

Tip: When the -z option is specified, the stack name on the first line of the report is changed from Stack Name to NSS Client Name.

**short**
Displays IP security information in short summary format. Short format displays minimal information on the screen in a vertical orientation. Each entry can span multiple lines. The heading lines for the record type are displayed once (and first), and contain a descriptive label for each record field that is displayed. Following the heading line, each record is displayed with one or more fields per line, arranged so that the primary name associated with the entry appears first and positionally separates the entries. Both the heading lines and the entry lines use a vertical bar (|) as a field separation character that delimits each value. The following example shows a short format.

```plaintext
ipsec -p tcpcs4 -f display -r short

670  z/OS Communications Server: IP System Administrator's Commands
### detail
Displays IP security information in detail format. Detail format displays all applicable details for the selected IP security information. Each entry can span multiple lines or even multiple screens. Each field of each entry record is shown with both the heading and value for the field. Entry records are separated by a line of asterisks.

Displays IP security information in wide format. Wide format displays each entry record (and the heading) on a single line of output. The heading line is first and each heading name is delimited by a vertical bar (|). This is followed by a line for each entry with all the data on a single line; values are also delimited by a vertical bar (|). Wide format is intended for use when redirecting output to a file. If this format is output to the screen, the lines wrap. See the following sample output for a key to the fields that are displayed.

```plaintext
ipsec -p tcpcs4 -f display -r wide

The ipsec command report heading

All display reports from the ipsec command begin with several heading lines, which give general information related to the request. The first three heading lines and the final line, which include a
selection count, exist in every report. Some reports might also have additional heading lines that contain information specific to the primary option.

**Tip:** When the `-z` option or the `-x` option is specified on the command, the stack name on the first line of the report is changed from Stack Name to NSS Client Name.

**Heading example:**

```
Line 1) CS V2R4 ipsec  Stack Name: TCPCS4  Fri Nov 25 06:53:45 2011
2) Primary: Filter          Function: Display            Format: Short
3) Source: Stack Policy    Scope:    Current            TotAvail: 164
4) Logging:  On            Predecap: Off             DVIPSec: Yes
5) NatKeepAlive:  20       FIPS140:  No                 DVLocalFltr: No
6) Defensive Mode: Inactive
7) Exclusion Address: 9.1.1.1
```

The first heading line shows the following fields:

**Stack Name**
The stack name that the command is associated with. If global defensive filters are being displayed (`-F dis -G`) the command is not associated with a stack. The Stack Name value is *ALL*.

**NSS Client Name**
The name that is associated with the NSS client's stack.

**<timestamp>**
The date and time of the report.

The second heading line shows:

**Primary**
The primary option as indicated by the request. The possible values are Filter, Defensive Filt, IKE tunnel, Dynamic tunnel, Manual tunnel, Interface, IP Traffic Test, NATT Port Trans, NSS Server, or Stack NSS.

**Function**
The function option for any report is display. If the request is for IKE tunnels with cascade (`-k dis -e`), then the function field displays display (cascade). If the request is for shadow dynamic tunnels (`-y dis -s`), then the function field displays display (shadows). If the request is for global defensive filters (`-F dis -G`), then the function field shows as display (global).

**Format**
The report format as indicated by the request. The possible values are detail, short, or wide.

The third heading line shows:

**Source**
The source of the data in the report.

Data sources are:

- Stack: Data is from the IP stack.
- IKED: Data is from the IKE daemon.
- DMD: Data is from the Defense Manager daemon.

For the Filter (`-f`) and IP traffic test (`-t`) primary options, the source is one of the following value:

- Stack Profile: Data is from the default IP security filter policy that is specified in the IP stack's profile.
- Stack Policy: Data is from the IP security filter policy that is specified by the Policy Agent.

For the defensive filter (`-F`) primary option, the source is one of the following value:

- Stack: Data is from the IP stack.
- DMD: Data is from the Defense Manager daemon.
For the Network security server (-x) primary option, the source is the server (data is from the NSS server).

**Scope**

The scope as indicated by the request.

- For the Filter (-f) primary option, the value is either current, policy, or profile (see “IP filter (-f) primary option” on page 681 for a discussion of the difference between policy and profile).
- For the IKE tunnel (-k) primary option, the value is current or all.
- For the Dynamic tunnel (-y) primary option, the value is current or all.
- For all other reports, the value is n/a.

**TotAvail**

The total number of items (filters or tunnel data) that are available from the stack. Depending on the selection criteria that is specified on the request, the report might not include all available entries. For example, a dynamic tunnel display for all tunnels (using the default Scope value of current) might format three tunnel entries, but the TotAvail field indicates the value 8. Reissuing the command with the Scope value all displays all eight tunnel entries and reveals that older, refreshed tunnels were not shown in the original display. For displays that are not stack oriented (Source is IKED), the value is n/a.

For the Filter (-f) and Defensive Filter (-F) primary options, the fourth heading line shows:

**Logging**

Indicates whether packet filter logging is in use globally for IP security filters.

- If the Source value is Stack Profile, the Logging value indicates the setting of the LOGENABLE or LOGDISABLE keyword of the IPSEC statement.
- If the Source value is Stack Policy, the Logging value is the same as the FilterLogging setting on the IpFilterPolicy statement.
- If the Source value is Stack, the value is n/a.
- If the Source value is DMD, the value is n/a.

**Tip:** Packet filter logging is always in use for defensive filters at a global level. Each defensive filter indicates whether packet filtering is in use for that filter.

**PreDecap**

Indicates whether decapsulated packets are first filtered at the stack.

- If the Source value is Stack Profile, the PreDecap value is Off.
- If the Source value is Stack Policy, the value indicates the PreDecap setting of the IpFilterPolicy statement.
- If the Source value is Stack, the value is n/a.
- If the Source value is DMD, the value is n/a.

**DVIPSec**

Indicates whether the filters for IP security tunnels that are associated with dynamic VIPA addresses can be distributed or moved during VIPA takeover or giveback. The value indicates the setting of the DVIPSEC keyword of the IPSEC statement in the TCPIP profile. This value applies to the treatment of both Stack Profile filters and Stack Policy filters. If the Source value is Stack or DMD, the value is n/a.

For the IP traffic test (-t) primary option, the fourth heading line shows:

**TestData**

Shows the test data as indicated from the request. The first and second positional fields are the source and destination IP address, respectively. The third positional field is the specified protocol. If the protocol is TCP or UDP, then the fourth and fifth positional fields are the source and destination port numbers, respectively.

For the IKE network security (-w) primary option the fourth heading line shows:
**System Name**
The name of the system on which the IKE daemon is running.

For the Network security server (-x) primary option the fourth heading line shows:

**System Name**
The name of the system on which the NSS server is running.

For all other primary options, there is no fourth heading line.

For the Filter (-f) and Defensive Filter (-F) primary options, the fifth heading line shows:

**NatKeepAlive**
The NAT keep alive interval in seconds that was defined with the NatKeepAliveInterval parameter on the KeyExchangePolicy statement. The value can be 0 (indicating that NAT keep alive messages should never be sent), or in the range 20 – 999 (indicating the number of seconds of inactivity that will trigger the sending of a NAT keep alive message). The default is 20 seconds. If the Source value is DMD, the value is n/a.

**FIPS140**
Specifies whether the stack is performing cryptographic operations using cryptographic algorithms and modules that are designed to meet the Federal Information Processing Standard (FIPS 140) security requirements. Possible values are:

- **Yes**
  All cryptographic operations performed by the stack are designed to meet the FIPS 140 security requirements.

- **No**
  The cryptographic operations performed by the stack are not designed to meet the FIPS 140 security requirements.

- **n/a**
  On the -F display, the FIPS140 field contains the value of n/a.

**DVLocalFtr**
Indicates whether IP filtering is enabled for TCP traffic between a client and an IPv4 dynamic VIPA that are defined on the same TCP/IP stack, when the traffic is forwarded to another TCP/IP stack. The value indicates the setting of the DVLOCALFTR keyword of the IPSEC statement in the TCP/IP profile. This value applies to the treatment of both Stack Profile filters and Stack Policy filters. If the Source value is Stack or DMD, the DVLocalFtr value is n/a.

For the Filter (-f) and Defensive Filter (-F) and IP traffic test (-t) primary options, subsequent heading lines show the following information:

**Defensive Mode**
Indicates the defensive filtering mode for the stack. The value is the same as the Mode setting on the DmStackConfig statement in the Defense Manager daemon (DMD) configuration file. The value is Active, Simulate, or Inactive. The value is Inactive if the Mode setting on the DmStackConfig statement is Inactive or if there is no DmStackConfig statement for this stack. If the Source value is DMD, the value is n/a.

**Exclusion Address**
If defensive filter processing is being used, you can specify an exclusion list of up to ten IP addresses or subnets in the DMD configuration file. This is intended to allow administrative access to the TCP/IP stack that could be inadvertently blocked by defensive filters. Inbound packets that originate from an IP address that is in the exclusion list are excluded from defensive filter processing. Outbound packets that are destined to an IP address that is in the exclusion list are excluded from defensive filter processing. Zero to ten Exclusion Address lines are included in the report heading.

The final line of any display report shows how many entries were actually listed in the report. Depending on the selection criteria that was specified on the request, the count of entries in the report might be less than the entire set.
The ipsec command report data

All data fields are shown, even if some of the fields are not applicable to the type of entry that is being displayed or if some of the fields are not applicable to the context of the data. For example, if a filter protocol is AH, the fields labeled ICMPType and ICMPCode remain part of the display, even though their values are n/a.

IP filter (-f) primary option

The -f primary option is used to display and manage IP filter rules that are used in the TCP/IP stack. The current IP security filter rules can originate from static configuration in the TCPIP profile (referred to here as PROFILE) or indirectly from a variety of filter and tunnel specifications, which are managed through the Policy Agent (referred to here as POLICY). A display of the current filters includes both IP security filter rules and defensive filter rules, if any exist. The defensive filter (-F) primary option provides management and further display of defensive filters.

See “The z/OS UNIX ipsec command IP filter (-f) option” on page 656 for parameter descriptions.

IP filter (-f) primary option syntax

See “The z/OS UNIX ipsec command syntax” on page 647 for -f primary option syntax.

IP filter (-f) primary option command examples

```
ipsec -f display -c current -p tcpcs1
Displays the current filter rules from stack tcpcs1. Both IP security filters and defensive filters are included, if in use.

ipsec -f display -c profile
Displays the profile IP security filter rules from the default stack.

ipsec -f dis -z nsclient1 -a y3
Displays the current filter rules from client nsclient1 that are related to dynamic tunnel y3. The request is directed to the NSS server.

ipsec -f dis -p tcpcs1 -a y2 -h
Displays the current filter rules from stack tcpcs1 that are related to dynamic tunnel y2 and include associated NRFs.

ipsec -f default -z nsclient1
Changes the IP security filter rule set that was obtained through the Policy Agent to the default IP security filter policy that was specified in the TCPIP profile. The request is directed to the NSS server.

ipsec -f reload
Changes the IP security filter rule set from the default IP security filter policy that was specified in the TCPIP profile to the IP security filter policy that was created in the Policy Agent.
```

Note: The inbound entries were truncated from the previous example. They have the same information format as the outbound entries that are displayed in that example.

**IP filter (-f) primary option report field descriptions**

For more information about the header, see “The ipsec command report heading” on page 677.

**FilterName**

All filter rules have a base name that is used for reference purposes.

**IP security filters**

The base FilterName value is assigned by the system for filters that were created from the TCPIP profile. For filters that were created from POLICY, the base FilterName value corresponds to the name field of the IpFilterRule statement. This is the name to use when you specify ipsec command selection criteria using the -n option.

**Defensive filters**

The base FilterName value corresponds to the name that was specified with the -N DefensiveFilterName on the ipsec -F add command that created the filter. This is the name to use when you specify Ipsec command selection criteria using the -N option. For global defensive filters, the generated stack specific filters have the same FilterName value as the global filters.

**FilterNameExtension**

Base filters as defined by the administrator might result in multiple filter rules maintained in the stack. The FilterNameExtension value is the system-assigned value that (when combined with the FilterName value) makes the filter unique.

**GroupName**

In POLICY, individual IpFilterRule statements can be grouped together into an IpFilterGroup group, which carries a name. If the individual filter is defined to an IpFilterGroup group, that name is displayed in this field. Use this name when specifying ipsec command selection criteria using the -g option.
LocalStartActionName
In POLICY, the IpFilterRule statement can reference an IpLocalStartAction statement (as part of the IpDynVpnAction specification) in order to control the local activation of a dynamic tunnel. If the individual filter is associated with an IpLocalStartAction statement, that name is displayed in this field.

VpnActionName
In POLICY, the IpFilterRule statement can reference an IpManVpnAction specification (for manual tunnels) or an IpDynVpnAction specification (for dynamic tunnels) in order to define how traffic should be managed between two security endpoints. If the individual filter is associated with an IpManVpnAction or IpDynVpnAction specification, that name is displayed in this field.

TunnelID
If the filter was created to control data traffic for a manual or dynamic tunnel, the tunnel ID with which the filter is associated is displayed in this field. The TunnelID parameter has the value M (for manual) or Y (for dynamic) followed by an arbitrary positive integer that was assigned by the system when the tunnel was activated. Use this name when specifying an `ipsec` command selection criteria using the -a option. If the filter Type is Dynamic Anchor or NATT anchor, the TunnelID is Y0. If the filter is not associated with a tunnel, the value is n/a.

Type
This field indicates whether the filter entry is one of the following values:

Manual
Statically defined for a manual tunnel.

Dynamic Anchor
Statically defined to control the creation of new filters for a dynamic tunnel.

Dynamic
Dynamically defined through negotiation through an IKE exchange.

NATT Dynamic
Dynamically defined through negotiation through an IKE exchange. The NATT dynamic filter is defined for an SA that traverses a NAT in certain configurations. See NATT anchor and NATT dynamic filters in the z/OS Communications Server: IP Configuration Guide for more information.

NATT Anchor
Dynamically defined to anchor the NATT dynamics.

NRF
Dynamically defined on inbound packet processing. The NRF filter is defined for traffic that is received over an SA that traverses a NAT in certain configurations. See NAT Resolution Filters (NRF) in the z/OS Communications Server: IP Configuration Guide for more information.

Generic
Statically defined to control traffic other than for a manual or dynamic tunnel

Defensive
Defensive filter defined with an `ipsec` -F add command.

DefensiveType
Indicates whether the defensive filter was added only to this stack or as a global filter to all eligible stacks on the z/OS system. Possible values are Global or Stack. If the DefensiveType value is Global, the filter was added globally to the z/OS system with the -G option. If the DefensiveType value is Stack, the filter was added to this stack with the -p option. If the filter is not a defensive filter, the value is n/a.

State
The current state of the filter entry. The `ipsec` command always displays active filter entries, so the value is always Active.

Action
Indicates the action that is to be taken on data traffic when the filter entry is invoked. Possible values are Permit, Deny, Defensive Block, or Defensive Simulate.
Results:

- When data traffic is to be protected with IPSec, the Action field displays the value Permit and the Type field displays one of the following values: Dynamic, Manual, NATT Dynamic, Dynamic Anchor, or NATT Anchor.

- A defensive filter has the action Defensive Block or Defensive Simulate that indicates the mode of the filter. If the Simulate mode is configured on the DmStackConfig statement in the DMD configuration file, that value overrides a mode of block on the defensive filter. If the Active mode is coded on the DmStackConfig statement, the mode setting of the filter is used. The Defensive Mode field in the report heading displays the mode from the configuration file of the DMD.

Scope
Indicates the scope of data traffic that is encompassed by the filter entry. Possible values are Local, Routed, or Both.

Direction
Indicates the direction of data traffic to which the filter entry applies. Possible values are Outbound or Inbound.

OnDemand
Indicates whether the filter entry was created to handle on-demand data traffic. This field is applicable only to filters associated with dynamic tunnels.

SecurityClass
The security class to which the filter entry applies. The security class is used to group interfaces by secure traffic patterns. The value 0 indicates that all security classes apply. For policy-configured dynamic anchor filters and generated dynamic filter rules, the security class value is always 0. For defensive filters, the security class value is always 0.

Logging
Indicates the logging that is to be performed when the filter is invoked. Possible values are:

- All
  A log entry is generated if data traffic is permitted or denied.

- Permit
  A log entry is generated only when data traffic is permitted.

- Deny
  A log entry is generated only when data traffic is denied.

- None
  No log entries are generated from this filter.

LogLimit
Indicates the average rate of defensive filter match messages that are allowed in a five-minute interval. A value of 0 indicates that filter match messages are not limited for this defensive filter. If the filter is not a defensive filter, the value is n/a. For more information see filter-match logging in z/OS Communications Server: IP Configuration Guide.

DiscardAction
Indicates the discard action for packets that are discarded as a result of this filter rule. Possible values are:

- Silent
  Packets are discarded silently.

- ICMP
  When a packet is discarded, an ICMP or ICMPv6 error is sent to the origin of the discarded packet to indicate that the packet was administratively prohibited.

Protocol
Indicates the protocol to which the filter applies. If the specification is for a specific protocol, the name and number of the protocol is displayed for commonly used protocols, or if the protocol is not commonly used, only the number of the protocol is displayed. See the following possible values:
All
  The specification is for all protocols.

Opaque
  The specification is for packets whose protocol is indeterminate.

ICMPType
  Indicates the ICMP type of the data traffic. The filter will match this type when the protocol is ICMP or ICMPv6. The value All indicates that the filter matches all ICMP types. The value Opaque indicates that the filter matches only packets with unknown ICMP types caused by packet fragmentation. The value n/a indicates that this field is not applicable to the current protocol.

ICMPTypeGranularity
  Granularity values are set in an IpLocalStartAction statement. These values control the data elements that are used in negotiating dynamic tunnels. If the granularity value was not set by an associated IpLocalStartAction statement, the display shows the default value. The value Rule indicates that dynamic tunnel negotiation uses the ICMP Type specification from the matching filter rule. The value Packet indicates that the dynamic tunnel negotiation uses the ICMP Type specification from the packet that initiated the dynamic tunnel activation. This field applies only when the filter type is Dynamic Anchor and the protocol is All, ICMP, or ICMPv6; the value n/a is displayed for all other cases.

ICMPCode
  Indicates the ICMP code of the data traffic. The filter matches this code when the protocol is ICMP or ICMPv6. The value All indicates that the filter matches all ICMP codes. The value Opaque indicates that the filter matches only packets with unknown ICMP codes caused by fragmentation. The value n/a indicates that this field is not applicable to the current protocol.

ICMPCodeGranularity
  Granularity values are set from an IpLocalStartAction statement. These values control the data elements that are used in negotiating dynamic tunnels. If the granularity value was not set by an associated IpLocalStartAction statement, the display shows the default value. The value Rule indicates that dynamic tunnel negotiation uses the ICMP Code specification from the matching filter rule. The value Packet indicates that the dynamic tunnel negotiation uses the ICMP Code specification from the packet that initiated the dynamic tunnel activation. This field applies only when the filter type is Dynamic Anchor and the protocol is All, ICMP, or ICMPV6; the value n/a is displayed for all other cases.

OSPFType
  Indicates the OSPF type of the data traffic. The filter matches this type when the protocol is OSPF. The value All indicates that the filter matches all OSPF types. The value n/a indicates that this field is not applicable to the current protocol.

MIPv6Type
  Indicates the MIPv6 type of the data traffic that the filter matches when the protocol is MIPv6. The value All indicates that the filter matches all MIPv6 types. The value Opaque indicates that the filter matches only packets with unknown MIPv6 types caused by packet fragmentation. The value n/a indicates that this field is not applicable to the current protocol.

MIPv6TypeGranularity
  Granularity values are set in an IpLocalStartAction statement. These values control the data elements that are used in negotiating dynamic tunnels. If the granularity value was not set by an associated IpLocalStartAction statement, the display shows the default value. The value Rule indicates that dynamic tunnel negotiation uses the MIPv6 type specification from the matching filter rule. The value Packet indicates that the dynamic tunnel negotiation uses the MIPv6 type specification from the packet that initiated the dynamic tunnel activation. This field applies only when the filter type is Dynamic Anchor and the protocol is All or MIPv6; the value n/a is displayed for all other cases.

TypeRange
  Indicates the upper value in the range of type numbers of the data traffic that the filter matches when the protocol is ICMP, ICMPv6, or MIPv6. The value n/a indicates that this field is not applicable to the current protocol, or that the tunnel's type selectors are entirely specified by either the ICMPType value or the MIPv6Type value.

690  z/OS Communications Server: IP System Administrator's Commands
**CodeRange**
Indicates the upper value in the range of code numbers of the data traffic that the filter matches when the protocol is ICMP or ICMPv6. The value n/a indicates that this field is not applicable to the current protocol, or that the tunnel’s code selectors are entirely specified by the Code value.

**TCPQualifier**
If the protocol is TCP and the direction of the filter rule specification was bidirectional, then additional criteria might have been specified to control TCP connection traffic. If the filter being displayed indicates a Direction value of Outbound, then this field displays Connect Outbound to indicate that TCP outbound connects are being controlled. If the filter being displayed indicates a Direction value of Inbound, this field displays Connect Inbound to indicate that TCP inbound connects are being controlled. If the protocol is not TCP, this field is not applicable.

**ProtocolGranularity**
Granularity values are set from an IpLocalStartAction statement to control the data elements used in negotiating dynamic tunnels. If the granularity value was not set by an associated IpLocalStartAction statement, the display shows the default value. The value Rule indicates that dynamic tunnel negotiation uses the protocol specification from the matching filter rule. The value Packet indicates that the dynamic tunnel negotiation uses the protocol specification from the packet that initiated the dynamic tunnel activation. This field applies only when the filter Type is Dynamic Anchor. The value n/a is displayed for all other cases.

**SourceAddress**
The source IP address to which this filter applies.
- If the SourceAddressPrefix and SourceAddressRange fields both indicate the value n/a, then the filter applies to this single IP address. Otherwise, the SourceAddress value is the base IP address for a collection of addresses to which the filter applies.
- If the SourceAddressPrefix field has a value, it represents a subnet mask and the combination of the SourceAddress value and the subnet mask defines the collection of addresses to which this filter applies.
- If the SourceAddressRange field has a value, it is the high end of a range of IP addresses (inclusive) to which this filter applies.
- If the SourceAddress value is all zeroes and either the SourceAddressPrefix value is 0 or the SourceAddressRange value is 255.255.255.255, then the filter applies to all source IP addresses.

**SourceAddressPrefix**
If this field contains a value, it represents a subnet mask, which in combination with the SourceAddress value, defines a collection of addresses to which this filter applies. The SourceAddressPrefix field is an integer that defines the number of high-order bits to be interpreted as a subnet mask. For example, the SourceAddressPrefix value 24 defines a subnet mask of 24 high-order bits or an address of 255.255.255.0. This subnet, as applied to the base IP address (the value SourceAddress), is the collection of addresses to which the filter applies.

**SourceAddressRange**
If this field contains a value, then the SourceAddress value is the first address of the range and the SourceAddressRange value indicates the final address of the range in a collection of addresses (inclusive) to which the filter applies.

**SourceAddressGranularity**
Granularity values are set from an IpLocalStartAction statement to control the data elements used in negotiating dynamic tunnels. If granularity values are not set by an associated IpLocalStartAction statement, the display shows the default value. The value Rule indicates that dynamic tunnel negotiation uses the source IP address specification from the matching filter rule. The value Packet indicates that dynamic tunnel negotiation uses the source IP address specification from the packet that initiated the dynamic tunnel activation. This field applies only when the filter Type is Dynamic Anchor. The value n/a is displayed for all other cases.

**SourcePort**
Indicates the source port number of the data traffic that the filter matches when the protocol is TCP or UDP. The value All indicates that the filter matches all source ports. The valueOpaque indicates that...
the filter matches only packets with unknown source ports caused by packet fragmentation. The value n/a indicates that this field is not applicable to the current protocol.

**SourcePortRange**
Indicates the upper value in the range of source port numbers of the data traffic that the filter matches when the protocol is TCP or UDP. The value n/a indicates that this field is not applicable to the current protocol, or that the filter's source port selectors are entirely specified by the SourcePort value.

**SourcePortGranularity**
Granularity values are set from an IpLocalStartAction statement to control the data elements used in negotiating dynamic tunnels. If granularity values are not set by an associated IpLocalStartAction statement, the display shows the default value. The value Rule indicates that dynamic tunnel negotiation uses the source port specification from the matching filter rule. The value Packet indicates that dynamic tunnel negotiation uses the source port specification from the packet that initiated the dynamic tunnel activation. This field applies only when the filter Type is Dynamic Anchor and Protocol is All, TCP or UDP. The value n/a is displayed for all other cases.

**DestAddress**
The destination IP address to which this filter applies.

- If the DestAddressPrefix and DestAddressRange fields both indicate the value n/a, then the filter applies to this single IP address. Otherwise, the DestAddress value is the base IP address for a collection of addresses to which the filter applies.
- If the DestAddressPrefix field has a value, it represents a subnet mask and the combination of the DestAddress value and the subnet mask defines the collection of addresses to which this filter applies.
- If the DestAddressRange field has a value, it is the high end of a range of IP addresses (inclusive) to which this filter applies.
- If the DestAddress value is all zeroes and either the DestAddressPrefix is 0 or the DestAddressRange is 255.255.255.255, then the filter applies to all destination IP addresses.

**DestAddressPrefix**
If this field contains a value, it represents a subnet mask, which in combination with the DestAddress value, defines a collection of addresses to which this filter applies. The DestAddressPrefix value is an integer that defines the number of high-order bits to be interpreted as a subnet mask. For example, if the DestAddressPrefix field contains the value 24, this defines a subnet mask of 24 high-order bits, or 255.255.255.0. This subnet, as applied to the base IP address (the value of DestAddress), is the collection of addresses to which the filter applies.

**DestAddressRange**
If this field contains a value, then the DestAddress value is the first address of the range and this field indicates the final address of the range in a collection of addresses (inclusive) to which the filter applies.

**DestAddressGranularity**
Granularity values are set from an IpLocalStartAction statement to control the data elements used in negotiating dynamic tunnels. If granularity values are not set by an associated IpLocalStartAction statement, the display shows the default value. The value Rule indicates that dynamic tunnel negotiation uses the destination IP address specification from the matching filter rule. The value Packet indicates that dynamic tunnel negotiation uses the destination IP address specification from the packet that initiated the dynamic tunnel activation. This field applies only when the filter Type is Dynamic Anchor. The value n/a is displayed for all other cases.

**DestPort**
Indicates the destination port number of the data traffic that the filter matches when the protocol is TCP or UDP. The value All indicates that the filter matches all destination ports. The value Opaque indicates that the filter matches only packets with unknown destination ports caused by packet fragmentation. The value n/a indicates that this field is not applicable to the current protocol.
DestPortRange
Indicates the upper value in the range of destination port numbers of the data traffic that the filter matches when the protocol is TCP or UDP. The value n/a indicates that this field is not applicable to the current protocol, or that the filter's destination port selectors are entirely specified by the DestPort value.

DestPortGranularity
Granularity values are set from an IpLocalStartAction statement to control the data elements used in negotiating dynamic tunnels. If granularity values are not set by an associated IpLocalStartAction statement, the display shows the default value. A value of Rule indicates that dynamic tunnel negotiation will use the destination port specification from the matching filter rule. A value of Packet indicates that dynamic tunnel negotiation will use the destination port specification from the packet that initiated the dynamic tunnel activation. This field applies only when the filter Type is Dynamic Anchor and Protocol is All, TCP or UDP. The value n/a is displayed for all other cases.

RemoteIdentityType
Specifies the type of the remote identity. This field is applicable only to dynamic anchor filters, dynamic filters, and NATT dynamic filters that are filtering on the basis of remote identity. If a value is specified in this field, it represents the remote IKE identity that is coded on a dynamic anchor filter, or the actual remote IKE identity determined for a dynamic filter or NATT dynamic filter. This field does not contain a value for shadow filters. Possible values are:

ID_IPV4_ADDR
An IPv4 address.

ID_IPV6_ADDR
An IPv6 address.

ID_FQDN
A fully qualified domain name.

ID_KEY_ID
An opaque byte stream.

ID_USER_FQDN
A user at a fully qualified domain name.

ID_DER_ASN1_DN
An X.500 distinguished name.

n/a
No remote identity is associated with this filter.

RemoteIdentity
Specifies the value of the remote identity. Contains the value n/a if no remote identity is present.

Restriction: If the RemoteIdentityType value is ID_KEY_ID, the RemoteIdentity value is truncated to avoid spanning multiple lines on a typical display device. An ellipsis is appended to the value to indicate that it was truncated. To display the entire value, use the wide (-r wide) display format.

FragmentsOnly
For a filter rule that might match routed traffic, this field indicates whether this filter rule applies to fragmented packets. Possible values are:

Yes
The filter rule matches only fragmented packets.

No
The filter rule matches both fragmented and non-fragmented packets.

OrigRmtConnPort
The connection port value of the remote endpoint. This field is applicable only for NRF filter entries. When the value is nonzero, remote port translation is being done and a remote port value of the connection might have been translated. The translated value is displayed as the SourcePort value for an inbound NRF entry and as the DestPort value for an outbound NRF entry. For other types of filter entries, the value in this field is n/a.
RmtIDPayload
For a NATT dynamic filter entry, this field displays the remote IP ID payload value for IKEv1 or remote Traffic Selector payload value for IKEv2. This field can display the value none, a single IP address, an IP address range, an IP address mask, or an MD5 hash of a non-IPv4 ID payload. For other types of filter entries, the value in this field is n/a.

RmtUdpEncapPort
For a NATT dynamic filter entry, this field is the UDP-encapsulated port number used by the remote security endpoint. For other types of filter entries, the value in this field is n/a.

CreateTime
For a statically defined filter that originates in the Policy Agent configuration, this field represents the time that the filter was first defined to the current instance of the TCP/IP stack. For a filter that originates in the TCP/IP profile, this field represents the time that the profile filter configuration was last replaced. For all dynamically defined filters, the value in this field is n/a.

UpdateTime
For a statically defined filter that originates in the Policy Agent configuration, this field represents the time that the attributes of the filter were last updated in the current instance of the TCP/IP stack. For a filter that originates in the TCP/IP profile, this field represents the time that the profile filter configuration was last replaced. For all dynamically defined filters, the value in this field is n/a.

FilterMatches
The number of times that a packet has matched this filter. For a NATT Dynamic filter entry, the value in this field is 0.

LifetimeExpires
For a defensive filter, this is the time at which the filter expires. For other types of filter entries, the value of this field is n/a.

AssociatedStackCount
The value of this field is always n/a on this display. This field is applicable only for a global defensive filter that is displayed from the DMD with the -G option.

Defensive filter (-F) primary option
Use the -F primary option to display and manage defensive filters both in the TCP/IP stack and at a global z/OS system level. Defensive filters deny traffic or simulate a denial. Traffic is checked first against defensive filters. If the traffic is not denied by a defensive filter, then the IP security filters are checked. See defensive filtering information in z/OS Communications Server: IP Configuration Guide for details. See “The z/OS UNIX ipsec command defensive filter (-F) option” on page 658 for parameter descriptions.

Defensive filter (-F) primary option syntax
See “The z/OS UNIX ipsec command syntax” on page 647 for -F primary option syntax.

Defensive filter (-F) primary option command examples
ipsec -F add srcip 192.30.30.0/24 dir inbound lifetime 30 mode block -p TCPCS1 -N Block_malformed
Adds a stack-specific defensive filter to the TCPCS1 stack with the name Block_malformed. The filter blocks inbound traffic from subnet 192.30.30.0/24 and remains installed in the stack for 30 minutes.

ipsec -F add destport 21 dir inbound lifetime 5 -G -N G_Block_local_FTP
Adds a global defensive filter with the name G_Block_local_FTP that blocks inbound traffic to port 21 for 5 minutes. The Defense Manager daemon (DMD) maintains a copy of the global filter and generates a copy that is installed in each local TCP/IP stack that is listed in the DMD configuration file that supports IP security.

ipsec -F update lifetime 10 -p TCPCS1 -N Block_malformed
Updates the lifetime for the stack-specific filter with the name Block_malformed on the TCPCS1 stack. The lifetime of the filter is 10 minutes from the time that the update is processed. The original lifetime value could be lengthened or shortened depending on when the update is processed.
**ipsec -F delete -N G_Block_local_FTP -p TCPCS1**
Deletes global filter G_Block_local_FTP from the TCPCS1 stack. The global filter remains in the DMD and it remains installed on other stacks on the local system.

**ipsec -F display -p TCPCS1**
Displays the defensive filters from stack TCPCS1.

**ipsec -F display -G**
Displays the global defensive filters from the DMD.

**Defensive filter (-F) primary option report example**

```
ipsec -F dis -p tcpcs1 -N Block_malformed

Defensive filter (-F) primary option field descriptions

For more information about the header, see “The ipsec command report heading” on page 677.

FilterName
All filter rules have a base name that is used for reference purposes. For defensive filters, the base FilterName value corresponds to the name specified with the -N DefensiveFilterName on the ipsec -F add command that created the filter. This is the name to use when you specify ipsec command selection criteria using the -N option. For global defensive filters, the stack-specific filters that are generated have the same FilterName value as the global filters.

FilterNameExtension
Base filters as defined by the administrator might result in multiple filter rules being maintained in the stack. The FilterNameExtension value is the system-assigned value that (when combined with the FilterName value) makes the filter unique.

GroupName
Not applicable for defensive filters.

LocalStartActionName
Not applicable for defensive filters.

VpnActionName
Not applicable for defensive filters.

TunnelID
Not applicable for defensive filters.

Type
The type value is always Defensive.

DefensiveType
Indicates whether the defensive filter was added only to this stack or as a global filter to all eligible stacks on the z/OS system. Possible values are Global or Stack. If the DefensiveType value is Global, the filter was added globally with the -G option to the z/OS system. If the DefensiveType value is Stack, the filter was added to this stack with the -p option.

State
The current state of the filter entry. The possible values are Active or Pending Inactive. The ipsec command always displays active filter entries from the stack, so the value for these entries is always Active. For a global filter that is displayed from the DMD with the -G option, the State value is Pending Inactive when the global filter has expired but one or more of its stack specific copies is active. The global filter is retained to allow global update and delete operations.

Action
Indicates the action that is to be taken on data traffic when the filter entry is invoked. Possible values are Defensive Block or Defensive Simulate, whichever is the mode of the filter. If you code the mode Simulate on the DmStackConfig statement in the DMD configuration file, this mode value overrides the defensive filter mode setting block. The mode value Active on the DmStackConfig statement honors the filter’s mode setting. The Defensive Mode field in the report heading displays the mode from the DMD configuration file.

Scope
Indicates the scope of data traffic that is encompassed by the filter entry. Possible values are Local, Routed, or Both.

Direction
Indicates the direction of data traffic to which the filter entry applies. Possible values are Outbound or Inbound.

OnDemand
Not applicable for defensive filters.
SecurityClass
The security class to which the filter entry applies. The security class is used to group interfaces by secure traffic patterns. The value 0 indicates that all security classes apply. For defensive filters, the security class value is always 0.

Logging
For a defensive filter with the Action value Defensive Block, the Logging field indicates the logging that is to be performed when the filter is invoked. Possible values are:

- All
  A log entry is generated.
- None
  No log entries are generated from this filter.

For a defensive filter with the Action value Defensive Simulate, logging is always performed when the filter is invoked. The Logging value is All (a log entry is generated).

LogLimit
Indicates the average rate of defensive filter match messages that are allowed in a five-minute interval. A value of 0 indicates that filter match messages are not limited for this defensive filter. For a global filter that is displayed from the DMD with the -G option, this field has the value Unspecified if loglimit was not specified on the ipsec add or update command. For more information, see filter-match logging in z/OS Communications Server: IP Configuration Guide.

Protocol
Indicates the protocol to which the filter applies. The value All indicates that the specification is for all protocols. If the specification is for a specific protocol, the name and number of the protocol is displayed for commonly used protocols. If the protocol is not commonly used, only the number of the protocol is displayed.

ICMPType
If the protocol is ICMP or ICMPv6, this field displays the type of ICMP message that is specified. If no ICMP type is specified, the value is All. If the protocol is not ICMP, this field is not applicable.

ICMPTypeGranularity
Not applicable for defensive filters.

ICMPCode
If the protocol is ICMP or ICMPv6, this field displays the code of ICMP message that is specified. If no ICMP code is specified, the value is All. If the protocol is not ICMP, this field is not applicable.

ICMPCodeGranularity
Not applicable for defensive filters.

OSPFType
If the protocol is OSPF, the value is All. If the protocol is not OSPF, this field is not applicable.

TCPQualifier
Not applicable for defensive filters.

ProtocolGranularity
Not applicable for defensive filters.

SourceAddress
The source IP address to which this filter applies.

- If the SourceAddressPrefix and SourceAddressRange fields both contain the value n/a, then the filter applies to this single IP address. Otherwise, the SourceAddress value is the base IP address for a collection of addresses to which the filter applies.
- If the SourceAddressPrefix field has a value, the value is an integer that specifies the number of high-order bits that are to be interpreted as a subnet mask, which is combined with the SourceAddress value to define the collection of addresses to which this filter applies.
- If the SourceAddress value is 0.0.0.0 and the SourceAddressPrefix is 0, then the filter applies to all source IPv4 addresses.
• If the SourceAddress value is :: and the SourceAddressPrefix is 0, then the filter applies to all source IPv6 addresses.

• If the SourceAddress value is All for a global filter that is displayed from the DMD with the -G option, then the global filter applies to all IPv4 and IPv6 source addresses. For a stack that supports IPv6, the DMD installs both an IPv4 and IPv6 defensive filter in the stack. If the SourceAddress value is All, the DestAddress value is All.

SourceAddressPrefix
If this field contains a value, it is an integer that specifies the number of high-order bits that are to be interpreted as a subnet mask. This value, when combined with the SourceAddress value, defines a collection of addresses to which this filter applies. For example, the SourceAddressPrefix value 24 defines a subnet mask of 24 high-order bits or the address 255.255.255.0. This subnet, as applied to the base IP address (the value of SourceAddress), is the collection of addresses to which the filter applies.

SourceAddressRange
Not applicable for defensive filters.

SourceAddressGranularity
Not applicable for defensive filters.

SourcePort
This field contains the number of the source port to which this filter applies. If a port range is specified, then SourcePort value is the first port number of the range. If the filter applies to all source ports, the value is All.

SourcePortRange
If this field contains a value, then the SourcePort value is the first port number of the range and this field indicates the final port number of the range in a collection of port numbers (inclusive) to which the filter applies.

SourcePortGranularity
Not applicable for defensive filters.

DestAddress
The destination IP address to which this filter applies.

• If the DestAddressPrefix and DestAddressRange fields both indicate the value n/a, then the filter applies to this single IP address. Otherwise, the DestAddress value is the base IP address for a collection of addresses to which the filter applies.

• If the DestAddressPrefix field has a value, that value represents a subnet mask. The combination of the DestAddress value and the subnet mask defines the collection of addresses to which this filter applies.

• If the DestAddress value is 0.0.0.0 and the DestAddressPrefix is 0, then the filter applies to all destination IPv4 addresses.

• If the DestAddress value is :: and the DestAddressPrefix is 0, then the filter applies to all destination IPv6 addresses.

• If the DestAddress value is All for a global filter displayed from the DMD with the -G option, then the global filter applies to all IPv4 and IPv6 destination addresses. For a stack that supports IPv6, the DMD installs both an IPv4 and IPv6 defensive filter in the stack. If the DestAddress value is All, the SourceAddress value is All.

DestAddressPrefix
If this field contains a value, the value represents a subnet mask, which in combination with the DestAddress value, defines a collection of addresses to which this filter applies. The DestAddressPrefix value is an integer that defines the number of high-order bits to be interpreted as a subnet mask. For example, if the DestAddressPrefix field contains the value 24, this defines a subnet mask of 24 high-order bits, or 255.255.255.0. This subnet, as applied to the base IP address (the value of DestAddress), is the collection of addresses to which the filter applies.

DestAddressRange
Not applicable for defensive filters.
DestAddressGranularity
Not applicable for defensive filters.

DestPort
Contains the number of the destination port to which this filter applies. If a port range was specified, then the DestPort value is the first port number of the range. If the filter applies to all destination ports, the value is All.

DestPortRange
If this field contains a value, then the DestPort value is the first port number of the range and this field indicates the final port number of the range in a collection of port numbers (inclusive) to which the filter applies.

DestPortGranularity
Not applicable for defensive filters.

OrigRmtConnPort
Not applicable for defensive filters.

RmtIDPayload
Not applicable for defensive filters.

RmtUdpEncapPort
Not applicable for defensive filters.

CreateTime
The time the defensive filter was added.

UpdateTime
The time the defensive filter was last updated.

DiscardAction
Indicates the discard action for packets that were discarded as a result of this filter rule. The value is Silent for a defensive filter, which indicates that packets are discarded silently with no ICMP notification.

MIPv6Type
Not applicable for defensive filters.

MIPv6TypeGranularity
Not applicable for defensive filters.

TypeRange
Not applicable for defensive filters.

CodeRange
Not applicable for defensive filters.

RemoteIdentityType
Not applicable for defensive filters.

RemoteIdentity
Not applicable for defensive filters.

FragmentsOnly
For a filter rule that might match routed traffic, this field indicates whether this filter rule applies to fragmented packets. Possible values are Yes (the rule matches only fragmented packets), No (the rule matches both fragmented and non-fragmented packets).

FilterMatches
The number of times a packet has matched this filter. For a global filter that is displayed from the DMD with the -G option, this field has the value n/a.

LifetimeExpires
The time the defensive filter will expire. For a global filter that is displayed from the DMD with the -G option, this field value is Expired when the global filter has expired but one or more of its stack-specific copies are still Active. The global filter is retained to allow global update and delete operations.
**AssociatedStackCount**

The number of TCP/IP stacks with which a global defensive filter is associated. This field is applicable only for a global filter that is displayed from the DMD with the `-G` option. For a defensive filter that is displayed without the `-G` option, this field has the value n/a.

**Manual tunnel (-m) primary option**

The `-m` primary option is used to display and manage manual tunnels as they are defined to the TCP/IP stack. Configuration for manual tunnels originates with `IpFilterRule` policy statements that include or reference `IpManVpnAction` statements.

See “The z/OS UNIX ipsec command manual tunnel (-m) option” on page 663 for parameter descriptions.

**Manual tunnel (-m) primary option syntax**

For `-m` primary option syntax see “The z/OS UNIX ipsec command syntax” on page 647.

**Manual tunnel (-m) primary option command examples**

**ipsec -m display**

Displays the current manual tunnel data from the default stack.

**ipsec -m activate -z nsclient1 -n ipManVpnAct1**

Activates the manual tunnel that was defined in policy as `ipManVpnAct1` for client `nsclient1`. The request is directed to the NSS server.

**ipsec -m deactivate -a M05**

Deactivates the manual tunnel with an ID of M05 (the tunnel ID was found from an earlier display command) for the default stack.

**Manual tunnel (-m) primary option report example**

```
ipsec -p tcpss2 -m display
  CS V2R4 ipsec Stack Name: TCPCS2 Fri Nov 25 07:11:45 2011

```
Manual tunnel (-m) primary option report field descriptions

For more information about the header, see “The ipsec command report heading” on page 677.

**TunnelID**

The ID that uniquely defines the manual tunnel. In this example, TunnelID has the value M (for manual) followed by an arbitrary positive integer that was assigned when the manual tunnel was installed in the stack by the Policy Agent. A change to the manual tunnel policy definition results in a new tunnel ID.

**VpnActionName**

The name of the IpManVpnAction statement in POLICY that defines this manual tunnel.

**State**

This field has the value Active or Inactive. The value Active indicates that the tunnel is available for use between the local endpoint and remote endpoint. The value Inactive indicates that the tunnel is not available and must be activated.

**LocalEndPoint**

The local security endpoint address, as defined by the LocalSecurityEndpointAddr field of the IpManVpnAction statement.

**RemoteEndPoint**

The remote security endpoint address, as defined by the RemoteSecurityEndpointAddr field of the IpManVpnAction statement.

**HowToEncap**

Indicates the encapsulation mode for the tunnel. Possible values are Transport or Tunnel.

**HowToAuth**

Indicates the protocol headers that are used to carry authentication data. Possible values are AH or ESP.

**AuthAlgorithm**

Indicates the authentication algorithm that is being used. Possible values are:

- AES-XCBC-MAC-96
- HMAC-MD5
- HMAC-SHA1
- HMAC-SHA2-256-128
- HMAC-SHA2-384-192
- HMAC-SHA2-512-256

**AuthInboundSpi**

Indicates the local Security Parameter Index.

**AuthOutboundSpi**

Indicates the remote Security Parameter Index.

**HowToEncrypt**

Indicates whether encryption is to be used, and if so, the encryption algorithm that is used. Possible values are:

- n/a
- AES-CBC
- DES-CBC
- 3DES-CBC

**EncryptInboundSpi**
If encryption is used, this field indicates the local Security Parameter Index.

**EncryptOutboundSpi**
If encryption is used, this field indicates the remote Security Parameter Index.

**KeyLength**
The length, in bits, of the key used by the encryption algorithm. The length is specified as n/a for algorithms with a fixed key length.

**OutboundPackets**
The total number of outbound packets that have been protected by the tunnel.

**OutboundBytes**
The total number of outbound bytes that have been protected by the tunnel.

**InboundPackets**
The total number of inbound packets that have been protected by the tunnel.

**InboundBytes**
The total number of inbound bytes that have been protected by the tunnel.

**PassthroughDF**
Indicates whether the don't-fragment bit is copied from the inner IP header to the outer IP header in tunnel mode. Possible values are:

- **Yes**
  The don't-fragment bit is copied to the outer IP header.

- **Clear**
  The don't-fragment bit is cleared in the outer header.

- **Set**
  The don't-fragment bit is set in the outer header.

- **n/a**
  The tunnel is not IPv4 or is not in tunnel mode.

**PassthroughDSCP**
Indicates whether the differentiated services code point (DSCP) value is copied from the inner IP header to the outer IP header in tunnel mode. Possible values are:

- **Yes**
  The DSCP value is copied to the outer IP header.

- **No**
  The DSCP value is set to 0 in the outer IP header.

- **n/a**
  The tunnel is not in tunnel mode.

**IKE tunnel (-k) primary option**
The -k primary option is used to display and manage IKE tunnels with respect to a particular TCP/IP stack. IKE tunnels are created to exchange key material on behalf of a dynamic tunnel. They are created using information from a KeyExchangeRule statement, which is located based on the local and remote addresses and (if available) the local and remote IDs that satisfy the needs of a specific data request (for example, a dynamic tunnel need). IKE tunnels can be displayed, deactivated, and refreshed using their tunnel ID. They can also be displayed based on the KeyExchangeRule statement with which they are associated. IKE tunnels have only a representation in the IKE daemon and each is associated with a specific stack.

See “The z/OS UNIX ipsec command IKE tunnel (-k) option” on page 664 for parameter descriptions.
**IKE tunnel (-k) primary option syntax**

For -k primary option syntax see “The z/OS UNIX ipsec command syntax” on page 647.

**IKE tunnel (-k) primary option command examples**

**ipsec -k display**
Displays the current IKE tunnels that are associated with the default stack.

**ipsec -k display -z nsclient1 -n keyExRule2 -e**
Displays the IKE tunnel that is defined in policy by the KeyExchangeRule statement keyExRule2 value. Additionally, displays the dynamic tunnels that are associated with the IKE tunnel. The request is directed to the NSS server.

**ipsec -k deactivate -a all**
Deactivates all IKE tunnels for the default stack. This causes all dynamic tunnels to be deactivated, effectively stopping all current dynamic tunnels and forcing new IKE tunnels to be created for any future activation.

**ipsec -k refresh -p tcpcs1 -a K05**
Refresh the IKE tunnel for stack tcpcs1 that is identified by K05 (the tunnel ID was obtained from an earlier display command). The current dynamic tunnels are not impacted by this request, but any new dynamic tunnel activation corresponding to K05 is associated with the refreshed IKE tunnel.

**IKE tunnel (-k) primary option report example**

```

IKE tunnel (-k) primary option report field descriptions

For more information about the header, see “The ipsec command report heading” on page 677.

**TunnelID**

The ID that uniquely defines the IKE tunnel. In this example, TunnelID has the value K (for IKE) followed by an arbitrary positive integer that was assigned by the system when the tunnel was defined. This is the name to use when specifying an ipsec command selection criteria using the -a option.

**Generation**

This number is used to differentiate SAs for the same tunnel. The first SA that is created for a given tunnel is number 1.

**IKEVersion**

Specifies the IKE major and minor version that is used to negotiate the tunnel. Possible values are:

- **1.x**
  - IKE version 1

- **2.x**
  - IKE version 2

**KeyExchangeRuleName**

The name of the KeyExchangeRule statement that was used to define and control the characteristics of the IKE tunnel. The KeyExchangeRuleName value is established at the time the IKE tunnel is established.

**KeyExchangeActionName**

The name of the KeyExchangeAction statement that was used to initiate the IKE tunnel. The KeyExchangeActionName value is established at the time the IKE tunnel is established.

**LocalEndpoint**

The local security endpoint address of the IKE tunnel.
LocalIDType
Specifies the type of the local identity. Possible values are:

**ID_IPV4_ADDR**
An IPv4 address.

**ID_IPV6_ADDR**
An IPv6 address.

**ID_FQDN**
A fully qualified domain name.

**ID_USER_FQDN**
A user at a fully qualified domain name.

**ID_DER_ASN1_DN**
An X.500 distinguished name.

**ID_KEY_ID**
A vendor-specific value used to perform certain proprietary forms of identification.

LocalID
Specifies the value of the local identity.

**Restriction:** If the LocalIDType value is ID_KEY_ID, the LocalID value is truncated to avoid spanning multiple lines on a typical display device. An ellipsis is appended to this value to indicate that it was truncated. To display the entire value, use the wide (-r wide) display format.

RemoteEndpoint
The remote security endpoint address of the IKE tunnel.

RemoteIDType
Specifies the type of the remote identity. Possible values are:

**ID_IPV4_ADDR**
An IPv4 address.

**ID_IPV6_ADDR**
An IPv6 address.

**ID_FQDN**
A fully qualified domain name.

**ID_USER_FQDN**
A user at a fully qualified domain name.

**ID_DER_ASN1_DN**
An X.500 distinguished name.

**ID_KEY_ID**
A vendor-specific value used to perform certain proprietary forms of identification.

RemoteID
Specifies the value of the remote identity.

**Restriction:** If the RemoteIDType value is ID_KEY_ID, then the RemoteID value is truncated to avoid spanning multiple lines on a typical display device. An ellipsis is appended to this value to indicate that it was truncated. To display the entire value, use the wide (-r wide) display format.

ExchangeMode
The exchange mode used to negotiate the IKE tunnel. Possible values for an IKEv1 tunnel are Aggressive or Main. This field is supported for IKEv1 tunnels only and is always set to n/a for IKEv2 tunnels.

State
The state of the tunnel with respect to the negotiation that occurs during activation.

Possible values for an IKEv1 tunnel are:
INIT
Indicates that no key exchange messages have been initiated.

WAIT SA
Indicates that the first key exchange message has been sent and the endpoint is waiting for a response.

IN KE
Indicates that a key exchange response has been sent.

WAIT KE
Indicates that a key exchange message has been sent and that the endpoint is waiting for a response.

DONE
Indicates that all key exchange messages have been completed and that the tunnel is available for data traffic.

EXPIRED
Indicates that tunnel has exceeded its lifetime and is not available for data traffic.

Possible values for an IKEv2 tunnel are:

INIT
Indicates that no key exchange messages have been initiated.

WAIT KE
Indicates that an SA Init request is in progress.

WAIT AUTH
Indicates that an SA Auth request is in progress.

DONE
Indicates that all key exchange messages have been completed and that the tunnel is available for data traffic.

HALF-CLOSED
Indicates that the tunnel is in the process of closing.

EXPIRED
Indicates that tunnel has exceeded its lifetime and is not available for data traffic.

Authentication Algorithm
Specifies the authentication algorithm that is used for authenticating IKE key exchange messages.

Possible values for IKEv1 tunnels are:

- HMAC-MD5
- HMAC-SHA1
- HMAC-SHA2-256-128
- HMAC-SHA2-384-192
- HMAC-SHA2-512-256

Possible values for IKEv2 tunnels are:

- AES128-XCBC-96
- HMAC-MD5-96
- HMAC-SHA1-96
- HMAC-SHA2-256-128
- HMAC-SHA2-384-192
- HMAC-SHA2-512-256
**EncryptionAlgorithm**
Specifies the encryption algorithm that is used for protecting IKE key exchange messages. Possible values are:
- AES-CBC
- DES-CBC
- 3DES-CBC

**KeyLength**
The length, in bits, of the key used by the encryption algorithm. The length is specified as n/a for algorithms with a fixed key length.

**PseudoRandomFunction**
Specifies the pseudo-random function that is used for generating keying material. For IKEv1, the PseudoRandomFunction value is always the same value as the AuthenticationAlgorithm value. For IKEv2, the pseudo-random function is negotiated separately and might differ from the authentication algorithm. Possible values are:
- AES128-XCBC
- HMAC-MD5
- HMAC-SHA1
- HMAC-SHA2-256
- HMAC-SHA2-384
- HMAC-SHA2-512

**DiffieHellmanGroup**
Indicates the Diffie-Hellman group that is used during key exchange. If no Diffie-Hellman group is used, the value is 0.

**LocalAuthenticationMethod**
Indicates the method that the remote peer is using to authenticate the local endpoint. Possible values are:
- PresharedKey
- RsaSignature
- ECDSA-256
- ECDSA-384
- ECDSA-521
- DigitalSignature
For IKEv1 tunnels, the authentication method is negotiated and it is always the same as the remote authentication method.
For IKEv2 tunnels, the authentication method is established by local policy and might differ from the remote authentication method.

**RemoteAuthenticationMethod**
Indicates the method that the local system is using to authenticate the remote endpoint. Possible values are:
- PresharedKey
- RsaSignature
- ECDSA-256
- ECDSA-384
- ECDSA-521
- Unknown - For IKEv2 tunnels only, the value Unknown is possible if the IKEv2 tunnel has not completed its initial exchanges.
For IKEv1 tunnels, the authentication method is negotiated and is always the same as the local authentication method.

For IKEv2 tunnels, the authentication method is established by policy on the remote peer and might differ from the local authentication method.

**InitiatorCookie**
During the phase 1 negotiation, the initiator created a cookie to identify itself during the exchange. This is the value of that cookie.

**ResponderCookie**
During the phase 1 negotiation, the responder created a cookie to identify itself during the exchange. This is the value of that cookie.

**Lifesize**
The number of kilobytes that can pass on the IKE tunnel before the tunnel must be refreshed. If the value is 0, then the refresh Lifesize value was None and byte counts are not used to monitor for tunnel refresh.

**CurrentByteCount**
The number of bytes that have been protected by the tunnel.

**Lifetime**
The number of minutes between each refresh.

**LifetimeRefresh**
The time at which the tunnel must be refreshed.

**LifetimeExpires**
The time at which the tunnel expires.

**ReauthInterval**
The number of minutes between each reauthentication.

**ReauthTime**
The time at which the tunnel must be reauthenticated.

**Role**
Indicates whether this endpoint was the initiator or responder on the IKE tunnel negotiation.

**AssociatedDynamicTunnels**
A count of how many dynamic tunnels depend on this IKE tunnel for their maintenance.

**NATTSupportLevel**
The level of NAT traversal support agreed to during the phase 1 SA negotiation. The following list shows the possible values:

**D2RFC**
Draft 2 of RFC 3947.

**D3RFC**
Draft 3 of RFC 3947.

**RFC**
RFC 3947, with a non-z/OS remote security endpoint.

**RFC_zOS**
RFC 3947, with a z/OS remote security endpoint.

**IKEv2**
RFC 5996, with a non-z/OS remote security endpoint.

**IKEv2_zOS**
RFC 5996, with a z/OS remote security endpoint.

**n/a**
NAT traversal is not supported for phase 1 SAs that use IPv6 addresses. This field has the value n/a.
None
No NAT Traversal support.

**NATInFrntLclScEndPnt**
Indicates whether or not a NAT has been detected in front of the local security endpoint. NAT traversal is not supported for phase 1 SAs using IPv6 addresses. In this case, the field has the value n/a.

**NATInFrntRmtScEndPnt**
Indicates whether or not a NAT has been detected in front of the remote security endpoint. NAT traversal is not supported for phase 1 SAs using IPv6 addresses. In this case, the field has the value n/a.

**zOSCanInitP1SA**
Indicates whether z/OS can initiate the initial phase 1 SA negotiation. NAT traversal is not supported for phase 1 SAs that use IPv6 addresses. In this case, the field has the value n/a.

**AllowNat**
Indicates whether NAT traversal support is enabled. This field indicates the configured setting of the AllowNat keyword. NAT traversal is not supported for phase 1 SAs that use IPv6 addresses. In this case, the field has the value n/a.

**RmtNAPTDetected**
Indicates whether or not a NAT in front of the remote security endpoint has been detected performing port address translation. The value Yes indicates that port address translation by a NAT in front of the remote security endpoint NAT has been detected; the value No indicates that it has not been detected. NAT traversal is not supported for phase 1 SAs that use IPv6 addresses. In this case, the field has the value n/a.

**RmtUdpEncapPort**
The UDP-encapsulated port number used by the remote security endpoint. This field is valid only for NAT-traversal tunnels. Otherwise, this field has the value n/a.

**Dynamic tunnel (-y) primary option**
The -y primary option is used to display and manage dynamic tunnels with respect to a particular TCP/IP stack. Dynamic tunnels that have a LocalDynVpnRule name defined can be activated, deactivated, refreshed, and displayed by referencing that LocalDynVpnRule name. When the dynamic tunnel is active, it has a tunnel ID and that tunnel ID can be used as selection criteria for displaying, deactivating, and refreshing the dynamic tunnel. Dynamic tunnels can also be referenced by their associated IpDynVpnAction name for display purposes.

Dynamic tunnels have a representation in the stack and also in the IKE daemon, so there are two versions of the display command, which are controlled by the -b option. When -b is specified, the dynamic tunnel data is reported from the IKE daemon. Otherwise, the dynamic tunnel data is reported from the stack. For any dynamic tunnel, some of the report data is unique to the stack representation, some of the report data is unique to the IKE daemon representation, and some of the report data is common. In general, the common data from each representation of a specific tunnel should match. However, because of timing considerations, the common data for a specific tunnel might not be completely consistent between the stack report and the IKE daemon report.

See “The z/OS UNIX ipsec command dynamic tunnel (-y) option” on page 665 for parameter descriptions.

**Dynamic tunnel (-y) primary option syntax**
For -y primary option syntax see “The z/OS UNIX ipsec command syntax” on page 647.

**Dynamic tunnel (-y) primary option command examples**

ipsec -y display
Displays the current dynamic tunnel data from the default stack.

**Tip:** The ipsec -y display -s command displays the same information; the header would indicate Display (shadows).
ipsec -y display -z nsclient1 -b
Displays the current dynamic tunnel data from the IKE daemon for NSS client nsclient1. The request is directed to the NSS server.

ipsec -y deactivate -a Y03
Deactivates the dynamic tunnel identified as Y03 (the tunnel ID was obtained from an earlier display command) from the default stack.

ipsec -y activate -l localDynVpnRule2
Activates the dynamic tunnel that is defined by the LocalDynVpnRule statement named localDynVpnRule2 from the default stack.

ipsec -y refresh -l localDynVpnRule1 -z nsclient1
Refreshes the dynamic tunnel that is defined by the LocalDynVpnRule statement named localDynVpnRule1 for NSS client nsclient1. The request is directed to the NSS server.

Dynamic tunnel (-y) primary option report field descriptions

For more information about the header, see “The ipsec command report heading” on page 677.

**TunnelID**

The ID that uniquely defines the dynamic tunnel. In this example, TunnelID has the value Y (for dynamic) followed by an arbitrary positive integer that was assigned by the system when the tunnel was defined. This is the name to use when specifying an `ipsec` command selection criteria using the -a option.
Generation
This number is used to differentiate SAs for the same tunnel. The first SA that is created for a given tunnel is number 1.

IKEVersion
Specifies the IKE major and minor version that is used to negotiate the tunnel. The possible values are:

1.x
IKE version 1
2.x
IKE version 2

ParentIKETunnelID
The tunnel ID of the phase 1 (IKE) tunnel that enables the creation of this dynamic tunnel.

VpnActionName
The name of the IpDynVpnAction statement in POLICY that defines this dynamic tunnel.

LocalDynVpnRule
The name of the LocalDynVpnRule statement with which the dynamic tunnel is associated. This is the name to use when specifying ipsec command selection criteria using the -l option. If the dynamic tunnel is not associated with a LocalDynVpnRule statement, the value is n/a. The LocalDynVpnRule value is established at the time the IKE tunnel is established.

State
Possible state values are:

Active
Indicates that the tunnel is available for use between the local endpoint and the remote endpoint.

Expired
Indicates that the tunnel reached its lifetime or lifesize value and could not be refreshed.

Refreshed
Indicates that the tunnel structure is not the current one representing the tunnel; another entry with the same TunnelID is considered current.

HowToEncap
Indicates the encapsulation mode for the tunnel. Possible values are Transport or Tunnel.

LocalEndPoint
The local security endpoint address of the dynamic tunnel.

RemoteEndPoint
The remote security endpoint address of the dynamic tunnel.

LocalAddressBase
The LocalAddressBase field describes the IP traffic protected by this dynamic tunnel. If the LocalAddressPrefix field and the LocalAddressRange field each display the value n/a, then the tunnel protects traffic with this single source address. Otherwise, the tunnel protects traffic with the source address described by the LocalAddressBase field and the corresponding mask or range.

LocalAddressPrefix
The LocalAddressBase field and the LocalAddressPrefix field describe the IP traffic protected by this dynamic tunnel. If this field does not display the value n/a, then the tunnel protects traffic whose source address is in the range defined by the LocalAddressBase field and the subnet indicated by this prefix.

LocalAddressRange
The LocalAddressBase field and the LocalAddressRange field describe the IP traffic protected by this dynamic tunnel. If this field does not display the value n/a, then the tunnel protects traffic in the range of IP addresses between the LocalAddressBase field value and this address (inclusive).
**RemoteAddressBase**
The RemoteAddressBase field describes the IP traffic protected by this dynamic tunnel. If the RemoteAddressPrefix field and RemoteAddressRange field display the value n/a, then the tunnel protects traffic with this single destination address. Otherwise, the tunnel protects traffic with the destination address described by the RemoteAddressBase field and the corresponding mask or range.

**RemoteAddressPrefix**
The RemoteAddressBase field and the RemoteAddressPrefix field describe the IP traffic protected by this dynamic tunnel. If this field does not display the value n/a, then the tunnel protects traffic whose destination address is in the range defined by the RemoteAddressBase field and the subnet indicated by this prefix.

**RemoteAddressRange**
The RemoteAddressBase field and the RemoteAddressRange field describe the IP traffic protected by this dynamic tunnel. If this field does not display the value n/a, then the tunnel protects traffic in the range of IP addresses between the RemoteAddressBase field value and this address (inclusive).

**HowToAuth**
Indicates what protocol headers are used to carry authentication data. Possible values are AH or ESP.

**AuthAlgorithm**
Indicates what authentication algorithm is being used. Possible values are:
- NULL
- AES-GMAC-128
- AES-GMAC-256
- AES-XCBC-MAC-96
- HMAC-MD5
- HMAC-SHA1
- HMAC-SHA2-256-128
- HMAC-SHA2-384-192
- HMAC-SHA2-512-256

**AuthInboundSpi**
Indicates the local Security Parameter Index.

**AuthOutboundSpi**
Indicates the remote Security Parameter Index.

**HowToEncrypt**
Indicates whether encryption is to be used, and if so, which encryption algorithm is used. Possible values are:
- AES-CBC
- AES-GCM-16
- DES-CBC
- 3DES-CBC
- NULL

**Note:** This value is displayed when no encryption is used and ESP protocol headers are in use.

- n/a

**Note:** This value is displayed when no encryption is used and AH protocol headers are in use.

**EncryptInboundSpi**
If encryption is being used, this field indicates the local Security Parameter Index.

**EncryptOutboundSpi**
If encryption is being used, this field indicates the remote Security Parameter Index.
**KeyLength**
The length, in bits, of the key used by the encryption algorithm. The length is specified as n/a for algorithms with a fixed key length, or if encryption is not used.

**Protocol**
Indicates the protocol that the dynamic tunnel is protecting. The value 0 indicates that the dynamic tunnel is protecting all protocols.

**LocalPort**
Indicates the source port number of the data traffic that the dynamic tunnel is protecting when the protocol is TCP or UDP. The value All indicates that the dynamic tunnel is protecting all source ports. The value Opaque indicates that the dynamic tunnel is protecting only packets with unknown source ports caused by packet fragmentation. The value n/a indicates that this field is not applicable to the current protocol.

**LocalPortRange**
Indicates the upper value in the range of source port numbers of the data traffic that the dynamic tunnel is protecting when the protocol is TCP or UDP. The value n/a indicates that this field is not applicable to the current protocol or that the tunnel's source port selectors are entirely specified by the LocalPort value.

**RemotePort**
Indicates the destination port number of the data traffic that the dynamic tunnel is protecting when the protocol is TCP or UDP. The value All indicates that the dynamic tunnel is protecting all destination ports. The value Opaque indicates that the dynamic tunnel is protecting only packets with unknown destination ports caused by packet fragmentation. The value n/a indicates that this field is not applicable to the current protocol.

**RemotePortRange**
Indicates the upper value in the range of destination port numbers of the data traffic that the dynamic tunnel is protecting when the protocol is TCP or UDP. The value n/a indicates that this field is not applicable to the current protocol or that the tunnel's destination port selectors are entirely specified by the RemotePort value.

**Type**
Indicates the type of the data traffic that the dynamic tunnel is protecting when the protocol is ICMP, ICMPv6 or MIPv6. The value All indicates that the dynamic tunnel is protecting all types. The value Opaque indicates that the dynamic tunnel is protecting only packets with unknown types caused by packet fragmentation. The value n/a indicates that this field is not applicable to the current protocol.

**TypeRange**
Indicates the upper value in the type range of the data traffic that the dynamic tunnel is protecting when the Protocol value is ICMP, ICMPv6, or MIPv6. The value n/a indicates that this field is not applicable to the current protocol or that the type selectors for the tunnel are entirely specified by the Type value. This field is not applicable for protocols other than ICMP, ICMPv6, or MIPv6.

**Code**
Indicates the specific type of the data traffic that the dynamic tunnel is protecting when the protocol is ICMP or ICMPv6. The value All indicates that the dynamic tunnel is protecting all codes. The value Opaque indicates that the dynamic tunnel is protecting only packets with unknown codes caused by packet fragmentation. The value n/a indicates that this field is not applicable to the current protocol.

**CodeRange**
Indicates the upper value in the range of code numbers of the data traffic that the dynamic tunnel is protecting when the protocol is ICMP or ICMPv6. The value n/a indicates that this field is not applicable to the current protocol, or else that the tunnel's type selectors are entirely specified by the Code value.

**OutboundPackets**
The total number of outbound packets that have been protected by the tunnel. This counter is maintained with the current tunnel structure so that when the tunnel is refreshed, the counter restarts at 0. The counter is updated only on the system at which the data traffic is encapsulated. In a SWSA environment, the field shows the total count for the local stack only (distributor or target), and not for any other distributed version of the tunnel in the sysplex.
OutboundBytes
The total number of outbound bytes that have been protected by the tunnel. This counter is maintained with the current tunnel structure so that when the tunnel is refreshed, the counter restarts at 0. The counter is updated only on the system at which the data traffic is encapsulated. In a SWSA environment, the field shows the total count for the local stack only (distributor or target), and not for any other distributed version of the tunnel in the sysplex.

InboundPackets
The total number of inbound packets that have been protected by the tunnel. This counter is maintained with the current tunnel structure so that when the tunnel is refreshed, the counter restarts at 0. The counter is updated only on the system at which the data traffic is decapsulated. In a SWSA environment, the field shows the total count for the local stack only (distributor or target), and not for any other distributed version of the tunnel in the sysplex.

InboundBytes
The total number of inbound bytes that have been protected by the tunnel. This counter is maintained with the current tunnel structure so that when the tunnel is refreshed, the counter restarts at 0. The counter is updated only on the system at which the data traffic is decapsulated. In a SWSA environment, the field shows the total count for the local stack only (distributor or target), and not for any other distributed version of the tunnel in the sysplex.

Lifesize
The number of kilobytes that can be protected by the tunnel before it must be refreshed. If the value is 0, then the refresh Lifesize value was None and byte counts are not used to monitor for tunnel refresh.

LifesizeRefresh
The total number of kilobytes that can be protected by the tunnel before it is refreshed. This is the refresh Lifesize value minus a threshold that enables the tunnel refresh to occur without traffic disruption. If the value is 0, then the refresh Lifesize value was None; byte counts are not used to monitor for a tunnel refresh.

CurrentByteCount
The number of bytes that have been protected by the tunnel. If the Lifesize value is 0, then this value is also 0.

LifetimeRefresh
A timestamp that indicates the time at which the tunnel must be refreshed. If the refresh time for the tunnel was 0, this value is n/a.

LifetimeExpires
A timestamp that indicates the time at which the tunnel expires. This is the LifetimeRefresh value minus a threshold that enables the tunnel refresh to occur without traffic disruption. If the refresh time for tunnel was 0, this value is n/a.

CurrentTime
A timestamp that indicates the current time of this display. This is for comparison with the values for the LifetimeRefresh, LifetimeExpires, and VPNLifeExpires fields.

VPNLifeExpires
A timestamp that indicates the time at which the tunnel expires and can no longer be used.

PassthroughDF
Indicates whether the don't-fragment bit is copied from the inner IP header to the outer IP header in tunnel mode. Possible values are:

Yes
The don't-fragment bit is copied to the outer IP header.

Clear
The don't-fragment bit is cleared in the outer header.

Set
The don't-fragment bit is set in the outer header.
n/a
The tunnel is not IPv4 or is not in tunnel mode.

**PassthroughDSCP**
Indicates whether the differentiated services code point (DSCP) value is copied from the inner IP header to the outer IP header in tunnel mode. Possible values are:

**Yes**
The DSCP value is copied to the outer IP header.

**No**
The DSCP value is set to 0 in the outer IP header.

n/a
The tunnel is not in tunnel mode.

**UdpEncapMode**
Indicates whether or not UDP encapsulation is being applied to an SA to enable it to traverse a NAT.

**LclNATDetected**
Indicates whether or not a NAT has been detected in front of the local security endpoint.

**RmtNATDetected**
Indicates whether or not a NAT has been detected in front of the remote security endpoint.

**RmtNAPTDetected**
Indicates whether or not a NAT in front of the remote security endpoint has been detected performing port address translation. The value **Yes** indicates that port address translation by a NAT in front of the remote security endpoint NAT was detected; the value **No** indicates that it was not detected. A NAPT (network address protocol translator) can be detected by IKE, the stack, or by both. There might be cases where the stack detects NAPT but IKE does not detect NAPT, or where IKE detects NAPT but the stack does not detect NAPT. In these cases, the IKE NAPT settings might not match the stack's NAPT settings. However, this setting should be consistent within the IKE daemon for all tunnels negotiated with the same remote security endpoint IP address.

**RmtIsGw**
Indicates whether or not the remote security endpoint is acting as a security gateway when UDP encapsulation is being applied to an SA. If UDP encapsulation is not being used, this field displays the value n/a.

**RmtIsZOS**
Indicates whether or not the remote security endpoint is z/OS when UDP encapsulation is being applied to an SA. If UDP encapsulation is not being used, this field displays the value n/a.

**zOSCanInitP2SA**
Indicates whether or not z/OS can initiate the initial phase 2 SA negotiation.

**RmtUdpEncapPort**
The UDP-encapsulated port number used by the remote security endpoint. This field is valid only for NAT-traversal tunnels. Otherwise, this field displays the value n/a.

**SrcNATOARecvd**
For a UDP-encapsulated transport SA: Source NAT original IP address received during the IKE negotiation. The IKE peer sends the source IP address that it is aware of. If the IKE peer is behind a NAT device, this is the peer's private address. This value is 0.0.0.0 if a source NAT original IP address was not received. An IKE peer at a pre-RFC3947 NAT Traversal support level cannot send a source NAT-OA payload containing the original IP address. For information about accessing RFCs, see Appendix G, “Related protocol specifications,” on page 1117.

For a non-UDP-encapsulated transport SA: The value is n/a.

**DstNATOARecvd**
For a UDP-encapsulated transport SA: Destination NAT original IP address received during the IKE negotiation. The IKE peer sends the destination IP address that it is aware of. If this host is behind a NAT, the value displayed can be the public address of the host. This value is 0.0.0.0 if a destination NAT original IP address was not received. An IKE peer at a pre-RFC3947 NAT traversal support level...
cannot send a destination NAT-OA payload containing the original IP address. For information about accessing RFCs, see Appendix G, “Related protocol specifications,” on page 1117.

**For a non-UDP-encapsulated transport SA:** The value is n/a.

### Dynamic tunnel (-y) primary option report examples

Managing network security 717
Dynamic tunnel (-y) primary option report field descriptions

For more information about the header, see “The ipsec command report heading” on page 677.

TunnelID
The ID that uniquely defines the dynamic tunnel. In this example, the TunnelID has the value Y (for dynamic), followed by an arbitrary positive integer that was assigned by the system when the tunnel was defined. This is the name to use when specifying an ipsec command selection criteria using the -a option. The tunnel ID is Y0 unless the state is DONE.

Generation
This number is used to differentiate SAs for the same tunnel. The first SA that is created for a given tunnel is number 1.

IKEVersion
Specifies the IKE major and minor version that is used to negotiate the tunnel. The possible values are:

1.x
IKE version 1

2.x
IKE version 2
**ParentIKETunnelID**
The tunnel ID of the phase 1 (IKE) tunnel that enabled the creation of this dynamic tunnel.

**VpnActionName**
The name of the IpDynVpnAction statement in POLICY that defines this dynamic tunnel.

**LocalDynVpnRule**
The name of the LocalDynVpnRule statement with which the dynamic tunnel is associated. This is the name to use when specifying the `ipsec` command selection criteria using the `-l` option. If the dynamic tunnel is not associated with a LocalDynVpnRule statement, the value is `n/a`. The LocalDynVpnRule value is established at the time the IKE tunnel is established.

**IpFilterRule**
The name of the dynamic anchor rule in POLICY that controlled the creation of the dynamic tunnel. The IpFilterRule value is established at the time the IKE tunnel is established.

**State**
This is the state of the tunnel with respect to the negotiation that occurs during activation. Possible values are:

- **INIT**
  Indicates that no key exchange messages have been initiated.

- **KEP**
  Indicates that key exchange messages are being processed, but that the full exchange has not completed.

- **DONE**
  Indicates that all key exchange messages have been completed and that the tunnel is usable for data traffic.

- **NOTIFY**
  Indicates that key exchange messages have been completed, but that until a connection notification is received from the tunnel endpoint, the tunnel is not done.

- **PENDING**
  Indicates that the report is for a dynamic tunnel request that is pending the activation of an IKE tunnel to allow it to begin; PENDING is the value only when the dynamic tunnel report is part of an IKE report that cascades the associated dynamic tunnels, where a pending dynamic tunnel request is shown with this state value.

**HowActivated**
Indicates the way in which this tunnel was activated. Possible values are:

- **Command**
  Indicates that the tunnel was activated as a result of an `ipsec` command invocation.

- **OnDemand**
  Indicates that the tunnel was activated to satisfy locally initiated data traffic.

- **Auto**
  Indicates that the tunnel was activated automatically when the IKE daemon received configuration information from Policy Agent.

- **VIPA**
  Indicates that the tunnel was activated as part of a SWSA takeover.

- **Remote**
  Indicates that the tunnel was initiated remotely and that this security endpoint was the responder in the negotiations.

**HowToEncap**
Indicates the encapsulation mode for the tunnel. Possible values are `Transport` or `Tunnel`.

**LocalEndPoint**
The local security endpoint address of the dynamic tunnel.
RemoteEndPoint
The remote security endpoint address of the dynamic tunnel.

LocalAddressBase
LocalAddressBase describes the IP traffic protected by this dynamic tunnel. If the LocalAddressPrefix and LocalAddressRange fields display the value n/a, then the tunnel protects traffic with this single source address. Otherwise, the tunnel protects traffic with the source address described by the LocalAddressBase field and the corresponding mask or range.

LocalAddressPrefix
The LocalAddressBase and LocalAddressPrefix fields describe the IP traffic protected by this dynamic tunnel. If this field does not display the value n/a, then the tunnel protects traffic whose source address is in the range defined by the LocalAddressBase field and the subnet indicated by this prefix.

LocalAddressRange
The LocalAddressBase and LocalAddressRange fields describe the IP traffic protected by this dynamic tunnel. If this field does not display the value n/a, then the tunnel protects traffic in the range of IP addresses between the LocalAddressBase field value and this address (inclusive).

RemoteAddressBase
RemoteAddressBase describes the IP traffic protected by this dynamic tunnel. If the RemoteAddressPrefix and RemoteAddressRange fields display the value n/a, then the tunnel protects traffic with this single destination address. Otherwise, the tunnel protects traffic with the destination address described by the RemoteAddressBase field and the corresponding mask or range.

RemoteAddressPrefix
The RemoteAddressBase and RemoteAddressPrefix fields describe the IP traffic protected by this dynamic tunnel. If this field does not display the value n/a, then the tunnel protects traffic whose destination address is in the range defined by the RemoteAddressBase field and the subnet indicated by this prefix.

RemoteAddressRange
The RemoteAddressBase and RemoteAddressRange fields describe the IP traffic protected by this dynamic tunnel. If this field does not display the value n/a, then the tunnel protects traffic in the range of IP addresses between the RemoteAddressBase field value and this address (inclusive).

HowToAuth
Indicates what protocol headers are used to carry authentication data. Possible values are AH or ESP.

AuthAlgorithm
Indicates what authentication algorithm is being used. Possible values are:

• NULL
• AES-GMAC-128
• AES-GMAC-256
• AES-XCBC-MAC-96
• HMAC-MD5
• HMAC-SHA1
• HMAC-SHA2-256-128
• HMAC-SHA2-384-192
• HMAC-SHA2-512-256

AuthInboundSpi
Indicates the local Security Parameter Index.

AuthOutboundSpi
Indicates the remote Security Parameter Index.

HowToEncrypt
Indicates whether encryption is to be used, and if so, which encryption algorithm is used. Possible values are:
• AES-CBC
• AES-GCM-16
• DES-CBC
• 3DES-CBC
• NULL

Note: This value is displayed when no encryption is used and ESP protocol headers are in use.
• n/a

Note: This value is displayed when no encryption is used and AH protocol headers are in use.

EncryptInboundSpi
If encryption is being used, this field indicates the remote Security Parameter Index.

EncryptOutboundSpi
If encryption is being used, this field indicates the local Security Parameter Index.

KeyLength
The length, in bits, of the key used by the encryption algorithm. The length is specified as n/a for algorithms with a fixed key length.

Lifesize
The number of kilobytes that can be protected by the tunnel before it must be refreshed. If the value is 0, then the refresh Lifesize value was None; byte counts are not used to monitor for tunnel refresh.

LifesizeRefresh
The total number of kilobytes that can be protected by the tunnel before it is refreshed. This is the refresh Lifesize value minus a threshold that enables the tunnel refresh to occur without traffic disruption. If the value is 0, then the negotiated refresh Lifesize value was None; byte counts are not used to monitor for tunnel refresh.

Lifet imeRefresh
A timestamp indicating the time at which the tunnel must be refreshed. This is the lifetime expire value minus a threshold that enables the tunnel refresh to occur without traffic disruption.

LifetimeExpires
A timestamp indicating the time at which the tunnel expires.

CurrentTime
A timestamp indicating the current time of this display. This is for comparison with LifetimeRefresh, LifetimeExpires, and VPNLifeExpires values.

VPNLifeExpires
A timestamp indicating the time at which the tunnel expires and can no longer be used.

AssociatedFiltProtocol
Indicates the protocol that is being protected by the dynamic tunnel. The value 0 indicates that the dynamic tunnel is protecting all protocols.

AssociatedFiltSrcPort
Indicates the source port number of the data traffic that the dynamic tunnel is protecting when the protocol is TCP or UDP. The value All indicates that the dynamic tunnel is protecting all source ports. The value Opaque indicates that the dynamic tunnel is protecting only packets with unknown source ports caused by packet fragmentation. The value n/a indicates that this field is not applicable to the current protocol.

AssociatedFiltSrcPortRange
Indicates the upper value in the range of source port numbers of the data traffic that the dynamic tunnel is protecting when the protocol is TCP or UDP. The value n/a indicates that this field is not applicable to the current protocol, or that the tunnel's source port selectors are entirely specified by the AssociatedFiltSrcPort value.
**AssociatedFiltDestPort**
Indicates the destination port number of the data traffic that the dynamic tunnel is protecting when the protocol is TCP or UDP. The value All indicates that the dynamic tunnel is protecting all destination ports. The value opaque indicates that the dynamic tunnel is protecting only packets with unknown destination ports caused by packet fragmentation. The value n/a indicates that this field is not applicable to the current protocol.

**AssociatedFiltDestPortRange**
Indicates the upper value in the range of destination port numbers of the data traffic that the dynamic tunnel is protecting when the protocol is TCP or UDP. The value n/a indicates that this field is not applicable to the current protocol or that the tunnel's destination port selectors are entirely specified by the AssociatedFiltDestPort value.

**AssociatedFiltType**
Indicates the type of the data traffic that the dynamic tunnel is protecting when Protocol is ICMP, ICMPv6, or MIPv6. The value ALL indicates that the dynamic tunnel is protecting all types. The value opaque indicates that the dynamic tunnel is protecting only packets with unknown source ports caused by packet fragmentation. This field is not applicable for protocols other than ICMP and ICMPv6.

**AssociatedFiltTypeRange**
Indicates the upper value in the range of type numbers of the data traffic that the dynamic tunnel is protecting when the protocol is ICMP, ICMPv6, or MIPv6. The value n/a indicates that this field is not applicable to the current protocol, or that the tunnel's type selectors are entirely specified by the AssociatedFiltType value.

**AssociatedFiltCode**
Indicates the code of the data traffic that the dynamic tunnel is protecting when Protocol is ICMP or ICMPv6. The value ALL indicates that the dynamic tunnel is protecting all codes. The value opaque indicates that the dynamic tunnel is protecting only packets with an unknown code caused by packet fragmentation. This field is not applicable for protocols other than ICMP, ICMPv6, or MIPv6.

**AssociatedFiltCodeRange**
Indicates the upper value in the range of code numbers of the data traffic that the dynamic tunnel is protecting when the protocol is ICMP or ICMPv6. The value n/a indicates that this field is not applicable to the current protocol, or that the tunnel's code selectors are entirely specified by the AssociatedFiltCode value.

**PFS**
Indicates whether the dynamic tunnel is using perfect forward secrecy. If the key exchange methodology uses a Diffie-Hellman group, then the PFS value is Yes.

**DiffieHellmanGroup**
Indicates the DiffieHellmanGroup that is used during key exchange. If no group is being used, the value is 0.

**PendingNewActivation**
Indicates whether the phase 2 is for a new activation attempt. The value Yes indicates that the phase 2 is a new activation attempt; the value No indicates that it is not a new activation attempt. This field is valid only when the State value is PENDING. Otherwise, this field has the value n/a.

**UdpEncapMode**
Indicates whether or not UDP encapsulation is being applied to an SA to enable it to traverse a NAT. NAT traversal is not supported for phase 2 SAs using IPv6 addresses. In this case, the field has the value n/a.

**LclNATDetected**
Indicates whether or not a NAT has been detected in front of the local security endpoint. NAT traversal is not supported for phase 2 SAs using IPv6 addresses. In this case, the field has the value n/a.

**RmtNATDetected**
Indicates whether or not a NAT has been detected in front of the remote security endpoint. NAT traversal is not supported for phase 2 SAs using IPv6 addresses. In this case, the field has the value n/a.
**RmtNAPTDetected**
Indicates whether or not a NAT in front of the remote security endpoint has been detected performing port address translation. A value of Yes indicates that port address translation by a NAT in front of the remote security endpoint NAT was detected; the value No indicates that it was not detected. A NAPT (network address protocol translator) can be detected by IKE, the stack, or by both. There might be cases where the stack detects NAPT but IKE does not, or where IKE detects NAPT but the stack does not. In these cases, the IKE NAPT settings might not match the stack's NAPT settings. However, this setting should be consistent within the IKE daemon for all tunnels negotiated with the same remote security endpoint IP address. NAT traversal is not supported for phase 2 SAs using IPv6 addresses. In this case, the field has the value n/a.

**RmtIsGw**
Indicates whether or not the remote security endpoint is acting as a security gateway when UDP encapsulation is being applied to an SA. If UDP encapsulation is not being used, this field displays the value n/a.

**RmtIsZOS**
Indicates whether or not the remote security endpoint is z/OS when UDP encapsulation is being applied to an SA. If UDP encapsulation is not being used, this field displays the value n/a.

**zosCanInitP2SA**
Indicates whether or not z/OS can initiate the initial phase 2 SA negotiation. If UDP encapsulation is not being used, this field displays the value n/a.

**RmtUdpEncapPort**
The UDP-encapsulated port number used by the remote security endpoint. If UDP encapsulation is not being used, this field displays the value n/a.

**SrcNATOARcvd**
For a UDP-encapsulated transport SA: Source NAT original IP address received during the IKE negotiation. The IKE peer sends the source IP address that it is aware of. If the IKE peer is behind a NAT device, this is the peer's private address. This value is 0.0.0.0 if a source NAT original IP address was not received. An IKE peer at a pre-RFC3947 NAT Traversal support level cannot send a source NAT-OA payload containing the original IP address. For information about accessing RFCs, see Appendix G, "Related protocol specifications," on page 1117.

For a non-UDP-encapsulated transport SA: The value is n/a.

**DstNATOARcvd**
For a UDP-encapsulated transport SA: Destination NAT original IP address received during the IKE negotiation. The IKE peer sends the destination IP address that it is aware of. If this host is behind a NAT, the value displayed can be the public address of the host. This value is 0.0.0.0 if a destination NAT original IP address was not received. An IKE peer at a pre-RFC3947 NAT traversal support level cannot send a destination NAT-OA payload containing the original IP address. For information about accessing RFCs, see Appendix G, "Related protocol specifications," on page 1117.

For a non-UDP-encapsulated transport SA: The value is n/a.

**LclIpSpecExIDPayload**
The local IP specification exchanged by the peers. If the SA is IKEv1, and if no ID payloads were exchanged, this field displays the value 0. The local IP specification is always a single IP address. If UDP encapsulation is not being used, this field displays the value n/a.

**RmtIpSpecExIDPayload**
The remote IP specification exchanged by the peers. If the SA is IKEv1, and if no ID payloads were exchanged, this field displays the value 0. The remote IP specification can be a single IP address, IP address range, IP address followed by a slash and number of bits mask, host name, RFC821 name, or distinguished name. If UDP encapsulation is not being used, this field displays the value n/a. For information about accessing RFCs, see Appendix G, "Related protocol specifications," on page 1117.
Interface (-i) primary option

The -i primary option is used to display interface information that is defined to the specified TCP/IP stack. Interface configuration is obtained from the TCPIP profile. This interface display applies only to stacks that are configured with IPSECURITY.

See “The z/OS UNIX ipsec command interface (-i) option” on page 666 for parameter descriptions.

Interface (-i) primary option syntax

For -i primary option syntax see “The z/OS UNIX ipsec command syntax” on page 647.

Interface (-i) primary option command examples

ipsec -i display
Displays the interface definition data from the default stack.

ipsec -i display -z nsclient1
Displays the interface definition data for the NSS client nsclient1. The request is directed to the NSS server.

Interface (-i) primary option report example

```
ipsec -p tcpcs4 -i display

Interface (-i) primary option report field descriptions

For more information about the header, see “The ipsec command report heading” on page 677.

InterfaceName
The name of the interface as defined on the system. The name is from a LINK or INTERFACE statement that corresponds to a HOME address in the profile.
SecurityClass
The value is in the range 1 to 255. Traffic over the interface matches a filter rule with the same security class value as the interface or a filter rule with a security class value 0.

- For IPv4, the security class is defined on the LINK statement or the IPCONFIG statement (with DYNAMICXCF)
- For IPv6, the security class is defined on the INTERFACE statement or on the IPCONFIG6 statement (with DYNAMICXCF).

Active
Indicates whether the interface is active or not.

DVIPA
Indicates whether the Address field represents a dynamic virtual IP address.

Address
The IP address of the interface.

IP traffic test (-t) primary option
The -t primary option is used to indirectly query the current filter rules to determine whether a rule exists that applies to a particular kind of data traffic. Given a source and destination address, a protocol, and (if the protocol requires it) a source and destination port pair, all of the filter rules that apply to that kind of data traffic are displayed in the order in which they would be applied. The search can be further qualified by specifying whether the traffic is outbound or inbound by security class.

See “The z/OS UNIX ipsec command IP traffic test (-t) option” on page 666 for parameter descriptions.

IP traffic test (-t) primary option syntax
For -t primary option syntax see “The z/OS UNIX ipsec command syntax” on page 647.

IP traffic test (-t) primary option command examples
ipsec -t 10.0.0.1 10.0.0.2 icmp
Displays the current filters that apply to ICMP traffic between two addresses from the default stack.

ipsec -t 10.0.0.1 10.0.0.2 tcp 1024 1025 -z nsclient1
Displays the current filters that apply to TCP traffic on the specified ports between two addresses from the IP stack for the NSS client nsclient1. The request is directed to the NSS server.

ipsec -t 2001::1:1 2001::1:2 udp 1026 1027
Displays the current filters that apply to UDP traffic on the specified ports between two IPv6 addresses from the default stack.

**IP traffic test (-t) primary option report field descriptions**

For a traffic test display, the third heading line of the report shows the command request options that were used to make the filters search. For the rest of the header information, see “The ipsec command report heading” on page 677.

The results of a traffic test display is the set of filters that apply to the input test data. The filters are shown in the order in which they are applied by the stack. See “IP filter (-f) primary option” on page 681 for a description of the fields in each filter.

**NATT port translation (-o) primary option**

The -o primary option is used to display the selected NAT traversal remote port translations. If no remote IP address is specified (using the -q option), all NAT traversal remote port translations are displayed. If there is a selected remote IP address (using the -q option), or a selected remote IP address with one or more ports (using the -q -u options), then the selected NAT traversal remote port translation information is displayed.

See “The z/OS UNIX ipsec command NATT port translation (-o) option” on page 667 for parameter descriptions.

**NATT port translation (-o) primary option syntax**

For -o primary option syntax see “The z/OS UNIX ipsec command syntax” on page 647.

**NATT port translation (-o) primary option command syntax examples**

**ipsec -o display**

Displays NAT traversal remote port translations from the default stack.

**ipsec -o display -z nsclient1 -q 1.1.1.1**

Displays NAT traversal remote port translations for the specified IP address from the NSS client nsclient1. The request is directed to the NSS server.

**ipsec -o display -q 1.1.1.1 -u 202 203**

Displays NAT traversal remote port translations for the specified IP address and ports from the default stack.

NATT port translation (-o) primary option report field descriptions

For the header information, see “The ipsec command report heading” on page 677.

RmtIpAddress
The public IP address assigned by NAT.

Protocol
TCP or UDP from the inner IP header of an inbound packet.

TransRmtConnPort
The translated port assigned by NAT traversal port translation processing. If different than the OrigRmtConnPort value, another client from the same remote public IP address was already using the original remote port. A translated remote port is assigned rather than rejecting the second client’s request.

OrigRmtConnPort
The peer’s original connection remote port.

RmtInnerIpAddress
- For tunnel mode, the remote IP address from the inner IP header of an inbound packet.
- For transport mode, the private address of the peer that is from the source NAT-OA payload received during the IKEv1 negotiation or from the Traffic Selector payload received during the IKEv2 negotiation. If the peer initiated the phase 2 IKEv2 negotiation, the address is from the TSi payload. Otherwise, if the local IKE daemon initiated the phase 2 IKEv2 negotiation, the address is from the TSr payload.
- Otherwise, this field displays the value n/a.

IKED network security information (-w) primary option

The -w primary option is used to display network security configuration information for each active stack on the system.

See “The z/OS UNIX ipsec command IKED network security (-w) option” on page 667 for parameter descriptions.

IKED network security information (-w) primary option syntax

For -w primary option syntax see “The z/OS UNIX ipsec command syntax” on page 647.
**IKED network security information (-w) primary option command syntax examples**

**ipsec -w display**
Displays network security information of each active stack on the system.

**IKED network security information (-w) primary option report field descriptions**

For the header information, see “The ipsec command report heading” on page 677.

**SystemName**
The name of the system on which the report is requested.

**StackName**
The name of the stack as defined on the host system.

**ClientName**
The name by which the NSS server identifies the stack when it is using IPSec management services. For more information see the ClientName parameter on the NSSStackConfig statement for the IkeConfig file in the z/OS Communications Server: IP Configuration Reference.

**ClientAPIVersion**
The version of the NSS client API that the NSS client is using.

1 The level of NSS support that is available is z/OS version V1R9 and later.
The level of NSS support that is available is z/OS version V1R10 and later.

ServerAPIVersion
The version of the NSS server API that the NSS server is using.

1
The level of NSS support that is available is z/OS version V1R9 and later.

2
The level of NSS support that is available is z/OS version V1R10 and later.

n/a
Indicates that NSS server version information is not currently available.

NSServicesSupported
Indicates whether NSS for IPSec is supported for the stack. The value Yes indicates that it is supported. The value No indicates that it is not supported.

RemoteManagementSelected
Indicates whether the stack is configured for remote management. The value Yes indicates that the stack is configured for the NSS remote management service. The value No indicates that the stack is not configured for the NSS remote management service.

RemoteManagementEnabled
Indicates whether the stack is enabled for remote management at the NSS server. The value Yes indicates that the stack is permitted to access the NSS remote management service. The value No indicates that the stack is not permitted to access the NSS remote management service.

CertificateServicesSelected
Indicates whether the stack is configured for certificate services. The value Yes indicates that the stack is configured for the NSS certificate service. The value No indicates that the stack is not configured for the NSS certificate service.

CertificateServicesEnabled
Indicates whether the stack is enabled for certificate services at the NSS server. The value Yes indicates that the stack is permitted to access the NSS certificate service. The value No indicates that the stack is not permitted to access the NSS certificate service.

NSClientIPAddress
The IP address by which the NSS server knows the NSS client.

NSClientPort
The port by which the NSS server knows the NSS client.

NSServerIPAddress
The IP address of the NSS server to which the stack is connected.

NSServerPort
The port number of the NSS server to which the stack is connected.

NSServerSystemName
The name of the system on which the NSS server is running.

UserID
The user ID that the stack used to connect to the NSS server.

ConnectionState
The state of the connection to the NSS server. The possible states are:

connected
Indicates that the stack can use enabled network security services.

connect pending
Indicates that the stack has requested a connection to the NSS server but it is not yet connected.

update pending
Indicates that the client has dynamically reconfigured its authentication information or its requested network security services. The client has requested a connection update but has not received a successful response from the NSS server.
disconnect pending
Indicates that the stack has requested that the connection be disconnected but it is not yet disconnected.

disconnected
Indicates that the stack is not connected to the NSS server.

**TimeConnectedToNSServer**
The time at which the stack connected to the NSS server.

**TimeOfLastMessageToNSServer**
The time that the stack last received a message from the NSS server.

**Network security server (-x) primary option**
Use the -x primary option to display information about NSS IPSec clients that are currently connected to the NSS server.

See “The z/OS UNIX ipsec command network security server (-x) option” on page 668 for parameter descriptions.

**Network security server (-x) primary option syntax**
For -x primary option syntax see “The z/OS UNIX ipsec command syntax” on page 647.

**Network security server (-x) primary option command syntax examples**

- **ipsec -x display**
  Display the status of all IPSec clients that are currently connected to the NSS server.

- **ipsec -x display -z nsclient1**
  Display the status of client nsclient1 that are currently connected to the NSS server.

**Network security server (-x) primary option report examples**

```
ipsec -x display
CS V2R4 ipsec NS Client Name: n/a Fri Nov 25 01:27:33 2011

```
**Network security server (-x) primary option report field descriptions**

For the header information, see “The ipsec command report heading” on page 677.

**ClientName**
The name of the NSS client.

**ClientAPIVersion**
The version of the NSS client API that the NSS client is using.

1  
The level of NSS support that is available is z/OS version V1R9 and later.

2  
The level of NSS support that is available is z/OS version V1R10 and later.

**StackName**
The name of the stack as defined on the client system.

**SystemName**
The name of the system on which the client is running.

**ClientIPAddress**
The IP address by which the NSS server knows the NSS client.

**ClientPort**
The port by which the NSS server knows the NSS client.

**ServerIPAddress**
The NSS server's IP address.

**ServerPort**
The NSS server's port number.

**UserID**
The user ID of the NSS client that is used to connect to the NSS server.

**RemoteManagementSelected**
Indicates whether the client is configured for remote management. The value Yes indicates that the client is configured for the NSS remote management service. The value No indicates that the client is not configured for the NSS remote management service.

**RemoteManagementEnabled**
Indicates whether the client is enabled for remote management at the NSS server. The value Yes indicates that the client is permitted to access the NSS remote management service. The value No indicates that the client is not permitted to access the NSS remote management service.

**CertificateServicesSelected**
Indicates whether the client is configured for certificate services. The value Yes indicates that the client is configured for the NSS certificate service. The value No indicates that the client is not configured for the NSS certificate service.
CertificateServicesEnabled
Indicates whether the client is enabled for certificate services at the NSS server. The value Yes indicates that the client is permitted to access the NSS certificate service. The value No indicates that the client is not permitted to access the NSS certificate service.

ConnectionState
The state of the connection from the NSS client. The possible states are:

- connected
  Indicates that the client can use enabled NSS services
- connect pending
  Indicates that the client has requested a connection to the NSS server but it is not yet connected.
- update pending
  Indicates that the client has dynamically reconfigured its authentication information or its requested NSS services. The client has requested a connection update but has not received a successful response from the NSS server.
- disconnect pending
  Indicates that the client has requested that the connection be disconnected but it is not yet disconnected.

TimeConnected
The time at which the NSS client connected to the NSS server.

TimeOfLastMessageFromClient
The time that the NSS server last received a message from the client.

**nssctl command**
Use the z/OS UNIX nssctl command to display information for NSS clients that are currently connected to the local NSS server. For a description of the terms and concepts that are used in the nssctl command information, see IP security and network security services information in z/OS Communications Server: IP Configuration Guide.

You can use the nssctl command to display information that is maintained by the NSS server for all NSS clients that are currently connected to the NSS server. You can also display information for a specific NSS client or for clients that use a specific NSS discipline.

**nssctl command security**
The nssctl command is an APF-authorized application. Users of the nssctl command must be authorized through the security access facility (SAF). This information assumes that the SAF that is being used is RACF. User authorization is managed with the SERVAUTH profile and is described in “nssctl command SERVAUTH profile” on page 739.

**nssctl command SERVAUTH profile**
Security product authorization (for example, RACF) is required to use the nssctl command. You must define a profile in the SERVAUTH class to enable control over the nssctl command function. The format of the profile is as follows:

```plaintext
EZB.NETMGMT.sysname.sysname.NSS.DISPLAY
```

Where:

- **sysname**
  The system name of the system on which the nssctl command is allowed to run.

**Requirement:** This profile must be defined on the system where the NSS server is running and where the nssctl command is issued.

**Tips:**
• If the security product is RACF, you can use the control statements in the sample JCL job that is provided in SEZAINST(EZARACF) to define this authorization. If the SERVAUTH class is not active or if a matching SERVAUTH policy is not found, the nssctl command request is rejected.
• Authorization is not required for the help option (nssctl -?).

The z/OS UNIX nssctl command syntax

The z/OS UNIX nssctl command displays information for NSS clients that are currently connected to the local NSS server.

Restriction: The nssctl command must be issued on the same host z/OS system as the NSS server.

Format:

```
nssctl [Primary Option] [Debug Option]
```

Primary Option

```
-d [Filter Option]
```

Filter Option

```
-c nsclientname
-D ipsec
```

Debug Option

```
-Z 3
ddebuglevel
```

The z/OS UNIX nssctl command parameter descriptions

The following information describes the individual parameter items that are identified in the syntax diagram. All options are case sensitive. Option values that are keywords and the nsclientname value for -c filter option are not case sensitive.

The z/OS UNIX nssctl command primary options

-\(\text{-d}\)
Display NSS server information for each NSS client.

-\(\text{-?}\)
Display command help.

The z/OS UNIX nssctl command filter options

The following parameters can be used to filter the output of the specified report.

-\(\text{-c nsclientname}\)
Filter the output of the display report using the specified NSS client name nsclientname.

-\(\text{-D}\)
Filter the report output using the specified discipline type.

\(\text{ipsec}\)
Filter the output of the display report to display NSS server information only for NSS IPSec clients.
xmlappliance
Filter the output of the display report to display NSS server information only for NSS XMLAppliance clients. The xmlappliance keyword can be shortened to the first four characters, for example, you can specify -D xmlappliance as -D xmla.

The z/OS UNIX nssctl command debug options

-Z
Generates debug information when the command runs. An optional **debuglevel** value can be specified with the -Z option. Debug output is sent to stderr or to stdout, as determined by the debug level. Debug information for a particular debug level also includes the information from lower levels (for example, debug level 3 also includes the information from level 1 and level 2).

**debuglevel**
The following debug levels are available:

1
Generate functional level debug information in stdout in a formatted form.

2
Generate general debug information in stderr in an unformatted form for criteria that was specified when the command was issued.

3
Generate operational level debug information in stderr in an unformatted form. This is the default debug level.

The nssctl command report details and examples

This information contains descriptions about the formatting and contents of **nssctl** reports, including examples.

The nssctl command general report concepts

To fully understand the following concepts and fields, you need some general knowledge of NSS. See information about preparing to provide network security services in z/OS Communications Server: IP Configuration Guide for more details.

The nssctl command report heading

The display report from the **nssctl** command begins with several heading lines that provide general information related to the request.

The nssctl command heading example:

<table>
<thead>
<tr>
<th>CS</th>
<th>V2R4 nssctl</th>
<th>System Name: zsystem7</th>
<th>Tue Feb 14 14:48:50 2012</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function: display</td>
<td>NS Client Name: n/a</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The first heading line displays the following information:

**System Name**
The system name of the system on which the server is running.

**timestamp**
The date and time of the report.

The second heading line displays the following information:

**Function**
The function option for any report is display.

**NS Client Name**
The name of the NSS client when the -c option is used. Otherwise, the value is n/a.

The final line of the display report shows how many entries were actually listed in the report. Depending on the selection criteria that was specified on the request, the count of entries in the report might be less than the entire set that is being queried.
The nssctl command report data

All data fields are shown, even if some of the fields are not applicable to the type of entry that is being displayed or if some of the fields are not applicable to the context of the data. Data fields in each entry display the common information first, followed by the discipline-specific information.

nssctl -d report

Display information about NSS clients that are managed by the NSS server.

nssctl -d report command syntax

For -d primary option syntax see “The z/OS UNIX nssctl command syntax” on page 740.

nssctl -d report command syntax examples

nssctl -d
Display the status of all clients that are connected to the local NSS server.
nssctl -d -c nsclient1
Display the status of the nsclient1 client that is connected to the local NSS server.

nssctl -d report example

nssctl -d:

CS V2R4 nssctl  SystemName: MVS093    Sat Dec 10 08:47:39 2011

nssctl -d report field descriptions
ClientName
The name of the NSS client. If the client is not authenticated to the server, a temporary client name is displayed.

ClientAPIVersion
The version of the NSS client API that the NSS client is using. Possible values are:
- 1
  The level of NSS support that is available in z/OS V1R9 and later.
- 2
  The level of NSS support that is available in z/OS V1R10 and later.
- 3
  The level of NSS support that is available in z/OS V1R11 and later.

StackName
The name of the stack as defined on the client system. If the NSS client is not running on a z/OS system, then this value is not applicable.

SystemName
The name of the system on which the client is running.

ClientIPAddress
The IP address by which the NSS server knows the NSS client.

ClientPort
The port by which the NSS server knows the NSS client.

ServerIPAddress
The IP address of the NSS server.

ServerPort
The port number of the NSS server.

UserID
The user ID of the NSS client that is used to connect to the NSS server.

ConnectionState
The state of the connection from the NSS client. Possible state values are:
- connected
  Indicates that the client can use enabled NSS services.
- connect pending
  Indicates that the client has requested a connection to the NSS server but it is not yet connected.
- update pending
  Indicates that the client has dynamically reconfigured its authentication information or its requested NSS services. The client has requested a connection update but has not received a successful response from the NSS server.
- disconnect pending
  Indicates that the client has requested to disconnect the connection, but the connection is not yet disconnected.

TimeConnected
The time at which the NSS client connected to the NSS server.

TimeOfLastMessageFromClient
The time that the NSS server last received a message from the client.

Discipline
The discipline from which the client is requesting NSS services. Possible discipline values are:
- IPSec
  The IPSec client is requesting NSS services. The following IPSec discipline-specific information is displayed:
CertificateServiceSelected
Indicates whether the IPSec client is configured for the IPSec certificate service. The value Yes indicates that the IPSec client is configured for the NSS IPSec certificate service. The value No indicates that the IPSec client is not configured for the NSS IPSec certificate service.

CertificateServiceEnabled
Indicates whether the IPSec client is enabled for the IPSec certificate service at the NSS server. The value Yes indicates that the IPSec client is requested and permitted to access the NSS IPSec certificate service. The value No indicates that the IPSec client is not permitted to access the NSS IPSec certificate service.

RemoteManagementSelected
Indicates whether the IPSec client is configured for remote management. The value Yes indicates that the IPSec client is configured for the NSS remote management service. The value No indicates that the IPSec client is not configured for the NSS remote management service.

RemoteManagementEnabled
Indicates whether the IPSec client is enabled for remote management at the NSS server. The value Yes indicates that the IPSec client is permitted to access the NSS remote management service. The value No indicates that the IPSec client is not permitted to access the NSS remote management service.

XMLAppliance
The XMLAppliance client is requesting NSS services. The following XMLAppliance discipline-specific information is displayed:

CertificateServiceSelected
Indicates whether the XMLAppliance client requested the XMLAppliance certificate service. The value Yes indicates that the XMLAppliance client requested the NSS XMLAppliance certificate service. The value No indicates that the XMLAppliance client did not request the NSS XMLAppliance certificate service.

CertificateServiceEnabled
Indicates whether the certificate service is enabled for the XMLAppliance client. The value Yes indicates that the certificate service is requested and permitted for the XMLAppliance client. The value No indicates that the certificate service is not permitted for the XMLAppliance client.

PrivateKeyServiceSelected
Indicates whether the XMLAppliance client requested the private key service. The value Yes indicates that the XMLAppliance client requested the NSS private key service. The value No indicates that the XMLAppliance client did not request the NSS private key service.

PrivateKeyServiceEnabled
Indicates whether the private key service is enabled for the XMLAppliance client. The value Yes indicates that the private key service is requested and permitted for the XMLAppliance client. The value No indicates that the private key service is not permitted for the XMLAppliance client.

SAFAccessServiceSelected
Indicates whether the XMLAppliance client requested the SAF access service. The value Yes indicates that the XMLAppliance client requested the NSS SAF access service. The value No indicates that the XMLAppliance client did not request the NSS SAF access service.

SAFAccessServiceEnabled
Indicates whether the SAF access service is enabled for the XMLAppliance client. The value Yes indicates that the SAF access service is requested and permitted for the XMLAppliance client. The value No indicates that the SAF access service is not permitted for the XMLAppliance client.
Use the z/OS UNIX certbundle command to create a certificate bundle file. A certificate bundle file can contain certificate and certificate revocation list (CRL) information. You can place certificate bundle files on an HTTP server. You can configure the CertificateBundleURL parameter on the IPSecDisciplineConfig statement in the configuration file of the network security services server to associate a label on the key ring of the NSSD with the URL for the certificate bundle. See the information about storing certificate-related information on an HTTP server in z/OS Communications Server: IP Configuration Guide for additional details.

The z/OS UNIX certbundle command syntax

Format:

```
certbundle [Primary Option] [Debug Option]
```

Primary Option

```
-c Create Option
-? Create Option
```

Create Option

```
-i cert_bundle_options_file  Debug Option
```

Debug Option

```
-d debuglevel
```

The z/OS UNIX certbundle command parameter descriptions

The following topics describe the individual parameter items that appear in the syntax diagram. All options are case sensitive.

The z/OS UNIX certbundle command primary options

`-c`
Create certificate bundle files.

`-?`
Display command help.

The z/OS UNIX certbundle command create options

`-i cert_bundle_options_file`
Name of the input certificate bundle options file. See “The z/OS UNIX certbundle command options file” on page 746 for more information.

The z/OS UNIX certbundle command debug options

`-d`
Generates debug information during command processing. You can specify an optional `debuglevel` value when you use the `-d` option. The debug level determines the level of debug information output to stdout. The debug information accumulates as the level number increases; for example, debug level 3 also includes the information from level 1 and level 2.

```
d debuglevel
```

The following debug levels are available:
1. Generate functional-level debug information in stdout in a formatted form.
2. Generate additional information in stdout in a formatted form. Example additional information includes key ring and certificate operations.
3. Generate verbose information in stdout in a formatted form. Example verbose information includes file parsing and memory management. This value is the default debug level.

The z/OS UNIX certbundle command options file

The certificate bundle options file identifies the location of certificates and certificate revocation that are to be included in a certificate bundle.

CertBundleOptions statement

You can code more than one CertBundleOptions statement. Each CertBundleOptions statement is processed separately.

Format:

```
CertBundleOptions
{  
    CertBundleOptions Parameters
  }
```

CertBundleOptions Parameters:

- **KeyRing userid/ringname**
  The owning user ID and ring name to be used. When you specify a key ring that is owned by the issuer of the command, specify the ring name as the `ringname` value. When you specify a key ring owned by another user, specify the ring name as a `userid/ringname` value. Specification of the KeyRing parameter requires specification of either the CertificateChain or CertificateLabel parameter. There is no default value.

- **CertificateChain label**
  The label of a certificate on the SAF key ring. This certificate and all certificates that are in the trust chain of this certificate that are in the key ring (excluding the certificate of the root certificate authority) are included in the bundle. The KeyRing parameter must also be specified to locate the specified certificate label.
**CertificateLabel**

The label of a certificate on the SAF key ring. This certificate is included in the bundle. The KeyRing parameter must also be specified to locate the specified certificate label.

**CRLFile filename**

The filename of the certificate revocation list file.

**Restriction:** When you generate a certificate bundle with CRLFile only, the KeyRing parameter must not be specified.

**BundleFile filename**

The name of the output certificate bundle file to be created. If this file already exists, it is replaced by the new file.

**Examples:**

The following certificate bundle options file creates three separate certificate bundle files:

- The first bundle file (/etc/security/BundleFile1) contains the three specified certificates from mykeyring and the CRL from the file /etc/security/CRL1.
- The second bundle file (/etc/security/BundleFile2) contains only the CRL from the file /etc/security/CRL2.
- The third bundle file (/etc/security/BundleFile3) contains only the three specified certificates from mykeyring.

```plaintext
CertBundleOptions
{
    Keyring       mykeyring
    CertificateLabel     label1
    CertificateLabel     label2
    CertificateLabel     label3
    CRLFile         /etc/security/CRL1
    BundleFile         /etc/security/BundleFile1
}
CertBundleOptions
{
    CRLFile         /etc/security/CRL2
    BundleFile         /etc/security/BundleFile2
}
CertBundleOptions
{
    Keyring       NSSD/mykeyring
    CertificateLabel     labelA
    CertificateLabel     labelB
    CertificateLabel     labelC
    BundleFile         /etc/security/BundleFile3
}
```
Chapter 4. Displaying policy-based networking information

You can use the following TCP/IP commands to display policy-based networking information from the network.

- The z/OS UNIX `pasearch` command queries information from the z/OS UNIX Policy Agent.
- The z/OS UNIX `trmdstat` command displays the Traffic Regulation Management Daemon (TRMD) log.

See Chapter 2, “Monitoring the TCP/IP network,” on page 273 for Netstat commands, such as `Netstat SLAP/-j` or `Netstat IDS/-k`, for information that might be relevant to retrieving information from the network, and “ipsec command security” on page 644 for information about the `ipsec` command.

Additionally, you can monitor policy implementation using the Network SLAPM2 subagent. Using SNMP, you can display policy configuration and performance data and generate notifications when monitored traffic performance crosses thresholds defined in the Network SLAPM2 MIB tables. See information about the Network SLAPM2 subagent in z/OS Communications Server: IP Configuration Guide for more details about using SNMP to monitor policy performance.

The z/OS UNIX pasearch command: Display policies

Use the z/OS UNIX `pasearch` command to query information from the z/OS UNIX Policy Agent. The command is issued from the UNIX System Services shell.

**Restriction:** The `pasearch` command requires access to the PAPI DLL at run time. Ensure that the LIBPATH environment variable is specified and points to the `/usr/lib` directory. For example, specify:

```
export LIBPATH=/usr/lib
```

**Note:** If the user is not a superuser, see z/OS Communications Server: IP Configuration Guide for information about configuring the Policy Agent and setting up authorization for the client to retrieve policies.

**Result:** If any of the information that is requested by the `pasearch` command is not currently available, the `pasearch` command displays `<not available>`. For example, when the `pasearch` command is issued on a policy client, some information might need to be obtained from the policy server. Reissue the `pasearch` command later to see the complete information.

**Format:**

```
pasearch [Option]
```

Option
Parameters:

-A
Display active policy entries that match input options for pasearch. This is the default. If all policy entries are requested (pasearch -e, pasearch, or pasearch -a -r) and the policy rule is active, then active policy actions are returned. Policies on the policy server that are loaded on behalf of policy clients always display as active policies.

-a
Display all policy actions that match the input options for the pasearch command. Because the default action is to return all types of policy actions, use the -i, -q, -R, -t, or -v option to limit the type of policy actions that are returned.

-C
Display all image names with policies that are configured in Policy Agent. This includes locally defined images (those defined on a TcpImage statement) and connected policy clients (where the image name is defined by each client on the ClientName parameter on the PolicyServer statement).

-c
Display policy object information (for example, FLUSH or NOFLUSH, PURGE or NOPURGE). This option can be used with the image option (-p), or the policy type options (-i, -q, -R, -t, or -v). All other options are either ignored or are not valid.
See the following descriptions of policy object fields:

**ConfigLocation**
Indicates the source from which the policies were loaded. The following might be displayed on the policy server:
- **Local**
  Indicates that the policies were loaded from local configuration files, an LDAP server, or both.
- **Client**
  Indicates that the policies were loaded for a connected policy client.

The following might be displayed on the policy client:
- **Local**
  Indicates that the policies were loaded from local configuration files, an LDAP server, or both.
- **Remote**
  Indicates that the policies were loaded from the policy server.

**LDAPServer**
Indicates whether or not an LDAP server is used for local policies.

**CommonFileName**
Indicates the name of the common configuration file, if one exists.

**ImageFileName**
Indicates the name of the stack-specific configuration file.

**ClientName**
Indicates the policy client name.

**ClientUserid**
Indicates the user ID being used for a policy client.

**PolicyServerAddr**
Indicates the IP address of the policy server being used for remote policies.

**PolicyServerPort**
Indicates the port of the policy server being used for remote policies.

**PolicyServSysname**
Indicates the system name of the policy server being used for remote policies.

**PolicyClientAddr**
Indicates the IP address of a connected policy client.

**PolicyClientPort**
Indicates the port of a connected policy client.

**ConnectTime**
Indicates the time when a policy client connected to the policy server.

**ApplyFlush**
Indicates whether the policy type uses the PolicyFlush flag for FLUSH or NOFLUSH processing.

**DeleteOnNoflush**
Indicates whether or not NOFLUSH processing is honored.

**ApplyPurge**
Indicates whether the policy type uses the PurgePolicies flag for PURGE or NOPURGE processing.

**AtomicParse**
Indicates whether or not parsing of the policy type is atomic. With atomic parsing, any errors result in the entire set of policy changes for that policy type being discarded. Without atomic parsing, only objects found to be in error are discarded.

**DummyOnEmptyPolicy**
Indicates whether the TCP/IP stack is informed if no policies are configured for this type of policy.
**ModifyOnIDChange**
Indicates whether or not a rule or action object is considered changed if only the rule or action ID changes due to the order of policies.

**PolicyFlush**
For policy types that honor FLUSH, indicates whether FLUSH or NOFLUSH was configured on the TcpImage, PEPInstance, or specific type configuration statement (for example TTLSConfig).

**PurgePolicies**
For policy types that honor PURGE, indicates whether PURGE or NOPURGE was configured on the TcpImage, PEPInstance, or specific type configuration statement (for example TTLSConfig).

**Configured**
Indicates whether any policies were configured for this policy type.

**UpdateInterval**
Indicates the time interval (in seconds) for checking the creation or modification time of the configuration file or files, and for refreshing policies from the LDAP server.

**PerfColEnabled**
Indicates whether the PolicyPerformanceCollection statement was enabled.

**InstanceId**
An identification associated with the last update for this policy type.

**LastPolicyChanged**
The time stamp value that indicates when any policy rule, policy action, or table for this policy type was last updated.

**Policy updated**
The time stamp value that indicates when the IPSec policy object was last updated.

-d
Display debug information to stdout.

-e
Display all policy entries (policy rules and policy actions) that match the input options for the pasearch command. If policy action matches, then the associated policy rule is returned. This is the default.

-f PolicyFilterName
Display policy entries that match the policy name based on input options for the pasearch command. For a policy rule or policy action the name is either the policy name specified on the configuration file statement that defines the policy entry (policy rule or policy action) or the name specified using the ServiceName, policyActionName, PolicyRulesName, or policyRuleName attribute for policy entries defined on an LDAP server. For the route table the name is the name configured on the RouteTable statement.

**Rules:**
- The name is case sensitive.
- To match the PolicyFilterName attribute with multiple policy entries, use the -w option with the -f option. The PolicyFilterName attribute is treated as a wildcard name; the default action is to find an exact match.
- To match the PolicyFilterName attribute with the policy rule name, do not use the -g option with the -f option. This is the default.
- To match the PolicyFilterName attribute with the policy action name, use the -g option with the -f option.
- To match the PolicyFilterName attribute with the route table name, use the -T option with the -f option.
-g
Matches the PolicyFilterName attribute to policy actions. If retrieving both policy rules and policy actions, then this request returns a policy rule when there is a matching policy action. If no PolicyFilterName attribute is passed, then no action name filtering is performed.

-I
Display inactive policy entries that match input options for the pasearch command. If all policy entries are requested (pasearch -e -I, pasearch -I, or pasearch -I -a -r) and the policy rule is inactive, then inactive policy actions are returned. Policies on the policy server that are loaded on behalf of policy clients always display as active policies.

-i
Display all IDS policy entries that match the input options for the pasearch command.

-n
Display only policy rule, policy action, or route table names (policy details are not displayed).

-o
Display the policy rule condition original level and condition original arrays. This option applies only to complex rules (those that use CNF or DNF conditions). For such rules, there are two sets of condition arrays maintained: the original set of specified conditions, and a working set that has been collapsed or summarized for performance reasons. By default, only the working set is displayed. Use this option to display the original set.

-p image
Display all policy entries that belong to the specified image name that match input options for the pasearch command. The default action is to return all policy entries for all TCP/IP stacks. The value used for the image name must match one of the values that is specified on the TcpImage or PEPInstance statement in the Policy Agent configuration file, or match a connected policy client name.

Result: If the -p option is not used, then only the policies that are configured with the TcpImage or PEPInstance statement are returned.

-q
Display all QoS policy entries that match the input options for the pasearch command.

-R
Display all Routing policy entries that match the input options for the pasearch command.
• With the -e option, this displays Routing policy rules and policy actions. This is the default.
• With the -r option or the -a option, this displays Routing policy rules or policy actions.
• With the -T option, this displays route tables.

-r
Display all policy rules that match the input options for the pasearch command.

-s PolicyScopeName
Display all policy actions that match the PolicyScopeName value. The PolicyScopeName attribute is not case sensitive.
• Display all QoS, IpFilter, or AT-TLS policy actions that match the PolicyScopeName value.
  – Valid QoS PolicyScopeName values are DataTraffic, RSVP, or both.
  – Valid IpFilter PolicyScopeName values are DynamicVpn, ManualVpn, GenericFilter, or LocalStart.
  – Valid AT-TLS PolicyScopeName values are Group, Environment, or Connection.
• If both policy rules and policy actions are requested (pasearch -e -s PolicyScopeName or pasearch -a -r -s PolicyScopeName), then the policy rule is returned with all its policy actions when there is a matching policy action with the requested PolicyScopeName value.

-T
Display all tables that match the input options for the pasearch command. The only supported table is routing policy type (-R). The -R policy type is the default.
• With the -A option, the -T option displays active routing tables. These are routing tables that are configured and referenced by an active Routing policy rule and its associated Routing policy action. This is the default.

• With the -I option, the -T option displays inactive routing tables. These are routing tables that are configured but not referenced by an active Routing policy rule and its associated Routing policy action.

-t
Display all Application Transparent Transport Layer Security (AT-TLS) policy entries that match the input options for pasearch.

Results:
• Pasearch does not display optional parameters that do not have a default value.
• Pasearch does not display the value of a password parameter and indicates only whether it is configured with a value of Yes or No.

-v
Displays IPSec IpFilter, KeyExchange, and LocalDynVpn policies that match the input options for the pasearch command.

a
Display all IPSec policy entries.

f
Display only IpFilter policy entries.

k
Display only KeyExchange policy entries.

l
Display only LocalDynVpn policy entries.

-w
The PolicyFilterName is a wildcard to be matched to the name. For example, if PolicyFilterName = Web, then all policy rules, policy actions, or route tables with the first 3 characters of their names equal to Web are returned. If no PolicyFilterName is passed, then no name filtering is done.

-?
Display pasearch options help information.

Examples:

The following example shows policy object information for all types of policies:

```
+-----------------------------------------------+----------+-----------------+-----------------+-----------+
| TCP/IP pasearch CS V2R4                      | Image Name: TCPCS1 |

The z/OS UNIX trmdstat command: Display traffic regulation management daemon (TRMD) log

Use the trmdstat command to give a consolidated view of the IDS log messages written out by the Traffic Regulation Management daemon (TRMD).

z/OS UNIX trmdstat command syntax

```
trmdstat -I log_filename
```

**Report Option**

- `-I`
- `-A`
- `-C`
- `-F`
- `-G`
- `-I`
- `-N`
- `-Q`
- `-T`
- `-U`
- `-?`

**Report Content**

- `-D`
- `-E`
- `-S`

**Filter**

Displaying policy-based networking information 767
z/OS UNIX trmdstat command parameter descriptions

The following topics describe the individual parameter items contained in the syntax diagram.

z/OS UNIX trmdstat command report options

The following report options can be used with the trmdstat command. If no report option is specified, trmdstat displays the default -I report.

-A
Displays the attack summary.
-C Displays the connection summary.
-F Displays the flood summary.
-G Displays the Global TCP Stall summary.
-I Displays the IDS Overall Summary Report.
-N Displays the scan summary.
-Q Displays the TCP Queue Size summary
-T Displays the TCP TR summary.
-U Displays the UDP TR summary.

log_file_name
Name of the input file to be analyzed (the logfile of TRMD). You must enter a log_file_name.

-? Displays the help information.

z/OS UNIX trmdstat command report content options
The following parameters can be used to specify the level of detail of the report content.

-D Displays detailed information. Valid only when the -A/-C/-F/-G/-N/-Q/-T/-U option is used (for example, -AD or -A-D).

-E Specifies the TCP extended summary report. Valid only with -T.

-S Displays statistics summary. Valid only when -A/-F/-T/-U is specified.

z/OS UNIX trmdstat command filter options
The following parameters can be used to filter the output of the specified report.

-i initial_time
The time of the first record to be considered. If this option is not specified, the first available record in the file is selected. The time is specified in the format MMDDHHMMSS.

MM Month
DD Date
HH Hours
MM Minutes
SS Seconds

For example, 1021143030 is Oct 21 14:30:30. Trailing zeros are not required (1021 for Oct 21 00:00:00).

For records generated by the TCP stack, the time the event actually occurred (the stack time) is used for the time filtering.
TRMD can also write syslog messages, for example, the EZZ8495I TRMD STARTED and the EZZ8501I TRMD ENDED messages. These messages contain only the syslog timestamp, which is used to filter these messages. The offset from the Coordinated Universal Time (UTC) of the syslog time is determined by the TZ environment variable when TRMD is started. For more information about setting the UTC offset, see the TRMD section in Intrusion Detection Services z/OS Communications Server: IP Configuration Guide.

- **f final_time**
  The time of the last record to be considered. If this option is not specified, the last record time available in the file is used. The format of the time is the same as in initial_time.

- **p port_range**
  The port range to be considered. If this is not specified, all the ports are considered. The port_range value can be specified as follows:
  - A single port: -p 21
  - A range of ports: -p 21-220

Valid only when -A/-C/-F/-G/-Q/-T/-U option is used except when the -A -S, or -F -S options are specified.

- For the attack summary (-A) and attack detail (-AD), the port_range filter value will be matched to the destination port in the messages.
- For the connection summary (-C) and connection detail (-CD), the port_range filter value will be matched to the local port in the messages.
- For the flood summary (-F) and flood detail (-FD), the port_range filter value will be matched to the bound port in the SYN flood messages.
- For the global TCP stall summary (-G) and global TCP stall detail (-GD), the port_range filter will be matched to the local port in the messages.
- For the TCP queue size summary (-Q) and TCP queue size detail (-QD), the port_range filter will be matched to the local port in the messages.
- For the TCP TR summary (-T), TCP TR extended summary (-TE), TCP TR detail (-TD), and TCP TR statistic (-TS), the port_range filter value will be matched to the local port in the messages.
- For the UDP TR summary (-U), UDP TR detail (-UD), and UDP TR statistic (-US), the port_range filter value will be matched to the local port in the messages.

- **h ip_address**
  Displays information about that particular IP address. Valid only when the -A/-C/-F/-G/-N/-Q/-U option is used except when the -A -S options are specified.

- For the attack summary (-A) and attack detail (-AD), the ip_address filter value will be matched to the destination address in the messages.
- For the connection summary (-C) and connection detail (-CD), the ip_address filter value will be matched to the source address in the messages.
- For the flood summary (-F) and flood detail (-FD), the ip_address filter value will be matched to the bound address in the SYN flood messages, the destination address in the Interface flood messages, and the destination address in the EE XID flood messages.
- For the global TCP stall summary (-G) and global TCP stall detail (-GD), the ip_address filter value will be matched to the remote host address in the messages.
- For the scan summary (-N) and scan detail (-ND) reports, the ip_address filter value will be matched to the source address in the messages.
- For the TCP queue size summary (-Q) and TCP queue size detail (-QD), the ip_address filter value will be matched to the remote host address in the messages.
- For the UDP TR summary (-U), UDP TR detail (-UD), and UDP TR statistic (-US), the ip_address filter value will be matched to the local IP address in the messages.
-j stack_name
Only messages containing the specified stack name are included in the report. The stack name is limited to eight characters.

-k ip_address
Specifies that information is to be gathered about the peak ip_address. Valid only when the -T and -S options are specified together.

-s ip_address
Specifies that information is to be gathered about the source ip_address. Valid only when the -A/-G/-Q/-T option is used except when the -A -S, or -T -S options are specified.
  • For the attack summary (-A) and attack detail (-AD), the ip_address filter value will be matched to the source address in the messages.
  • For the global TCP stall summary (-G) and global TCP stall detail (-GD), the ip_address filter value will be matched to the remote host address in the messages.
  • For the TCP queue size summary (-Q) and TCP queue size detail (-QD), the ip_address filter value will be matched to the remote host address in the messages.
  • For the TCP TR summary (-T), TCP TR extended summary (-TE), and TCP TR detail (-TD), the ip_address filter value will be matched to the source host address in the messages.

-t ip_address
Specifies that information is to be gathered about the destination ip_address. Valid only when the -A/-G/-Q/-T option is used except when the -A -S option is specified.
  • For the attack summary (-A) and attack detail (-AD), the ip_address filter value will be matched to the destination address in the messages.
  • For the global TCP stall summary (-G) and global TCP stall detail (-GD), the ip_address filter value will be matched to the local host address in the messages.
  • For the TCP queue size summary (-Q) and TCP queue size detail (-QD), the ip_address filter value will be matched to the local host address in the messages.
  • For the TCP TR summary (-T), TCP TR extended summary (-TE), TCP TR detail (-TD), and TCP TR statistic (-TS), the ip_address filter value will be matched to the local host address in the messages.

-c correlator
Specifies that information is to be gathered for records with the specified correlator. Not valid with -S or -I.

-n interface_name
Specifies that information is to be gathered about the interface (or Link). Valid only when -F is specified. If interface name is not applicable, such as in overall flood data, the record is not selected. The interface name is case sensitive and must be specified as shown in the report.

z/OS UNIX trmdstat command global options
The following parameter can be used to get debug information with any report option.

-d n
Specifies the debug level. The default level is 0, no debug. The higher the debug level, the greater the number of messages that are displayed. The valid debug levels are in the range 0 - 2.

z/OS UNIX trmdstat command report details and examples
This section contains descriptive information about the formatting and contents of trmdstat reports, including examples.

The trmdstat report general concept
To fully understand the following concepts and fields, you need to have some general knowledge of intrusion detection services (IDS). See Intrusion Detection Services in z/OS Communications Server: IP Configuration Guide for more information about Intrusion Detection Services.
The trmdstat command report heading:

All display reports from the trmdstat command begin with heading lines, which give general information related to the request.

<table>
<thead>
<tr>
<th>Command Entered</th>
<th>trmdstat -A /tmp/syslog.log</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log Time Interval</td>
<td>Feb 22 12:32:49 - Feb 22 16:19:53</td>
</tr>
<tr>
<td>Stack Time Interval</td>
<td>Feb 22 17:32:19 - Feb 22 21:19:35</td>
</tr>
<tr>
<td>TRM Records Scanned</td>
<td>336</td>
</tr>
</tbody>
</table>

The heading lines contain the following fields:

**CommandName**
The command name.

**VersionRelease**
The version and release of trmdstat that was used to generate the report.

**timestamp**
The date and time the report was generated.

**Command Entered**
The command that was entered, including all specified parameters and the name of the input file.

**Log Time Interval**
The time interval from which syslog records were processed to generate the report, based on the syslog timestamp in the records. The syslog timestamp represents the time that the record was written to syslogd. This timestamp is dependent on the setting of the TZ environment variable at the time when TRMD is started. See the TRMD section in Intrusion Detection Services z/OS Communications Server: IP Configuration Guide for more information about setting the TZ variable.

**Stack Time Interval**
The time interval from which syslog records were processed to generate the report, based on the stack timestamp in the records. The stack timestamp represents the time that the event was detected by the stack. This timestamp is always Coordinated Universal Time (UTC).

**TRM Records Scanned**
The number of records in the input file that were scanned while generating the report.

**Messages lost:**

This data comes from an EZZ9325I or EZZ9326I message. An EZZ9325I or EZZ9326I message is written to syslog when TRMD is unable to write syslog messages rapidly enough to keep up with the stack, and the storage allocated to contain messages is overwritten with new ones before the old ones are copied to syslog by TRMD. If this event occurs, consider increasing the priority of the TRMD task or reducing the amount of logging activity by changing IDS policy. For example,

```
07/09/2011 14:34:05.02 Number of ATTACK messages lost: 10
07/30/2011 01:34:05.05 Number of TCPTPR messages lost: 22
```

Messages-lost data can appear at the end of a trmdstat report. These messages do not contain detailed information and so are not included in the trmdstat report totals. However, if messages that relate to the requested trmdstat report exist, information from these messages is written at the end of the report.

**Log-suppressed messages:**

Log-suppressed messages can appear at the end of a trmdstat report. These messages can occur if log messages were suppressed by IDS to prevent possible flooding of syslog. Both TCP traffic regulation and IDS attack detection limit the number of log records that can be written in a 5-minute interval. If the limit is exceeded, the log record is not written. However, at the end of the 5-minute interval, a log record is written that indicates the number of suppressed log records. EZZ8660I, EZZ8661I, and EZZ9327I are log-suppressed messages. These messages do not contain detail information and, therefore, are not included in the trmdstat report totals. However, if messages that relate to the requested trmdstat report exist, information from these messages is written at the end of the report.
TCP TR message suppression

TCP TR limits the number of connection refused (EZ9324I), would have been refused (EZ9319I), QoS exception made (EZ9317I), or QoS exception logged (EZ9318I) records written in a 5-minute interval. For a listening port, a maximum of 100 of these log records is written within a 5-minute interval. Globally, TCP TR writes a maximum of 1000 log records in a 5-minute interval. If a log record was not written because of these limits, the count of refused or would have been refused connections log records that were not logged is recorded in the EZ88660I TRMD TCP connection log records suppressed log record after the 5-minute interval ends. Similarly, the count of QoS exception records that were not written is recorded in the EZ8661I TRMD TCP QOS exception log records suppressed log message. The counts from these messages are not included in the trmdstat report totals. Instead, the counts are listed at the end of the requested report in the following format:

```
datetime  Number of TCP type messages suppressed for local host laddr port lport scope rsn: count
```

For example:

```
07/30/2011 01:35:05.01 Number of TCP connection refused messages suppressed for local host :: port 345 scope TR: 8
07/30/2011 01:35:05.01 Number of TCP QOS exception messages suppressed for local host 50c9:c2d4::9:42:105:25 port 25 scope Port: 6
```

The values in the report follow:

- **datetime**: The stack date and time when the first log record in the 5-minute interval was suppressed.
- **type**: The type of suppressed TCP connections. Can be connection refused or QOS exception.
- **laddr**: The local IP address.
- **lport**: The local listening port.
- **rsn**: The reason that the log records were suppressed. Can be one of the following values:
  - **Port**: The log record was suppressed because 100 log records had already been written for the listening port in the 5-minute interval.
  - **TR**: The log record was suppressed because the total number of TCP TR log records written during the five minute interval exceeded 1000 log records.
- **count**: The number of log records suppressed during the 5-minute interval.

The TCP TR suppressed count messages can be written for the IDS Overall Summary report and any of the TCP summary or detail reports that are requested with the -T or -C options.

If the trmdstat report requested filtering by source IP address (with either the -h or -s options), the suppressed count messages are not included following the report because the source IP address is not included in the TCP suppressed messages (EZ88660I and EZ8661I). However, if there were suppressed messages that met all the other filtering criteria, the following warning message is written at the end of the report:

```
Suppressed messages do not contain filter information and are not displayed.
```

If this message occurs and the suppressed count messages are required, reissue the trmdstat request without the -h or -s options or request the IDS Overall Summary report (-I option).

**Attack message suppression**

IDS attack-processing limits the number of log records written for a particular attack type to 100 records in a 5-minute interval. The following messages can be suppressed: EZ98648I, EZ98649I,
If a log record was not written because of this limit, the number of suppressed messages is recorded in the EZZ9327I Attack log. The counts from these messages are not included in the trmdstat report totals. The counts are listed at the end of the requested report in the following format:

```
datetime Number of ATTACK type messages suppressed: count
```

Examples:

```
07/09/2011 15:53:03.94 Number of ATTACK Malform messages suppressed: 3
07/09/2011 15:53:05.94 Number of ATTACK OutRaw4 messages suppressed: 4
07/09/2011 15:53:06.94 Number of ATTACK PerpEcho messages suppressed: 3
```

The values are:

- **datetime**: The stack date and time when the first log record in the 5-minute interval was suppressed.
- **type**: The attack type. It can be one of the following types: DataHide, DestOpt, EELDLC, EEMalfmd, EEPort, EEID, Flood, Fragment, HopOpt, IPOpt, Malform, NextHdrs, OutRaw4, OutRaw6, PerpEcho, Redirect, TCPQueSz, TCPStall, NoId.
- **count**: The number of log records suppressed during the 5-minute interval.

The attack-suppressed count messages can be written for the IDS overall summary report and any of the attack summary or detail reports.

**Attack summary (-A) report**

This report is displayed when the -A option is specified with the trmdstat command. It displays the summary of all attack events. The information presented in this report is derived from EZZ8648I and EZZ8649I types of syslog messages. Information is grouped by destination IP address - source IP address pair. It is sorted by destination IP address and then by destination port.

774 z/OS Communications Server: IP System Administrator's Commands
The following information describes the areas of the ATTACK summary report.

**Destination IP Address**
- Specifies the destination IP address.

**Source IP Address**
- Specifies the source IP address.

**DestPort**
- Specifies the destination port number.

**Malform**
- Specifies the number of malformed packet attacks detected.
Fragment
   Specifies the number of IP fragment packet attacks detected.

OutRaw4
   Specifies the number of outbound IPv4 raw packet attacks detected.

OutRaw6
   Specifies the number of outbound IPv6 raw packet attacks detected.

Redirect
   Specifies the number of ICMP Redirect packet attacks detected.

IPOption
   Specifies the number of restricted IPv4 option packet attacks detected.

DestOpts
   Specifies the number of restricted IPv6 destination option packet attacks detected.

HopOpts
   Specifies the number of restricted IPv6 hop-by-hop option packet attacks detected.

IPProto
   Specifies the number of restricted IPv4 protocol packet attacks detected.

NextHdrs
   Specifies the number of restricted IPv6 next header packet attacks detected.

PerpEcho
   Specifies the number of perpetual echo packet attacks detected.

DataHide
   Specifies the number of packets detected with possible hidden data.

EELDLC
   Specifies the number of EE LDLC packets detected that were received on the wrong port.

EEPort
   Specifies the number of EE packets detected with the incorrect source port value.

EEMalfmd
   Specifies the number of EE malformed packets detected.

Nold
   Specifies the number of EZZ8648I or EZZ8649I messages received with an unknown attack type. It might be that the version of the z/OS Communications Server on which the trmdstat command is being run is older than the version of z/OS Communication Server that detected the attacks.

Packets Discarded
   A report section header indicating packets that were discarded.

Packets Would Have Been Discarded
   A report section header indicating packets that would have been discarded.

messages suppressed
   The number of attack messages suppressed with attack type, date and time. This data comes from an EZZ9327I message. See in “The trmdstat report general concept” on page 771 for a detailed description.

Attack detail (-A -D) report

This report is displayed when both the -A and -D options are specified on the trmdstat command. It displays the contents of attack event records. The information presented in this report is derived from EZZ8648I and EZZ8649I types of syslog messages. Information is grouped by destination IP address - source IP address pair. It is sorted by destination IP address.
<table>
<thead>
<tr>
<th>Attack Correlator</th>
<th>Date and Time</th>
<th>Destination IP Address/ Source IP Address</th>
<th>DestPort/ SrcPort</th>
</tr>
</thead>
<tbody>
<tr>
<td>EEPorcK 11/12/2011 04:36:47.22</td>
<td>192.168.105.53</td>
<td>192.168.105.50</td>
<td>8000</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Attack Correlator</th>
<th>Date and Time</th>
<th>Destination IP Address/ Source IP Address</th>
<th>DestPort/ SrcPort</th>
</tr>
</thead>
</table>
The following information describes the areas of the attack detail report.

**Attack**
Specifies the attack type. The values that can be displayed are:
- DataHide - Data hiding
- DestOpts - Restricted IPv6 destination option
- EELDLCCk - Enterprise Extender LDLC check
- EEMalfmd - EE malformed packet
- EEPortCk - EE source port check
- Fragment - IP Fragment
- HopOpts - Restricted IPv6 hop-by-hop option
- IPOption - Restricted IPv4 option
- IPPrto - Restricted IPv4 protocol
- Malform - Malformed packet
- NextHdrs - Restricted IPv6 next header
- OutRaw4 - Outbound IPv4 Raw
- OutRaw6 - Outbound IPv6 Raw
- PerpEcho - Perpetual echo
- Redirect - ICMP redirect
- Blank - The attack type is unrecognized. It might be that the version of the z/OS Communications Server running the trmdstat command is older than the version of z/OS Communication Server that detected the attack.

**Date and Time**
Specifies the date and time.

**Destination IP Address**
Specifies the destination IP address.

**Source IP Address**
Specifies the source IP address.

**DestPort**
Specifies the destination port.

**SrcPort**
Specifies the source port.

**Correlator**
Specifies the trace correlator.

**ProbeID**
Specifies the IDS probeID that generated this event.

**Packets Discarded**
A report section header indicating packets that were discarded.

**Packets Would Have Been Discarded**
A report section header indicating packets that would have been discarded.

**messages suppressed**
The number of attack messages suppressed with attack type, date and time. This data comes from an EZZ9327I message. See in “The trmdstat report general concept” on page 771 for a detailed description.
**Attack statistics (-A -S) report**

This report is displayed when both the -A and -S options are specified on the trmdstat command. It displays the contents of attack statistics records, EZ8653I. An attack statistics log record contains the number of attacks detected in a specific attack type during a statistics interval. This report takes an attack statistics record and formats it. There is no consolidation or sorting of records. For the Flood type, the attacks number represents the total number of SYN flood and Interface flood starts that are detected during the interval. For the XIDFlood type, the attacks number represents the total number of XID flood starts that are detected during the interval. For the TCPStall type, the attacks number represents the number of times a global TCP stall event is detected during the interval. For the TCPQueSz type, the attacks number represents the total number of TCP queue size constraints that are detected during the interval.

The following information describes the areas of the attack statistics report.

**Attack**

Indicates the attack type. The values that can be displayed are:

- DataHide - Data hiding
- DestOpts - Restricted IPv6 destination option
- EELDLCCk - Enterprise Extender LDLC check
- EEMalfmd - EE malformed packet
- EEPortCk - EE source port check
- Flood - SYN flood and interface flood
- Fragment - IP Fragment
- HopOpts - Restricted IPv6 hop-by-hop option
- IPOption - Restricted IPv4 option
- IPProto - Restricted IPv4 protocol
- Malform - Malformed packet
- NextHdrs - Restricted IPv6 next header
- OutRaw4 - Outbound IPv4 Raw
- OutRaw6 - Outbound IPv6 Raw
- PerpEcho - Perpetual echo
- Redirect - ICMP redirect
- TCPQueSz - TCP queue size
• TCPStall - Global TCP stall
• XIDFlood - EE XID flood

Date and Time
Indicates the date and time at which the statistics information was gathered by the TCP/IP stack.

Attacks
Indicates the number of attacks recorded.

Action
Indicates the action that is configured for the attack type. The possible action values are:

discard
Indicates that packets associated with an attack are discarded.

nodiscard
Indicates that packets associated with an attack are not discarded.

resetconn
Indicates that connections associated with an attack are reset.

noresetconn
Indicates that connections associated with an attack are not reset.

Flood summary (-F) report
This report is displayed when the -F option is specified with the trmdstat command. It displays the summary of all flood events. The information presented in this report is derived from EZZ8650I, EZZ8651I, EZZ8654I, EZZ8655I, EZZ8677I, and EZZ8678I types of syslog messages. Summary data related to SYN floods, interface floods, and EE XID floods is shown in separate sections of the report. Summary data for SYN floods is sorted by IP address and then port. Summary data for interface floods is sorted by interface name. Summary data for EE XID floods is sorted by local IP address.

</table>
```

The following information describes the areas of the SYN flood summary report.

Local IP Address
Specifies the bound IP address.
Local Port
Specifies the bound port number.

SYN Flood Start
Specifies the number of SYN flood starts.

SYN Flood End
Specifies the number of SYN flood ends.

SYN Flood Duration
Specifies the accumulated duration, in seconds, of the SYN floods that have ended.

The following describes the areas of the interface flood summary report.

Interface Name
Specifies the name of the interface for which an interface flood was detected.

IFC Flood Start
Specifies the number of interface flood starts detected.

IFC Flood End
Specifies the number of interface flood ends detected.

IFC Flood Duration
Specifies the accumulated duration, in seconds, of the interface floods that have ended. Duration is non-zero only if the interface has experienced at least one flood that has ended.

The following describes the areas of the EE XID FLOOD summary report.

Local IP address
Specifies the destination IP address for which an EE XID flood was detected.

XID Flood Start
Specifies the number of EE XID flood starts detected.

XID Flood End
Specifies the number of EE XID flood ends detected.

XID Flood Duration
Specifies the accumulated duration of the EE XID floods that have ended in seconds. Duration is non-zero only if the local IP address has experienced at least one flood that has ended.

messages suppressed
The number of attack messages suppressed with attack type, date and time. This data comes from an EZZ9327I message. See in “The trmdstat report general concept” on page 771 for a detailed description.

Flood detail (-F -D) report
This report is displayed when both the -F and -D options are specified with the trmdstat command. It displays the contents of flood event records. The information that is presented in this report is derived from EZZ8650I, EZZ8651I, EZZ8654I, EZZ8655I, EZZ8677I, and EZZ8678I types of syslog messages.

Data that is related to SYN floods, interface floods, and EE XID floods is shown in separate sections of the report. Data for SYN floods and EE XID floods is sorted by IP address. Data for interface floods is sorted by interface name. For the interface flood exit and continuing record types, some information about the discarded packets is also provided. This information includes the protocol discarded most frequently during the flood and the category of discards seen most frequently during the interface flood. If the interface type provides the source MAC address of the prior hop, the most frequently seen prior hop source MAC address is also provided.

<th>Threshold</th>
<th>Flood</th>
<th>Count</th>
<th>Duration</th>
</tr>
</thead>
</table>

782 z/OS Communications Server: IP System Administrator's Commands
The following information describes the areas of the SYN flood detail report.

**Date and Time**
Specifies the date and time.

**Local IP Address**
Specifies the bound IP address.

**Local Port**
Specifies the bound port number.

**Type**
Specifies the entry to or exit from constrained state.

- E  enter
- X  exit

**SYNsRecvd**
The number of handshakes started during SYN flood. Present only on EXIT records.

**FirstAck**
The number of handshakes completed during SYN flood. Present only on EXIT records.

**SYNsDiscd**
The number of SYNs randomly discarded during SYN flood. Present only on EXIT records.

**SYNsTimeO**
The number of SYNs timing out during SYN flood. Present only on EXIT records.

**Duration**
Specifies the duration of flood in seconds. Present only on EXIT records.

**Correlator**
Specifies the trace correlator.

The following describes the areas of the interface flood events report.

**Date and Time**
Specifies the date and time.

**Interface**
The name of the interface experiencing the interface flood condition.

**Type**
Specifies flood entry, flood exit, or continuing flood condition.

- E  enter
- X  exit
- C  continuing

**Duration**
The number of seconds since the start of the interface flood was detected. Duration is displayed in both continuing and exit records.
Discard Count/Percent

Discard Count
On interface flood entry, this is the number of discarded inbound packets or not processed packets that triggered the interface flood detection. On interface flood exit or continuation, this is the number of inbound packets discarded or not processed since the interface flood was detected.

Discard Percent
On interface flood entry, this is the percentage of total packets received that were discarded and that triggered the interface flood detection. On interface flood exit or continuation, this is the percentage of total packets received that were discarded on the interface since the interface flood was detected.

Correlator/ProbeID

Correlator
Specifies the trace correlator.

ProbeID
Specifies the IDS probeID that generated this event.

Last Count
The consecutive number of discarded packets for the interface that have the same source IP address as the last discarded packet. If the previously discarded packet's source IP address is not the same as the last discarded packet's source IP address, the count is one. Reported for interface flood continuing and exit record types.

Last Source IP/Dest Address

Last Source IP address
Source IP address of the last packet discarded on this interface during the interface flood condition.

Destination Address
Local IP address associated with the interface when the interface flood was detected.

Most Frequent
This data is tracked from the time the interface flood is detected until the interface flood ends. The counts do not include the initial discards that contributed to the interface flood detection.

This data is reported for interface flood continuing and exit record types. The data is cumulative from the time the interface flood started until the time the record was generated.

Overall

Proto/Percent

Proto
IP protocol most frequently seen in the discarded packets. The protocol value is the protocol number or zero if the protocol value is invalid or unknown.

Percent
Percentage of times the protocol was seen in the discarded packets.

Category/Percent

Category
Discard category most frequently seen in the discarded packets. Possible values are:

Storage
Storage could not be obtained to process the packet. Storage shortages might indicate a problem in the system other than an inbound packet flood.

CheckSum
Packet had checksum error.

Malform
Malformed packet.
Dest
Destination not found. For example, the port is not active or is reserved, the matching
socket not available, no listeners for the RAW protocol.

Firewall
Packet rejected by IP security.

MedHdr
Bad media header.

Forward
Packet is not for us but could not be forwarded. Some cases that prevent forwarding
are bad headers or IPCONFIG NODATAGRAMFWD specified.

QOSPpol
Packet dropped due to QoS policy.

IDSPol
Packet dropped due to IDS policy.

Access
Packet dropped due to NetAccess, multilevel security, or OSM access checks.

ATTLS
Packet dropped due to AT-TLS policy.

OtherPol
Packet dropped due to other configuration policy.

Queue
Queue limit (other than those specified by IDS) prevented queueing the packet for
processing. For example, the SYN queue, the reassembly queue, the UDP or RAW
receive queues.

OtherSyn
Syn problems other than SYN queue full.

State
State mismatch.

UnpackEr
Packet dropped due to unpacking problems.

Misc
Miscellaneous reasons not listed above. For example, TCP packet outside of TCP
window, duplicate fragments found during packet reassembly.

Percent
The percentage of times the discard category was seen in the discarded packets.

Source MAC Data
Source MAC Data is reported for LCS devices and OSA QDIO devices at a microcode level that
supports providing the source MAC address of the prior hop. It is not applicable for other devices.
This data is reported for interface flood continuing and exit record types.

SrcMAC/Percent
SrcMAC
Source MAC of the prior hop seen most frequently in the discarded packets. The value N/A
appears in the field if the device does not support providing the source MAC.

Percent
Percentage of times the most frequent source MAC was seen in the discarded packets.

Proto/Percent
Proto
The most frequent IP protocol seen in the discarded packets associated with the source
MAC address. The protocol value is the protocol number or zero if the protocol value is
invalid or unknown.
Percent
Percentage of times the protocol was seen in the discarded packets associated with the source MAC address.

Category/Percent
Category
The most frequent discard category seen in the discarded packets associated with the source MAC address. The possible values are the same as those listed for Most Frequent Overall Category.

Percent
Percentage of times the discard category was seen in the discarded packets associated with the source MAC address.

The following list describes the areas of the EE XID FLOOD detail report.

Date and Time
Specifies the date and time.

Local IP Address
Specifies the destination IP address of the XID flood.

Last Source IP Address
Source IP address of the last XID that timed out to this local IP address during the EE XID flood condition.

Type
Specifies the entry to or exit from constrained state.

E
Enter. Use type E for the XID timeout threshold, which is the number of XID timeouts that occurred before an EE XID flood was detected.

X
Exit. Use type X for the number of XIDs that timed out during this EE XID flood.

XID
Timeouts

Last Count
The consecutive number of XID timeouts to the local IP address that has the same source IP address as the last XID that timed out. If the previously timed out XID source IP address is not the same as the last XID time-out packet's source IP address, the count is 1.

Duration
Specifies the duration of the flood in seconds. Duration is displayed only on exit records.

Correlator
Specifies the trace correlator.

messages suppressed
The number of attack messages suppressed with attack type, date and time. This data comes from an EZZ9327I message. See in “The trmdstat report general concept” on page 771 for a detailed description.

The interface flood events report width is 132 characters. If you are displaying or printing this report, use an output device that can accommodate this width.

Flood statistics (-F -S) report
This report is displayed when both the -F and -S options are specified on the trmdstat command. It displays the contents of attack flood statistics records only. This report only formats an attack flood statistics record. There is no consolidation or sorting of records. An overall flood statistics log record, EZZ8653I with attack type Flood, contains the number of floods detected during a statistics interval regardless of the type of flood.

More detailed statistics information is also kept by interface for interface flood reporting and to provide data to help an installation determine the policy action values for flood percentage and minimum discard.
that are used for interface flood detection. The interface flood specific statistics information is contained in the EZZ8657I statistics record and is reported in the Interface FLOOD Detailed Statistics section of the report.

More detailed statistics information is also kept by local IP address for EE XID flood reporting. The EE XID flood specific statistics information is contained in the EZZ8676I statistics record and is reported in the XID FLOOD Detailed Statistics section of the report.

XID FLOOD Detailed Statistics

-----XID Timeouts-----

Date and Time                     Local IP Address                 Interval      Peak       Attacks
----------------------  ---------------------------------------------  ----------  ----------  ----------
```

The following information describes the areas of the overall flood statistics report.

**Date and Time**
Indicates the date and time at which the statistics information was gathered by the TCP/IP stack.

**Flood Count**
The total number of SYN flood and Interface flood entries detected during the interval.

The following describes the areas of the interface flood detailed statistics report.

**Date and Time**
Indicates the date and time at which the statistics information was gathered by the TCP/IP stack.

**Interface**
The name of the interface for which the data is reported.

**Discard Count**
Number of inbound packets discarded or not processed during the statistics interval.

**Discard Pct**
Percentage of the total packets received on the interface during the statistics interval that were discarded.

**Attacks**
Number of Interface flood entries detected on the interface during the statistics interval.

The following list describes the areas of the EE XID FLOOD detailed statistics report.

**Date and Time**
Indicates the date and time at which the statistics information was gathered by the TCP/IP stack.
Local IP Address
   Destination IP address for which the data is reported.

Timeout Interval
   Number of inbound EE XID packets that timed out during the statistics interval.

Timeout Peak
   The maximum number of EE XID packets that timed out during a 1-minute interval.

Attacks
   Number of EE XID floods starts detected during the statistics interval.

Global TCP stall summary (-G) report

This report is displayed when the -G option is specified on the trmdstat command. It displays the summary of global TCP stall events. The information presented in this report is derived from EZZ8671I, EZZ8672I, EZZ8673I, and EZZ8674I types of syslog messages. In the Connections Reset and Connections Would Have Been Reset sections, information is sorted by remote IP address.

```
>trmdstat -G /tmp/tstlog.log
trmdstat for z/OS CS V2R4  Fri Nov 25 13:16:37 2011
Command Entered     : trmdstat -G /tmp/tstlog.log
TRM Records Scanned : 504

   Global TCP Stall Summary

Global TCP Stall Entered: 1
Global TCP Stall Exited: 1
Global TCP Stall Duration: 2920

   Connections Reset

   No records to display

   Connections Would Have Been Reset

        Remote IP Address   Count
        --------------------- ----
        10.11.2.1            126
        10.12.2.1            125

        2001:db8:10::12:2:1  125
```

The following information describes the areas of the global TCP stall summary report:

**Global TCP Stall Entered**
   The number of global TCP stall enter conditions that have been detected.

**Global TCP Stall Exited**
   The number of global TCP stall exit conditions that have been detected.

**Global TCP Stall Duration**
   The accumulated duration, in seconds, of the global TCP stall conditions that have ended. Global TCP Stall Duration is non-zero if the TCP/IP stack has experienced at least one global TCP stall that has ended.

**Remote IP Address**
   The remote IP address of one or more stalled TCP connections.

**Count**
   The number of stalled TCP connections with the remote IP address that contributed to a global TCP stall condition. When the global TCP stall condition was detected, the connections were reset if a reset action was requested in the Intrusion Detection Services (IDS) policy for the global TCP stall attack type.

**messages suppressed**
   The number of attack messages suppressed with attack type, date and time. This data comes from an EZZ9327I message. See in “The trmdstat report general concept” on page 771 for a detailed description.
**Global TCP stall detail (-G -D) report**

This report is displayed when both the -G and -D options are specified on the trmdstat command. It displays the contents of individual global TCP stall event records. The information presented in this report is derived from EZZ8671I, EZZ8672I, EZZ8673I, and EZZ8674I types of syslog messages. In the Connections Reset and Connections Would Have Been Reset sections, information is grouped and sorted by remote IP address.

Displaying policy-based networking information 789
The following information describes the areas of the global TCP stall event detail report:

**Date and Time**
The stack date and time when the event occurred.

**Type**
- **Enter**: A global TCP stall condition was entered
- **Exit**: A global TCP stall condition was exited.
- **ExitPlcy**: A global TCP stall condition was exited because IDS Global TCP Stall policy was no longer in effect.

**Stalled Percent**
The percentage of the active TCP connections that were stalled. A TCP connection is considered stalled if one or more of the following conditions are true:

- The TCP send window size is less than 256 or is less than the smaller of the largest send window that has been seen for the connection and the default MTU. The TCP send window size is set based on values provided by the TCP peer. The default MTU for IPv4 is 576. The default MTU for IPv6 is 1280.
- The TCP send queue is full and the data is not being retransmitted.

**TotalConns**
The total number of active TCP connections.

**Small Window Percent**
The percentage of the active TCP connections that were stalled because the TCP send window size is less than the smaller of the MSS of the connection and the default MTU. A TCP connection can be stalled due to multiple conditions. For example, a TCP connection might be included in both the Small Window Percent value and the Write Block Percent value.

**Write Block Percent**
The percentage of the active TCP connections that were stalled because the TCP send queue is full and the data is not being retransmitted. A TCP connection can be stalled due to multiple conditions. For example, a TCP connection might be included in both the Small Window Percent value and the Write Block Percent value.
Duration
The duration, in seconds, of the global TCP stall. Present only for Exit and ExitPlcy records.

Correlator
The correlator for a global TCP stall condition. The correlator can be used to correlate global TCP stall enter and exit conditions with individual TCP connections that contributed to the condition. The individual connections are reset or would have been reset.

Action
The action specified in the IDS policy for the global TCP stall attack type. The action value can be resetconn or noresetconn.

Results:
- If the value is resetconn, all stalled TCP connections were reset. If you requested detailed syslogd messages for the global TCP stall attack type in the IDS policy, the Connections Reset section contains an entry for each stalled connection that was reset during the global TCP stall attack.
- If the value is noresetconn, stalled TCP connections were not reset. However, if you requested detailed syslogd messages for the global TCP stall attack type in the IDS policy, the Connection Would Have Been Reset section contains an entry for each connection that was stalled at the time that the global TCP stall was detected.

Remote IP Address
The remote IP address of the stalled TCP connections described in the table.

Local Port
The local port number of the stalled TCP connection that was reset or would have been reset.

Local IP Address
The local IP address of the stalled TCP connection that was reset or would have been reset.

Remote Port
The remote port number of the stalled TCP connection that was reset or would have been reset.

ConnID
The ID of the TCP connection that was reset or would have been reset.

JobName
The job name of the TCP connection that was reset or would have been reset.

SendQSize
The amount of data queued to send queue for the stalled TCP connection.

WindowSize
The size of the send window for the stalled TCP connection.

messages suppressed
The number of attack messages suppressed with attack type, date and time. This data comes from an EZZ9327I message. See in “The trmdstat report general concept” on page 771 for a detailed description.

IDS overall summary (-I) report option
This report is displayed when the -I option is specified with the trmdstat command or when no report option is provided on the trmdstat command invocation. It displays the summary of all the IDS information present in the log. Using this report enables you to get an idea of the overall effect of the IDS policies installed in the system.

<table>
<thead>
<tr>
<th></th>
<th>TCP - Traffic regulation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constrained entry logged</td>
<td>Specifies the number of times that a TCP listener would have entered a constrained state if policy action LIMIT had been specified in the TR policy. This count indicates the total number of EZZ9320I messages present in the log.</td>
</tr>
<tr>
<td>Connections refused</td>
<td>Indicates the number of connections refused by the system. This count indicates the total number of EZZ9324I messages present in the log.</td>
</tr>
<tr>
<td>Constrained entry logged</td>
<td>Specifies the number of connections that would have been refused if policy action LIMIT had been specified in the TR policy. This count indicates the total number of EZZ9319I messages present in the log.</td>
</tr>
</tbody>
</table>
**Constrained exit logged**
Specifies the number of times that a TCP listener would have exited a constrained state if policy action LIMIT had been specified in the TR policy. This count indicates the total number of EZZ9322I messages present in the log.

**Constrained entry**
Specifies the number of times that a TCP listener entered a constrained state. This count indicates the total number of EZZ9321I messages present in the log.

**Constrained exit**
Specifies the number of times that a TCP listener exited a constrained state. This count indicates the total number of EZZ9323I messages present in the log.

**QOS exceptions logged**
Specifies the number of times a QoS exception was logged because the QoS policy guarantees a higher number of connections to this port than would be allowed by the TCP TR policy. This count indicates the total number of EZZ9318I messages present in the log.

**QOS exceptions made**
Specifies the number of times a QoS exception was made because the QoS policy guarantees a higher number of connections to this port than would be allowed by the TCP TR policy. This count indicates the total number of EZZ9317II messages present in the log.

**UDP - Traffic regulation**

**Constrained entry logged**
Specifies the number of times that a UDP socket would have entered a constrained state if policy action LIMIT had been specified in the TR policy. This count indicates the total number of EZZ8638I messages present in the log.

**Constrained exit logged**
Specifies the number of times that a UDP socket would have exited a constrained state if policy action LIMIT had been specified in the TR policy. This count indicates the total number of EZZ8640I messages present in the log.

**Constrained entry**
Specifies the number of times that a UDP socket entered a constrained state. This count indicates the total number of EZZ8639I messages present in the log.

**Constrained exit**
Specifies the number of times that a UDP socket exited a constrained state. This count indicates the total number of EZZ8641I messages present in the log.

**Scan detection**

**Threshold exceeded**
Specifies the number of scan events detected. This count indicates the total number of EZZ8643I messages present in the log.

**Detection delayed**
Specifies the number of scan interval overrun events detected. This count indicates the total number of EZZ8645I messages present in the log.

**Storage constrained entry**
Specifies the number of times scan storage constraint entry was detected. This count indicates the total number of EZZ8646I messages present in the log.

**Storage constrained exit**
Specifies the number of times scan storage constraint exit was detected. This count indicates the total number of EZZ8647I messages present in the log.

**Attack detection**

**Packet would have been discarded**
Specifies the total number of attack packets that would have been discarded if policy action Discard had been specified in the attack policy. This count indicates the total number of EZZ8649I messages present in the log.

Displaying policy-based networking information 793
Packet discarded
   Specifies the total number of attack packets discarded. This count indicates the total number of EZZ86481 messages present in the log.

Flood detection

Accept queue expanded
   Specifies the number of accept queue expansions. This count indicates the total number of EZZ86521 messages present in the log.

SYN flood start
   Specifies the number of SYN flood starts detected. This count indicates the total number of EZZ86501 messages present in the log.

SYN flood end
   Specifies the number of SYN flood ends detected. This count indicates the total number of EZZ86511 messages present in the log.

Interface flood start
   Specifies the number of interface flood starts detected. This count indicates the total number of EZZ86541 messages present in the log.

Interface flood end
   Specifies the number of interface flood ends detected. This count indicates the total number of EZZ86551 messages present in the log.

EE XID flood start
   Specifies the number of EE XID flood starts detected. This count indicates the total number of EZZ86771 messages present in the log.

EE XID flood end
   Specifies the number of EE XID flood ends detected. This count indicates the total number of EZZ86781 messages present in the log.

Global TCP stall detection

Global TCP stall entered
   Specifies the number of global TCP stall enter conditions that have been detected. This count indicates the number of EZZ86711 messages present in the log.

Global TCP stall exited
   Specifies the number of global TCP stall exit conditions that have been detected. This count indicates the number of EZZ86721 messages present in the log.

Connections would have been reset
   Specifies the number of stalled TCP connections that contributed to a global TCP stall condition. These stalled TCP connections were not reset because Intrusion Detection Services (IDS) policy for the global TCP stall attack type specified that connections should not be reset. This count indicates the number of EZZ86741 messages present in the log.

Connections reset
   Specifies the number of stalled TCP connections that contributed to a global TCP stall condition. These stalled TCP connections were reset because Intrusion Detection Services (IDS) policy for the global TCP stall attack type specified that connections should be reset. This count indicates the number of EZZ86731 messages present in the log.

TCP Queue size detection

Send queue

Constrained entered
   Specifies the number of times a TCP connection’s send queue entered a constrained state. This count indicates the total number of EZZ86641 messages present in the log.

Constrained exited
   Specifies the number of times a TCP connection’s send queue exited a constrained state. This count indicates the total number of EZZ86651 messages present in the log.
Connections reset
Specifies the number of TCP connections that were reset because the connections' send queues were constrained. This count indicates the number of EZZ8669I messages present in the log.

Receive queue
Constrained entered
Specifies the number of times a TCP connection's receive queue entered a constrained state. This count indicates the total number of EZZ8662I messages present in the log.

Constrained exited
Specifies the number of times a TCP connection's receive queue exited a constrained state. This count indicates the total number of EZZ8663I messages present in the log.

Connections reset
Specifies the number of TCP connections that were reset because the connections' receive queues were constrained. This count indicates the number of EZZ8668I messages present in the log.

Out-of-order queue
Constrained entered
Specifies the number of times a TCP connection's out-of-order queue entered a constrained state. This count indicates the total number of EZZ8666I messages present in the log.

Constrained exited
Specifies the number of times a TCP connection's out-of-order queue exited a constrained state. This count indicates the total number of EZZ8667I messages present in the log.

Connections reset
Specifies the number of TCP connections that were reset because the connections' out-of-order queues were constrained. This count indicates the number of EZZ8670I messages present in the log.

messages suppressed
Specifies the number of messages suppressed with date and time. This data comes from an EZZ8660I, EZZ8661I, or EZZ9327I message. See in "The trmdstat report general concept" on page 771 for a detailed description.

Scan summary (-N) report
This report is displayed when the -N option is specified on the trmdstat command. It displays the summary of scan events. The information presented in this report is derived from EZZ8643I type syslog messages. The information is sorted by source IP address.

```
> trmdstat -N /tmp/tstlog.log
trmdstat for z/OS CS V2R4  Fri Nov 25 08:34:49 2011

Command Entered : trmdstat -N /tmp/tstlog.log
TRM Records Scanned : 128

SCAN  Summary
Source IP Address                       Scans                 Suspicion Level
                                           Fast  Slow  Very Possibly  Normal
--------------------------------------------- ---------- ---------- ---------- ---------- ----------
192.168.16.48                                          1          1          8         10         22
2001:db8:11:16::44                                     1          1         10         35         19
11
```

The following information describes the areas of the scan summary report.

Source IP Address
Specifies the IP address of the source host that triggered scan detection.
Fast Scans
Specifies the number of fast scans detected.

Slow Scans
Specifies the number of slow scans detected.

Suspicion Level
Specifies the number of packets at each suspicion level that contributed to the scan detection.

Restriction: When a scan is detected for a source IP address, additional suspicious packets from that source IP that are received during the current fast scan interval are not reflected in these suspicious counts.

Very
Specifies the number of packets at the very suspicious suspicion level that contributed to the scan detection.

Possible
Specifies the number of packets at the possibly suspicious suspicion level that contributed to the scan detection.

Normal
Specifies the number of packets at the normal suspicion level that contributed to the scan detection.

Scan detail (-N -D) report
This report is displayed when both the -N and -D options are specified on the trmdstat command. It displays the contents of individual scan event records. The records are sorted by source IP address. The information in this report is derived from EZZ8643I type syslog messages.

> trmdstat -ND /tmp/tstlog.log

The following information describes the areas of the scan detail report.

Date and Time
Specifies the date and time in the message at which the scan events were logged.
**Source IP Address**
Specifies the IP address of the source host that triggered scan detection.

**Suspicion Level**
Specifies the number of packets at each suspicion level that contributed to the scan detection.

**Restriction:** When a scan is detected for a source IP address, additional suspicious packets from that source IP that are received during the current fast scan interval are not reflected in these suspicious counts.

**Very**
Specifies the number of packets at the very suspicious suspicion level that contributed to the scan detection.

**Possible**
Specifies the number of packets at the possibly suspicious suspicion level that contributed to the scan detection.

**Normal**
Specifies the number of packets at the normal suspicion level that contributed to the scan detection.

**Type**
Specifies the scan type.

**F**
Fast

**S**
Slow

**Correlator**
Specifies the trace correlator.

**TCP queue size (-Q) summary report**
This report is displayed when the -Q option is specified on the trmdstat command. It displays the summary of TCP queue size events. The information presented in this report is derived from EZZ8662I, EZZ8663I, EZZ8664I, EZZ8665I, EZZ8666I, EZZ8667I, EZZ8668I, EZZ8669I, and EZZ8670I types of syslog messages. Information is sorted by remote IP addresses, and then by local ports.

```

The following information describes the areas of the TCP Queue Size detail report:

**Remote IP Address**
The remote IP address of the TCP connection associated with the event. This value will be an IP address on the local TCP/IP stack when the IP addresses at both ends of the TCP connection reside on the local TCP/IP stack.

**Date and Time**
The stack date and time when the event occurred.

**Type**
Event type. Possible values include:

- **Enter**
  Constrained state was entered because there was either excessive or old data accumulating on the queue.

- **Exit**
  Constrained state was exited.

**Queue**
The TCP connection's queue associated with the event. Possible values include:

- **OofO**
  Out-of-order queue

- **Recv**
  Receive queue

- **Send**
  Send queue

**Local Port**
The local port number of the TCP connection associated with the event.

**Local IP Address**
The local IP address of the TCP connection associated with the event.

**Remote Port**
The remote port of the TCP connection associated with the event.

**ConnID**
The connection ID of the TCP connection associated with the event.

**JobName**
The job name of the TCP connection associated with the event.
QueueSize
The abstract TCP queue size value that was configured in the IDS policy for the TCP queue size attack type.

VS
Very short

S
Short

L
Long

VL
Very long

Trigger
The condition that triggered the event. This field is present only for Enter type records. The possible values are:

DataAge
The event was triggered by the length of time that data had been on the specified queue.

BytesQed
The event was triggered by the amount of data on the specified queue.

DataAge
The age in seconds of the oldest data on the specified queue when the event occurred.

BytesQd
The number of bytes queued on the specified queue when the event occurred.

Duration
The number of seconds that the specified queue was constrained. This field is present only for Exit type records.

Correlator
The correlator for a constrained queue condition. The correlator can be used to correlate TCP queue size constrained enter and exit events.

messages suppressed
The number of attack messages suppressed with attack type, date and time. This data comes from an EZZ9327I message. See in “The trmdstat report general concept” on page 771 for a detailed description.

TCP TR summary (-T) report
This report is displayed when the -T option is specified with the trmdstat command. It displays the summary of all TCP traffic regulation events. The information presented in this report is derived from EZZ9317I, EZZ9318I, EZZ9319I, EZZ9320I, EZZ9321I, EZZ9322I, EZZ9323I, and EZZ9324I types of syslog messages. Information is grouped by local host and sorted by local host and then by local port.

>trmdstat -T /tmp/tstlog.log

</tbody>
</table>
The following information describes the areas of the TR TCP Summary Report:

**Local Host**
If the policy was configured to limit by all sockets (also known as limit by port), this is either 255.255.255.255 or ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff. If the policy was configured to limit by each socket (also known as limit by port instance), this is the IP address that is bound to by the local listener applications. The value 0.0.0.0 indicates that the application bound to INADDR_ANY. The value :: indicates that the application bound to in6addr_any.

**Limited | Logged**
For each Local Host the report is first generated for ports with a policy that specified both an action of LIMIT and an action of LOG and then for ports that specified only a policy action of LOG.

**Local Port**
Indicates the port number bound to by a local listener application.

**Constrained States**
The number of times this port entered and exited constrained state and the total duration in seconds of constrained state.

**Excp QOS**
The number of connections that were allowed because the QoS policy for a particular source IP guaranteed a higher number of connections to this port than were allowed by the TCP TR percentage of total connections for a single host.

**Connections Refused Appl**
The number of connections refused because the total number of connections limit was exceeded.

**Connections Refused Host**
The number of connections refused because the number of connections requested from a single host exceeded the percentage of total connections allowed for a single host.

**Connections Would Have Been Refused Appl**
The number of connections that would have been refused because the total number of connections limit was exceeded. The connections were allowed because policy action LIMIT was not specified.

**Connections Would Have Been Refused Host**
The number of connections that would have been refused because the number of connections requested from a single host exceeded the percentage of total connections allowed for a single host. The connections were allowed because policy action LIMIT was not specified.

**messages suppressed**
The number of TCP TR messages suppressed with date and time, type of suppressed TCP connections, local IP address, local listening port, and the reason that the log records were suppressed. This data comes from an EZZ8660I or EZZ8661I message. See in “The trmdstat report general concept” on page 771 for a detailed description.

**TCP TR detail (-T -D) report**
This report is displayed when both the -T and -D options are specified with the trmdstat command. It displays the contents of individual TCP TR records. The information displayed in this report is derived from EZZ9317I, EZZ9318I, EZZ9319I, EZZ9320I, EZZ9321I, EZZ9322I, EZZ9323I, and EZZ9324I types of syslog messages. Information is grouped and sorted by local host.

No TypeActions LOG records to display.

The following information describes the areas of the TCP TR detail report:

**Events Limited | Logged**

For each Local Host the report is first generated for ports with a policy that specifies both an action of LIMIT and an action of LOG and then for ports that specify only an action of LOG.

**Local Host**

If the policy was configured to limit by all sockets (also known as limit by port), this is either 255.255.255.255 or ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff. If the policy was configured to limit by each socket (also known as limit by port instance), this is the IP address bound to by the local listener applications. The value 0.0.0.0 indicates that the application bound to INADDR_ANY. The value :: indicates that the application bound to in6addr_any.

**Date and Time**

The stack date and time the event occurred.

**Local Port**

The port bound to by a local listener application.
Source Host
The source host associated with the event.

Rec Typ
The record type of the event. Possible values are:

• C - Connection refused or would have been refused events
• Q - Connection allowed due to QoS exception events. The QOS policy guarantees a higher number of connections to this port than would be allowed by the TCP TR policy
• S - Port entered or exited constraint events

Cns Typ
Constraint event type:
• E - Entered
• X - Exited

Connections Current
The number of connections that were active on this port at the time of this event and that were established while policy was in effect.

Connections Available
The remaining number of connections available to this port at the time of this event.

Policy Total Conn
The total number of connections allowed for this port.

Policy Pct
The percentage of total connections that can be used by a single IP address for this port.

Policy QoS Limit
The maximum number of connections specified in the QoS policy for this source host and this port.

Correlator
The trace correlator for this event.

ProbeID
The IDS probeID that generated this event.

messages suppressed
The number of TCP TR messages suppressed with date and time, type of suppressed TCP connections, local IP address, local listening port, and the reason that the log records were suppressed. This data comes from an EZZ8660I or EZZ8661I message. See in “The trmdstat report general concept” on page 771 for a detailed description.

TCP TR extended (-T -E) report
This report is displayed when both the -T and -E options are specified with the trmdstat command. It displays an extended summary of all TCP traffic regulation events. For each port a separate line of totals is generated for each source host. The information presented in this report is derived from EZZ9317I, EZZ9318I, EZZ9319I, EZZ9320I, EZZ9321I, EZZ9322I, EZZ9323I, and EZZ9324I types of syslog messages. Information is sorted by local host and then by local port and source host pair.

>trmdstat -TE /tmp/tstlog.log
trmdstat for z/OS CS V2R4  Wed Dec 14 09:03:02 2011

Command Entered : trmdstat -TE /tmp/tstlog.log
Stack Time Interval : May 27 19:19:05 - May 28 21:26:02
TRM Records Scanned : 86
The following information describes the areas of the TR TCP extended summary report:

**Local Host**
- If the policy was configured to limit by all sockets (also known as limit by port), this is either 255.255.255.255 or ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff. If the policy was configured to limit by each socket (also known as limit by port instance), this is the IP address that is bound to by the local listener applications. The value 0.0.0.0 indicates that the application bound to INADDR_ANY. The value :: indicates that the application bound to in6addr_any.

**Limited | Logged**
- For each Local Host the report is first generated for ports with a policy that specified both an action of LIMIT and an action of LOG and then for ports that specified only a policy action of LOG.

**Local Port**
- Indicates the port number bound to by a local listener application.

**Source Host**
- For each port a separate line of totals is generated for each source host.

**Constrained States**
- The number of times this port entered and exited constrained state and the total duration in seconds of constrained state.

**Excp QOS**
- The number of connections that were allowed because the QoS policy for a particular source IP guaranteed a higher number of connections to this port than were allowed by the TCP TR percentage of total connections for a single host.

**Connections Refused Appl**
- The number of connections refused because the total number of connections limit was exceeded.
Connections Refused Host
The number of connections refused because the number of connections requested from a single host exceeded the percentage of total connections allowed for a single host.

Connections Would Have Been Refused Appl
The number of connections that would have been refused because the total number of connections limit was exceeded. The connections were allowed because policy action LIMIT was not specified.

Connections Would Have Been Refused Host
The number of connections that would have been refused because the number of connections requested from a single host exceeded the percentage of total connections allowed for a single host. The connections were allowed because policy action LIMIT was not specified.

messages suppressed
The number of TCP TR messages suppressed with date and time, type of suppressed TCP connections, local IP address, local listening port, and the reason that the log records were suppressed. This data comes from an EZZ8660I or EZZ8661I message. See in “The trmdstat report general concept” on page 771 for a detailed description.

TCP TR statistics (-T -S) report
This report is displayed when both the -T and -S options are specified on the trmdstat command. It displays the contents of the TCP traffic regulation statistics records, EZZ9316I. Information is sorted by local host.

```

806  z/OS Communications Server: IP System Administrator's Commands
The following information describes the areas of the TR TCP statistics report:

**Local Host**
If the policy was configured to limit by all sockets (also known as limit by port), this is either 255.255.255.255 or ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff. If the policy was configured to limit by each socket (also known as limit by port instance), this is the IP address bound to by the local listener applications. The value 0.0.0.0 indicates that the application bound to INADDR_ANY. The value :: indicates that the application bound to in6addr_any.

**Date and Time**
The stack date and time the statistics were reported.

**Local Port**
The port bound to by a local listener application.

**Action**
Indicates whether or not an action of LIMIT was specified in the policy that is in effect at the end of the statistics interval.

**Peak**
The highest number of concurrent connections from all sources during the statistics interval.

**Peak Host**
The IP address of the source host with the largest number of concurrent connections that also requested an additional connection during the statistics interval.

**HostPeak**
The number of allowed connections held by the source host identified in Peak Host.

**Requests**
The total number of new connection requests received during the statistics interval.

**Warnings**
The total number of connections that would have been denied during the statistics interval if a policy action of LIMIT had been in effect at the time of the request.

**QosExcepts**
The total number of connections that were allowed during this statistics interval because the QoS policy for a particular source IP guaranteed a higher number of connections to this port than were allowed by the TCP TR percentage of total connections for a single host.

**Terminates**
The total number of connections that were denied during the statistics interval because a policy action of LIMIT was in effect at the time of the request.

**Current**
The number of connections existing at the end of the statistics interval.

**Duration**
The number of seconds this port was in constrained state during this statistics interval.

**SugLimit**
A suggested value for the total number of connections limit that will avoid any connections being denied for exceeding either limit in future periods with the same number of total requests and requests from a single source. If a policy action of LIMIT was in effect then this value is 0.

**SugPercent**
A suggested companion value for the percentage of total connections that can be used by a single IP address. If a policy action of LIMIT was in effect then this value is 0.
TCP TR connection (-C) report

This report is displayed when the -C option is specified with the trmdstat command. It displays the connection summary information of all TCP traffic regulation events. The information presented in this report is derived from EZZ9319I and EZZ9324I types of syslog messages. Information is grouped and sorted by local port.

```
>trmdstat -C /tmp/tstlog.log
trmdstat for z/OS CS V2R4  Wed Dec 14 09:03:57 2011
Command Entered     : trmdstat -C /tmp/tstlog.log
Stack Time Interval : May 27 19:19:05  - May 28 21:05:23
TRM Records Scanned : 86

Local Port  Connections Refused
----------  -------------------
21                 1
333                6
345               10

Local Port  Connections Would Have Been Refused
----------  -----------------------------------
No records to display
```

The following information describes the areas of the TCP TR connection summary report:

**Local Port**
Indicates the port number bound to by a local listener application.

**Connections Refused**
The total number of connections refused for this port.

**Connections Would Have Been Refused**
The total number of connections that would have been refused for this port if a policy action of LIMIT was specified in the policy.

TCP TR connection detail (-C -D) report

This report is displayed when both the -C and -D options are specified with the trmdstat command. It displays the connection information of all TCP traffic regulation events. The information presented in this report is derived from EZZ9319I and EZZ9324I types of syslog messages. Information is grouped and sorted by local port and then by source IP address.

```
>trmdstat -CD /tmp/tstlog.log
trmdstat for z/OS CS V2R4  Wed Dec 14 09:04:15 2011
Command Entered     : trmdstat -CD /tmp/tstlog.log
Stack Time Interval : May 27 19:19:05  - May 28 21:05:23
TRM Records Scanned : 86

333                6  10.42.0.1
345               10  10.42.105.135
1  2001:db8::9:42:105:25

Local Port  Connections Would Have Been Refused  Source IP Address
----------  ----------------------------------------------
No records to display
```

808  z/OS Communications Server: IP System Administrator's Commands
This report first shows the total number of 'Connections Refused' or 'Connection Would Have Been Refused' by port number. Under each port total, the data for the port is broken out by source IP for which the connection was refused or would have been refused.

Data under the 'Connections Refused' heading reports on connections that were refused because the policy specified an action of limit. Data under the 'Connections Would Have Been Refused' heading are connections that exceeded policy limits but were not rejected because policy did not specify an action of limit.

The following information describes the areas of the TR TCP connection detail report:

**Local Port**
Indicates the port number bound to by a local listener application.

**Connections Refused**
If the report line contains a Port Number, this is the total number of connections refused for this port. If the report line contains an IP Address, this is the number of connections refused for the Port and IP Address combination.

**Connections Would Have Been Refused**
If the report line contains a Port Number, then this is the total number of connections that would have been refused for this port if an action of LIMIT was specified in the policy. If the report line contains an IP Address, this is the number of connections that would have been refused for this port and IP Address combination if an action of LIMIT was specified in the policy.

**Source IP Address**
Indicates the source IP address.

**TCP TR connection detail for a specific host (-C -D -h) report**
This report is displayed when -h filter is specified along with both the -C and -D options in the trmdstat command. It displays the connection information for the particular host whose IP address matches to the -h filter value. The information presented in this report is derived from EZZ9319I and EZZ9324I types of syslog messages. Information is grouped and sorted by local port.

```
>trmdstat -CD -h 10.42.105.25 /tmp/tstlog.log
trmdstat for z/OS CS V2R4 Wed Dec 14 09:05:09 2011
Command Entered     : trmdstat -CD -h 10.42.105.25 /tmp/tstlog.log
Log Time Interval   : May 27 21:15:49 - May 28 01:39:08
Stack Time Interval : May 27 21:15:38 - May 28 01:39:03
TRM Records Scanned : 86

Local Port  Connections Refused
-------------  -------------------
Date and Time       HostCurrent   Available   Percent
----------------------  -----------   ----------  -------
333     05/27/2011 21:15:38.67            2            3    50%
345     05/28/2011 01:38:39.75            2            3    50%
345     05/28/2011 01:39:03.85            2            3    50%

Local Port  Connections Would Have Been Refused
-------------  -----------------------------------
Date and Time       HostCurrent   Available   Percent
----------------------  -----------   ----------  -------
No records to display
```

The following information describes the areas of the TCP TR connection detail when the -h filter is used to retrieve data for a specific host:

**Local Port**
Indicates the port number bound to by a local listener application.

**Connections Refused**
Each entry under this heading represents a connection request that was refused.

**Connections Would Have Been Refused**
Each entry under this heading represents a connection that would have been refused if a policy action of LIMIT was specified.
**Date and Time**

The stack date and time the connection was refused or would have been refused.

**HostCurrent**

The number of connections that were active on this port at the time the connection was refused or would have been refused.

**Available**

The remaining number of connections available to this port at the time the connection was refused or would have been refused.

**Percent**

The percentage of total connections that can be used by a single IP address for this port.

**UDP TR summary (-U) report**

This report is displayed when the -U option is specified with the trmdstat command. It displays the summary of UDP constrained state and datagram discard information. The information presented in this report is derived from EZZ8638I, EZZ8639I, EZZ8640I, and EZZ8641I syslog messages. Information is grouped and sorted by local IP address and then by local port.

```
> trmdstat -U /tmp/tstlog.log
trmdstat for z/OS CS V2R4  Fri Nov 11 08:54:00 2011
Command Entered     : trmdstat -U /tmp/tstlog.log
Log Time Interval   : Nov  9 22:15:10  - Nov 10 03:02:22
Stack Time Interval : Nov  9 22:14:59  - Nov 10 03:02:19
TRM Records Scanned : 128

TRMD Started for TCPCS : Oct 28 01:23:18
```

The following information describes the areas of the UDP summary report.

**Local IP Address**

Specifies the bound IP address.

**Local Port**

Specifies the bound port number.

**Constrained State**

Specifies constrained state status.

**Entered**

The number of constrained state entries.

**Exited**

The number of constrained state exits.

**Duration**

Specifies the accumulated duration, in seconds, that the UDP inbound queue was constrained based on the duration reported when a constraint was exited. Duration is non-zero only if the UDP inbound queue exited a constraint at least once.

**Datagram Disposition**

Specifies disposition of datagrams.
**Discarded**
Specifies the number of datagrams discarded.

**Would Have Been Discarded**
Specifies the number of datagrams that would have been discarded if policy action LIMIT had been specified in UDP TR policy.

**UDP TR detail (-U -D) report**
This report is displayed when both the -U and -D options are specified. It displays the contents of individual UDP records. The information presented in this report is derived from EZZ8638I, EZZ8639I, EZZ8640I, and EZZ8641I syslog messages. Information is grouped and sorted by local IP address.

The following information describes the areas of the UDP detail report.

**Local IP Address**
Specifies the bound IP address.

**Date and Time**
Specifies the date and time the event occurred.

**Local Port**
Specifies the bound port number.

**Type**
Specifies the entry to or exit from constrained state. Add the values in a list under Type.
Duration
Specifies the duration of constrained state in seconds. This field is present only on EXIT records.

Datagram Disposition
Specifies the datagram disposition. This field is present only on EXIT records.
- Number of datagrams Discarded
- Number of datagrams that Would have been Discarded if policy action LIMIT had been specified in UDP TR policy.

Qsize
Specifies the queue limit specified on the policy.
- VS
  Very small
- S
  Small
- L
  Large
- VL
  Very large

Correlator
Specifies the trace correlator.

UDP TR statistics (-U -S) report
This report is displayed when both the -U and -S options are specified on the trmdstat command. It displays the contents of the UDP traffic regulation statistics records, EZZ8642I. There is no consolidation or sorting of records.

The following describes the areas of the UDP statistics report.

**Local IP Address**

Specifies the bound IP address.

**Date and Time**

Specifies the date and time in the message when the statistics were logged.

**Local Port**

Specifies the bound port number.

**Datagrams Received**

Specifies the number of datagrams received in the statistics interval.

**Datagrams Discarded**

Specifies the number of datagrams that were discarded or would have been discarded during the statistics interval. If Action is LIMIT, then this is the number of datagrams discarded. If Action is NOLIMIT, then this is the number of datagrams that would have been discarded.

**Datagrams Peak**

Specifies the largest number of datagrams queued during the statistics interval. Set only if a receive is processed during the statistics interval. Does not include datagrams from a Pascal API.

**Bytes Received**

Specifies the number of bytes received in the statistics interval.

**Bytes Discarded**

Specifies the number of bytes that were discarded or would have been discarded during the statistics interval. If Action is LIMIT, then this is the number of bytes discarded. If Action is NOLIMIT, then this is the number of bytes that would have been discarded.

**Bytes Peak**

Specifies the largest number of bytes queued during the statistics interval. Set only if a receive is processed during the statistics interval.
**Duration**
Specifies the number of seconds the UDP inbound queue was constrained during this statistics interval.

**Constraints**
Specifies the number of times the UDP inbound queue entered the constrained state during this statistics interval.

**Qsize**
Specifies the queue size specified on the policy.
- **VS** Very small
- **S** Small
- **L** Large
- **VL** Very large

**Action**
LIMIT if the policy action LIMIT has been specified in UDP TR policy. NOLIMIT if the policy action LIMIT has not been specified in the UDP TR policy.
Chapter 5. Querying and administrating a Domain Name System (DNS)

This information describes the Domain Name System (DNS) domain names, domain name servers, resolvers, and resource records. It also provides the following descriptions:

• NSLOOKUP, onlookup, nsupdate, DIG, and dig commands used to query name servers
• hostname, dnsdomainname, and domainname commands used to display the local DNS host name and domain name

Resolver related commands

Programs that query a name server are called resolvers. Because many TCP/IP applications need to query the name server, a set of routines is usually provided for application programmers to perform queries. However, utility programs with resolver interface are provided for system administrators to interactively query and update the name server.

z/OS Communications Server provides the following resolver related utility programs:

• NSLOOKUP, see “Using the TSO NSLOOKUP command” on page 815
• onlookup/nslookup, see “Using the z/OS UNIX onlookup/nslookup command” on page 827
• nsupdate, see “Using the z/OS UNIX nsupdate command” on page 837
• DIG (TSO), see “Using the TSO DIG command” on page 842
• dig (z/OS UNIX), see “Using the z/OS UNIX dig command” on page 856
• host, see “Using the z/OS UNIX host command ” on page 865

The TSO DIG command uses the z/OS Communications Server provided resolver for resolver facilities. The BIND 9 onlookup and dig commands use the resolver initialization facilities of the z/OS Communications Server provided resolver but use their own resolver for additional resolver facilities needed. For a complete discussion of resolver configuration files, see the z/OS Communications Server: IP Configuration Guide.

Restriction: Scope information is not permitted on the operands that represent the target host name on the NSLOOKUP, onlookup, nslookup, nsupdate, DIG (TSO), or dig (z/OS UNIX) utility programs.

Using the TSO NSLOOKUP command

The NSLOOKUP command enables you to query name servers in order to accomplish the following tasks:

• Locate information about network nodes
• Examine the contents of a name-server database
• Establish the accessibility of name servers

Rule: The NSLOOKUP command does not use resolver caching.

NSLOOKUP has two modes of operation: interactive mode and command mode. Interactive mode enables you to repeatedly query one or more name servers for information about various hosts and domains and display that information on your terminal. Command mode displays the output from the query supplied as part of the command and then exits.

TSO NSLOOKUP has been deprecated in favor of the z/OS UNIX dig command. There are a number of the more recent resource record types that TSO NSLOOKUP will not understand, including the forward and some reverse resource records used for IPv6.
**NSLOOKUP configuration**

The configuration options of NSLOOKUP determine the operation and results of your name server queries. You can configure NSLOOKUP operation using the following methods:

- TCP/IP client program configuration data set, TCPIP.DATA
- NSLOOKUP options data set, user_id.NSLOOKUP.ENV
- NSLOOKUP command options

For information about the TCPIP.DATA data set, see the z/OS Communications Server: IP Configuration Reference. For information about the NSLOOKUP.ENV options data set and the NSLOOKUP command options, see “NSLOOKUP options” on page 820.

**NSLOOKUP: Query a name server in command mode**

Use the NSLOOKUP command to specify an individual query in command mode.

**Format:**

```
NSLOOKUP -Option domain_name domain_address server_name server_address
```

**Parameters:**

- **-Option**
  For a description of the NSLOOKUP options, see “NSLOOKUP options” on page 820.

  **domain_name**
  Queries the name server for information about the current query type of `domain_name`. The default query type is A (address query).
  
  If the domain name starts with an underscore (_), you must prefix the domain name with the escape character (\).

  **domain_address**
  Reverses the components of the address and generates a pointer type (PTR) query to the name server for the `in-addr.arpa` domain mapping of the address to a domain name.

  **server_name**
  Directs the default name server to map `server_name` to an IP address and then use the name server at that IP address.

  **server_address**
  Specifies the IP address of the name server to be queried other than the default name server. A query for the address in the `in-addr.arpa` domain is initially made to the default name server to map the IP address to a domain name for the server.

**Usage:**

The parameters and subcommands of NSLOOKUP are case sensitive and must be entered in lowercase. Parameter values and domain names are not case sensitive.

If the resolver trace is active, the trace will show the initial values before the NSLOOKUP command line options are processed.

**Context:**

- See “NSLOOKUP options” on page 820 for the complete list and description of NSLOOKUP options.
- See “NSLOOKUP: Issue queries to name servers in interactive mode ” on page 817 for the complete list and description of subcommand and query formats.
NSLOOKUP: Issue queries to name servers in interactive mode

Use the NSLOOKUP command to issue multiple queries in interactive mode. In interactive mode, an initial query is made to the selected name server to verify that the server is accessible. All subsequent interactive queries are sent to that server unless you specify another server using the server or lserver options.

Format:

```
NSLOOKUP -Option - server_name - server_address
```

SubCommand

```
domain_name
  domain_address
  server_name
  server_address
  > data_set_name
  >>
  exit
  finger
  loginname
  > data_set_name
  >>
  help
  ?
  ls
  domain
    -a
    -d
    -h
    -s
    -t
    type
  lserver
    name
    address
  root
  server
    name
    address
  set
    Option
  view
    data_set_name
```

Parameters:

Queries processed by NSLOOKUP that specify an address can give unexpected results. If the current query type is address (A) or domain-name pointer (PTR), NSLOOKUP generates a PTR type query for the specified address in the in-addr.arpa domain. This returns PTR records which define the host name for the specified address. If the current query type is neither of these two types, a query is performed using the current query type, with the domain name specified as the address given.
Text that does not conform to the defined options and follows the preceding syntax is treated as a domain query. NSLOOKUP does not issue a query for a domain name if the name is unqualified and is the same as one of the defined options.

-Option
   For a description of the NSLOOKUP options, see “NSLOOKUP options” on page 820.

address
   Specifies the IP address of the server.

data_set_name

Output can be placed in a data set for later viewing by specifying data_set_name. The > data_set_name option places the output in data_set_name and overwrites the contents, if any, of the data set. The >> data_set_name option places the output in data_set_name and appends it to the contents, if any, of the data set. There must be at least one space before and after the > or >> symbol.

domain_address
   Reverses the components of the address and generates a pointer type (PTR) query to the name server for the in-addr.arpa domain mapping of the address to a domain name.

domain_name
   Queries the name server for information about the current query type of domain_name. The default query type is A (address query).
   If the domain name starts with an underscore (_), you must prefix the domain name with the escape character (\).

exit
   Exits from NSLOOKUP interactive mode.

finger parms
   Extracts information from the finger server of the node found in the last address query. By default, this command returns a list of logged-in users for the node last found. You can find information about a particular user by specifying the loginnname of the user as a parameter.
   An error occurs if the preceding subcommand was not a successful address query or finger operation.
   If the current host is not defined, querying the name server defines that name server to be the current host for a subsequent finger operation.
   The finger option expects that the finger server is operating on the node found. An error occurs if the server is not operating or the node cannot be reached.

help or ?
   Displays a brief summary of commands.

loginnname
   The logged-in user name. The loginnname variable is case sensitive and must be specified in the same case (upper or lower) as that used by the host.

ls parms
   Lists various information available for the domain. By default, the IP address of each node in the domain is listed.
   To select resource records other than the default, specify one of the following options:
   -a
     CNAME
   -d
     ALL
   -h
     HINFO
   -s
     WKS
-t [type]  
Retrieves the resource record type specified in type. If no record type is specified with the -t option, the current default type is used.

If type is ns, up to 24 characters of the returned DNS name is displayed. The UNIX nslookup/onslookup command can be used to display the entire DNS name.

See the z/OS Communications Server: IP Configuration Reference for detailed information about valid query types.

The ls command expects the domain name specified in domain to be a zone. If the domain name specified refers to a host, an error message is printed and no information is given. This command should create a virtual circuit (TCP connection) with the current name server to service the request. An error message is printed if the virtual circuit cannot be established.

A # symbol is displayed at the terminal as every 50 lines are written to the data set to indicate the command is still executing.

ls
Changes the current server. If server_name is specified, the IP address of server_name is determined using the initial server defined at command invocation.

An error occurs if the domain name cannot be mapped to an IP address. This option does not ensure that a name server can be reached at the node specified; it simply changes a local variable storing the address of the default name server.

name
Specifies the name of the server.

root
Changes the current server address to the address of the root server. The root server is ns.nic.ddn.mil by default, but can be changed using the root=name SET subcommand. This command is equivalent to lserver name.

An error occurs if the name of the root server cannot be mapped to an IP address. This option does not ensure that a name server can be reached at the node specified; it simply changes a local variable storing the address of the default name server.

server_address
Specifies the IP address of the name server to be queried other than the default name server. A query for the address in the in-addr.arpa domain is initially made to the default name server to map the IP address to a domain name for the server.

server_name
Directs the default name server to map server_name to an IP address and then use the name server at that IP address.

server parms
Changes the current server. If name is specified, the IP address of name is determined using the current server.

An error occurs if the domain name cannot be mapped to an IP address. This option does not ensure that a name server can be reached at the address; it simply changes a local variable storing the address of the default name server.

set option
Changes internal state information values. See “NSLOOKUP options” on page 820 for a description of the options.

view data_set_name
Sorts and lists the contents of data_set_name one screen at a time. An error occurs if the data set does not exist.

Usage:
• You can query by entering the domain name of the node or subnetwork for which information is required. Define the data type of information to be retrieved using the SET querytype= option. You can
define only one type of resource record for a domain name in a single query, unless the wildcard query type of ANY has been set. If an IP address is given instead of a domain name, a query for the address in the In-addr.arpa domain is made to map the IP address to a domain name.

The domain name or address for the query can be followed by the domain name or IP address of a name server to contact for the query. If this is not specified, the current name server is used. For example, entering:

```
toolah wurrup.fourex.oz
```

queries the name server on wurrup.fourex.oz for information about the node toolah. When specifying domain names that include periods, the trailing period (indicating a fully qualified domain name) is optional. NSLOOKUP deletes the trailing period if it is present. If you are specifying a root domain, the domain name must have two trailing periods. For example, specify mynode.. when the node mynode is in the root domain.

- The name server often requires a fully qualified domain name for queries. However, NSLOOKUP enables the specification of a default subnetwork domain using the SET domain= option, with the initial default obtained from the TCPIP.DATA data set. When the defname flag is enabled using the SET defname option, the default domain name specified by SET domain= is appended to all unqualified domain names. For example, if the default domain name is fourex.oz and the defname flag is enabled, a query for the name toolah automatically generates a query packet containing the domain name toolah.fourex.oz.

- A timeout error occurs if the name server is not running or is unreachable. A Non-existent Domain error occurs if any resource record type for the specified domain name is not available at the name server. A Server Failed error occurs when the local name server cannot communicate with the remote name server.

- NSLOOKUP might interpret typing or syntax errors in subcommands as queries. This results in a query being sent and the name server response printed. The response is usually Non-existent Domain, which indicates that the server could not find a match for the query.

**NSLOOKUP options**

The configuration options of NSLOOKUP determine the operation and results of your name server queries. These options can be specified in command-mode queries, interactive-mode queries, or in the user_id.NSLOOKUP.ENV data set. When you include NSLOOKUP options with the initial NSLOOKUP command the (-) operand must immediately precede the option. If you specify NSLOOKUP options while in interactive mode, the SET subcommand must precede the option. Specifying NSLOOKUP options in the user_id.NSLOOKUP.ENV data set is optional. Use the SET subcommand before the option if you want to reset the option value. The (-) operand is not valid preceding options in the user_id.NSLOOKUP.ENV data set.

For example, to specify a name server (NS) type record lookup for the domain name fourex.oz in command mode you enter:

```
nsllookup -querytype=ns fourex.oz
```

To submit the same request using interactive mode enter the following sequence:

```
nsllookup
set querytype=ns
fourex.oz
```

To make querytype of NS a default option for your NSLOOKUP commands, place one of the following statements in the user_id.NSLOOKUP.ENV data set:

- `set querytype=ns`
- `querytype=ns`

The optional data set user_id.NSLOOKUP.ENV contains only NSLOOKUP options and defines the NSLOOKUP defaults. If the user_id.NSLOOKUP.ENV data set exists, the NSLOOKUP options are read from
the data set and executed before any queries are made. You must enter each option on a separate line. Blank lines are ignored.

The following example shows the contents of the user_id.NSLOOKUP.ENV data set:

```
set domain=powers.oz
querytype=HINFO
set norecurse
vc
```

**Option**

- **all**
  Enables you to print the current values of the internal state variables. This option does not alter the internal state of NSLOOKUP.

- **class=class**
  Sets the class of information returned by queries. The class must be identified by its mnemonic. The minimum abbreviation for this option is `cl`.

- **d2**
  Directs NSLOOKUP to enable extra debugging mode. Using `d2` also enables debug mode.

  **Note:** To obtain all alias names for a host when using reverse query, you must set the `d2` option.
nod2
Directs NSLOOKUP to disable extra debugging mode. The default is nod2.

dbek
Directs NSLOOKUP to print debugging information for each query and its corresponding response. The minimum abbreviation is deb and nodeb.

dnodeb
Directs NSLOOKUP to not print debugging information for each query and its corresponding response. This option also disables d2. The minimum abbreviation is nodeb. This is the default.

defname
Directs NSLOOKUP to append the default domain name to an unqualified domain name in a query. This value is the default. If the search list is also enabled, then the domain names specified in the search list will also be appended until a query is resolved or until no more domain names are left in the search list.

The default domain name is initially obtained from the TCPIP.DATA data set, but can be changed using the domain= name option. The minimum abbreviation for this option is def.

nodefname
Directs NSLOOKUP to not append the default domain name to an unqualified domain name in a query. If you specify this option, the domain name specified in the query is passed to the server without modification. The search list will not be used, even if it is enabled. The minimum abbreviation for this option is nodef.

domain=name
Sets the default domain name to name. Initially, the default domain name is obtained from the TCPIP.DATA data set. The validity of name is not verified. This option also updates the search list. The search list contains the domain specified and the parents of the default domain if it has at least two components in its name. For example, if the default domain is wurrup.forex.oz, the search list contains wurrup.forex.oz and forex.oz. Use the SET srchlist command to specify a different search list. The minimum abbreviation for this option is do.

ignoretc
Directs NSLOOKUP on the handling of truncated responses. The name server indicates, in the response header, that the complete query response did not fit into a single UDP packet and has been truncated.

Specifying ignoretc directs NSLOOKUP to ignore the truncation condition when it is set in the response by the name server.

NSLOOKUP does not handle responses greater than 512 characters in length. Responses greater than 512 characters are truncated and the internal truncation flag is set. This condition is revealed only when the debug option is enabled. The minimum abbreviation for this option is ig.

noignorectc
Directs NSLOOKUP to automatically retry the query using a TCP connection when a response is sent with the truncation indicator set. This is the default. The minimum abbreviation for this option is noig.

port=port
Specifies the port number to use when contacting the name server. The Domain Name System is a well-known service and has been allocated port 53. NSLOOKUP uses port 53 by default, but the port option enables you to specify another port to access. The minimum abbreviation for this option is po.

querytype=type
Specifies the type of information returned by queries. The initial query type is A (address information). See the z/OS Communications Server: IP Configuration Reference for detailed information about available query types.

NSLOOKUP cannot generate queries about type NULL. However, it can accept responses containing resource records of type NULL. In this case, NSLOOKUP displays the number of bytes returned in the NULL record. Global queries that return all resource records for a specific domain name are specified by the wildcard value ANY. The minimum abbreviation for this option is q.
The type=type option is accepted by NSLOOKUP as a synonym for the querytype=type option.

**recurse**
Directs NSLOOKUP to request a recursive query when querying a name server. The minimum abbreviation for this option is rec. This is the default.

**norecurse**
Specifies that a recursive query is not returned. The minimum abbreviation for this option is norec.

**retry=limit**
Specifies the number of times a request is resent. When a request is sent and the timeout period expires for a response, the request is resent until the value specified in limit has been exceeded. The value specified in limit determines the number of attempts made to contact the name server. The default value for limit is retrieved from the TCPIP.DATA data set.

Setting limit to 0 disables NSLOOKUP from contacting the name server. The result is an error message no response from server.

The retry algorithm for NSLOOKUP uses both the limit value and the timeout period. The minimum abbreviation for this option is ret.

**root=name**
Specifies the name of a root server. The root server is ns.nic.ddn.mil by default.

**search**
Directs NSLOOKUP to enable the use of a search list. The minimum abbreviation for this option is sea.

**nosearch**
Directs NSLOOKUP to disable the use of a search list. The minimum abbreviation for this option is nosea.

**srchlist=[domain
domain...]**
Specifies one or up to three domain names to be appended to non-fully-qualified domain names when attempting to resolve the host name. Each domain name specified is tried in turn until a match is found or no domain names are left to try.

This option also directs the default domain to be set to the first domain name specified in the search list. The minimum abbreviation for this option is srchl.

**timeout=interval**
Specifies the number of seconds to wait before timing out of a request. The default for interval is retrieved from the TCPIP.DATA data set. The minimum abbreviation for this option is t.

**vc**
Specifies to use a virtual circuit (TCP connection) to transport queries to the name server or datagrams (UDP). The default is retrieved from the TCPIP.DATA data set.

**novc**
Specifies to not use a virtual circuit to transport queries to the name server or datagrams. This option is the default.

**NSLOOKUP examples**
This material contains examples of NSLOOKUP command-mode queries, and interactive-mode queries using the various options available for NSLOOKUP commands.

In Figure 2 on page 824, the router wurrup has two IP addresses and there are two name servers, wurrup being the primary name server. This network is described by a single zone in the domain naming hierarchy stored in the name servers.
Figure 2. Hierarchical naming tree—A TCP/IP network

The following examples show how to use NSLOOKUP to extract information from a name server. The queries are executed from the z/OS host uluru on the network described in Figure 2 on page 824.

The following examples are command-mode queries.

- To make a simple address query:

```
User:    nslookup toolah.fourex.oz wurrup.fourex.oz
System:  Server:  wurrup
         Address:   101.3.104.12
         Name:   toolah.fourex.oz
         Address:   101.3.100.2
```

- To specify a name server (NS) type record lookup:

```
User:    nslookup -querytype=ns fourex.oz
System:  Server:  canetoad
         Address:   101.3.104.40
         fourex.oz  nameserver = wurrup.fourex.oz
         fourex.oz  nameserver = canetoad.fourex.oz
         wurrup.fourex.oz   internet address = 101.3.100.12
         wurrup.fourex.oz   internet address = 101.3.104.12
         canetoad.fourex.oz internet address = 101.3.104.40
```

- To specify a different default domain name to be appended to an unqualified domain name given as input:

```
User:    nslookup -do=fourex.oz uluru
System:  Server:  canetoad.fourex.oz
         Address:   101.3.104.40
         Name:    uluru.fourex.oz
         Address:   101.3.104.38
```

- To specify a list of domain names to be appended in turn to the unqualified host name when attempting to resolve it:

```
User:    nslookup -srchlist=nowhere.oz/fourex.oz uluru
System:  Server:  canetoad.fourex.oz
         Address:   101.3.104.40
         Name:    uluru.fourex.oz
         Address:   101.3.104.38
```

The following command places NSLOOKUP in interactive mode with wurrup as the default server.
All following examples are in the interactive mode initiated in the preceding example.

- **Show the default flag settings:**

```plaintext
User:
set all
Default Server:  wurrup.fourex.oz
Address:  101.3.104.12

Set options:
nodebug      defname      nosearch      recurse
nod2         novc         noignoretc    port=53
querytype=A  class=IN    timeout=60    retry=1
root=ns.nic.ddn.mil.
domain=FOUREX.OZ
srchlist=FOUREX.OZ
```

- **Perform a simple address query:**

```plaintext
User:
toolah
System:  Server:  wurrup
Address:  101.3.104.12

Name:  toolah.FOUREX.OZ
Address:  101.3.100.2
```

- **Set the query record type to HINFO, and perform another query:**

```plaintext
User:
set q=HINFO
toolah
System:  Server:  wurrup
Address:  101.3.104.12

toolah.FOUREX.OZ  CPU = RS6000     OS = AIX3.1
```

- **Find out the name servers available for a domain:**

```plaintext
User:
set q=NS
fourex.oz
System:  Server:  wurrup
Address:  101.3.104.12

fourex.oz  nameserver = wurrup.fourex.oz
fourex.oz  nameserver = canetoad.fourex.oz
wurrup.fourex.oz  internet address = 101.3.100.12
wurrup.fourex.oz  internet address = 101.3.104.12
canetoad.fourex.oz  internet address = 101.3.104.40
```

- **Change the current server from wurrup to canetoad and make more queries:**

```plaintext
User:   server canetoad
System:  Default Server:  canetoad.FOUREX.OZ
Address:  101.3.104.40

User:
set q=A
gecko
System:  Server:  canetoad.FOUREX.OZ
Address:  101.3.104.40

Name:  gecko.FOUREX.OZ
Address:  101.3.100.90
```

- **Enable debugging and execute a simple query to see the result, and then disable debugging:**

```plaintext
Querying and administrating a Domain Name System (DNS)  825
```
set deb
wurrup
System:  Server:  canetoad.FOUREX.OZ
Address:  101.3.104.40
res_mkquery(0,  wurrup.FOUREX.OZ, 1, 1)
--------------
Got answer:
HEADER:
  opcode = QUERY, id = 7, rcode = NOERROR
header flags:  response, auth. answer, want recursion, recursion avail
questions = 1, answers = 2, authority records = 0, additional = 0

QUESTIONS:
  wurrup.FOUREX.OZ, type = A, class = IN
ANSWERS:
  wurrup.FOUREX.OZ
    internet address = 101.3.104.12
    ttl = 9999999 (115 days 17 hours 46 mins 39 secs)
  wurrup.FOUREX.OZ
    internet address = 101.3.100.12
    ttl = 9999999 (115 days 17 hours 46 mins 39 secs)

--------------
Name:  wurrup.FOUREX.OZ
Addresses:  101.3.104.12, 101.3.100.12

set nodeb

• Find all addresses in the fourex.oz domain using the ls option:

User:
ls fourex.oz
System:  [canetoad.FOUREX.OZ]
fourex.oz              server = wurrup.fourex.oz
wurrup                 101.3.104.12
wurrup                 101.3.100.12
fourex.oz              server = canetoad.fourex.oz
canetoad               101.3.104.40
gecko                  101.3.100.90
wurrup                 101.3.100.12
galah                  101.3.100.20
bandicoot              101.3.104.52
toolah                 101.3.100.2
canetoad               101.3.104.40
loopback               127.0.0.1
uluru                  101.3.104.38

• Find all aliases in the fourex.oz domain, then exit from NSLOOKUP interactive mode:

User:
ls -a fourex.oz
System:  [canetoad.FOUREX.OZ]
localhost             loopback.fourex.oz
infoserver            wurrup.fourex.oz
pabxserver            wurrup.fourex.oz
User:
exit

• To display a summary of available commands:
• To find information for all the users currently logged in on the node specified in the last address query:

User:
finger
System:
[canetoad.FOUREX.OZ]
Further output to be generated ....

• To set the default domain name to fourex.oz, use the command

```
set domain=fourex.oz
```

This command overrides the DOMAINORIGIN statement in the tcpip.TCPIP.DATA data set.

• To specify that the default domain name is to be appended to an unqualified domain name given in a query, use the SET defname command.

• To request that the query be resent three times if the timeout period expires for a response, use the SET retry=3 command. A value of 3 is the maximum valid value.

Using the z/OS UNIX onslookup/nslookup command

The z/OS UNIX nslookup is a program used to query Internet domain name servers. The nslookup command has two modes: interactive and non-interactive. Use the interactive mode to query name servers for information about various hosts and domains. Non-interactive mode is used to display just the name and requested information for a host or domain.

Rule: The onslookup/nslookup command does not use resolver caching.

The z/OS UNIX onslookup/nslookup command enables you to perform the following tasks from the z/OS UNIX environment:

• Identify the location of name servers

• Examine the contents of a name server database
Establish the accessibility of name servers

See “nslookup versions” on page 828 for listings of valid start options and subcommands for the different versions of nslookup.

To display a list of options, enter the following from the command line:

```bash
nslookup -h
```

**Note:**

1. The onslookup command is a synonym for the nslookup command in the z/OS UNIX shell. The nslookup command syntax is the same as that for the onslookup command. The nslookup command can be run from the z/OS UNIX shell or from TSO; however, only the legacy TSO version of NSLOOKUP is available from TSO.

2. The onslookup messages are not documented in the z/OS Communications Server library. Therefore, onslookup command messages do not give a message ID for debugging.

The onslookup command has two modes of operation: interactive mode and command mode. In both modes, the address of the default name server comes from the resolver configuration file.

In the following example, the default domain is raleigh.ibm.com, and the default name server is at 9.37.34.149. If that name server fails to respond, the one at 9.37.34.7 is used.

```bash
domain raleigh.ibm.com
nameserver 9.37.34.149
nameserver 9.37.34.7
```

**onslookup configuration**

BIND 9 DNS uses the z/OS application's search order to find TCPIP.DATA statements. See the z/OS Communications Server: IP Configuration Guide for details. It uses the following directives from the resolver configuration file.

1. nameserver/nsinteraddr
2. options ndots:n
3. search
4. domain/domainorigin

The value specified by ResolverTimeout in the /etc/resolv.conf file has priority over the value specified by ResolverTimeout in the TCPIP.DATA configuration data set. See “Resolver related commands” on page 815 for detailed descriptions.

See the z/OS Communications Server: IP Configuration Guide for detailed information about onslookup configuration.

**nslookup versions**

This material presents similarities and differences for the two separate versions (TSO and z/OS UNIX shell) of the nslookup command. The following tables present the start options and subcommands used by each version. The only version of nslookup that supports IPv6 addresses and resource record types is nslookup that is invoked from the z/OS UNIX shell.

The following table shows the validity of start options between TSO and z/OS UNIX shell nslookup commands.

<table>
<thead>
<tr>
<th>Start option</th>
<th>TSO NSLOOKUP</th>
<th>nslookup in the z/OS UNIX shell</th>
</tr>

onslookup/nslookup (command mode): Querying a name server in command mode

Command (non-interactive) mode is used to print just the name and requested information for a host or domain. Use the command mode entry of onslookup command to specify a single query.

Command mode query is invoked when the name or IP address of the host to be looked up is given as the first argument. The optional second argument specifies the host name or address of a name server.

Note:
1. The nslookup command is a synonym for the onslookup command in the z/OS UNIX shell. The nslookup command syntax is the same as that for the onslookup command.
2. The onslookup help command works only in the interactive mode.

Format:

```
onslookup <Option> name address server_name server_address
```

Parameters:
- **Option**
  For a description of the onslookup options, see “onslookup options” on page 834.
- **name**
  Queries the name server for the current query-type of name. The name typically represents a host name.
**address**
Reverses the components of the address and generates a pointer type (PTR) query to the name server for the in-addr.arpa domain mapping of the address to a domain name.

**server_name**
Directs the default name server to map server_name to an IP address and then uses the name server at that address. This argument is optional. The default is the default name server found by the search order described in “onslookup configuration” on page 828. This name can be a name that resolves to an IPv4 or an IPv6 address.

**server_address**
Specifies the IP address of the name server to be queried other than the default name server. A query for the address is initially made to the default name server to map the IP address to a domain name for the server. This argument is optional. The default value is the default name server found by the search order described in “onslookup configuration” on page 828. This address can be an IPv4 or an IPv6 address.

**Usage:**
Parameter values and domain names are not case sensitive.

**Context:**
Options can also be specified on the command line if they precede the arguments and are prefixed with a hyphen. For example, to change the default query type to host information and the initial timeout to 10 seconds, type:

```
nslookup -query=hinfo -timeout=10
```

To display a list of options, enter the following from the command line:

```
onslookup -h
```

For a complete list and description of onslookup options, see “onslookup options” on page 834.

**onslookup/nslookup (interactive mode): Issuing multiple queries to name servers**

Interactive mode enables you to query one or more name servers repeatedly for information about various hosts and domains, to display that information on your console, and, in some cases, to write response data to a file. nslookup is a synonym for the onslookup command in the z/OS UNIX shell. nslookup command syntax is the same as that for the onslookup command.

You can enter the interactive mode under the following conditions only:

- No arguments are supplied on command invocation. The default name server is used.
- The first argument is a hyphen (-), and the second argument is the host name or IP address of a name server.

In interactive mode:

- An initial query is made to the selected name server to verify that the server is accessible.
- All subsequent interactive queries are sent to that server unless you specify another server using the server or lservr subcommands.
- The command line length must be less than 256 characters.
- To treat a built-in command as a host name, precede it with an escape character (\). An unrecognized command is interpreted as a host name.

For a complete list and description of onslookup options, see “onslookup options” on page 834. See “nslookup versions” on page 828 for listing of valid commands and start options.

**Format:**

- Interactive mode
onslookup

- Option

Interactive commands, subsequent queries

Parameters:

- Option
  For a description of the onlookup options, see “onslookup options” on page 834.

- server_name
  Directs the default name server to map -server_name to an IP address and then uses the name server at that address. This argument is optional. The default is the default name server found by the search order described in “onslookup configuration” on page 828. This name can be a name that resolves to an IPv4 or an IPv6 address.

- server_address
  Specifies the IP address of the name server to be queried other than the default name server. A query for the address is initially made to the default name server to map the IP address to a domain name for the server. This argument is optional. The default is the default name server found by the search order described in “onslookup configuration” on page 828. This can be an IPv4 or an IPv6 address.

exit
  Exits from onlookup interactive mode.

host
  host is the host name or IP address you want the name server to resolve. Use this format to look up information for a host using the current default server or using server if specified. If host is an IP address and the query type is A or PTR, the name of the host is returned. If host is a name and does not have a trailing period, the default domain name is appended to the name. (This behavior depends on the state of the set options -domain, -srchlist, -defname, and -search.) To look up a host not in the current domain, append a period to the name.

lserver
  Change the default server to one determined by name or address. This command uses the initial server to look up information about the new server. This can be a name that resolves to an IPv4 or an IPv6 address, or an actual IPv4 or IPv6 address.

  If an authoritative answer cannot be found, the names of servers that might have the answer are returned.

server
  Change the default server to one determined by name or address. This command uses the current default server to look up information about the new server. This can be a name that resolves to an IPv4 or IPv6 address, or an actual IPv4 or IPv6 address.

  If an authoritative answer cannot be found, the names of servers that might have the answer are returned.
**set keyword**

Allows changes to query environment. The following describes the keyword and values that can be used.

**all**
Prints the current values of the frequently used options to set. Information about the current default server and host is also printed.

**class=QUERY_CLASS**
The class specifies the protocol group of the information. The class changes the query class. See the z/OS Communications Server: IP Configuration Reference for detailed information about valid query types. The default class is IN. The keyword class can be abbreviated as c1.

**[no]d2**
Turn exhaustive debugging mode on (d2) or off (nod2). You will not see any difference between debug, d2 and trace resolver. This turns on nslookup internal trace. The default is nod2.

**[no]debug**
Turn basic debugging mode on (debug) or off (nodebug). Information is printed about the packet sent to the server and the resulting answer. The default is nodebug. The keyword debug can be abbreviated as deb.

**[no]defname**
If set, append the default domain name to a single-component lookup request (one that does not contain a period). The default is defname. The keyword defname can be abbreviated as def. This is equivalent to the [no]search option. Specifying the '-domain=' option also causes the default domain name to be appended to the name being queried.

**domain=NAME**
Change the default domain name to name. The default domain name is appended to a lookup request depending on the state of the defname and search options. The keyword domain can be abbreviated as do. This also causes the -search option to be turned on. Also, this becomes the default search list and overrides the default domain specified in the resolver configuration file.

**port=value**
Change the default TCP/UDP name server port to value. The default port number is 53. The keyword port can be abbreviated as po.

**querytype=TYPE**
- The keyword querytype can be abbreviated as type.
- The keyword querytype can also be abbreviated as qu.

Change the type of information query type. See the z/OS Communications Server: IP Configuration Reference for detailed information about valid query types. The default value is A.

**[no]recurse**
Tell the name server to query other servers if it does not have the information. The default is recurse. The keyword recurse can be abbreviated as rec.

**retry=NUMBER**
Set the number of retries to number. When a reply to a request is not received within a certain amount of time (changed with set timeout), the timeout period is doubled and the request is resent. The retry value controls how many times a request is sent before giving up. The default is 4. The keyword retry can be abbreviated as ret.

**[no]search**
If the lookup request contains at least one period but does not end with a trailing period, append the domain names in the domain search list to the request until an answer is received. The default is search. The keyword search can be abbreviated as sea. This is equivalent to the [no]defname option.

**timeout=NUMBER**
Change the initial timeout interval for waiting for a reply to number seconds. Each retry doubles the timeout period. The default is 5 seconds. The keyword timeout can be abbreviated as t.
[no]vc
Always use a virtual circuit (TCP) when sending requests to the server. The default is novc. The keyword vc can be abbreviated as v.

onslookup options

The configuration options of onlookup determine the operation and results of name server queries. These options can be specified in command-mode queries, interactive-mode queries, or by the methods described in “onslookup configuration” on page 828.

When you include onlookup options with the initial onlookup command, the hyphen (-) operand must immediately precede the option. If you specify onlookup options while in interactive mode, the SET subcommand must precede the option.

For example, to specify a name server (NS) type record lookup for the domain name fourex.oz in command mode you enter:

```
onslookup -querytype=ns fourex.oz
```

To submit the same request using interactive mode, enter the following sequence:

```
onslookup
set querytype=ns
fourex.oz
```

Format:
Parameters:

-all
  Prints the current values of the frequently used options to set. Information about the current default server and host is also printed.

-class=query_class
  The class specifies the protocol group of the information. Changes the class to query class. See the z/OS Communications Server: IP Configuration Reference for detailed information about valid classes. The default class is IN. The option class can be abbreviated as cl.

-[no]d2
  Turn exhaustive debugging mode on (d2) or off (nod2). You will not see any difference between debug, d2, and trace resolver. This turns on nslookup internal trace. The default is nod2.

-[no]debug
  Turn basic debugging mode on (debug) or off (nodebug). Information is printed about the packet sent to the server and the resulting answer. The default is nodebug. The option debug can be abbreviated as deb.

-[no]defname
  If set, append the default domain name to a single-component lookup request (one that does not contain a period). The default is defname. The option defname can be abbreviated as def.
-domain=name
The default domain name is appended to a lookup request depending on the state of the defname and
search options. The domain search list contains the parents of the default domain if it has at least two
components in its name. For example, if the default domain is CC.Berkeley.EDU, the search list is
CC.Berkeley.EDU and Berkeley.EDU. Use the set srchlist command to specify a different list. Use
the set all command to display the list. The option domain can be abbreviated as do.

-h
Prints a brief summary of commands.

-port=port_number
Change the default TCP/UDP name server port to port_number. The default port number is 53. The
option port can be abbreviated as po.

-querytype=resource_record_type
• The option querytype can be abbreviated as type.
• The option querytype can also be abbreviated as qu.
Change the type of information query resource_record_type. See the z/OS Communications Server: IP
Configuration Reference for detailed information about valid query types. The default
resource_record_type is A.

-[no]recurse
Tell the name server to query other servers if it does not have the information. The default is
recurse. The option recurse can be abbreviated as rec.

-retry=limit
Set the number of retries to limit. When a reply to a request is not received within a certain amount of
time (changed with the command set timeout), the timeout period is doubled and the request is
resent. The retry value controls how many times a request is sent before giving up. The default is 4.
The option retry can be abbreviated as ret.

-[no]search
If the lookup request contains at least one period but does not end with a trailing period, append the
domain names in the domain search list to the request until an answer is received. The default is
search. The option search can be abbreviated as sea.

-sil
Suppress deprecation message.

-timeout=interval
Change the initial timeout interval for waiting for a reply to interval seconds. Each retry doubles the
timeout period. The default is 5 seconds. The keyword timeout can be abbreviated as t.

-V
Sets BIND 9 mode.

-[no]vc
Always use a virtual circuit (TCP) when sending requests to the server. The default is novc. The option
vc can be abbreviated as v.

**onslookup: diagnosing problems**

The **onslookup** program lets you query other name servers with the same query packet another name
server would use. This is helpful in diagnosing lookup problems in TCP/IP UNIX System Services.

To turn debugging on at level 1, enter the following commands from the z/OS shell:

```bash
onslookup
set debug
```

The **onslookup** program shows timeouts and displays response packets.

To turn the debug option off, enter the following command:

```bash
set nodebug
```
You can set the debugging option to level 2 by entering the `set d2` command just as the `set debug` command was entered previously. The `set d2` command provides program trace information and `set debug` shows parts of the formatted DNS response message.

The resolver shows the normal debugging information plus the query packets that were sent out. Turning on `d2` also turns on `debug`. Turning off `d2`, however, turns off only `d2`; `debug` remains on. To turn off both `d2` and `debug`, enter the command `set nodebug`.

If the lookup request was not successful, an error message is printed. Possible errors include:

**Timed out**
The server did not respond to a request after a certain amount of time (changed with `set timeout=value`) and a certain number of retries (changed with `set retry=value`).

**No response from server**
No name server is running on the server machine.

**No records**
The server does not have resource records of the current query type for the host, although the host name is valid. The query type is specified with the `set querytype` command.

**Non-existent domain**
The host or domain name does not exist.

**Connection refused**
The host or domain name refused the connection.

**Network is unreachable**
The connection to the name could not be made at the current time. This error commonly occurs with `ls` requests.

**Server failure**
The name server found an internal inconsistency in its database and could not return a valid answer.

**Refused**
The name server refused to service the request.

**Format error**
The name server found that the request packet was not in the correct format. It might indicate an error in `nslookup`.

**Note:** The `onslookup` messages are not documented in the z/OS Communications Server library. Therefore, `onslookup` command messages do not give a message ID for debugging.

For help with `onslookup` commands from the command line, type `onslookup -h`.

### Using the z/OS UNIX nsupdate command

You can use the `nsupdate` command to create and execute DNS update operations on a host record as defined in RFC 2136 (for DNS 9) to a name server. This allows resource records to be added or removed from a zone without manually editing the zone file. A single update request can contain requests to add or remove more than one resource record.

**Rules:**

- Do not manually edit zones that are under dynamic control by `nsupdate` or a DHCP server. Manual edits could conflict with dynamic updates and cause data to be lost.
- Do not use the `nsupdate` command to update DNS zones that are managed by the automated domain name registration (ADNR) application. See information about updates to an ADNR-managed zone in the z/OS Communications Server: IP Configuration Guide for more details.

The `nsupdate` command can be used for both IPv4 and IPv6 connections.

The resource records for `nsupdate` using BIND 9 that are dynamically added or removed with `nsupdate` have to be in the same zone. Requests are sent to the zone’s master server. This is identified by the MNAME field of the zone’s SOA record.
Batch mode is supported when `nsupdate` subcommands are stacked in a file, and the name of the file is specified as the last argument on the command line:

```bash
nsupdate /tmp/update.zone
```

The file name must not immediately follow the `-d` option.

BIND 9 DNS uses the z/OS application's search order to find TCPIP.DAT statements. See the `z/OS Communications Server: IP Configuration Guide` for details. It uses the following directives from the resolver configuration file:

1. `nameserver/nsinteraddr`
2. `options ndots:n`
3. `search domain/domainorigin`

**nsupdate: Command mode**

Use `nsupdate` to create and execute DNS update operations on a host record to a name server. You can add or remove resource records from a zone without manually editing the zone file. A single update request can contain requests to add or remove more than one resource record.

You can use this command in an interactive fashion (where you are prompted through a series of subcommands and associated input values), or if you know the sequence of operations and input values beforehand, you can use `nsupdate` in batch mode. You can read input from a file. The file name must appear at the end of the `nsupdate` command line and must not follow the `-d` option.

**Format:**

```bash
nsupdate -d -v -y keyname:secret -k keyfile -D -M -V v9 batch_file_name
```

**Parameters:**

- `batch_file_name`  
  The name of a z/OS UNIX file that contains `nsupdate` subcommands, which can be used as input to the `nsupdate` command. If the `batch_file_name` does not specify a directory, the file must be in the current directory. The file name can contain v9 `nsupdate` commands, one per line.

- `-d`  
  Turn debug trace on. This provides tracing information about the update requests that are made and the replies received from the name server. Use this option if you want to see the response from the server on the `nsupdate` client side.

- `-v`  
  By default `nsupdate` uses UDP to send update requests to the name server. The `-v` option makes `nsupdate` use a TCP connection. This might be preferable when a batch of update requests is made.

- `-y keyname:secret`  
  `nsupdate` uses the `-y` or `-k` option to provide the shared-secret needed to generate a TSIG record for authenticating Dynamic DNS update requests. These options are mutually exclusive. When the `-y`
option is used, a signature is generated from keyname:secret. The name of the key is keyname, and secret is the base-64 encoded shared-secret. Use of the -y option is discouraged because the shared-secret is supplied as a command line argument in clear text. This might be visible in the output from ps -ef or in a history file maintained by the user's shell.

-k keyfile
nsupdate uses the -y or -k option to provide the shared-secret needed to generate a TSIG record for authenticating Dynamic DNS update requests. These options are mutually exclusive. With the -k option, nsupdate reads the shared-secret from the file keyfile, whose name is of the form K{name}.+157.+{random}.private. For historical reasons, the file K{name}.+157.+{random}.key must also be present.

-D
Turn debug trace and procedure trace on.

-M
Turn debug, procedure, and memory trace on.

-V
Specifies the version of nsupdate. The only valid version is v9.

Transaction signatures can be used to authenticate the Dynamic DNS updates. These use the TSIG resource record type described in RFC 2845. The signatures rely on a shared-secret that should be known only to nsupdate and the name server. Currently, the only supported encryption algorithm for TSIG is HMAC-MD5, which is defined in RFC 2104. Suitable key{} statements and allow-update{} or update-policy{} options must be added to the BIND 9 name server configuration file (for example, /etc/named.conf) so that the name server can authorize nsupdate clients that use TSIG authentication. nsupdate does not read /etc/named.conf.

nsupdate: Subcommand mode

The following subcommands can be used in the nsupdate command shell. nsupdate reads commands from its standard input. Each command is supplied on exactly one line of input. Some commands are for administrative purposes. The others are either update instructions or prerequisite checks on the contents of the zone.

Format:
This section shows syntax format of nsupdate: Subcommand mode.

Start nsupdate subcommand mode

| Start nsupdate subcommand mode | nsupdate — Enter |
Subsequent subcommand entry

Parameters:
The following subcommands can be used in the **nsupdate** command shell. Some of these subcommands make prerequisite checks on the contents of the zone. These checks set conditions that some name or set of resource records (RRset) either exists or is absent from the zone. These conditions must be met if the entire update request is to succeed. Updates are rejected if the tests for the prerequisite conditions fail.

Every update request consists of 0 or more prerequisites and 0 or more updates. This allows a suitably authenticated update request to proceed if some specified resource records are present or missing from the zone. A blank input line causes the accumulated commands to be sent as one Dynamic DNS update request to the name server.

**quit**
Quits the program.

**prereq nxdomain** *domain-name*
Requires that no resource record of any type exists with name *domain-name*.

**prereq yxdomain** *domain-name*
Requires that *domain-name* exists (has at least one resource record, of any type).

**prereq nxrrset** *domain-name* [*class*] *type*
Requires that no resource record exists of the specified *type*, *class* and *domain-name*. If *class* is omitted, IN (Internet) is assumed. See the z/OS Communications Server: IP Configuration Reference for detailed information about valid classes and types.

**prereq yxrrset** *domain-name* [*class*] *type* data...
The data from each set of prerequisites of this form sharing a common *type*, *class* and *domain-name* are combined to form an RRset. This RRset must exactly match the RRset existing in the zone at the given *type*, *class* and *domain-name*. The data is written in the standard text representation of the resource record’s RDATA. See the z/OS Communications Server: IP Configuration Reference for detailed information about valid classes and types.

**server** *servername* [*port*]
Specifies the server name or IP address where all dynamic update requests are sent. This can be an IPv4 or an IPv6 address or a name that resolves to an IPv4 or IPv6 address. When no server statement is provided, nsupdate sends updates to the master server of the correct zone. The latter
capability, like use of a server name instead of IP address, is assuming \texttt{nsupdate} can find resolver data to connect to a name server.

The MNAME field of that zone's SOA record will identify the master server for that zone. \textit{port} is the port number on \textit{servername} where the dynamic update requests get sent. If no port number is specified, the default DNS port number is 53.

\texttt{send}

Sends update to server.

\texttt{show}

Shows update to be sent.

\texttt{update delete domain-name [class] [type [data...]]}

Deletes any resource records named \textit{domain-name}. If \textit{type} and \textit{data} is provided, only matching resource records are removed. If \textit{class} is omitted, IN (Internet) is assumed.

\texttt{update add domain-name ttl [class] type data...}

Adds a new resource record with the specified \textit{ttl}, \textit{class}, \textit{type} and \textit{data}. See the \texttt{z/OS Communications Server: IP Configuration Reference} for detailed information about valid classes and types.

\texttt{zone zonename}

Specifies that all updates are to be made to the zone \textit{zonename}. If no zone statement is provided, \texttt{nsupdate} will attempt to determine the correct zone to update based on the rest of the input.

\textbf{nsupdate BIND v9 examples}

You can see the following examples of \texttt{nsupdate BIND v9}.

\textbf{How to insert and delete resource records}

The examples below show how \texttt{nsupdate} with BIND 9 could be used to insert and delete resource records from the example.com zone. Notice that the input in each example contains a trailing blank line so that a group of commands are sent as one dynamic update request to the master name server for example.com.

```
# nsupdate
> update delete oldhost.example.com A
> update add newhost.example.com 86400 A 172.16.1.1
>
```

Any A records for oldhost.example.com are deleted, and an A record for newhost.example.com at IP address 172.16.1.1 is added. The newly added record has a 1-day TTL (86400 seconds).

```
# nsupdate
> prereq nxdomain nickname.example.com
> update add nickname.example.com CNAME somehost.example.com
>
```

The prerequisite condition gets the name server to check that there are no resource records of any type for nickname.example.com. If there are, the update request fails. If this name does not exist, a CNAME for it is added. This ensures that when the CNAME is added, it cannot conflict with the long-standing rule in RFC 1034 that a name must not exist as any other record type if it exists as a CNAME. (The rule has been updated for DNSSEC in RFC 2535 to allow CNAMEs to have SIG, KEY and NXT records.)

\textbf{How to use an input file for nsupdate}

The example below shows how to have \texttt{nsupdate} read subcommands from a file for BIND 9.

1. Create a z/OS UNIX file containing the following \texttt{nsupdate} subcommands. Assume the file is named nsupdate.commands.

```
update delete oldhost.example.com A
update add newhost.example.com 86400 A 172.16.1.1
show
send
quit
```

Querying and administrating a Domain Name System (DNS) 841
2. Then issue the following command from the directory where the file, nsupdate.commands resides.

```
nsupdate nsupdate.commands
```

3. Because the zone and server subcommands were not explicitly issued, the defaults will come from the resolver configuration data set. Assume the following information is coded in the resolver configuration data set.

```
domain example.com
nameserver 127.0.0.1
```

4. The name server on the local host would be used to look up the location of the example.com domain. Once the authoritative name server is located, the updates in the nsupdate.commands file are executed and sent to that name server.

5. The output is sent to stdout. The following information might appear on the z/OS UNIX screen.

```
> nsupdate nsupdate.commands
Running nsupdate version 9
Allocated socket 6, type udp
Outgoing update query:
    ;; ->>HEADER<<- opcode: UPDATE, status: NOERROR, id:      0
    ;; flags: ; ZONE: 0, PREREQ: 0, UPDATE: 0, ADDITIONAL: 0
    ;; UPDATE SECTION:
oldhost.example.com.    0       ANY     A
newhost.example.com.    86400   IN      A       172.16.1.1
```

### Using the TSO DIG command

DIG is a program for querying Domain Name Servers, which enables you to:

- Exercise name servers
- Gather large volumes of domain name information
- Execute simple domain name queries

**Rule:** The DIG command does not use resolver caching.

If you have a group of queries to be resolved, you must issue an NSLOOKUP command for each query. Compared to NSLOOKUP, the DIG command provides a larger range of options for controlling queries and screen output.

The TSO DIG command has been deprecated in favor of the z/OS UNIX `dig` command. TSO DIG will not understand some of the newer resource record types, including many types of IPv6 data.

### DIG internal state information

The internal state information of DIG determines the operation and results of your name server queries. You can configure the internal state information of DIG using the following methods, listed in order of preference:

1. TCP/IP client program configuration data set, TCPIP.DATA
2. DIG startup data set, `user_id`.DIG.ENV
3. Query options on the command line or in a batch data set

The `user_id`.DIG.ENV data set contains a list of query option defaults. This list is initialized from the `user_id`.DIG.ENV data set when DIG is invoked. The default values in `user_id`.DIG.ENV are used for all queries unless overridden by query flags on the command line. The defaults can be reset during a batch run by using the `-envset` flag on a batch data set line.

The `user_id`.DIG.ENV data set is created and updated using the `-envset` option, which writes the current defaults out to the data set after parsing the query options on the command line. The `-envset` option specified on the command line and the existing default values are saved in the `user_id`.DIG.ENV data set as the default environment for future invocations of DIG. The `user_id`.DIG.ENV data set is not reread when
the environment is updated during batch queries and the -envset flag has no effect on subsequent queries in a batch data set. The user_id.DIG.ENV data set is written in nontext format, and cannot be viewed or edited.

**DIG command: Query name servers**

You can use DIG in command mode, where all options are specified on the invoking command line, or in batch mode, where a group of queries are placed in a data set and executed by a single invocation of DIG. DIG provides a large number of options for controlling queries and screen output, including most of the functions of NSLOOKUP.

You can create a data set for batch mode queries using the -f data_set option. The data set contains complete queries, one per line, that are executed in a single invocation of DIG. The keyword DIG is not used when specifying queries in a batch data set. Blank lines are ignored, and lines beginning with a # symbol or a semicolon (;) in the first column are comment lines.

Options specified on the initial command line are in effect for all queries in the batch data set unless explicitly overridden. Several options are provided exclusively for use within batch data sets, giving greater control over DIG operation.

Some internal state information is retrieved from the TCPIP.DATA data set. See the z/OS Communications Server: IP Configuration Guide for more information about the TCPIP.DATA data set.

Z/OS Communications Server: IP System Administrator's Commands
Parameters:

@server
Specifies the domain name or IP address of the name server to contact for the query. The default is the name server specified in the TCPIP.DATA data set. TSO DIG can use only IPv4 addresses.

If a domain name is specified, DIG uses the resolver library routines provided in the TCP/IP for MVS programming interface to map the name to an IP address.

domain_name
Specifies the name of the domain for which information is requested. If the domain name does not exist in the default domain specified in the TCPIP.DATA data set, you must specify a fully qualified domain name.

qtype
Specifies the type of query to be performed. DIG does not support the MAILA, MD, MF, and NULL query types. The wildcard query types are ANY, MAILB, and AXFR. See the z/OS Communications Server: IP Configuration Reference for detailed information about valid query types.

If the qtype option is omitted, the default query type is A (an address query).

qclass
Specifies which network class to request in the query. DIG recognizes only the IN, CHAOS, HESIOD, and ANY network classes.

%comment
Provides a means of including comments in a DIG command. Any characters following the percent (%) character up to the next space character (space or end-of-record) are ignored by DIG. This option is useful in batch data sets for annotating a command.

For example, using a dotted decimal notation IP address rather than a domain name removes any overhead associated with address mapping; however, this makes the command less readable. Therefore, in a batch data set you can include the domain name as a comment for readability.

+queryoption
Interprets the string following the plus sign (+) character as a query option. Query options have the format:

parameter[=value]
and are a superset of the SET subcommand options for NSLOOKUP.
**aaonly**
Accepts only authoritative responses to queries.

**noaaonly**
Accepts all responses to queries. This option is the default.

**addit**
Prints the additional section of the response. The additional section contains resource records that have not been explicitly requested, but could be useful. See RFC 1035 for more information about this option. This option is the default.

**noaddit**
Does not print the additional section of the response.

**answer**
Prints the answer section of the response. The answer section contains the set of all resource records from the name server database that satisfy the query. This option is the default.

**noanswer**
Does not print the answer section of the response.

**author**
Prints the authoritative section of the response. The authoritative section contains resource records that specify the address of an authoritative name server for the query. This section is used when the name server queried cannot provide an authoritative answer. This option is the default.

**noauthor**
Does not print the authoritative section of the response.

**cl**
Prints network class information for each of the resource records returned.

**nocl**
Does not print network class information for each of the resource records returned. This option is the default.

**cmd**
Echos the parsed options. This option is the default.

**nocmd**
Does not echo the parsed options.

**d2**
Prints the details of each query sent out to the network, including send time stamp and the timeout time stamp. When a server does not respond within the timeout period, DIG either sends the query to another server, or resends the query to the original server. The details of the query are visible when d2 is set.

**Note:** You will not see any difference between debug, d2 and trace resolver. Resolver DNS responses and queries are traced for both options.

**nod2**
Does not print the details of each query sent out to the network. This option is the default.

**debug**
Directs DIG to print additional error messages. This option is the default.

**nodebug**
Directs DIG to not print additional error messages.

**defname**
Appends the default domain name to all unqualified domain names in a query. The default domain name is set by specifying the +domain=name option. This option is the default.

**nodefname**
Does not append the default domain name to all unqualified domain names in a query. This option causes the domain name specified to pass to the server without modification.
domain=name
Sets the default domain name to name. Initially the default domain name is obtained from the TCPIP.DATA data set. The validity of name is not verified. If the defname option is set, the domain name specified in name is appended to all unqualified domain names before the queries are sent to the name server.

Header
Prints the header line containing the operation code, returned status, and query identifier of each response. This option is distinct from the header option. This option is the default.

noHeader
Does not print the header line containing the operation code, returned status, and query identifier of each response.

header
Prints the query flags of each response. The query flags are defined in RFC 1035. This option is the default.

noheader
Does not print the query flags of each response.

ignore
Ignores truncation errors. Truncation errors occur when a response is too long for a single datagram.

noignore
Reports truncation errors. This option is the default.

ko
Keeps the virtual circuit open for queries in batch mode only. This option has no effect when used on the command line or when datagrams are used to transport queries (see the novc option later in this material).

noko
Does not keep the virtual circuit open for queries in batch mode only. This option is the default.

pfand=number
Performs a bitwise AND of the current print flags with the value specified in number. The number can be octal, decimal, or hexadecimal.

Note: To specify a number in octal, a 0 is required in front of the number. To specify a number in hexadecimal, 0X is required in front of the number.

pfdef
Sets the print flags to their default values. The default print flag values are 0x2FF9. For query type AXFR, the print flag values are 0x24F9.

Note: To specify a number in octal, a 0 is required in front of the number. To specify a number in hexadecimal, 0X is required in front of the number.

pfmin
Sets the print flags to the minimum default values. This option specifies that minimal information is printed for each response. The minimum print flag values are 0xA930.

Note: To specify a number in octal, a 0 is required in front of the number. To specify a number in hexadecimal, 0X is required in front of the number.

pfor=number
Performs a bitwise OR of the current print flags with the value specified in number. The number can be octal, decimal, or hexadecimal.

Note: To specify a number in octal, a 0 is required in front of the number. To specify a number in hexadecimal, 0X is required in front of the number.

pfset=number
Sets the print flags to the value specified in number. The number can be octal, decimal, or hexadecimal.
Note: To specify a number in octal, a 0 is required in front of the number. To specify a number in hexadecimal, 0X is required in front of the number.

The print flags are represented by a 16-bit value. The following list describes the individual bits of the print flags in order of most-significant bit to least-significant bit.

0  Sort reply records
1  Unused
2  Display reply section
3  Display query section
4  Show basic header
5  Display time to live (TTL) in reply records
6  Show flags for query and reply
7  Show section headers with reply record totals
8  Show additional subsections
9  Show authoritative subsection
10 Show answer subsections
11 Show question subsections
12 Echo DIG command line
13 Display query class info in reply records
14 Unused
15 Display statistics

primary
Includes only the primary name server for the zone, or includes the secondary name servers.

noprimar
Indicates that you should not use only the primary name server for the zone. This option is the default.

qr
Prints the outgoing query. The outgoing query consists of the header and the question, empty answer, additional, and authoritative sections. See RFC 1035 for more information about outgoing queries.

noqr
Does not print the outgoing query. This option is the default.

ques
Prints the question section of a response. The question section contains the original query. This option is the default.
noques
  Does not print the question section of a response.

recurse
  Requests a recursive query when querying a name server. This option is the default.

norecurse
  Specifies that a recursive query is not requested.

reply
  Prints the response from the name server. This option is the default.

noreply
  Does not print the response from the name server. When this option is disabled, other print flags that affect printing of the name server response are ignored and no sections of the response are printed.

retry=limit
  Specifies the number of times a request is resent. When a request is sent and the timeout period expires for a response, the request is resent until the value specified in limit has been exceeded. The value specified in limit determines the number of attempts made to contact the name server. The default value for limit is retrieved from the TCPIP.DATA data set.

Setting limit to 0 disables DIG from contacting the name server. The result is an error message no response from server.

The retry procedure for DIG uses both the limit value and the timeout period. Each time a request is resent, the timeout period for the request is twice the timeout period used for the last attempt.

sort
  Sorts resource records before printing. Records are sorted alphabetically on record type names.

nosort
  Does not sort resource records before printing. This option is the default.

stats
  Prints the query statistics including time and date of query, size of query and response packets, and name of server used. This option is the default.

nostats
  Does not print the query statistics.

timeout=time_out_value
  Specifies the number of seconds to wait before timing out of a request. The default timeout value is retrieved from the data set.

ttlid
  Prints the time to live (TTL) for each resource record in a response. This option is the default.

nottlid
  Does not print the TTL for each resource record in a response.

vc
  Uses a virtual circuit (TCP connection) to transport queries to the name server or datagrams. The default is retrieved from the TCPIP.DATA data set.

novc
  Does not use a virtual circuit to transport queries to the name server or datagrams. This option is the default.

digoption
  Interprets the string following the hyphen (-) as a DIG option. The DIG options are either a parameter or a single character followed by a parameter.

c query_class
  Specifies that the command-mode query or batch query retrieves resource records having the given network class. The qclass parameter, described in this topic, can also be used to specify the query class. In addition to the mnemonics, this option also accepts the equivalent numeric value that defines the class.
envsav
Directs DIG to save the environment specified on the current command line in the user_id.DIG.ENV data set. The DIG environment is described in “DIG internal state information” on page 842. This hlq.DIG.ENV data set initializes the default environment each time DIG is invoked.

envset
This option is valid for batch mode only. It directs DIG to set the default environment (see “DIG internal state information” on page 842) specified on the current line in the batch data set. This default environment remains in effect for all subsequent queries in the batch data set, or until the next line in the batch data set containing the -envset option is reached.

f data_set
Specifies a data set for DIG batch mode queries. The batch data set contains a list of queries that are to be executed in order. The keyword DIG is not used when specifying queries in a batch data set. Lines beginning with a number character (#) or semicolon (;) in the first column are comment lines, and blank lines are ignored. Options that are specified on the original command line are in effect for all queries in the batch data set unless explicitly overwritten. The following example shows a batch data set.

```
# A comment
; more comments
wurrup any in +noH =noqu -c IN
toolah +pfmin
```

Note: You must limit your query string to 99 characters to avoid error messages.

P
Directs DIG to execute a PING command for response time comparison after receiving a query response. The last three lines of output from the following command are printed after the query returns:

```
PING server_name ( Length 56 Count 3
```

p port
Use the port number given when contacting the name server. The Domain Name System is a TCP/IP well-known service and has been allocated port 53. DIG uses port 53 by default, but this option enables you to override the port assignment.

stick
Restores the default environment (see “DIG internal state information” on page 842) before processing each line of a batch data set. This flag is valid for batch mode only. If you set the stick option, queries in the batch data set are not affected by the options specified for preceding queries in the data set.

nostick
Causes the query option specified on the current line in the batch data set to remain in effect until the option is overridden by a subsequent query. The result of each query in the batch data set depends on the preceding queries. This option is the default.

T seconds
Specifies the wait time between successive queries when operating in batch mode. The default wait time is 0 (do not wait).

t query_type
Specifies that the query retrieves resource records having the given resource record type. The qtype parameter, described in this topic, can also be used to specify the query type. In addition to the mnemonics, this parameter also accepts the equivalent numeric value that defines the type.

x dotted_decimal_notation_address
Simplifies the specification of a query for the in-addr.arpa domain. Normally these queries are made by specifying a query type of PTR for nn.nn.nn.nn.in-addr.arpa, where the four nn components are replaced by the dotted decimal notation IP address components in reverse order.
This option enables you to make this query by simply specifying the dotted decimal notation IP address.

For example, the domain name corresponding to IP address 101.3.100.2 is found by a query for the domain name 2.100.3.101.in-addr.arpa. You can use DIG -x 101.3.100.2 rather than reversing the address and appending in-addr.arpa.

**Examples:**

The following examples show how to use DIG to extract information from a name server. In Figure 3 on page 851, the router wurrup has two IP addresses, and there are two name servers, wurrup being the primary name server. This network is described by a single zone in the domain naming hierarchy stored in the name servers.

![Figure 3. A TCP/IP network](image)

In the examples, all queries are issued from the MVS uluru system.

Create a default environment (default options) that gives minimal output from subsequent DIG commands:

```plaintext
System:
Ready
User:
DIG wurrup +noqu +noH +nohe +nocomd +nodns +noau +nost +nocl +nottl -envsav
System: ; Ques: 1, Ans: 2, Auth: 0, Addit: 0
;; ANSWERS:
wurrup.FOUREX.OZ.       A 101.3.104.12
wurrup.FOUREX.OZ.       A 101.3.100.12
```

The following queries show which part of the response output is controlled by each of the output control options. Each example enables or disables query options for tailoring output.

- Set the query type to ns, the query class to in, and print the additional section of the output:

```plaintext
System: Ready
User:
DIG fourex.oz ns in +ad
System: ; Ques: 1, Ans: 2, Auth: 0, Addit: 3
;; ANSWERS:
fourex.oz NS wurrup.fourex.oz
fourex.oz NS canetoad.fourex.oz
;; ADDITIONAL RECORDS:
wurrup.fourex.oz A 101.3.100.12
wurrup.fourex.oz A 101.3.104.12
canetoad.fourex.oz A 101.3.104.40
```

- Set the query type to ns, the query class to in, print the additional section of the output, but do not print the answer section:
• Query a nonexistent domain and print the authoritative section of the output:

In the previous example, the nonexistent domain name is *noname*.

• Use the default query options:

• Print the network class information:

• Echo the input query:

• Print the question section of the output:

• Turn the header on:
The following examples show how options control the use and value of the default domain.
• Do not append the default domain name to unqualified domain names and print the question section of the response:

```
System:       Ready
User:
DIG wurrup +nodefname +qu
System:       ;;>>HEADER<<- opcode: QUERY , status: SERVFAIL, id: 3
             ; Ques: 1, Ans: 0, Auth: 0, Addit: 0
             ;; QUESTIONS:
             ;;     wurrup, type = A, class = IN
```

• Set the default domain name to fourexpd and print the question section of the response:

```
System:       Ready
User:
DIG wurrup +do=fourexpd +qu
System:       ;; -->HEADER<<- opcode: QUERY , status: SERVFAIL, id: 3
             ; Ques: 1, Ans: 0, Auth: 0, Addit: 0
             ;; QUESTIONS:
             ;;     wurrup.fourexpd, type = A, class = IN
```

• Set the query type to ns, the query class to in and sort the output:

```
System:       Ready
User:
DIG fourex.oz ns in +sort
System:       ; Ques: 1, Ans: 2, Auth: 0, Addit: 3
             ;; ANSWERS:
             fourex.oz NS      canetoad.fourex.oz
             fourex.oz NS      wurrup.fourex.oz
```

• Query the domain at the address 101.3.100.20, and print the question section of the response:

```
System:       Ready
User:
DIG -x 101.3.100.20 +qu
System:       ; Ques: 1, Ans: 1, Auth: 0, Addit: 0
             ;; QUESTIONS:
             ;;    20.100.3.101.in-addr.arpa, type = ANY, class = IN
             ;; ANSWERS:
             20.100.3.101.in-addr.arpa.      PTR     galah.
```

• Retrieve resource records with a network class of ANY and print the question section of the response:

```
System:       Ready
User:
DIG wurrup -c any +qu
System:       ; Ques: 1, Ans: 2, Auth: 0, Addit: 0
             ;; QUESTIONS:
             ;;     wurrup.FOUREX.OZ, type = A, class = ANY
             ;; ANSWERS:
             wurrup.FOUREX.OZ.  A       101.3.104.12
             wurrup.FOUREX.OZ.  A       101.3.100.12
```

• Retrieve resource records with a query type of ANY and print the question section of the response:

```
System:       Ready
User:
DIG wurrup -t any +qu
System:       ; Ques: 1, Ans: 3, Auth: 0, Addit: 0
             ;; QUESTIONS:
             ;;     wurrup.FOUREX.OZ, type = ANY, class = IN
             ;; ANSWERS:
             wurrup.FOUREX.OZ.  A       101.3.104.12
             wurrup.FOUREX.OZ.  A       101.3.100.12
             wurrup.FOUREX.OZ.  HINFO   RS6000 AIX3.1
```
The following lists the batch data set, test.digbat, used for this example. The default environment has been removed by discarding the user_id.DIG.ENV data set. The DIG command is omitted for all entries in the data set.

Note the effect of the -envset and -stick options on the output:

```
wurrup any in +noH +nohe +noqu +noad +noau -envset -stick
wurrup any in
toolah a in +d2
	toolah a in
toolah a in +d2 -nostick
toolah a in
toolah a in +nod2
toolah a in

Specify the batch data set test.digbat:
```

System:  Ready
User: DIG -f test.digbat

```

Usage:

The `queryoption` and `digoption` parameters are case sensitive and must be entered in lowercase. Domain names, query types, query classes, and the values associated with `queryoption` and `digoption` parameters are not case sensitive.

Using the z/OS UNIX dig command

The domain information groper (`dig`) is a command line tool that can be used to gather information from the Domain Name System servers. The `dig` command has two modes: simple interactive mode for a single query, and batch mode, which executes one query for each in a list of several query lines. All query options are accessible from the command line.

Rule: The `dig` command does not use resolver caching.

The `dig` command is used to query Domain Name Servers, which enables you to:

- Exercise name servers
- Gather large volumes of domain name information
- Execute simple domain name queries
- Execute multiple lookups from the command line

**dig command: Query name servers**

You can use `dig` in several methods:

- Command Line
All options are specified on the invoking command line.

- **Batch Mode**

  A group of queries are placed in a file and executed by a single invocation of `dig` using the `-f filename` option. The `filename` contains complete queries, one per line. The keyword `dig` is not used within a batch file when specifying queries. Blank lines are ignored, and lines beginning with a # character or a semicolon (;) in the first column are comment lines.

- **Multiple Queries**

  The BIND 9 implementation of `dig` supports specifying multiple queries on the command line (in addition to supporting the `-f` batch file option). Each of those queries can be supplied with its own set of flags, options and query options. In multiple queries, `query1`, `query2`, and so on represent an individual query in the command-line syntax. Each consists of any of the standard options and flags, the name to be looked up, an optional query type and class and any query options that are applied to that query.

  **Note:** When entered on a z/OS UNIX shell command line, long `dig` commands can be broken into segments entered with a terminating backslash (\) except for the last segment.

  A global set of query options, which are applied to all queries, can also be supplied. These global query options must precede the first query set (name, class, type, options, flags, and query options) supplied on the command line. Any global query options can be overridden by a query-specific set of query options.

  Options specified on the initial command line are in effect for all queries in the batch file unless explicitly overridden. Several options are provided exclusively for use within batch data sets, giving greater control over `dig` operation.

  If a name server is not specified, `dig` tries each of the servers found in its TCPIP.DATA statements. When no command line arguments or options are given, `dig` performs an NS query for "." (the root).

  Some of `dig` initial settings are retrieved from TCPIP.DATA, according to the resolver search order. See the z/OS Communications Server: IP Configuration Guide for more information about the search order for finding TCPIP.DATA statements. It uses directives from the resolver configuration file in the following order:

  1. nameserver/nsinteraddr
  2. options ndots:n
  3. search
  4. domain/domainorigin

  **Format:**

  **Command Line Mode**

  

  **Multiple Query Mode**

  query
+queryopt or +global_queryopt
### Parameters:

- **-h**
  Provides help for the `dig` command.

- **@server**
  The name or IP address of the name server to query. An IPv4 or IPv6 address or a name that resolves to an IPv4 or IPv6 address can be specified. When the supplied server argument is a host name, `dig`
resolves that name before querying that name server. If no server argument is provided, **dig** consults TCP/IP DATA statements and queries the name servers listed there. The reply from the name server that responds is displayed.

**name**
The name of the resource record that is to be looked up.

**type**
Specifies what type of query is required. See the z/OS Communications Server: IP Configuration Reference for detailed information about valid query types.

If the type option is omitted, the default query type is A (an address query).

**class**
Specifies which network class to request in the query. **dig** recognizes only the IN, CHAOS, HESIOD, and ANY network classes. The default class is IN. See the z/OS Communications Server: IP Configuration Reference for detailed information about valid query classes.

**-query_options**
These options must be preceded by a minus (-) sign.

**-b address**
Sets the source IP address of the query to **address**. This must be a valid address on one of the host's network interfaces. An IPv6 address can be used here only if the address of the name server is also an IPv6 address. In order to accomplish this, the IPv6 name server address must be explicitly specified with the @ symbol.

**-c class**
Overrides the default query class (IN for Internet). See the z/OS Communications Server: IP Configuration Reference for detailed information about valid query classes.

**-f filename**
Makes **dig** operate in batch mode by reading a list of lookup requests to process from the file **filename**. The file contains a number of queries, one per line. Organize each entry in the file in the same way they would be presented as queries to **dig** using the command line interface.

**-k filename**
Specifies a TSIG key **filename** to sign the DNS queries sent by **dig** and their responses using transaction signatures (TSIG).

**-n**
Sends the query for the IPv6 address specified on the -x option as a nibble label in the IP6.ARPA domain.

**-p port#**
This option would be used to test a name server that has been configured to listen for queries on a non-standard port number. **dig** will send its queries to **port#**. The standard DNS port number is 53.

**-s**
Sends the reverse query for the IPv6 address specified on the -x option as a bitstring label in the IP6.ARPA domain.

**-t type**
Sets the query type to **type**. It can be any valid query type supported in BIND 9. The default query type is A, unless the -x option is supplied to indicate a reverse lookup. A zone transfer can be requested by specifying a type of AXFR. When an incremental zone transfer (IXFR) is required, type is set to ixfr=N. The incremental zone transfer will contain the changes made to the zone because the serial number in the zone's SOA record was N.

**-x addr**
Reverses lookups by mapping addresses to names. **addr** is an IPv4 address in dotted decimal notation, or an IPv6 address in colon hexadecimal notation. When this option is used, there is no need to provide the name, class and type arguments. **dig** automatically performs a lookup for a name like 11.12.13.10.in-addr.arpa and sets the query type and class to PTR and IN respectively. By default, IPv6 addresses are looked up using the IP6.ARPA domain and binary
labels as defined in RFC 2874. To use the older RFC 1886 method using the IP6.ARPA domain and nibble labels, specify the \texttt{-n} (nibble) option.

\textbf{-y name:key}

You can use this option to specify the TSIG key itself on the command line. \texttt{name} is the name of the TSIG key and \texttt{key} is the actual key. The key is a base-64 encoded string, typically generated by \texttt{dnssec-keygen}. Take care when using this option on multiuser systems as the key can be visible in the output from \texttt{ps \ -e \f} or in the shell's history file. When using TSIG authentication with \texttt{dig}, the name server that is queried needs to know the key and algorithm that is being used. In BIND 9, this is done by providing appropriate \texttt{key{}} and \texttt{server{}} statements in \texttt{named.conf}.

\textbf{+queryopt}

The query options available in the \texttt{dig} command. These options must be preceded by a plus (+) sign. Many of these options can be abbreviated by the minimum unique prefix string that is usually two characters, but three for \texttt{+additional} and \texttt{+adflag}. To abbreviate the negative command, prepend the unique string with \texttt{no}. Some of these set or reset flag bits in the query header, some determine which sections of the answer get printed, and others determine the timeout and retry strategies.

When used in multiple queries, \texttt{+queryopt} options can become a global options \texttt{(+queryoption\_global)}. To be a valid global option, \texttt{+queryoption\_global} must be placed before the first query set to be queried.

\textbf{+[no]aaonly}

This option does nothing. It is provided for compatibility with old versions of \texttt{dig} where it set an unimplemented resolver flag.

\textbf{+[no]additional}

Display [do not display] the additional section of a reply. The default is to display it.

\textbf{+[no]adflag}

Set [do not set] the AD (authentic data) bit in the query. The AD bit currently has a standard meaning only in responses, not in queries, but the ability to set the bit in the query is provided for completeness.

\textbf{+[no]all}

Set or clear all display flags. The default is on.

\textbf{+[no]answer}

Display [do not display] the answer section of a reply. The default is to display it.

\textbf{+[no]authority}

Display [do not display] the authority section of a reply. The default is to display it.

\textbf{+[no]besteffort}

Try [do not try] to parse illegal messages. The default is not to parse illegal messages.

\textbf{+[no]cdflag}

Set [do not set] the CD (checking disabled) bit in the query. This requests the server to not perform DNSSEC validation of responses. The default is off, meaning that DNSSEC validation will occur.

\textbf{+[no]cmd}

Toggles the printing of the initial comment in the output identifying the version of \texttt{dig} and the query options that have been applied. This comment is printed by default. This option is recognized only when used as a global option (placed before the first query).

\textbf{+[no]comments}

Toggle the display of comment lines in the output. The default is to print comments.

\textbf{+[no]defname}

Use [do not use] the default domain name, if any, in TCPIP.DATA. The default is not to append that name to name when making queries.

\textbf{+[no]dnssec}

Request [do not request] DNSSEC records. The default is not to request DNSSEC records.

\textbf{+[no]fail}

Try the next server on SERVFAIL (fail), or do not try the next server on SERVFAIL (nofail). The default is not to try the next server on SERVFAIL.
+[no]identify
Show [do not show] the IP address and port number that supplied the answer when the +short option is enabled. If short form answers are requested, the default is not to show the source address and port number of the server that provided the answer.

+ignore
Ignore truncation in UDP responses instead of trying again with TCP. By default, TCP retries are performed.

+[no]multiline
Print [do not print] records in expanded format. The default is not to print records in expanded format.

+[no]nssearch
When this option is set on, dig attempts to find the authoritative name servers for the zone containing the name being looked up and display the SOA record that each name server has for the zone. The default is off.

+[no]qr
Print [do not print] the query as it is sent before sending the query. By default, the query is not printed.

+[no]question
Print [do not print] the question section of a query when an answer is returned. The default is to print the question section as a comment.

+[no]recursive
Toggle the setting of the RD (recursion required) bit in the query. This bit is set by default, which means dig normally sends recursive queries. Recursion is automatically disabled when the +nssearch or +trace query options are used.

+[no]search
Use [do not use] the search list in TCPIP.DATA. The search list is not used by default.

+[no]short
Provide a terse answer. The default is to print the answer in a verbose form.

+[no]sta
This query option toggles the printing of statistics when the query was made, the size of the reply and so on. The default behavior is to print the query statistics.

+[no]tcp
Use [do not use] TCP when querying name servers. The default is UDP unless an AXFR or IXFR query is requested, in which case a TCP connection is used.

+[no]trace
Toggle tracing of the delegation path from the root name servers for the name being looked up. Tracing is disabled by default. When tracing is enabled, dig makes iterative queries to resolve the name being looked up. It will follow referrals from the root servers, showing the answer from each server that was used to resolve the lookup.

+[no]vc
Use [do not use] TCP virtual circuit when querying name servers. This alternate syntax to +[no]tcp is provided for backwards compatibility. By default, UDP is used instead of TCP.

+[bufsize=B]
Set the UDP message buffer size advertised using EDNS0 to B bytes. The maximum and minimum sizes of this buffer are 65 535 and 0 respectively. Values outside this range are rounded up or down appropriately. The default value is 2048.

+[domain=somename]
Set the default domain to somename, as if specified in a domain directive or domainorigin in the resolver configuration file.

+[ndots=D]
Set the number of dots that have to appear in name to be considered absolute. The default value is that defined using the ndots statement in resolver configuration file, or 1 if ndots statement is
not present. Names with fewer dots are interpreted as relative names and are searched for in the
domains listed in the search or domain/domainorigin directive in the resolver
configuration
file.

+time=T
Sets the timeout for a query to T seconds. The default timeout is 5 seconds. An attempt to set T to
less than 1 will result in a query timeout of 1 second being applied.

+tries=A
Sets the number of times to retry UDP queries to server. The default number of tries is 3. If T is
less than or equal to 0, the number of retries is set to 1.

Examples:
The following examples show how to use dig to extract information from a name server.

Any global query options can be overridden by a query-specific set of query options.

```
dig +qr www.isc.org any -x 127.0.0.1 isc.org ns +noqr
```
Shows how dig could be used from the command line to make three lookups: an ANY query for
www.isc.org, a reverse lookup of 127.0.0.1 and a query for the NS records of isc.org. A global
query option of +qr is applied, so that dig shows the initial query it made for each lookup. The final query
has a local query option of +noqr which means that dig will not print the initial query when it looks up the
NS records for isc.org.

The following example shows a basic dig command, with default print options.

```
>dig @9.67.128.82 vic032.tcp.raleigh.ibm.com.
>> Dig 9.2.0 <<< @9.67.128.82 vic032.tcp.raleigh.ibm.com.
;; global options: printcmd

The *queryopt*ion and *option* parameters are case sensitive and must be entered in lowercase. Domain names, query types, query classes, and the values associated with *queryoption* and *option* parameters are not case sensitive.

**Using the z/OS UNIX host command**

The z/OS UNIX host command queries the configured name server to perform the following tasks:

- Identify the IP addresses associated with a specified DNS host name
- Identify the DNS hostnames associated with a specified IP address

The host command must be issued from within the z/OS UNIX shell.

**z/OS UNIX host: Identify the remote host**

Use the z/OS UNIX host command to identify the IP addresses associated with a specified DNS host name or to identify the DNS hostnames associated with a specified IP address.

**Format:**

```
$host host
```

**Parameters:**

- `host`
  
  DNS host name or IP address to look up

**Examples:**

The following example shows the command output:

```
host 204.146.18.33
EZ883211 www.ibm.com has addresses 204.146.18.33

host www.ibm.com
EZ883211 www.ibm.com has addresses 204.146.18.33
```

**Using the z/OS UNIX hostname command**

Use the z/OS UNIX hostname command to display the fully-qualified DNS host name of the system. This command uses the following to determine this information:

- TCPIP.DATA statement information
• DNS lookup on the value that is returned by gethostname()
• The gethostname() function call, which is documented in z/OS XL C/C++ Runtime Library Reference.

TCPIP.DATA statement information

To display the TCPIP.DATA information found in the search order, you can use the z/OS Communications Server resolver trace support. To activate the trace, you can set the RESOLVER_TRACE environment variable before invoking the hostname command. Setting the environment variable to use stdout is recommended. The resolver trace is described in z/OS Communications Server: IP Diagnosis Guide.

See z/OS Communications Server: IP Configuration Reference for detailed information about TCPIP.DATA statements. The z/OS UNIX search order is always used to find the TCPIP.DATA statements for the hostname command. See information about search orders used in the z/OS UNIX environment in z/OS Communications Server: IP Configuration Guide for a description of this search order.

gethostname() function call

The gethostname() function call is processed by a TCP/IP stack. In a single-stack (INET) environment, the host name of the active stack is returned. In a multi-stack (CINET) environment, the gethostname() call is sent either to the stack with which the z/OS UNIX user has set affinity (for example, by setting the _BPXK_SETIBMOPT_TRANSPORT environment variable) or, if there is no stack affinity, it is sent to the default stack. The default stack in a CINET environment is determined by SUBFILESYSTYPE statements in the BPXPRMxx parmlib member. If the default stack is not active, the first stack that is activated is designated as the default stack. You can display the current default stack using the DISPLAY OMVS,PFS operator command. The FLAGS column on the command output indicates which stack is the default. See z/OS MVS System Commands for the DISPLAY command output. See z/OS UNIX System Services Planning for information about how z/OS selects the default stack and how stack affinity can be established.

The TCP/IP stack that receives the gethostname() function call returns the host name value that was determined during stack initialization. During initialization, the configuration component of the stack issues the __iphost() function call to get the TCPIP.DATA HOSTNAME statement value of the stack.

Note: If the HOSTNAME statement is changed, TCPIP needs to be restarted for this change to take effect.

The z/OS UNIX search order for the started task of the stack is used to find the TCPIP.DATA statement information of the stack. The host name is determined in the following order:

1. If the found TCPIP.DATA information contains a valid HOSTNAME statement, its value is returned. If a system name parameter was specified on the HOSTNAME statement, the parameter value is compared to one of the following to determine whether the value matches the current system name:

   • If you have configured VMCF and TNF as non-restartable subsystems, the system name is specified in the IEFSSNxx member of PARMLIB.
   • If you have configured VMCF and TNF as restartable subsystems, the system name is obtained from the value of the P= parameter of the EZAZSSI started procedure.

2. If there is no valid HOSTNAME statement, the VMCF node name with which VMCF was started is returned.

3. If VMCF was not active when the stack was started, the CVTSNAME value (this is the SYSNAME=value in the IEASYSxx member that was used during the IPL) is returned.

If the host name came from TCPIP.DATA, the case used is the case that was specified on the HOSTNAME statement. For VMCF or CVTSNAME, the name is in uppercase.

The z/OS UNIX hostname command must be issued from within the z/OS UNIX shell.

z/OS UNIX hostname: Identify the local host

Use the z/OS UNIX hostname command to display the fully qualified DNS host name of the local system.

Format:
Notes:

1. Only one of the -c, -g, and -r parameters can be specified.

Parameters:

-c
Uses the TCPIP.DATA configuration (this is the default).

Specifies the fully qualified host name (the host name with its appended domain name). The host name is obtained with the __iphost() function call. The host name portion of the displayed name is the value of the z/OS UNIX user's TCPIP.DATA HOSTNAME statement. The domain name portion of the displayed name is the value of the z/OS UNIX user's TCPIP.DATA DomainOrigin statement or the first domain name that is specified by the SEARCH statement.

-g
Uses gethostname() result.

Specifies the host name without the domain name. The host name is obtained by using the gethostname() function call. The displayed name is the value of the TCPIP.DATA HOSTNAME statement for the TCP/IP stack.

-r
Uses DNS lookup on gethostname() result.

Specifies the fully qualified host name (the host name that is returned by a gethostname() function call), appended with the domain name. The returned host name is the value of the TCPIP.DATA HOSTNAME statement for the TCP/IP stack. The gethostbyname() call uses the TCPIP.DATA resolver statements of the z/OS UNIX user to obtain the fully qualified host name. Based on those statements, Domain Name Servers (DNS) and resolver local host tables are used for the name resolution. The displayed name is the result of the name resolution.

-s
Prints the short name of the host (without the DNS domain name).

Specifies the host name without the domain name. The host name is obtained by using the __iphost() function call. The displayed name is the value of the TCPIP.DATA HOSTNAME statement of the z/OS UNIX user.

-p stackname
Uses this AF_INET stack.

Specifies which TCP/IP stack the -g or -r parameter uses for its gethostname() function call.

-d
Prints trace messages for problem diagnosis.
Using the z/OS UNIX dnsdomainname command

Use the z/OS UNIX dnsdomainname command to display the DNS domain name of the system. The dnsdomainname command uses the following for determining this information:

- TCPIP.DATA statement information
- DNS lookup on the value returned by gethostname()
- The gethostname() function call, which is documented in z/OS XL C/C++ Runtime Library Reference

The dnsdomainname command and the hostname command are processed by the same function and support most of the same parameters. See “Using the z/OS UNIX hostname command ” on page 865 for more detailed information about the methods used to provide the host and domain names. See the description of the hostname command parameters in “z/OS UNIX hostname: Identify the local host” on page 866 for a more detailed description of the dnsdomainname command parameters.

You must issue the z/OS UNIX dnsdomainname command from within the z/OS UNIX shell.

z/OS UNIX dnsdomainname: Display the DNS domain name

Use the z/OS UNIX dnsdomainname command to display the DNS domain name of the system.

Format:

```
```

Notes:

1. Only one of the -c, -g, and -r parameters can be specified.

Parameters:

- **-c**
  uses the TCPIP.DATA configuration.

- **-g**
  uses gethostname() result.

- **-r**
  uses DNS lookup on gethostname() result.

- **-p stackname**
  uses this AF_INET stack.

- **-d**
  prints trace messages for problem diagnosis.
Usage:

- If the DNS domain name cannot be retrieved, an error message is displayed.

Using the z/OS UNIX domainname command

The z/OS UNIX domainname command is a synonym for the z/OS UNIX dnsdomainname command. See “Using the z/OS UNIX dnsdomainname command” on page 868 for information about using this command.

Note: On some operating systems, the domainname command displays the system NIS/YP domain name, which might or might not be the same as the system DNS domain name. Portable shell scripts must use dnsdomainname rather than domainname if this distinction is important.
Chapter 6. Managing TCP/IP network resources with SNMP

This information describes how to use the Simple Network Management Protocol (SNMP) commands and details what support the z/OS Communications Server SNMP agent and subagents provide.

The z/OS UNIX snmp command

The z/OS UNIX snmp command provides the following SNMP manager functions from the z/OS UNIX shell:

- Query SNMP agents for network management information.
- Receive and format SNMP traps and notifications.

Use the snmp command to issue SNMP requests to agents and to process SNMP responses returned by agents. This command supports a maximum SNMP response packet size of 65 535 bytes. SNMPv1, SNMPv2c, and SNMPv3 requests are supported.

Use the snmp command with the trap request type to receive and format traps and notifications.

**Note:** snmp is a synonym for the osnmp command in the z/OS UNIX shell. The osnmp command syntax is the same as that for the snmp command.

**Format:**

**Getting MIB Variables:**

```
> snmp -d 0 -h localhost -r 2 -c public -t 3 -m 10 -n 0 mib_variable
```

**Setting the MIB Variables:**

```
> snmp -a get
```

```
> snmp -a getnext
```

```
> snmp -a getbulk
```

```
> snmp -a set
```

© Copyright IBM Corp. 2000, 2019
Walking the MIB Tree:

```
snmp -d 0 -h localhost -r 2
-c public -c community_name
-t 3
-t timeout value
-v
-a walk
-m 10
-m max repetitions
-n 0
-n non-repeaters
bulkwalk
```

Displaying snmp Help:

```
snmp -?
```

Receiving a Trap:

```
snmp -d 0 -p 162
```

Finding a MIB Variable Name:

```
findname mib_variable
```

Parameters:

- **-d debug_level**
  Specifies the debug level. The valid debug levels are 0-4. The default level is 0, which means no debug. Each higher trace level includes all the trace messages from the lower levels.

- **-h target host**
  Specifies the target host to which you want to send a request. This can be an IPv4 (dotted decimal) or IPv6 (colon hexadecimal) address, a host name, or a winSNMP name in the OSNMP.CONF configuration file. If you do not specify a host, the default is your local host.
The `snmp` command supports sending SNMPv1, SNMPv2c, and SNMPv3 requests. The `snmp` command uses the OSNMP.CONF file to determine whether it sends an SNMPv1, SNMPv2c, or SNMPv3 request. If the target specified by way of the `-h` parameter matches a winSNMP name in the OSNMP.CONF file, `snmp` sends the request by using the parameters specified on the entry. If the `-h` parameter is not specified, the request is sent as an SNMPv1 request. If the `-h` parameter is specified and is not found in the OSNMP.CONF file, the following error message is issued:

```
EZZ3306I Error converting <name> to Entity
```

**Restriction:** You cannot specify scope information as part of the host name or the IP address of the target host.

**Rule:** The SNMP Getbulk request and the retrieval of Counter64 MIB object values are not supported for SNMPv1 requests. To perform these functions, configure an entry in the OSNMP.CONF file with the SNMPv2c or SNMPv3 security model and specify that entry’s winSNMPname as the target host on the `-h` parameter.

**-r retry number**
Specifies the maximum number of times to retry the command if it timed out. The default is 2.

**-c community_name**
Specifies the community name that is used to access the specified variables at the destination SNMP agent. If you do not specify a community name, the default name is `public`. Community names are not required when using the user-based security model.

**Note:** Community names are case-sensitive.

**-t timeout value**
Specifies the amount of time (in seconds) that the `snmp` command waits for a reply from the SNMP agent. The default value is 3.

**-v**
Specifies that the output from a request is displayed using verbose output. Use of this option causes the values to be returned with the textual name in place of the MIB object identifier.

**-a**
Specifies that the request packet is sent using the physical interface addresses, rather than a VIPA address (if one is available) as the originating IP address. By default, the `snmp` command now uses the VIPA address. Alternately, the NOSVIPA option can be configured in the OSNMP.CONF file.

**-m max repetitions**
Applies only to getbulk and bulkwalk requests. This is ignored if the function request is not a getbulk or bulkwalk. Maximum repetitions is the number of lexicographic successors to be returned for each variable binding pair after the first `-n` number successors. For example, starting with successor `-n` number+1, return `-m` number of successors for each variable binding pair. The default is 10.

**-n nonrepeaters**
Applies only to getbulk or bulkwalk requests. This is ignored if the function request is not a getbulk or bulkwalk. The value `nonrepeaters` is the number of variable binding pairs (name and value), starting with the first, for which only a single successor is returned. The default value is 0.

**mib_variable**
Specifies the Management Information Base (MIB) object, using its object descriptor (textual name), object identifier in ASN.1 notation, or a combination of the two. When used with walk and bulkwalk requests, this is the MIB object prefix. A prefix can be any leading portion of the complete object identifier. When used with findname, this is the object identifier in ASN.1 notation.

**vartype**
Specifies the type of value being set. To complete an SNMP SET request, the SMI_type must be known. If no type is specified, `snmp` searches first the MIBS.DATA file and then the compiled MIB to determine the type. If the variable is not found, an error is returned. If a `vartype` is specified, the `vartype` takes precedence over any type that can be assigned in the MIB. The `vartype` and value must be compatible. For example, if you specify a type of "number" and a `value` of "foo", an error is returned because "foo" is not a number. The `vartype` parameter is not case-sensitive. Valid variable types are:

- bitstring
• counter
• counter32
• counter64
• display or displaystring
• integer
• integer32
• ipaddress
• gauge
• gauge32
• nsapaddress
• null
• objectidentifier or OID
• octetstring
• opaque
• opaqueascii
• timeticks
• uinteger

value
Specifies the value to be set by the SET function. If white space is needed in the value, you must enclose the value in double quotation marks ("'). If you want to set a variable to a value that is also a type, you must specify the type.

-?
Displays help information.

-p port_number
Specifies the number of the port that listens for traps. If a port number is not specified, the snmp command trap function listens on the well-known port 162, the default port for snmp traps.

SNMP request types:

get
Sends a request to an SNMP agent for a specific management information base (MIB) variable. The snmp command then waits for a response or times out.

getnext
Sends a request to an SNMP agent for the next MIB variable that lexicographically follows the mib_variable value specified. The snmp command then waits for a response or times out.

getbulk
Obtains the value of the variables in the MIB tree specified by the OID or MIB variable name. A single getbulk request performs the same function as a series of getnext requests with fewer data exchanges between the snmp command and the SNMP agent.

Rule: The GETBULK request requires that the target host specified on the -h parameter must be configured as an OSNMP.CONF entry with the SNMPv2c or SNMPv3 security model. If the SNMP agent at the target host supports only SNMPv1, the request times out.

set
Sends a request to an SNMP agent to set a specific MIB variable. The snmp command then waits for a response or times out.

walk
Issues a getnext request for a specified prefix, then continues to issue getnext requests for as long as there are variables that match the specified prefix. A prefix can be any leading portion of the complete object identifier.
bulkwalk
Issues a GETBULK request for a specified prefix, then continues to issue GETBULK requests for as long as there are variables that match the specified prefix.

Rule: The GETBULK request requires that the target host specified on the -h parameter must be configured as an OSNMP.CONF entry with the SNMPv2c or SNMPv3 security model. If the SNMP agent at the target host supports only SNMPv1, the request times out.

trap
Listens for SNMP traps and displays trap information when they occur. Uses the default well-known port 162 or the port number specified on the -p option. The snmp trap function continues to listen for traps until the process is killed or canceled.

findname
Sends a request that a search be done to obtain the textual name, for a given mib_variable input, whose internal ASN.1 value best matches the input ASN.1 value. The search first checks the MIBS.DATA file, and if a matching textual name is not found, continues with the compiled MIB. Only one mib_variable is allowed per snmp findname invocation.

Usage:
• The set operation is not supported on all MIB objects. The set operation might be rejected if the agent or subagents managing the MIB object do not support SET.
• The function keywords are not case-sensitive. The - options and variable types and values are case-sensitive.
• In order to issue the snmp trap command, you must be in superuser mode if the use of the low port numbers is restricted by the UDPCONFIG statement in the TCP/IP profile. Low port access is required in order to bind to well-known port 162. If you are not in superuser mode, you receive error EZZ3301I Error return from bind() : EDC5111I Permission denied. For more information about the UDPCONFIG statement, see the z/OS Communications Server: IP Configuration Reference.
• In order to listen to traps from NetView SNMP and z/OS UNIX snmp command at the same time, use the -p port_number parameter on the snmp command. Only one management application at an IP address can listen on a port at a time. Specifying -p on the snmp trap command enables a port other than well-known port 162 to be used. Both ports must be configured as agent trap destinations.
• An snmp command that is not authenticated (by using an acceptable community name or user name) will time out.
• The snmp command uses two configuration files: MIBS.DATA and OSNMP.CONF. Sample files are shipped in the/usr/lpp/tcpip/samples directory. For information about these configuration files, see the z/OS Communications Server: IP Configuration Reference.

Examples:
• Getting the MIB variable
  The following requests MIB object sysName.0:

  ```
  snmp get sysName.0 1.3.6.1.2.1.1.5.0 = MVS SNMP
  ```
  The following requests MIB object myName.0, where myName is defined in the MIBS.DATA file to be the same object identified by sysName.0:

  ```
  snmp get myName.0 1.3.6.1.2.1.1.5.0 = MVSX SNMPv2 Agent
  ```

• Getting the next MIB variable
  The following requests the next logical MIB object:
The following requests the next logical object, using the -v option to have value displayed with textual name instead of object identifier:

```
snmp -v getnext udp
udpInDatagrams.0 = 653
```

**Setting the MIB variable**

The following sets MIB object sysName.0 to a value of 'MVSX SNMPv2 Agent':

```
snmp set sysName.0 "MVSX SNMPv2 Agent"
```

```
1.3.6.1.2.1.1.5.0 = MVSX SNMPv2 Agent
```

The following sets MIB object usmUserAuthKeyChange.1.2.2.117.49 to a hexadecimal value. Backward slashes are included in the value before each single quote to indicate to the UNIX shell that the single quote is part of the string to be passed to the `snmp` command. The 'h at the end of the value indicates that a hexadecimal value is passed.

```
snmp set usmUserAuthKeyChange.1.2.2.117.49 \"3eca6ff34b59010d262845210a40165678dd9646e31e9f890480a233dbe1114d\"h
```

**Walking the MIB tree**

The following returns by name all objects beginning with the same object identifier prefix:

```
snmp -v walk udp
udpInDatagrams.0 = 13
udpNoPorts.0 = 7
udpInErrors.0 = 0
udpOutDatagrams.0 = 20
udpLocalAddress.0.0.0.161 = 0.0.0.0
udpLocalAddress.0.0.0.514 = 0.0.0.0
udpLocalAddress.0.0.0.4001 = 0.0.0.0
udpLocalAddress.0.0.0.50003 = 0.0.0.0
udpLocalAddress.9.42.103.27.1029 = 9.42.103.27
udpLocalPort.0.0.0.161 = 161
udpLocalPort.0.0.0.514 = 514
udpLocalPort.0.0.0.4001 = 4001
udpLocalPort.0.0.0.50003 = 50003
udpLocalPort.9.42.103.27.1029 = 1029
udpEndpointProcess.0.0.161.0.0.0.33 = 0
udpEndpointProcess.0.0.514.0.0.0.28 = 0
udpEndpointProcess.0.0.4001.0.0.0.44 = 0
udpEndpointProcess.0.0.50003.0.0.0.70 = 0
udpEndpointProcess.1.4.9.42.103.27.1029.0.0.0.67 = 0
udpEndpointProcess.2.0.4002.2.16.32.13.184.0.0.0.0.0.0.0.0.0.0.1.9002.45 = 0

```

**Walking the tree using bulkwalk**

The following returns by name all objects beginning with the same object identifier prefix, but with fewer data packages to be exchanged between the `snmp` command and the SNMP agent.

The bulkwalk request type is an SNMPv2 function. The -h parameter identifies a host, loopback, defined in the OSNMP.CONF file as an agent that supports SNMPv2 or SNMPv3.
The following requests multiple MIB objects using the getbulk request type. The getbulk request type returns the next logical object for one or more MIB objects listed on the command. In the following example, the -n option indicates that only one next logical object is requested for the first two variables (sysObjectId and ifNumber). For all other objects in the list (ifName, ifHCInOctets, ifHCOutOctets), the -m option indicates that 5 repetitions are requested. As a result of this command, the following SNMP data is returned:

- sysObjectId - the SNMP OID (object identifier) that identifies the agent
- ifNumber - the total number of interfaces defined to the TCP/IP stack with which the agent is associated
- The ifName, ifHCInOctets, and ifHCOutOctets values for the first 5 interfaces defined to the stack

The getbulk request type is an SNMPv2 function. The -h parameter identifies a host, loopback, defined in the OSNMP.CONF file as an agent that supports SNMPv2 or SNMPv3.

The following sends a request that a search be done to obtain the textual name, for a given mib_variable input, whose internal ASN.1 value best matches the input ASN.1 value. The search begins with the MIBS.DATA file and, if not found, continues with the compiled MIB. Only one mib_variable is allowed per snmp findname command invocation:

```
• Finding the name of an ASN.1 variable
```

Managing TCP/IP network resources with SNMP 877
Sending requests with the physical interface address as originating address:

By default, the `snmp` command no longer sets the SO_IGNRESOURCETIPA socket option to force the originating address in the request packet to be that of the physical interface over which the packet is sent. A source VIPA address, if one is configured, is used instead. To cause the `snmp` command to use the physical address instead, the `-a` option can be specified. This implies that the SNMP agent receiving the request must be configured to accept requests from the physical interface address rather than the source VIPA address.

To have the `snmp` command use the physical interface address as the originating address, use the `-a` parameter on the `snmp` command:

```bash
snmp -a get sysUpTime.0
1.3.6.1.2.1.1.3.0 = 2950600
```

Alternately, if an entry exists in the OSNMP.CONF file for hostA that specifies NOSVIPA, the following command would achieve the same results:

```bash
snmp -h hostA get sysUpTime.0
1.3.6.1.2.1.1.3.0 = 2950600
```

Using SNMP from NetView

If you want to use SNMP from NetView, you have several alternatives. The most basic is the command line interface, the NetView SNMP command, documented in “The NetView SNMP command” on page 878.

For more sophisticated management support, consider using the AON support provided in Tivoli NetView for z/OS, which provides panel-based support for retrieval and modification of SNMP management data at a TCP/IP host. For additional information, see the Tivoli NetView for z/OS Automated Operations Network User's Guide, GC31-8851.

Additionally, z/OS Communications Server provides sample NetView command lists. These are sample files only and do not reflect the most recent MIB variable support. Two sets of sample command lists are provided to execute SNMP requests from full-screen mode. One, written in the NetView Command List (CLIST) language, is documented in the SNMPCLST.README file. The other is written in REXX and is documented in the SNMPREXX.README file.

The NetView SNMP command

To issue an SNMP request from NetView, use the SNMP command. The SNMP command provides SNMP manager function with the NetView program to query SNMP agents for network management information.

The NetView SNMP command uses the SNMP Query Engine to issue SNMP requests to agents and to process SNMP responses returned by agents. The SNMP command supports issuance of SNMPv1 requests.

The SNMP command does not support the use of IPv6 addresses.
Note: The z/OS Communications Server SNMP agent supports SNMPv1, SNMPv2c, and SNMPv3 requests.

Stop Forwarding Traps:

![SNMP flowchart]

Pinging a Node:

![SNMP flowchart]

Parameters:

SNMP request types

- **Get**
  Sends a request to an SNMP agent for a specific management information base (MIB) variable.

- **GETNext**
  Sends a request to an SNMP agent for the next MIB variable that lexicographically follows the `var_name` specified.

- **Set**
  Sends a request to an SNMP agent to set a specific MIB variable.

- **MIBvname**
  Requests the textual name of an ASN.1 MIB object.

- **TRAPson**
  Requests that the SNMP Query Engine listen on the trap port for SNMP traps and forward them to the NetView program, which displays trap information when it occurs.

- **TRAPSOFF**
  Causes the SNMP Query Engine to stop listening on the trap port for SNMP traps and stop forwarding them to the NetView program.

- **PING**
  Obtains the minimum round-trip response time from the Query Engine to a specific node.
Variables

host_name
 Specifies the destination host to which you want to send a request. The host can be specified with its name or with its IP address in dotted decimal notation.

community_name
 Specifies the community name used to access the specified variables at the destination SNMP agent.

Note: Community names are case-sensitive. SNMP commands issued from the NetView console are converted to uppercase. Those issued from REXX execs are not converted to uppercase.

descr

var_name
 Specifies one or more MIB variable names to be retrieved or set. You can specify the textual names or ASN.1 notation (for example, sysDescr.0 or 1.3.6.1.2.1.1.1.0). The SNMP Query Engine can accept a maximum of 10 variables for each request.

All MIB variables that are defined as part of a sequence represent variables that can have more than one occurrence. These variables require an instance identifier appended to the end of the variable name to identify which occurrence of the variable is being requested.

value
 Specifies the value to be set by the SET function. On the Set command from the NetView console, a value is enclosed in single quotation marks, not double quotation marks. From the panels, you can specify no quotation marks, single quotation marks ("), or double quotation marks ("'). No quotation marks and single quotation marks work the same. If you specify double quotation marks, you get double quotation marks as part of the value.

asn.1_name
 Specifies the MIB object, using its object identifier in ASN.1 notation. You can specify only one variable. Additional arguments are ignored.

net_mask
 Specifies, in dotted decimal notation, the network mask to be evaluated with the IP address of incoming traps. The dotted decimal IP address is ANDed with this mask.

net_desired
 Specifies the network from which you want to receive traps.

filter_id
 Specifies the trap filter ID.

When you request traps using the SNMP TRAPSON command, it returns a request number or filter_id, which the SNMP Query Engine associates with the TRAPSON request. To stop receiving traps, specify this filter_id in the TRAPSOFF request.

Usage:

• If you start and stop NetView, you must do the same to the SNMP Query Engine.

• When the SNMP command is issued from the NetView Command Facility command line, all input is translated to uppercase (standard NetView format) before it is sent to the SNMP Query Engine.

• When the SNMP command is issued from a CLIST, input is passed in whatever case it was passed from the CLIST (for example, mixed case).

• The textual names for the variables passed to the query engine are compared against the entries in the MIBDESC.DATA file. This comparison is not case-sensitive.

• If multiple variables are specified with the GET, GETNext, or SET commands, they are all packaged in one SNMP PDU to be sent to the agent.

• If multiple SNMP requests are issued, the responses might not be received in the same order the requests are issued.

• The SNMP agent can receive SNMP requests over any interface.

• The SNMP Query Engine treats numbers with leading zeros as octal numbers. Therefore, do not use leading zeros.
• If an SNMP request is issued with the wrong community name, it could receive multiple AUTHENTICATION FAILURE traps with the same filter_id but different time stamps from the same host. This is because the SNMP Query Engine tries the request again if a response is not received from the host, and each attempt causes the host to generate an AUTHENTICATION FAILURE trap.

**Return code:**

The following table lists the return codes generated by SNMP.

<table>
<thead>
<tr>
<th>Return code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Error from DSIGET, cannot continue</td>
</tr>
<tr>
<td>2</td>
<td>Incorrect function specified</td>
</tr>
<tr>
<td>3</td>
<td>Missing SNMP function</td>
</tr>
<tr>
<td>4</td>
<td>Not enough parameters</td>
</tr>
<tr>
<td>5</td>
<td>Missing variable name</td>
</tr>
<tr>
<td>6</td>
<td>Missing variable value</td>
</tr>
<tr>
<td>7</td>
<td>Missing or incorrect host name</td>
</tr>
<tr>
<td>8</td>
<td>Missing community name</td>
</tr>
<tr>
<td>9</td>
<td>SNMPiUCV not active</td>
</tr>
<tr>
<td>10</td>
<td>Error from DSIMQS</td>
</tr>
<tr>
<td>11</td>
<td>Incorrect net_mask/desired network</td>
</tr>
<tr>
<td>12</td>
<td>Missing/Incorrect trap filter_id</td>
</tr>
<tr>
<td>1001+</td>
<td>Command successful — all return codes above 1000</td>
</tr>
</tbody>
</table>

**Examples:**

- **Retrieving the MIB variable**

  For example, if you know:

<table>
<thead>
<tr>
<th>hostname</th>
<th>anyhost</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>129.34.222.72</td>
</tr>
<tr>
<td>community name</td>
<td>public</td>
</tr>
<tr>
<td>variable name</td>
<td>sysDescr.0</td>
</tr>
<tr>
<td>as1 variable name</td>
<td>1.3.6.1.2.1.1.1.0</td>
</tr>
<tr>
<td>variable name</td>
<td>sysObjectID.0</td>
</tr>
<tr>
<td>as1 variable name</td>
<td>1.3.6.1.2.1.1.2.0</td>
</tr>
<tr>
<td>variable name</td>
<td>sysUpTime.0</td>
</tr>
<tr>
<td>as1 variable name</td>
<td>1.3.6.1.2.1.1.3.0</td>
</tr>
</tbody>
</table>

  You can issue the following SNMP GET commands:

  ```
  snmp get 129.34.222.72 public 1.3.6.1.2.1.1.1.0
  snmp get 129.34.222.72 public 1.3.6.1.2.1.1.1.0
  snmp get anyhost public 1.3.6.1.2.1.1.1.0
  snmp get anyhost public sysDescr.0
  snmp get anyhost public sysObjectID.0
  snmp get anyhost public sysUpTime.0
  ```

  After the last SNMP GET command is completed, you get a message similar to the following one:

  ```
  SNM0501 SNP Request 1001 from NETOP accepted, sent to Query Engine
  ```

  When the response arrives in the NetView program (asynchronously), it displays the response as a multiline message in the following form:
**Retrieving the next MIB variable**

For example, if you know:

- **hostname**: anyhost
- **IP address**: 129.34.222.72
- **community name**: public
- **variable name**: ifAdminStatus (in ifTable)
- **asn.1 variable name**: 1.3.6.1.2.1.2.2.1.7

You can issue an SNMP GETNext command in one of the following ways:

```
snmp getnext 129.34.222.72 public 1.3.6.1.2.1.2.2.1.7.0
snmp getnext 129.34.222.72 public ifAdminStatus.0
snmp getnext anyhost public 1.3.6.1.2.1.2.2.1.7.0
snmp getnext anyhost public ifAdminStatus.0
```

The GETNext command is completed in the same manner as the GET command, and you receive an asynchronous response similar to the following one:

```
SNM040I SNMP Request 1001 from NETOP Returned the following response:
SNM042I Variable name: 1.3.6.1.2.1.2.2.1.7.1
SNM043I Variable value type: 1
SNM044I Variable value: 1
SNM049I SNMP Request 1001 end of response
```

In this example, the first instance of the variable has a status of 1 or greater (ends in 7.1).

You can then issue another GETNext command in one of the following ways:

```
snmp getnext 129.34.222.72 public 1.3.6.1.2.1.2.2.1.7.1
snmp getnext 129.34.222.72 public ifAdminStatus.1
snmp getnext anyhost public 1.3.6.1.2.1.2.2.1.7.1
snmp getnext anyhost public ifAdminStatus.1
```

The GETNext command is completed in the same manner as the GET command, and you receive an asynchronous response similar to the following one:

```
SNM040I SNMP Request 1002 from NETOP Returned the following response:
SNM042I Variable name: 1.3.6.1.2.1.2.2.1.7.2
SNM043I Variable value type: 1
SNM044I Variable value: 1
SNM049I SNMP Request 1002 end of response
```

In this example, the second instance of the variable has a status of 1 or greater (ends in 7.2).

You can then issue another GETNext command in one of the following ways:

```
snmp getnext 129.34.222.72 public 1.3.6.1.2.1.2.2.1.7.2
snmp getnext 129.34.222.72 public ifAdminStatus.2
snmp getnext anyhost public 1.3.6.1.2.1.2.2.1.7.2
snmp getnext anyhost public ifAdminStatus.2
```

The GETNext command is completed in the same manner as the GET command, and you receive an asynchronous response similar to the following one:
• Setting the MIB variable

For example, if you know:

<table>
<thead>
<tr>
<th>hostname</th>
<th>anyhost</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>129.34.222.72</td>
</tr>
<tr>
<td>community name</td>
<td>publicw</td>
</tr>
<tr>
<td>variable name</td>
<td>ifAdminStatus</td>
</tr>
<tr>
<td>asn.1 variable name</td>
<td>1.3.6.1.2.1.2.1.7.1</td>
</tr>
</tbody>
</table>

You can then issue an SNMP SET command in one of the following forms to set the administrative status of the first interface in the ifTable (first instance) to test:

```plaintext
snmp set 129.34.222.72 publicw 1.3.6.1.2.1.2.2.1.7.1 3
snmp set 129.34.222.72 publicw IfAdminStatus.1 3
snmp set anyhost publicw 1.3.6.1.2.1.2.2.1.7.1 3
snmp set anyhost publicw IfAdminStatus.1 3
```

After the command is completed, you receive a message similar to the following one:

```
SNM050I SNMP Request 1001 from NETOP accepted, sent to Query Engine
```

When the response arrives in the NetView program (asynchronously), it displays the response as a multiline message in the following form:

```
SNM040I SNMP Request 1001 from NETOP Returned the following response:
SNM042I Variable name: 1.3.6.1.2.1.2.7.1
SNM043I Variable value type: 1
SNM044I Variable value: 3
SNM049I SNMP Request 1001 end of response
```

If a SET request is attempted against an object for which the target agent or subagent does not allow SETs, you receive:

- noSuchName for SNMPv1 requests

Appendix C, “Management Information Base (MIB) objects,” on page 941 identifies the objects supported by the z/OS Communications Server SNMP agent and subagents and the level of access supported for each object.

**Note:** The variable being set must be present in the MIBDESC.DATA data set for the Query Engine to determine the syntax to use when encoding the SNMP PDU.

• Receiving a trap

The SNMP TRAPSON command permits the specification of a filtering condition that enables the Query Engine to perform filtering. The SNMP TRAPSON command assigns a unique request number to each filter (also called a filter_id) and returns this number in a message and in the return code. This filter_id is the argument to an SNMP TRAPSOFF command, which is used to stop receiving traps that pass this filter.

For example, if you know:

<table>
<thead>
<tr>
<th>IP address</th>
<th>129.34.222.72</th>
</tr>
</thead>
<tbody>
<tr>
<td>net mask</td>
<td>255.255.255.255</td>
</tr>
</tbody>
</table>

You can issue the following SNMP TRAPSON commands:

```plaintext
snmp trapson
snmp trapson 255.255.255.255 129.34.222.72
```
The first command receives all traps (the default is a mask of 0 and a required network of 0). The second command receives traps only from the specific host 129.34.222.72.

After the command is completed, you receive a message similar to the following one:

```
SNM050I SNMP Request 1001 from NETOP accepted, sent to Query Engine
```

The number returned in the message (1001 in the previous example) is used as the filter_id. This filter_id is displayed in the header message of traps passed by this filter. The filter_id is used in the TRAPSOFF command to turn the filter off.

When the response arrives in the NetView program (asynchronously), it displays the response as a multiline message in the following form to indicate that the TRAPSON request was accepted:

```
SNM040I SNMP Request 1001 from NETOP Returned the following response:
SNM045I Major error code: 0
SNM046I Minor error code: 0
SNM047I Error index: 0
SNM048I Error text: no error
SNM049I SNMP Request 1001 end of response
```

When traps arrive, the NetView program displays each trap with a multiline message in the following form. This multiline message is sent to the NetView operator who is designated as the authorized receiver (AUTH MSGRECVR=YES in the operator profile); it might not show up on the console of the operator who issues the TRAPSON command.

```
SNM030I SNMP request 1001 received following trap:
SNM031I Agent Address: 129.34.222.34
SNM032I Generic trap type: 4
SNM033I Specific trap type: 0
SNM034I Time stamp: 472600
SNM035I Enterprise Object ID: 1.3.6.1.4.1.2.1.1
SNM039I SNMP request 1001 End of trap data
```

After the TRAPSON command has been issued, traps can start to arrive asynchronously. They can even arrive after the operator who issued the TRAPSON command has logged off. Often, a TRAPSON command is issued by a CLIST, and the received trap data triggers another CLIST to handle the trap data. Therefore, the messages in the range SNM030—SNM039 are sent to the authorized receiver. For a NetView operator to see the traps, the operator must have the following statement in the NetView Operator profile:

```
AUTH MSGRECVR=YES
```

However, only one operator receives the message. The message also goes to the log file, so you can always browse the log file to see trap data. Additionally, you can assign trap messages to go to a specific operator using the NetView ASSIGN operator command.

In the response to the SNMP TRAPSON request, not all lines need to be present, but the first line is always message SNM040I, and the last line is always message SNM049I.

For the multiline trap message, not all lines need to be present, but the first line is always message SNM030I, and the last line is always message SNM039I.

Additional messages (SNM036I—SNM038I) could be present if the trap has additional data.

If a variable value is too long, message SNM038 might not fit on an 80-character line. If this happens, the value is split and multiple SNM038 messages are displayed.

The SNMP trap data always displays the variable name in ASN.1 notation. You can use SNMP MIBVNAME to obtain the textual name for the variable.

A trap always shows the agent address in the form of an IP address in dotted decimal notation.

You can issue multiple TRAPSON requests, with either the same or a different filter. If a trap passes multiple filters, the trap is sent to the NetView program multiple times. However, in the NetView program, the header and trailer lines (messages SNM030I and SNM039I) of the duplicate trap are
different, because they contain the `filter_id` (request number) by which the trap was forwarded. Different types of traps from different hosts can have the same `filter_id`, if these traps pass the same trap filter.

The SNMP Query Engine can forward only those traps that it receives. Each agent has a trap destination table, which lists all the hosts that receive that agent’s traps. The host name of your system must be in the trap destination table of all agents from which you want to receive traps.

- **Stop listening for traps**

  For example, if you know the `filter_id` is 1001, you can issue the following SNMP TRAPSOFF command to tell the SNMP Query Engine to quit sending traps that would pass filter 1001:

  ```
  snmp trapsoff 1001
  ```

  The command completes with a message similar to the following one:

  ```
  SNM050I SNMP Request 1001 from NETOP accepted, sent to Query Engine
  ```

  When the response arrives in the NetView program (asynchronously), it displays the response as a multiline message in the following form to indicate that the TRAPSOFF request was accepted.

  ```
  SNM040I SNMP Request 1002 from NETOP Returned the following response:
  SNM041I Major error code: 0
  SNM042I Minor error code: 0
  SNM043I Error index: 0
  SNM044I Error text: no error
  SNM045I SNMP Request 1002 end of response
  ```

  Only one `filter_id` for each SNMP TRAPSOFF command can be passed. Extraneous arguments are ignored.

- **Finding the name of an ASN.1 variable**

  For example, if you have a trap that tells you:

  ```
  SNM030I SNMP request 1001 received following trap:
  SNM031I Agent Address: 129.34.222.34
  SNM032I Generic trap type: 2
  SNM033I Specific trap type: 0
  SNM034I Time stamp: 472600
  SNM035I Enterprise Object ID: 1.3.6.1.4.1.2.1.1
  SNM036I Variable name: 1.3.6.1.2.1.2.2.1.1
  SNM037I Variable value type: 0
  SNM038I Variable value: 2
  SNM039I SNMP request 1001 End of trap data
  ```

  You can issue the following SNMP MIBVNAME command to find the textual MIB variable name:

  ```
  snmp mibvname 1.3.6.1.2.1.2.2.1.1
  ```

  The command completes with a message similar to the following one:

  ```
  SNM050I SNMP Request 1002 from NETOP accepted, sent to Query Engine
  ```

  When the response arrives in the NetView program (asynchronously), it displays the response as a multiline message in the following form:

  ```
  SNM040I SNMP Request 1002 from NETOP Returned the following response:
  SNM041I Variable name: 1.3.6.1.2.1.2.2.1.1
  SNM042I Variable value type: 9
  SNM043I Variable value: ifIndex
  SNM044I SNMP Request 1002 end of response
  ```

  Only one ASN.1 variable name can be passed for each SNMP MIBVNAME command. Additional parameters are ignored.

- **Pinging a node**
For example, if you know:

<table>
<thead>
<tr>
<th>nodename</th>
<th>- anynode</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>- 129.34.222.72</td>
</tr>
</tbody>
</table>

You can issue the following SNMP PING commands:

```
SNMP PING ANYNODE  
SNMP PING 129.34.222.72
```

The command completes with a message similar to the following one:

```
SNM050I SNMP Request 1001 from NETOP accepted, sent to Query Engine
```

When the response arrives in the NetView program (asynchronously), it displays the response as a multiline message in the following form:

```
SNM048I SNMP Request 1001 from NETOP Returned the following response:
SNM042I Variable name: 1.3.6.1.4.1.2.2.1.3.2.129.34.222.72
SNM043I Variable value type: 1
SNM044I Variable value: 26
SNM049I SNMP Request 1001 end of response
```

The Query Engine issues one PING (an ICMP echo on a raw socket) and returns the value in milliseconds in an IBM-defined SNMP variable minRTT. Because only one PING is issued, this is also the average and the maximum response time.

If the PING does not respond, the Query Engine tries again twice, once after one second and again after two seconds (Query Engine default retry mechanism). If a response is not received after all retries have been exhausted, a variable value of -1 is returned to indicate that a reply was not received.

The 129.34.222.72 in the example for the SNMP PING command represents an instance of the IBM variable minRTT.

Only one node name can be passed for each SNMP PING command.

SNMP uses ICMP Echo to send a PING command to the remote host. No SNMP PDU exchange with the remote host occurs. Therefore, a successful SNMP PING indicates only that the remote host is active and reachable. It does not indicate that the SNMP agent at the remote host is active, or that the SNMP manager can send requests to the SNMP agent if it is active.

**Usage:**

- The SNMP response always displays the variable name in ASN.1 notation. You can use SNMP MIBVNAME to obtain the textual name for the variable.
- If you issue a GET for multiple variables, messages SNM042–SNM044 are displayed for each variable.
- When you issue a GET for multiple variables, they are returned in the same sequence as requested. In Figure 4 on page 882, GET was issued for sysDescr.0  sysObjectID.0  sysUpTime.0. The same 3 variables are returned in the response.
- If an error was detected, messages SNM042–SNM044 might not be present. You can get (in addition to other messages) error messages in the following forms (all as part of multiline message SNM040I):

```
SNM045I Major error code: n
SNM046I Minor error code: y
SNM047I Error index: z
SNM048I Error text: message text
```

- If a variable value is too long, message SNM044 might not fit on an 80-character line. If this happens, the value is split and multiple SNMP044 messages are displayed.
- According to RFC 1157 (Simple Network Management Protocol (SNMP)), a message exchanged between SNMP entities (including version identification and community name) can be as small as 484 octets. If you specify up to 10 variables in a GET/GETNext command, the names could be short enough to send...
the GET command to the SNMP agent, but the response could be too long to fit in the message. As a result, you receive a `tooBig` error.

- If one (or more) of the variables requested results in an error, all variables listed after the first variable in error are ignored, and data is not returned for them.
- To correctly retrieve the next variable for the GETNext command, you must specify an instance identifier as part of the variable name. If the variable has only one occurrence, or if the first occurrence of a table variable is needed, use .0 as the instance identifier.
- The GETNext command is used to interrogate a table (for example, the interface table) or an array. You can issue a GETNext command at the start of a table (use instance 0.0). The first element in the table is returned. The process continues in a loop, performing GETNext requests on the previously obtained variable name, until the name of the variable returned no longer has the same prefix as the one at the start of the table. This condition occurs when the GETNext request returns a variable that is in the next group.

**Context:**

For information about the variable `ibmMvsRPingResponseTime`, which enables you to send remote PING commands, see “SNMP remote PING” on page 897.

For a list of variables supported by the z/OS Communications Server IP agent, see Appendix C, “Management Information Base (MIB) objects,” on page 941.

### Host name resolution

When a NetView SNMP request uses a symbolic host name rather than an IP address, the SNMP Query Engine uses the standard gethostbyname() function to look up the IP address of that host. The IP address is then saved in an SNMP Query Engine in-memory cache for future reference. Use of this cache improves the performance of subsequent requests for the same host.

**Note:** Because the cache cannot be refreshed, if the mapping between host names and IP addresses changes, you must restart the SNMP Query Engine (the SQESERV module) to rebuild the cache. You must also restart the SNMP Query Engine after a host name is added to the name server data base.

### Major and minor error codes and SNMP value types

This section describes the possible major and minor error codes and variable value types that can be returned in a NetView SNMP response or trap.

- The major error code can have one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Major error code</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No error detected</td>
</tr>
<tr>
<td>1</td>
<td>SNMP agent reported error</td>
</tr>
<tr>
<td>2</td>
<td>Internally detected error</td>
</tr>
</tbody>
</table>

- The minor error code can have one of the following values when the major error code indicates that an SNMP agent detected an error (1):

<table>
<thead>
<tr>
<th>Value</th>
<th>SNMP Agent detected minor error code</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No error</td>
</tr>
<tr>
<td>1</td>
<td>Too big</td>
</tr>
<tr>
<td>2</td>
<td>No such name</td>
</tr>
<tr>
<td>3</td>
<td>Incorrect value</td>
</tr>
<tr>
<td>Value</td>
<td>SNMP Agent detected minor error code</td>
</tr>
<tr>
<td>-------</td>
<td>-------------------------------------</td>
</tr>
<tr>
<td>4</td>
<td>Read only</td>
</tr>
<tr>
<td>5</td>
<td>General error</td>
</tr>
</tbody>
</table>

- The minor error code can have one of the following values when the major error code indicates that an internal error was detected (2):

<table>
<thead>
<tr>
<th>Value</th>
<th>Internal minor error code</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No error</td>
</tr>
<tr>
<td>1</td>
<td>Protocol error</td>
</tr>
<tr>
<td>2</td>
<td>Out of memory</td>
</tr>
<tr>
<td>3</td>
<td>No response—all retries failed</td>
</tr>
<tr>
<td>4</td>
<td>Some I/O error occurred</td>
</tr>
<tr>
<td>5</td>
<td>Illegal request</td>
</tr>
<tr>
<td>6</td>
<td>Unknown host specified</td>
</tr>
<tr>
<td>7</td>
<td>Unknown MIB variable</td>
</tr>
<tr>
<td>8</td>
<td>No such filter</td>
</tr>
<tr>
<td>9</td>
<td>Too many variables specified</td>
</tr>
</tbody>
</table>

- If the major error code indicates that an SNMP agent detected the error (1), the error index indicates the position of the first variable in error.
- The variable value type is one of the following, as specified in RFC 1155 (Structure and Identification of Management Information for TCP/IP-Based Internets) and RFC 1156 (Management Information Base for Network Management of TCP/IP-Based Internets):

<table>
<thead>
<tr>
<th>Value</th>
<th>Value type</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Text representation</td>
</tr>
<tr>
<td>1</td>
<td>Number (integer, signed)</td>
</tr>
<tr>
<td>2</td>
<td>Binary data string</td>
</tr>
<tr>
<td>3</td>
<td>Object identifier</td>
</tr>
<tr>
<td>4</td>
<td>Empty (no value)</td>
</tr>
<tr>
<td>5</td>
<td>IP address</td>
</tr>
<tr>
<td>6</td>
<td>Counter (unsigned)</td>
</tr>
<tr>
<td>7</td>
<td>Gauge (unsigned)</td>
</tr>
<tr>
<td>8</td>
<td>Time ticks (1/100ths seconds)</td>
</tr>
<tr>
<td>9</td>
<td>Display string</td>
</tr>
</tbody>
</table>

**Note:** The binary data string is displayed in the NetView program as a contiguous string of hexadecimal characters (for example, X’0123’ is displayed as 0123).

**Creating user keys**

The following information describes authentication keys and z/OS Communications Server encryptions support.
Authentication

Authentication is generally required for SNMPv3 requests to be processed (unless the security level requested is 'noAuth'). When authenticating a request, the SNMP agent verifies that the authentication key sent in an SNMPv3 request can be used to create a message digest that matches the message digest created from the authentication key defined for the user.

The `snmp` command uses the authentication key found on an entry in the OSNMP.CONF configuration file. It needs to correlate with the authentication key specified on a USM_USER entry for that user in the agent SNMPD.CONF configuration file.

As an alternative to storing authentication keys in the client configuration file, the `snmp` command allows user passwords to be stored. If the `snmp` command is configured with a password, the code will generate an authentication key (and privacy key if requested) for the user. These keys must, of course, produce the same authentication values as the keys configured for the USM_USER in the agent's SNMPD.CONF file or configured dynamically with SNMP SET commands. Note, however, the use of passwords in the client configuration file is considered less secure than the use of keys in the configuration file.

The authentication key is generated from two pieces of information:

- The specified password
- The identification of the SNMP agent at which the key will be used. If the agent is an IBM agent and its engineID was generated using the vendor-specific engineID formula, the agent might be identified by IP address or host name. Otherwise, the engineID must be provided as the agent identification.

A key that incorporates the identification of the agent at which it will be used is called a localized key. It can be used only at that agent. A key that does not incorporate the engineID of the agent at which it will be used is called nonlocalized.

Keys stored in the `snmp` command configuration file, OSNMP.CONF, are expected to be nonlocalized keys. Keys stored in the SNMP agent's configuration file, SNMPD.CONF, can be either localized or nonlocalized, though the use of localized keys is considered more secure.

Encryption

As of z/OS V1R2 Communications Server, encryption support is provided in the base product. Keys used for encryption are generated using the same algorithms as are used for authentication. However, key lengths might differ. For example, an HMAC-SHA authentication key is 20 bytes long, but a localized encryption key used with HMAC-SHA are only 16 bytes in length.

Using the pwtokey facility

z/OS Communications Server provides a facility called pwtokey that allows conversion of passwords into localized and non-localized authentication and privacy keys, for SNMP or OMPROUTE.

- For OMPROUTE, pwtokey takes as input a password and generates an authentication key. No localized or privacy keys are needed or generated for OMPROUTE. Some restrictions apply when using pwtokey for OMPROUTE. See the description of the password parameter for more information.
- For SNMP, the pwtokey procedure takes as input a password and an identifier of the agent and generates authentication and privacy keys. The procedure used by the pwtokey facility is the same algorithm used by the z/OS UNIX `snmp` command. The person configuring the SNMP agent can generate appropriate authentication and privacy keys to put in the SNMPD.CONF file for a user, given a particular password and the IP address at which the agent runs.

Tip: For privacy, encryption requires the use of keys of 32 hexadecimal digits (16 bytes) in length. However, if the key is generated by using HMAC-SHA, which produces keys of 40 hexadecimal digits (20 bytes) in length, the truncation from 40 to 32 hexadecimal digits is not done until after the key is localized. Therefore, a non-localized privacy key generated using HMAC-SHA is 40 hexadecimal digits (20 bytes) long, and a localized privacy key generated using HMAC-SHA is 32 hexadecimal digits (16 bytes) long.
bytes) long. A privacy key generated with HMAC-MD5 (localized or not) is 32 hexadecimal digits (16 bytes) long.

To convert passwords into authentication and privacy keys, issue the following command from z/OS UNIX to use the pwtokey facility.

**Format:**

```
pwtokey -e -d 0 -d n -p HMAC-MD5 -p HMAC-SHA -p all -u auth -u key_usage
```

**Parameters:**

- **-e**
  This flag indicates that the agent for which the key is being defined is identified by engineID rather than by IP address or host name. This is applicable only when generating keys for SNMP.

- **-d n**
  This flag indicates what level of debug information is wanted. Debug tracing is either on or off, so a value of 1 causes debug tracing to be generated to the screen of the command issuer (sysout), and a value of 0 specifies that no debug tracing be generated. Debug tracing is off (0) by default.

- **-p protocol**
  This flag indicates the protocols for which the keys are generated. Valid values are:

  **HMAC-MD5**
  Generates keys for use with the HMAC-MD5 authentication protocol. This is the only protocol to use when generating OSPF MD5 keys for OMPROUTE.

  **HMAC-SHA**
  Generates keys for use with the HMAC-SHA authentication protocol.

  **all**
  Generates both HMAC-MD5 and HMAC-SHA keys.

  The default is that keys for the HMAC-MD5 protocol are generated.

- **-u key_usage**
  This flag indicates the usage intended for the key. Valid values are:

  **auth**
  An authentication key. This is the recommended usage for generating OSPF MD5 keys for OMPROUTE.

  **priv**
  A privacy key.

  **all**
  Both authentication and privacy keys.

  **Note:** There is no difference between a key generated for authentication and a key generated for privacy. However, the length of privacy keys depends on whether the key is localized or not.

- **-s**
  This flag indicates that output data is displayed with additional spaces to improve readability. By default, data is displayed in a condensed format to facilitate cut-and-paste operations on the keys into configuration files or command lines.
password  
Specifies the text string to be used in generating the keys. The password must be in the range of 8–255 characters long. In general, while any printable characters can be used in the passwords, the z/OS UNIX shell might interpret some characters rather than passing them to the pwtokey command. Include passwords in single quotation marks to avoid interpretation of the characters by the z/OS UNIX shell.

Note:
1. This password is not related to the community name (or password) used with community-based security (SNMPv1 and SNMPv2c). This password is used only to generate keys for user-based security, an entirely different security scheme.
2. For easier OMPROUTE migration from password to MD5 authentication, you can base the input password on the OMPROUTE password (there is no requirement for you to do so). Because the input password must be at least 8 characters and OMPROUTE supports passwords as few as 1 character, it might be necessary for you to pad or otherwise alter the OMPROUTE password to bring it up to 8 characters. Some restrictions apply when using PWTOKEY for OMPROUTE. See the MD5 Authentication specification for OMPROUTE in the z/OS Communications Server: IP Configuration Reference.

IPaddress  
Specifies the IP address in IPv4 dotted decimal or IPv6 colon hexadecimal notation of the SNMP agent at which the key will be used on an SNMP request. This parameter is used only in generation of the localized key, and is not needed when generating MD5 keys for OMPROUTE.

hostname  
Specifies the SNMP agent at which the key will be used on an SNMP request. This parameter is used only in generation of the localized key and is not needed when generating MD5 keys for OMPROUTE.

engineID  
Specifies the engine ID of the SNMP agent at which the key will be used. The engine ID is determined at SNMP agent initialization from the SNMPD.BOOTS file. The engine ID must be a string of 1–32 octets (2–64 hexadecimal digits). If the engineID is specified, the -e option must also be specified. The default is that the agent identification is not an engine ID. This parameter is used only in generation of the localized key and is not needed when generating MD5 keys for OMPROUTE.

Examples:
Sample output from the pwtokey command:

```
# pwtokey testpassword 9.67.113.79
Display of 16 byte HMAC-MD5 authKey:
775b109f79a6b71f94cca5d22451cc0e
Display of 16 byte HMAC-MD5 localized authKey:
de25243d5c2765f0dce273e4bcf941781
```
pwtokey generates two keys – one that is localized (has been tailored to be usable only at the agent identified) and one that has not been localized. Typically, the localized key is used in the configuration for the SNMP agent. The nonlocalized key is used in the configuration for the snmp command.

If pwtokey is invoked requesting HMAC-SHA keys for both authentication and privacy, the output looks like this:

```
# pwtokey -p HMAC-SHA -u all testpassword 9.67.113.79
Display of 20 byte HMAC-SHA authKey:
b267809aaee4b8e1450a78726be3487131f0b9c50
Display of 20 byte HMAC-SHA localized authKey:
e5438092d109ba43e27e597e5d32c0daaa39b7c
Display of 20 byte HMAC-SHA privKey:
b267809aaee4b8e1450a78726be3487131f0b9c50
Display of 16 byte HMAC-SHA localized privKey:
e54380892d1098a43e27e597e5d32c0e
```

The output for the privacy keys is the same as the output for the authentication keys, except that the localized privacy key has been truncated to 16 bytes as is required.

**Note:** If encryption is used, it is more secure to use different passwords for authentication and privacy.

If `pwtok` is invoked requesting an MD5 authentication key for OMPROUTE, the output looks like this:

```
# pwtok testpassword
Display of 16 byte HMAC-MD5 authKey:
775b109f79a6b71f94cca5d22451cc0e
```

**Usage:**

If the IP address or the host name is specified, the SNMP agent must be an IBM agent. The `engineID` is created using a vendor-specific formula that incorporates the IP address of the agent and an Enterprise ID representing IBM.

**Using the pwchange facility**

The `pwchange` command is provided to facilitate dynamic changes of user authentication and privacy keys. Dynamic configuration of authentication and privacy keys is done by doing SET commands to objects of syntax `keyChange`. The `keyChange` syntax provides a way of changing keys without requiring that the actual keys (either new or old) be flowed directly across the wire, which would not be secure. Instead, if an object, such as `usmUserAuthKeyChange` is to be set, the `keyChange` value must be derived from the old and new passwords and the `engineID` of the agent at which the key will be used. The `pwchange` command is used to generate the `keyChange` values.

**Format:**

```
pwchange
```

```
-e
-d n
-p HMAC-MD5
-p protocol
-u auth
-u key_usage
-s old_password — new_password
-IPaddress hostname engineID
```

**Parameters:**

-e
This flag indicates that the agent for which the `keyChange` value is being defined is identified by `engineID` rather than by IP address or host name.

-d n
This flag indicates what level of debug information is required. Debug tracing is either on or off: 1 causes debug tracing to be generated to the screen of the command issuer (sysout). Debug tracing is off (0) by default.

-p *protocol*
This flag indicates the protocols for which the `keyChange` values are generated. Valid values for `protocol` are:

- **HMAC-MD5**
  Generates `keyChange` values for use with the HMAC-MD5 authentication protocol. This is the default.

- **HMAC-SHA**
  Generates `keyChange` values for use with the HMAC-SHA authentication protocol.

- **all**
  Generates both HMAC-MD5 and HMAC-SHA `keyChange` values.

The default is that `keyChange` values for the HMAC-MD5 protocol are generated.
-u **key_usage**
  This flag indicates the usage intended for the keychange value. Valid values are:
  
  - **auth**
    An authentication keychange value
  
  - **priv**
    A privacy keychange value
  
  - **all**
    Both authentication and privacy keychange values
  
  **Note:** There is no difference between a keychange value generated for authentication and a keychange value generated for privacy. However, the length of privacy keychange values depends on whether the keychange value is localized.

-s
This flag indicates that output is displayed with additional spaces to improve readability. By default, data is displayed in a condensed format to facilitate cut-and-paste operations on the keychange values onto command lines in shell scripts.

**old_password**
Specifies the password that was used in generating the key originally. The password must be between eight and 255 characters long.

**new_password**
Specifies the password that will be used in generating the new key. The password must be between eight and 255 characters long.

**IPaddress**
Specifies the IP address in IPv4 dotted decimal or IPv6 colon hexadecimal notation of the agent at the destination host at which the key is to be used.

**hostname**
Specifies the destination host at which the key is to be used.

**engineID**
Specifies the engine ID (1–32 octets, 2–64 hexadecimal digits) of the destination host at which the key is to be used. The engine ID must be a string of 1–32 octets (2–64 hexadecimal digits). If the engine ID is specified, the -e option must also be specified. The default is that the agent identification is not an engine ID.

**Usage:**
The pwchange command generates different output, depending on which protocol and what key usage is selected. Keychange values are typically twice as long as the key to be changed.

**Examples:**
Sample pwchange output:

```bash
# pwchange oldpassword newpassword 9.67.113.79
Dump of 32 byte HMAC-MD5 authKey keyChange value:
3eca6ff34b59010d262845210a401656
78dd9646e31e9f890480a233db1114d
```

The value to be set should be passed as a hex value:

```bash
snmp set usmUserAuthKeyChange.12.0.0.0.2.0.0.0.0.9.67.113.79.2.117.49
'3eca6ff34b59010d262845210a40165678dd9646e31e9f890480a233db1114d'h
```

**Note:** The backslash in the preceding example is required before the single quotation mark to enable z/OS UNIX to correctly interpret the hexadecimal value.

(The index of the usmUserTable is made up of the engineID and the ASCII representation of the user name; in this case it is 2 characters long and translates to 117.49.)
**Note:** pwchange incorporates a random component in generating keys and keyChange values. The output from multiple commands with the same input does not produce duplicate results.

### Modifying SNMP agent parameters

Some SNMP agent initialization parameters can be modified while the agent is executing using the MVS MODIFY command. The MODIFY command can also be used to display the current level of SNMP agent tracing.

**Format:**

```
MODIFY F snmp_agent_jobname, INTERVAL=n TRACE, LEVEL=n QUERY
```

**Parameters:**

- **snmp_agent_jobname**
  
  The SNMP agent being used.

- **INTERVAL**
  
  Specifies an integer in the range 0–10 that indicates the maximum number of minutes before committed configuration changes to the SNMPD.CONF file will be written out. A value of 0 means that the changes will be written out at the time the SNMP SET request is committed.

- **TRACE**
  
  Indicates SNMP agent tracing is to be queried or changed.

- **LEVEL**
  
  Specifies an integer in the range 0–255 that indicates the level of agent tracing. This corresponds to the -d parameter at agent initialization. See the z/OS Communications Server: IP Configuration Reference for additional guidance on setting the trace level.

- **QUERY**
  
  Requests that the current level of SNMP agent tracing be displayed.

### SNMP agent: Management data supported

The following sections describe the type of management data supported by the z/OS Communications Server SNMP agent and subagents and how this data can be used to support network management. The SNMP agent supports objects related to the agent's configuration and the subagents connected to it. The subagents shipped with z/OS Communications Server are:

- The TCP/IP subagent
- The OMPROUTE subagent
- The Network SLAPM2 subagent
- The TN3270 Telnet subagent

The agent and subagents support many MIB objects defined as standard objects in RFCs. Additionally, the SNMP agent and the TCP/IP subagent support nonstandard MIB objects, called Enterprise-specific objects. The complete list of MIB objects supported by the SNMP agent and subagents is in Appendix C, “Management Information Base (MIB) objects,” on page 941. Additionally, subagents other than those shipped with z/OS Communications Server can communicate with the z/OS Communications Server SNMP agent to extend the MIB objects supported. These subagents must use the Distributed Protocol Interface, as documented in the z/OS Communications Server: IP Programmer's Guide and Reference.
SNMP MIB support

The z/OS Communications Server SNMP agent and subagents support for nonstandard MIB variables is defined in several files shipped with the product. These files are installed into the z/OS UNIX file system in the /usr/lpp/tcpip/samples directory:

- mvstcpi.caps
  This file is the z/OS Communications Server SNMP Capability Statement. It contains the formal SMIv2 definition of the MIBs supported by the SNMP agent and subagents shipped with z/OS Communications Server.
- mvstcpi.mi2
  Contains the formal SMIv2 syntax of the IBM MVS Enterprise-specific MIB extension. This is supported by the TCP/IP subagent.
- mvstcpi.mib
  Contains the formal SMIv1 syntax of the IBM MVS Enterprise-specific MIB extension. This is supported by the TCP/IP subagent.
- mvstn3270.mi2
  Contains the SMIv2 syntax for the IBM MVS Enterprise-specific TN3270 MIB. This is supported by the SNMP TN3270 Telnet subagent.
- saMIB.mib
  Contains the formal SMIv1 syntax for the subagent MIB (saMIB) objects. This is supported by the SNMP agent.
- saMIB.mi2
  Contains the formal SMIv2 syntax for the subagent MIB (saMIB) objects. This is supported by the SNMP agent.
- slapm2.mi2
  Contains the formal SMIv2 syntax for NETWORK-SLAPM2-MIB objects. This is supported by the Nework SLAPM2 subagent (nslapm2).
- rfc1592b.mib
  Contains the SMIv1 syntax for the additional information that expands the implementation of RFC 1592 (Simple Network Management Protocol Distributed Protocol Interface Version 2.0) in z/OS Communications Server. This is supported by the SNMP agent.
- rfc1592b.mi2
  Contains the SMIv2 syntax for the additional information that expands the implementation of RFC 1592 (Simple Network Management Protocol Distributed Protocol Interface Version 2.0) in z/OS Communications Server. This is supported by the SNMP agent.
- ibm3172.mi2
  Contains the SMIv2 syntax for the 3172 Enterprise-specific MIB objects. This is supported by the SNMP agent.
- ibm3172.mib
  Contains the SMIv1 syntax for the 3172 Enterprise-specific MIB objects. This is supported by the SNMP agent.

TCP/IP subagent

The TCP/IP subagent supports SNMP management data from both standard and Enterprise-specific SNMP Management Information Base (MIB) modules. The data defined in MIB modules are called MIB objects. The standard MIB modules are those published by the IETF in RFCs. Some of the Enterprise-
specific MIB objects extend the standard MIBs by providing additional management information. Other Enterprise-specific MIB objects provide management information specific to the z/OS Communications Server TCP/IP stack implementation, such as:

- The ability to perform a remote ping request to provide response time data between two remote hosts.
- Support for TCP/IP stack configuration parameters. The Enterprise-specific MIB defines several MIB objects that correspond to parameters on Profile configuration statements such as IPCONFIG, IPCONFIG6, TCPCONFIG, UDPCONFIG and so on. For some of these MIB objects, an `snmp set` command can be issued to remotely change the configured value.
- Retrieval of IBM 3172 Interconnect Controller data.
- Retrieval of OSA data.
- Retrieval of dynamic VIPA and sysplex distributor data.

Details of the subagent support for both the standard and Enterprise-specific MIB data can be found in the SNMP Agent Capabilities statement, which is installed in the z/OS UNIX file system as file `/usr/lpp/tcpip/samples/mvstcpip.caps`. Most of the Enterprise-specific MIB data mentioned in this section is defined in the IBM MVS TCP/IP Enterprise-specific MIB module. This MIB module is installed in the z/OS UNIX file system directory `/usr/lpp/tcpip/samples` as file `mvstcip.mi2`.

The TCP/IP subagent supports only the following types of IP addresses from the INET-ADDRESS-MIB (RFC 4001):

- unknown - Normally used for local or remote IP addresses of TCP Listeners and UDP endpoints, where the socket has not been bound to a local IP address.
- ipv4 - IPv4 addresses
- ipv6 - IPv6 addresses, except for link-local
- ipv6z - IPv6 link-local addresses, where the zone index value is the SNMP interface index of the associated interface.

### TCP/IP subagent: Management data supported

The following items are the main areas of the TCP/IP stack for which MIB data is supported:

- **IP/ICMP/Route MIB data**
  
  The subagent supports IP/ICMP MIB data from the IP-MIB in RFC 4293, and some additional IP counters from the Enterprise-specific MIB. The subagent supports Route MIB data from the IP-FORWARD-MIB in RFC 4292, and from the TCP/IP Enterprise-specific MIB.

- **Interface MIB data**

  The subagent supports interface (IF) MIB data from the IF-MIB in RFC 2233. The TCP/IP Enterprise-specific MIB defines the following additional MIB data:
  
  - Information from the DEVICE, LINK, and INTERFACE profile statements.
  - Multicast group information per interface.
  - Packet trace parameters per interface
  - `ibmMvsTcpiplntfUp` and `ibmMvsTcpiplntfDown` notifications, which include the name of the interface whose state is changing.

  The TCP/IP stack assigns the interface index values that are used to identify each interface for this data as each interface is defined. The values might not be continuous. For example, the TCP/IP stack reserves some interface index values for potential interfaces that are used with the Shared Memory Communications over Remote Direct Memory Access (SMC-R) function.

  Although the subagent supports interface state change notifications, these notifications are not created for VIPA interfaces (static or dynamic). This is because VIPA interfaces do not change operational state. If they are successfully defined, then they are always active and they cannot be stopped by using the `VARY TCPIP,,STOP` command. This affects the following interface state change notifications:
  
  - The linkup and linkdown notifications from the IF-MIB
The ibmMvsTcpipIntfUp and ibmMvsTcpipIntfDown notifications from the TCP/IP Enterprise-specific MIB

Proprietary status change notifications are still created for dynamic VIPA interfaces. See “SNMP Enterprise-specific trap types” on page 1110 for more information about these notifications.

**• TCP MIB data**

The subagent supports the TCP MIB data from the TCP-MIB in RFC 4022. The TCP global counters in the TCP-MIB reflect both IPv4 and IPv6 processing. The Enterprise-specific MIB augments the standard IPv4-only and version-neutral TCP connection table; provides a TCP Listener table with server MIB data; and provides additional TCP stack counters.

**• UDP MIB data**

The subagent supports the UDP MIB data from the UDP-MIB in RFC 4113. The UDP global counters in the UDP-MIB reflect both IPv4 and IPv6 processing. The Enterprise-specific MIB augments the standard UDP listener table (IPv4-only) and the version-neutral UDP endpoint table, and also provides multicast information.

**• TCP/IP stack configuration data**

The TCP/IP Enterprise-specific MIB defines MIB objects that support the following configuration data:

– Data from Profile configuration statements such as IPCONFIG, IPCONFIG6, SACONFIG, TCPConfigure, and UDPCONFIG
– TCP/IP stack name
– MVS image name
– XCF group name used by the stack when joining the sysplex

**SNMP remote PING**

SNMP remote PING is a function of the TCP/IP subagent that gives an SNMP manager the ability to obtain the round-trip response time for an ICMP echo request message (PING) from an SNMP agent to a destination IP address.

The SNMP remote PING function is a valuable tool in an Enterprise network that provides centralized management services because it gives a third-party (SNMP manager) system the ability to request that a PING operation be performed on a remote system running z/OS. The remote system must be running the SNMP agent and the TCP/IP subagent.

For example, if there are three hosts (A, B, and C) as shown in Figure 5 on page 898, you can obtain the response time between the two remote hosts. In this example, your host is running the SNMP manager function (Host A), Host B is running the SNMP agent and TCP/IP subagent functions, and Host C is some arbitrary remote host. The standard PING function enables Host A to obtain the round-trip response time from A to B and from A to C, but not from B to C. With the SNMP remote PING function on the TCP/IP subagent, Host A can obtain the round-trip response time from B to C.
Figure 5. SNMP remote PING function

With the SNMP remote PING function, you can specify the size of the packet, in bytes, that is sent in the ICMP echo request message and the time period, in seconds, to wait for that ICMP echo request message to return from the requested destination address.

SNMP remote PING format

To send a remote ping command, use the NetView SNMP GET command or the z/OS UNIX snmp get command. Specify `ibmMvsRemPingResponseTime` as the mib_variable on the command. The earlier `ibmMvsRPingResponseTime` MIB object can also be specified on the command but this MIB object supports only IPv4 ping requests and has been deprecated. Both MIB objects are defined in the IBM MVS TCP/IP Enterprise-specific MIB module. The object identifier (OID) of the `ibmMvsRemPingResponseTime` MIB object in ASN.1 notation is 1.3.6.1.4.1.2.6.19.2.2.1.2.1.5.

SNMP remote PING parameters

mib_variable

Specifies one or more MIB variable names to be retrieved. You can specify the names in textual form or ASN.1 notation.
For the remote ping object, a three-part index is required, with each part separated by periods (.), as in the following example:

```
snmp -h host_name get ibmMvsRemPingResponseTime.packet_size.time_out.ip_address
```

**Note:** To find a description of the other parameters, see parameters in “The z/OS UNIX snmp command” on page 871.

The following list describes the get portion of the command, including the three-part index for the remote ping object:

<table>
<thead>
<tr>
<th>Instance</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ibmMvsRemPingResponseTime</td>
<td>Specifies that the remote ping command should be issued.</td>
</tr>
<tr>
<td>packet_size</td>
<td>Specifies the packet size of the ping request.</td>
</tr>
<tr>
<td>time_out</td>
<td>Specifies the timeout value, in seconds, for the ping request.</td>
</tr>
</tbody>
</table>
| ip_address                    | Specifies the IP address of the remote host to which the ping request is directed. The IP address is comprised of the following three parts:  
  1. IP address type from the INET-ADDRESS-MIB. The currently supported types are: 1 - ipv4, 2 - ipv6, 4 - ipv6z (link-local).  
  2. IP address length: 4 - ipv4, 16 - ipv6, 20 - ipv6z.  
  3. IP address, where each octet of the address is converted to decimal and separated from the other octets by a period. |

**SNMP remote PING example**

The example shows how to use the z/OS UNIX `snmp get` command to perform a remote ping to an IPv4 remote host:

```
snmp -h mvs1 -c mvs150 get ibmMvsRemPingResponseTime.2048.5.1.4.9.37.33.175
```

where:

- **host_name** = mvs1
- **community_name** = mvs150
- **mib_variable** = ibmMvsRemPingResponseTime.2048.5.1.4.9.37.33.175

The expected response is as follows:

```
1.3.6.1.4.1.2.6.19.2.2.1.2.1.5.2048.5.1.4.9.37.33.175=33
```

The variable value in the previous example is a positive value (33) indicating a successful response. The variable number, when positive, is the round-trip response time, in milliseconds, from the SNMP agent host system to the requested destination IP address. The following example shows how to use the z/OS UNIX `snmp get` command to perform a remote ping to IPv6 remote host 2001:0DB8::1:

```
snmp -h mvs1 -c mvs150 get ibmMvsRemPingResponseTime.2048.5.1.4.9.37.33.175
```
The expected response is as follows:

```
1.3.6.1.4.1.2.6.19.2.2.1.2.1.5.2048.5.2.16.254.192.0.0.0.0.0.0.0.0.0.0.0.0.0.0.0.1 = 33
```

The variable value can be a negative integer indicating that a failure has occurred. A negative integer is a result of the SNMP agent or TCP/IP subagent detecting either an internal error, an incorrect MIB instance format, an ICMP echo request timeout, an incorrect packet size value, an incorrect timeout value or an incorrect destination IP address. See Table 17 on page 900 for a description of what the variable value can represent.

**Table 17. SNMP Get command responses for variable value**

<table>
<thead>
<tr>
<th>Returned value</th>
<th>Description</th>
<th>Condition</th>
<th>Valid input</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;0 (milliseconds)</td>
<td>Round-Trip Response Time</td>
<td>Success</td>
<td>N/A</td>
</tr>
<tr>
<td>-1</td>
<td>Internal error</td>
<td>Failure</td>
<td>N/A</td>
</tr>
<tr>
<td>-2</td>
<td>ICMP echo request timed out</td>
<td>Failure</td>
<td>N/A</td>
</tr>
<tr>
<td>-3</td>
<td>Destination was IPv6 but subagent stack not IPv6 enabled</td>
<td>Failure</td>
<td>N/A</td>
</tr>
<tr>
<td>-4</td>
<td>Incorrect packet size</td>
<td>Failure</td>
<td>0, 16–4096 (bytes)</td>
</tr>
<tr>
<td>-5</td>
<td>Incorrect timeout</td>
<td>Failure</td>
<td>0, 3–15 (seconds)</td>
</tr>
<tr>
<td>-6</td>
<td>Unknown destination IP address</td>
<td>Failure</td>
<td>IP address types of 1, 2, or 4; IP address lengths of 4, 16, or 20; fully-qualified IP address.</td>
</tr>
<tr>
<td>-7</td>
<td>Incorrect MIB instance format</td>
<td>Failure</td>
<td>Packet size.timeout.IP address.type.length.address</td>
</tr>
</tbody>
</table>

**Note:** The packet size and the timeout in the *mib_variable* value part of the *snmp get* command can have a value of 0, which indicates that the default values are 256 bytes and 10 seconds, respectively.

**Interface layering**

In the SNMP framework, the most fundamental MIB table is the interfaces table. The TCP/IP subagent supports interface MIB data from the IF-MIB from RFC 2233. For more information, see Appendix B, “SNMP capability statement,” on page 919 for a list of supported IF-MIB objects. RFC 2233 provides the following basic interface tables:

- The ifTable and ifXTable
- The ifStackTable, which shows how interfaces are layered

The TCP/IP subagent interface layering implementation is explained by the following example, in which DEVICE, LINK, and INTERFACE profile statements are specified in the TCP/IP profile data set. This example defines only OSA-Express QDIO Ethernet interfaces.
The previous example code would create the interface entries described in Table 18 on page 901:

<table>
<thead>
<tr>
<th>ifIndex</th>
<th>ifType</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>53 (propVirtual)</td>
<td>LOOPBACK device</td>
</tr>
<tr>
<td>2</td>
<td>24 (softwareLOOPBACK)</td>
<td>LOOPBACK link</td>
</tr>
<tr>
<td>3</td>
<td>24 (softwareLOOPBACK)</td>
<td>LOOPBACK6 interface</td>
</tr>
<tr>
<td>4</td>
<td>53 (propVirtual)</td>
<td>MPCIPA device OSA4C</td>
</tr>
<tr>
<td>5</td>
<td>6 (ethernetCsmacd)</td>
<td>IPAQENET link LV4OSA4C</td>
</tr>
<tr>
<td>6</td>
<td>6 (ethernetCsmacd)</td>
<td>IPAQENET6 interface LV6OSA4C</td>
</tr>
<tr>
<td>7</td>
<td>53 (propVirtual)</td>
<td>OSA-Express port interface OSA8D</td>
</tr>
<tr>
<td>8</td>
<td>6 (ethernetCsmacd)</td>
<td>IPAQENET interface LV4OSA8D</td>
</tr>
<tr>
<td>9</td>
<td>6 (ethernetCsmacd)</td>
<td>IPAQENET6 interface LV6OSA8D</td>
</tr>
</tbody>
</table>

The ifType values indicate the interface type and are assigned by the Internet Assigned Numbers Authority (IANA). In z/OS Communications Server, a DEVICE profile statement has a corresponding entry in the IF-MIB interface tables. The lower-layer interfaces for the DEVICE (defined by LINK statements) are also defined as interface entries, stacked below the device entry.

For INTERFACE profile statements (other than IPAQENET or IPAQENET6), only an interface entry is created in the interface tables. There is no higher-layer device entry associated with the interface.

For OSA-Express QDIO Ethernet interfaces (IPAQENET and IPAQENET6), the associated OSA-Express port is always the highest-layer entry in the interface tables. The OSA-Express port entry is either created as the result of a DEVICE profile statement or is dynamically created when only INTERFACE profile statements are used to define IPAQENET or IPAQENET6 interfaces. For dynamically created OSA-Express port entries, the ifName MIB object is set to the PORTNAME parameter value from the INTERFACE profile statements. All of the interfaces for the same OSA-Express port are stacked below the same OSA-Express port entry.

The ifTable and ifXTable counters for each device or OSA-Express port entry reflect the sum of the counters for the underlying links or interfaces. See the IF-MIB table for a detailed explanation of how the ifStackTable is used to display interface relationships.

Table 18 on page 901 shows that a LOOPBACK device entry and link entry were created in the IF-MIB tables, even though the interfaces were not explicitly defined. TCP/IP automatically generated these entries. Because the TCP/IP stack was enabled for IPv6 support, a LOOPBACK6 interface entry was also automatically generated.

When an ATM DEVICE is defined, two subordinate interface entries are created below it, AAL5 and ATM. AAL5 and ATM are UNI-defined layers that exist physically in an ATM port. The ifEntry and ifXEntry counters reflect traffic through the port. If the ATM DEVICE is configured for LAN emulation mode, two additional subordinate layers might be created after the AAL5 and ATM layers. These additional layers
represent emulated link interfaces. The counter data for all of these ATM subordinate layers is obtained directly from the Open Systems Adapter/Support Facility (OSA/SF). See “ATM-specific management data” on page 904 for more information.

**IBM 3172 Enterprise-specific MIB variables**

The IBM 3172 interconnect controller maintains a set of Enterprise-specific MIB variables. The SNMP agent can act as a proxy agent to retrieve these variables from the 3172 device. You can issue either a GET or GETNext command to retrieve the 3172 variables. The 3172 variable names can be included in a GET or GETNext command that also contains standard MIB variable names. See Appendix C, “Management Information Base (MIB) objects,” on page 941 for a description of the 3172 Enterprise-specific MIB variables.

The 3172 variables are referenced by a single element instance identifier, for example, (.1, .2, .3). This identifier is the interface index, ifIndex, assigned to the LAN channel system (LCS) device and links by TCP/IP. TCP/IP assigns ifIndex values to its devices and links based on the order in which they are defined to TCP/IP. The following example shows the profile statements and the ifIndex values that would be assigned:

<table>
<thead>
<tr>
<th>DEVICE</th>
<th>LCS1</th>
<th>LCS</th>
<th>120</th>
<th>NETMAN</th>
<th>ifIndex</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEVICE</td>
<td>CTCD00</td>
<td>CTC</td>
<td>D00</td>
<td></td>
<td>3</td>
</tr>
<tr>
<td>LINK</td>
<td>CTC1</td>
<td>CTC</td>
<td>1</td>
<td>CTCD00</td>
<td>4</td>
</tr>
<tr>
<td>LINK</td>
<td>TR1</td>
<td>IBMTR</td>
<td>LCS1</td>
<td></td>
<td>6</td>
</tr>
</tbody>
</table>

For objects which pertain to the entire 3172, the instance identifier is the ifIndex of the LCS device. In the example above, this is an ifIndex value of 3.

For counter objects related to a specific link interface, the instance identifier is the ifIndex value of that link. In the example above, this is an ifIndex value of 6.

If a GET command is issued for a counter object using an instance identifier of a link that does not support the 3172 objects, a response of NO SUCH INSTANCE is returned from the SNMP agent.

If a GETNext command is issued, the links that do not support the 3172 objects are skipped and the NEXT link that does support the 3172 objects is returned.

If an error occurs accessing a 3172 variable from the 3172 (either an error return code is received from the 3172 device or no response is received from the 3172 device), an error code of GEN ERROR is returned to the client in the SNMP response PDU for that variable. An error message containing more specific information about the error that occurred is written to the syslog daemon if SNMP subagent tracing has been activated by the ITRACE profile statement. Several of the potential error conditions reference the 3172 MIB variable by the 3172 attribute index. See Appendix D, "IBM 3172 attribute index," on page 1107 for a list of the 3172 attribute indices and the corresponding MIB variable names.

**OSA feature management data**

The TCP/IP subagent supports management data for following types of OSA features:

- OSA-2 ATM
- OSA-Express Gigabit
- OSA-Express fast Ethernet (QDIO and non-QDIO modes)
- OSA-Express ATM (LAN emulation mode only)
- OSA-Express2 or later Gigabit

The TCP/IP subagent requires the OSA/SF product to retrieve the management data from the OSA features. The OSA product also provides an SNMP subagent, the OSA-Express Direct subagent, that supports management data for OSA-Express features and OSA-Express2 or later features. The MVS-started procedure name of this subagent is IOBSNMP. You should use the OSA-Express Direct subagent to obtain OSA management data, because it communicates directly with the OSA features and does not require the OSA/SF and IOASNMP applications. If you are using the TCP/IP subagent’s OSA management
data support and decide to switch to the OSA-Express Direct subagent, you no longer need to start the
OSA/SF address space or the OSA IOASNMP application. For a complete understanding of the
management data provided by the OSA-Express Direct subagent, see the z Systems

For the TCP/IP subagent OSA adapter support, some of the management data is defined in standard RFCs
and the remaining data is defined in the IBM MVS TCP/IP Enterprise-specific MIB. See “SNMP MIB
support” on page 895 for information on locating the IBM MVS TCP/IP Enterprise-specific MIB. Some of
the management data values are provided by TCP/IP and some by OSA/SF.

See Step 4: Configure the Open Systems Adapter (OSA) support in the z/OS Communications Server: IP
Configuration Guide for information on configuring the SNMP subagent to communicate with OSA/SF. See
Appendix G, “Related protocol specifications,” on page 1117 for information about RFCs.

The following MIB tables describe the supported OSA feature management data. The
osaexpChannelTable, osaexpPerfTable, and osaexpEthPortTable, which are defined in the IBM MVS
Enterprise-specific MIB, have been deprecated because the same data is supported by the OSA-Express
Direct subagent. The MIB data supported by the OSA-Express Direct subagent is defined in the OSA
Enterprise-specific MIB module, IBM-OSA-MIB. See the z Systems: Open Systems Adapter-Express
Customer’s Guide and Reference for instructions about obtaining a copy of the IBM-OSA-MIB module.

• osaexpChannelTable
An entry in this table is created for every OSA-Express Ethernet or ATM port that is in use by the TCP/IP
stack. The table contains descriptive and performance data. The values are retrieved from OSA/SF. This
table is indexed by the ifIndex of the device or OSA-Express port interface and is defined in the IBM
MVS Enterprise-specific MIB.

• osaexpPerfTable
An entry in this table is created for every OSA-Express Ethernet or ATM port that is in use by the TCP/IP
stack, one entry per LPAR to which the adapter is defined. The table contains performance data per
LPAR’s use of the adapter and the values are retrieved from OSA/SF. This table is indexed by the ifIndex
of the device or OSA-Express port interface concatenated with the decimal LPAR number. This table is
defined in the IBM MVS Enterprise-specific MIB.

• osaexpEthPortTable
An entry in this table is created for every OSA-Express Ethernet port that is in use by the TCP/IP stack.
The table contains descriptive and performance data related to the adapter’s physical port and the
values are retrieved from OSA/SF. This table is indexed by the ifIndex of the device or OSA-Express port
interface and is defined in the IBM MVS Enterprise-specific MIB.

• osaexpEthSnaTable
An entry in this table is created for every OSA-Express Ethernet feature that is configured for SNA and
defined to TCP/IP by LCS DEVICE and Ethernet LINK profile statements. The values are retrieved from
OSA/SF. This table is indexed by the ifIndex of the device interface and is defined in the IBM MVS
Enterprise-specific MIB.

• Interface Table Data
An entry is created in the ifTable and ifXTable tables for the following statements:
  – Every DEVICE and LINK profile statement that represents an OSA-Express feature.
  – Every INTERFACE profile statement that represents an OSA-Express feature. If only INTERFACE
    profile statements are used to define the interfaces, then an additional OSA-Express port entry is
dynamically created in the tables.

The ifTable and ifXTable data for OSA-Express interfaces that are used by TCP/IP for data transport is
retrieved from TCP/IP. Interface Table Data is defined in the IF-MIB from RFC 2233.

• dot3StatsTable
An entry in this Ethernet table is created for every OSA-Express Ethernet port that is in use by the
TCP/IP stack. The values are retrieved from OSA/SF. This table is indexed by the ifIndex of the device or
OSA-Express port interface and is defined in the EtherLike-MIB (RFC 2665).
The OSA-Express Direct SNMP subagent can also support the dot3StatsTable if the OSA feature LIC
level that you are using supports it. In that case, the OSA-Express Direct SNMP subagent takes over
ownership of the dot3StatsTable MIB data. If the OSA-Express Direct subagent is not active, or was
active and then terminated, the TCP/IP subagent takes over the ownership of the data. The movement
of ownership of this MIB data between the TCP/IP subagent and the OSA-Express Direct subagent
should be transparent and SNMP requests for the data continue to be processed. For more information
about using the OSA-Express Direct SNMP subagent, see the z Systems: Open Systems Adapter-

ATM-specific management data
Some OSA-Express ATM management data is represented in the osaexpChannelTable and the
osaexpPerfTable. Outside of the Interface Table Data, the rest of the OSA-Express ATM data and all of the
OSA-2 ATM data are represented in the following tables.

- **osasfChannelTable**
  An entry in this table is created for every OSA-2 ATM DEVICE profile statement. Each ATM DEVICE
  statement represents one ATM adapter card externally through SNMP. This table is indexed by the
  ifIndex of the ATM DEVICE and the values are retrieved from OSA/SF. This table is defined in the IBM
  MVS Enterprise-specific MIB.

- **osasfPvcTable**
  An entry in this table is created for every PVC defined for an OSA-Express or OSA-2 ATM Port. Indexing
  is by the ifIndex of the AAL5 layer and pvcName. The values are retrieved from OSA/SF. Each port has a
  limit of 256 PVCs. This table is defined in the IBM MVS Enterprise-specific MIB.

- **osasfPortTable**
  An entry in this table is created for every OSA-Express or OSA-2 ATM DEVICE interface. Indexing is by
  the ifIndex of the AAL5 interface layer. This table is defined in the IBM MVS Enterprise-specific MIB.

- **ibmMvsAtmSnaLeTable**
  One entry in this table is created for every OSA-Express or OSA-2 ATM LAN Emulation interface where
  the ATM port is configured for SNA and LAN Emulation mode. Indexing is by the ifIndex of the ATM LAN
  Emulation interface. This table is defined in the IBM MVS Enterprise-specific MIB.

- **ibmMvsAtmLecConfigTable**
  One entry in this table is created for every OSA-Express or OSA-2 ATM LAN Emulation interface, where
  the ATM port is configured for LAN Emulation mode. This table is modeled after the LEC Config Table
  from the LAN Emulation MIB defined by the ATM Forum. Indexing is by the ifIndex of the ATM LAN
  Emulation interface. This table is defined in the IBM MVS Enterprise-specific MIB.

- **ibmMvsAtmLecStatusTable**
  One entry in this table is created for every OSA-Express or OSA-2 ATM LAN Emulation interface, where
  the ATM port is configured for LAN Emulation mode. This table is modeled after the LEC Status Table
  from the LAN Emulation MIB defined by the ATM Forum. Indexing is by the ifIndex of the ATM LAN
  Emulation interface. This table is defined in the IBM MVS Enterprise-specific MIB.

- **ibmMvsAtmLecStatisticsTable**
  One entry in this table is created for every OSA-Express or OSA-2 ATM LAN Emulation interface, where
  the ATM port is configured for LAN Emulation mode. This table is modeled after the LEC Statistics Table
  from the LAN Emulation MIB defined by the ATM Forum. Indexing is by the ifIndex of the ATM LAN
  Emulation interface. This table is defined in the IBM MVS Enterprise-specific MIB.

- **ibmMvsAtmLecServerTable**
  One entry in this table is created for every OSA-Express or OSA-2 ATM LAN emulation interface, where
  the ATM port is configured for LAN emulation mode. This table is modeled after the LEC server table
  from the LAN emulation MIB defined by the ATM Forum. Indexing is by the ifIndex of the ATM LAN
  emulation interface. This table is defined in the IBM MVS Enterprise-specific MIB.

- **ibmMvsAtmLecMacAddressTable**
One entry in this table is created for every OSA-Express or OSA-2 ATM LAN emulation interface, where the ATM port is configured for LAN emulation mode. This table is modeled after the LEC Mac Address Table from the LAN emulation MIB defined by the ATM forum. Indexing is by the ifIndex of the ATM LAN emulation interface. This table is defined in the IBM MVS Enterprise-specific MIB.

**Interface Table Data**

IfTable and ifXTable data are retrieved from OSA/SF for the AAL5, ATM, and LAN emulation interfaces subordinate to an ATM DEVICE interface. IfTable and ifXTable data for ATM DEVICE and LINK interfaces used by TCP/IP for data transport is retrieved from TCP/IP. Interface table data is from the ifMIB - RFC 2233.

**atmInterfaceConfTable**

One entry in this table is created for every ATM LINK interface. It is, however, indexed by the ifIndex of the AAL5 interface entry. This table is defined in the atmMIB - RFC 1695 (*Definitions of Managed Objects for ATM Management Version 8.0 Using SMIv2*).

**ipoaLisTable**

An entry in this table is created for every ATMLIS statement whose LIS name is referenced on an ATM LINK statement. The ipoaLisTable is from the ipoaMIB - RFC 2320 (*Definitions of Managed Objects for Classical IP and ARP over ATM Using SMIv2*).

**ipoaLisIfMappingTable**

An entry in this table is created for every ATM LINK statement, which includes an LIS name. The ipoaLisIfMappingTable is from the ipoaMIB - RFC 2320 (*Definitions of Managed Objects for Classical IP and ARP over ATM Using SMIv2*).

**ipoaArpClientTable**

An entry in this table is created for every local IP address that is assigned to an ATM interface (for every LINK ATM statement on a DEVICE ATM). The ipoaArpClientTable is from the ipoaMIB - RFC 2320 (*Definitions of Managed Objects for Classical IP and ARP over ATM Using SMIv2*).

**ipoaArpRemoteServerTable**

An entry in this table is created for every TCP/IP link to an ATMARP remote server. The ipoaArpRemoteServerTable is from the ipoaMIB - RFC 2320 (*Definitions of Managed Objects for Classical IP and ARP over ATM Using SMIv2*).

**ipoaVcTable**

An entry in this table is created for each ATM VC connection. The ipoaVcTable is from the ipoaMIB - RFC 2320 (*Definitions of Managed Objects for Classical IP and ARP over ATM Using SMIv2*).

**ipoaConfigPvcTable**

An entry in this table is created for each ATM VC connection, which is a permanent VC. The ipoaConfigPvcTable is from the ipoaMIB - RFC 2320 (*Definitions of Managed Objects for Classical IP and ARP over ATM Using SMIv2*).

**ATM port IP address assignment**

SNMP provides a method for assigning an IP address to an OSA-2 ATM port. The ATM port reports the IP address, atmIfMyIpNmAddress, as specified by the ATM Forum User-Network Interface (UNI) specification. UNI defines an Interim Local Management Interface (ILMI) layer that provides an MIB that can be accessed directly over an ATM network by way of an SNMP request.

To specify an IP address for an ATM port, use the `snmp set` command against the ibmMvsAtmOsasfPortIpAddress MIB object (this MIB object is defined in the IBM MVS Enterprise-specific MIB). Once an IP address is set, the ATM port remembers the IP address and it does not have to be reset. Make sure you issue the `snmp set` command on the MVS image where the managing OSA/SF for the ATM device is running. For information about the `snmp set` command, see “*The z/OS UNIX snmp command*” on page 871.
ATM trap notification from OSA/SF

Asynchronous events are forwarded from OSA/SF to the SNMP TCP/IP subagents. These events are converted to traps and sent to the snmp agent associated with the TCP/IP instance receiving the notification, for forwarding. The traps supported for ATM Management are:

- **Permanent Virtual Circuit (PVC) creation**—ibmMvsAtmOsasfAtmPvcCreate Trap
  
  This trap is supported only for ATM OSA-2 adapters. It is not supported for OSA-Express ATM155 adapters. An ibmMvsAtmOsasfAtmPvcCreate notification is generated when OSA/SF sends an asynchronous notification to a subagent that a PVC was created for a given OSA-2 ATM Port.

- **Permanent Virtual Circuit (PVC) deletion**—ibmMvsAtmOsasfAtmPvcDelete Trap
  
  This trap is supported only for ATM OSA-2 adapters. It is not supported for OSA-Express ATM155 adapters. An ibmMvsAtmOsasfAtmPvcDelete notification is generated when a PVC is deleted.

**Note:** The TCP/IP subagent discards any notification received for an ATM port that is not properly defined through an ATM DEVICE statement.

Dynamic VIPA and sysplex distributor management data

The TCP/IP subagent supports dynamic VIPA (DVIPA) and sysplex distributor management data from the IBM MVS TCP/IP Enterprise-specific MIB. See Appendix C, “Management Information Base (MIB) objects,” on page 941 for a list of all the DVIPA MIB objects. See “SNMP Enterprise-specific trap types” on page 1110 for a description of all the supported traps. The following describe new MIB tables:

**ibmMvsDVIPATable**

An entry is created in this table for each dynamic VIPA defined to a TCP/IP stack.

**ibmMvsDVIPARouteConfTable**

An entry is created in this table for every VIPAROUTE profile statement.

**ibmMvsDVIPARangeConfTable**

An entry is created in this table for every IPv4 dynamic VIPA address range defined by the VIPARANGE profile statement. This table cannot support IPv6 entries as it uses an address mask as part of the index value, and address masks do not apply to IPv6. Because of this, support for this table has been deprecated. This means the data in the table will continue to be supported but management applications should not implement new support for this table. Instead management applications should support the ibmMvsDVIPARangeConfigTable.

**ibmMvsDVIPARangeConfigTable**

An entry is created in this table for every IPv4 and IPv6 dynamic VIPA address range defined by the VIPARANGE profile statement.

**ibmMvsDVIPADistConfTable**

An entry is created in this table for every dynamic VIPA and port for which connection requests are to be distributed to other TCP/IP stacks as defined by a VIPADISTRIBUTE profile statement.

**ibmMvsDVIPAConnRoutingTable**

Each entry in this table represents a dynamic VIPA TCP connection. Entries will be added to the table only for dynamic VIPA connections for which MOVEABLE IMMEDIATE or NONDISRUPTIVE was specific in the TCP/IP profile. On a sysplex distributor routing stack, there is an entry in this table for every connection being routed through the distributor. On a stack taking over a dynamic VIPA, there is an entry in this table for every connection to the dynamic VIPA. On a sysplex distributor target stack or a stack that is in the process of giving up a dynamic VIPA, there is an entry in this table for every connection for which the stack is an endpoint.

**ibmMvsDVIPADistPortTable**

An entry is created in this table for every target stack per distributed dynamic VIPA IP address and port. This table is supported only by stacks that are distributing connection requests as part of the sysplex distributor function. This table is not supported by stacks that are targets only of the sysplex distributor function.

There are also scalar MIB objects to support the sysplex distributor Service Manager function and to control generation of dynamic VIPA traps.
OMPROUTE subagent

The OMPROUTE subagent provides an alternative to DISPLAY commands for displaying Open Shortest Path First (OSPF) protocol configuration and state information. The subagent implements the Management Information Base (MIB) variables defined in RFC 1850 (OSPF Version 2 Management Information Base).

Network SLAPM2 subagent

The Network SLAPM2 subagent provides support for the Network Service Level Agreement Performance Monitor MIB (NETWORK-SLAPM2-MIB).

This MIB provides information about defined policy rules, and performance statistics for TCP and UDP connections that map to active policies. It can monitor various types of policy rules for TCP connections. When monitoring entry is created, a set of gauges and counters related to the policy rule being monitored are maintained. The monitor table entries can be configured to send not ok SNMP traps when a specified threshold related to the gauges goes above its high threshold, and then an ok trap is sent when it goes below its low threshold. SNMP traps can be configured when a policy rule monitored entry is deleted or a policy rule static entry is deleted. See the Network SLAPM2 subagent section of the z/OS Communications Server: IP Configuration Guide for more information about the Network SLAPM2-MIB subagent.

TN3270 Telnet subagent

The TN3270 Telnet subagent provides support for the TN3270 Server transaction management data defined in the IBM MVS Enterprise-specific TN3270 MIB. The IBM MVS TN3270 Enterprise-specific MIB is installed in the z/OS UNIX file system as file /usr/lpp/tcpip/samples/mvstn3270.mi2. See Appendix C, “Management Information Base (MIB) objects,” on page 941 for a list of all the TN3270 Server SNMP MIB objects defined in this MIB.

The following describe the new MIB tables:

- **ibmMvsTN3270ConnTable**
  An entry is created in this table for each TN3270 connection being monitored. Each entry contains transaction data for a specific connection.

- **ibmMvsTN3270MonGroupTable**
  An entry is created in this table for every Monitor Group defined by a TN3270 Server MONITORGROUP profile statement.

For more details about the data that is defined in the IBM MVS Enterprise-specific TN3270 MIB, and about how to cause connections to be monitored, see the information about accessing remote hosts using Telnet in the z/OS Communications Server: IP Configuration Guide.

The trap forwarder daemon (TRAPFWD)

The trap forwarder daemon receives a trap on a specified port and forwards it to multiple ports on the same host and on different hosts. This allows multiple SNMP managers at one IP address to be able to receive all of the traps sent to one port.

When traps are forwarded, the originating IP address on the forwarded datagram will be that of the trap forwarder daemon, not the originating agent. SNMPv1 format traps are not typically a problem; the trap PDU contains the IP address of the originating agent. However, SNMPv2 format traps do not contain the agent’s IP address. For SNMPv2 format traps, the trap forwarder daemon can be configured to append the originating agent’s IP address to the datagram that gets forwarded. The receiving management application must have logic to obtain the agent’s IP address from the end of the datagram. The default is to pass the datagram that was received without adding anything to it.
For the trap forwarder daemon to forward the datagram with the agent address, the ADD_RECV_FROM_INFO option must be coded on the destination address line in the TRAPFWD.CONF configuration file. See the z/OS Communications Server: IP Configuration Reference for statement syntax. The receiving management application must parse the received datagram, along with the appended agent address. The address field contains the originating agent address, followed by the length of the address. By examining the last four bytes of the received datagram, the management application can determine the length of the agent address.
Chapter 7. SNTP daemon: Simple Network Time Protocol

SNTPD is a TCP/IP daemon that is used to synchronize time between a client and a server. SNTP (Simple Network Time Protocol) is a protocol for synchronizing clocks across a WAN or a LAN through a specific formatted message.

An External Time Reference (ETR) named stratum 0, is chosen as the highest timer reference. A stratum 1 server is a server attached to a stratum 0 timer. For example, the z/OS sysplex timer could be a stratum 0 timer and z/OS Communications Server would be a stratum 1 server. A client attached to stratum 1 server can also be a stratum 2 server, and so on. SNTP uses UDP packets for data transfer with the well-known port number 123. RFC 2030 (Mills 1996) describes SNTP. You can start SNTPD from the z/OS UNIX shell or as a started procedure. Each of these methods is described in the z/OS Communications Server: IP Configuration Reference.

The z/OS UNIX sntpd command: Simple Network Time Protocol

The z/OS UNIX sntpd command is used to start the sntp daemon.

Note: TCP/IP must be started prior to starting SNTPD.

Format:
```
sntpd -d -df pathname -pf pathname -b nnnnn -m nnnnn -s n
```

Parameters:

- `-?` Specifies the command help.

- `-d` Enables debugging. Debug messages go to the syslog daemon.

- `-df pathname` Enables debugging. Debug messages go to the specified file location. For example:
  ```
  -df /var/sntpd.debug
  ```

- `-pf pathname` z/OS UNIX file system path for the pid file. For example:
  ```
  -pf /var
  ```

- `-b nnnnn` Act in broadcast mode. Send local broadcasts on all interfaces every `nnnnn` seconds. Valid values are in the range `1 – 16 284`. Listen for requests and respond with unicast replies.

- `-m nnnnn` Act in multicast mode. Send multicast updates (TTL = 1) on all interfaces every `nnnnn` seconds. Valid values are in the range `1 – 16 284`. Listen for requests and respond with unicast replies.

- `-s n` Use `n` as the stratum level in all replies sent by the server. Valid values for `n` are in the range `1 – 15`. The stratum level indicates the relative accuracy of the local clock compared to the clocks of other SNTP servers in the network. One is most accurate. Fifteen is least accurate.
If -s is not specified or an invalid value is specified, the default stratum level will be 1.

**Note:** The SNTP server always responds to client requests (unicast mode) whether the -b, -m, or both start options are specified.

**Examples:**

Sample SNTPD debug output

```plaintext
Tue Apr  2 15:26:14 2002 Writing PID to file /etc/sntpd.pid

```
Chapter 8. Browsing and searching syslog daemon files and archives

You can use the syslogd browse and search tool that is generally referred to as the syslogd browser to browse and search syslog daemon files and archives. See the tutorial and help panels of the syslogd browser for full and detailed information on its use.

**Prerequisite:** See syslogd information in z/OS Communications Server: IP Configuration Reference for details about preparing your TSO/ISPF environment for using the syslogd browser.

### Syslogd browser

The syslogd browser is a TSO/ISPF application that you can use to search and browse the following syslogd message locations:

- The active UNIX files that syslogd currently is writing to.
- Syslogd MVS archive data sets that have been created with the syslogd archival function. See syslogd information in z/OS Communications Server: IP Configuration Reference for details about enabling the syslogd archival function.

Input to the syslogd browser is the name of a syslogd configuration file or data set.

**Rules:**

- You must use the syslogd browser on a z/OS system that has access to the active syslogd UNIX files as well as the syslogd archive data sets.
- If UNIX file systems and MVS data sets are accessible from all logical partitions (LPARs) in a z/OS sysplex, you can use the syslogd browser on any of those LPARs to access the syslogd data on any other LPAR in the z/OS sysplex; otherwise, you must use the syslogd browser on the individual LPARs to view syslogd data from each of those LPARs.
- The TSO user ID that is using the syslogd browser must have the permissions that are required to read the configuration file, access the log files, and access the archive data sets.

### Starting the syslogd browser

You are able to browse syslog daemon files and archives with the syslogd browser.

To start the syslogd browser, do the following steps:

1. Start the syslogd browser from ISPF in the way that you set up. See syslogd in z/OS Communications Server: IP Configuration Reference for more information.

2. **Optional:** Enter values for the following syslogd browser options.

   **Tip:** You can change the values if you do not want to use the default values.

   - **Recall migrated data sets**
   - **Maximum hits to display**
   - **Maximum file archives**
   - **Display start date/time**
   - **Display active files only**

For more information about syslogd browser options, see “Syslogd browser start panel option descriptions” on page 912.
3. Enter the file or data set name of syslogd configuration, or select one from the list of the configuration files or data sets that you used.

The default location for the syslogd configuration is `/etc/syslogd.conf`. You can specify a different file name or MVS data set to use instead. The last 10 configuration files or data set names are saved. You can reuse them by selecting them with an S line command from the list of the configuration files or data sets that you used.

**Result:** When you enter or select a file or data set name, the syslogd browser reads the specified syslogd configuration and collects information about active UNIX files and available archives. For large syslogd configurations, this process might take a few seconds.

4. **Optional:** You can use line commands on each recently used syslogd configuration file or data set. For more information about line commands, see “Syslogd browser start panel line commands” on page 913.

5. Press ENTER to continue or the END PF key to exit without a selection.

**Example:**

When you start the browser, you can change some options and select a syslogd configuration file or data set as shown in the following example.

```
*------------------------- z/OS CS Syslogd Browser ----------- Row 1 to 7 of 7
Command ===>                                                  Scroll ===> PAGE
Enter syslogd browser options
Recall migrated data sets ==> YES    (Yes/No) Recall data sets or not
Maximum hits to display ==> 200    (1-99999) Search results to display
Maximum file archives ==> 30     (0-400) Days to look for file archives
Display start date/time ==> YES    (Yes/No) Retrieve start date/time
Display active files only ==> NO     (Yes/No) Active files only, no archives

Enter file or data set name of syslogd configuration, or select one from below:
File/DS Name ==> 'user1.tcpcs.tcParms(syslogt)'

Press ENTER to continue or the END PF key to exit without a selection
Line commands: S Select, R Remove from list, B Browse content, E Edit content

Cmd Recently used syslogd configuration file or data set name
--- --------------------------------------------------------------------------
'user1.tcpcs.tcParms(syslogt)'
'user1.tcpcs.tcParms(syslogn)'
'user1.tcpcs.tcParms(syslogt)'
tcps.tcParms(test)
tcps.tcParms(syslogt)
/etc/syslog.test
/etc/syslog.alfred.conf

************************************************************************************ Bottom of data ************************************************************************************
```

**Syslogd browser start panel option descriptions**

You can use the following syslogd browser options to browse syslog daemon files and archives.

**Recall migrated data sets**

Configures the syslogd browser to allocate MVS data sets that are currently migrated to Level 1 or Level 2. The value YES enables the syslogd browser to initiate a recall when such data sets are being accessed. The value NO makes such migrated data sets unavailable to the browser. The default value is NO.

**Maximum hits to display**

Sets an upper limit for how many hits you want displayed as the result of a search operation. You can change this value on the search panel itself. Valid values are in the range 1 - 99999. The default value is 200.

**Maximum file archives**

The syslogd browser supports accessing UNIX file names that include percent signs (%). %d indicates a 2-digit day, %m indicates a 2-digit month, %y indicates a 2-digit year, and %Y indicates a 4-digit year. When such file names are in use, you are likely to have some form of automation that sends a
SIGHUP signal to syslogd immediately after midnight. The signal causes syslogd to close the file that was created yesterday and create a new file with today's date. The syslogd browser supports locating such files as long as they stay in the directory that they originally were created in. If your automation moves them to another location, the syslogd browser does not have enough information available to determine their location.

Use this option to set an upper limit for how many previous days archive files are to be searched. Valid values are in the range 0 - 99. If you do not use percent signs (%) in your syslogd file names, then set this option to 0. The default value is 30 days.

**Display start date/time**
Determines whether the syslogd browser retrieves the start date and time of each UNIX file and MVS data set. If the start date and time is retrieved, it is shown in the overview panels for each of the files and data sets that are available. For best usability, specify YES for this option. If your syslogd configuration is large (many UNIX file destinations) and you keep many data-set archive generations available, you can set this option to NO to eliminate the overhead of opening and reading the first message in each of these files and data sets to retrieve the starting date and time.

**Display active files only**
Set this option to NO if you intend to browse or search only in the currently active z/OS UNIX files. If you select NO, archive file or data set information is not retrieved. If your syslogd configuration is large (has many UNIX file destinations) and you keep many data-set archive generations available, you can set this option to NO to save the overhead of collecting information about the archives.

**Syslogd browser start panel line commands**
You can use the following line commands on each recently used syslogd configuration file or data set.

- **S - Select**
  Selects the syslogd configuration file or data set for processing.

- **R - Remove from list**
  Removes the syslogd configuration file or data set from the list.

- **B - Browse content**
  Displays the syslogd configuration file or data set in a browser window.

- **E - Edit content**
  Lets you edit the content of the syslogd configuration file or data set.

**Browsing syslogd files and archives**
After you start the syslogd browser, you can browse syslogd files and archives in the panel that displays the list of active UNIX files that syslogd is writing to.

Perform the following steps to list all syslogd rules that have been configured with a UNIX file name destination:

1. Press Enter in the panel that you start in “Starting the syslogd browser” on page 911.
2. **Optional:** Select one of the following primary options:
   
   **Tip:** You can choose to work with the list of files without using these options.
   
   - 1 Change current syslogd configuration file and/or options
   - 2 Guide me to a possible syslogd destination
   - 3 Clear guide-me hits (indicated by ==> in the Cmd column)
   - 4 Search across all active syslogd files

For detailed information about the primary options, see “Syslogd browser display panel option descriptions” on page 914.
3. **Optional:** You can use line commands on each destination entry that was found in the syslogd configuration. For more information about line commands, see "Syslogd browser display panel line commands" on page 915.

4. Press ENTER to select an entry or the END PF key to exit the syslogd browser

**Example:**

The following example lists all syslogd rules that have been configured with a UNIX file name destination. Any syslogd rules that use /dev destinations (/dev/console, /dev/operlog, and so on), user IDs, remote syslogd servers, or AF_UNIX named pipes are not included in this list.

</table>
```

**Syslogd browser display panel option descriptions**

The following primary options are available for you to use.

1. Use this option to change the current syslogd configuration. You will be returned to the initial options and syslogd configuration data panel. You can use this option when you need to reset the information that the browser collects during initialization; for example, when someone is using the syslogd browser while an archive operation occurs. In that scenario, a reinitialization is necessary so that the syslogd browser can pick up information about the new archives.

2. This option guides you to the mostly likely destination for a specific set of log messages. Use this option when you do not know where a specific set of log messages is stored.

3. Use this option to clear the indicators on individual lines that remain from a previous use of option 2. The indicator is the character string ==>.
Use this option to perform a search operation across all active syslogd files that are listed on the panel. Archive data sets are not included in the search when you use this option.

Syslogd browser display panel line commands

You can use one of the following line commands for each destination entry that was found in the syslogd configuration:

**B - Browse**
Browses the specified UNIX file.

**A - List archives**
Lists the available archives.

**S - Search active file and archives**
Performs a search operation across the active UNIX files and all available archives.

**SF - Search active file**
Performs a search operation across the active UNIX file only.

**SA - Search archives**
Performs a search operation across all available archives, but not the active UNIX file.

**I - File or DSN info**
Displays detailed information about the file or data set.

Searching syslogd log messages

You can invoke the search function from different locations in the syslogd browser dialog. You can limit a search operation to a single active syslogd UNIX file, a single archive, or a combination of active syslogd UNIX files and associated available archives.

Perform the following steps to search syslogd log messages:

1. Enter your search options and search arguments as shown in the following example:

```
*------------------------- z/OS CS Syslogd Browser ---------------------------*
OPTION ===>
Enter your search options.
Case sensitive ==> NO         (Yes/No) Are string arguments case sensitive?
Maximum hits ==> 5          (1-99999) Max number of hits to display
Result DSN name ==> USER1_SYSLOGD_LIST
Result DSN UNIT ==> SYSALLDA   Unit name for allocating new result DSN
Result DSN disp ==> 1          1:Keep, 2:Delete, 3:Display print menu
Enter your search arguments.  All arguments will be logically ANDed.
From date . . . ==> 2008/10/02 (yyyy/mm/dd) Search from date
- and time . . . ==> 10:50:00 (hh:mm:ss) - and time (24-hour clock)
To date . . . . ==> 2008/10/03 (yyyy/mm/dd) Search to date
- and time . . . ==> 02:00:00 (hh:mm:ss) - and time (24-hour clock)
User ID . . . . ==> z/OS user ID of logging process
Job name . . . . ==> z/OS jobname of logging process
Rem. host name ==> Rem. IP address ==>
Message tag . . ==> Pageant Enter ? for list
Process ID . . . ==> z/OS UNIX process ID
String 1 . . . ==> PAPI
String 2 . . . ==> PAPI
String 3 . . . ==> PAPI
String 4 . . . ==> PAPI
```

Message tags are typically component names. PID availability depends on options set by the logging application. UserID and Jobnames are available for local messages if syslogd is started with the -u option.

UserID, jobname, message tag, and remote host name will always be case insensitive.
Tip: The case sensitive option applies to search strings 1 - 4 only. The User ID, Job name, Message tag, and Rem. host name fields are not case sensitive.

2. Optional: For the message tag, you can enter a message tag value to search for, or enter a question mark (?) and press the ENTER key. In that case, a selection list is displayed in which you select the message tag that is to be part of the search arguments.

Rule: A message must match all the specified search arguments to be considered a hit.

Result: If there are many messages to search, the search might take a few seconds. A popup panel like the following example is displayed while the search is being performed:

```
$-----------------------------------------$
  *------ z/OS CS Syslogd Browser ------*
  !                                         !
  !        *** SEARCHING ***        !
  !                                         !
  !   1 of 4 files/dsn processed so far     !
  !      90000 lines processed so far      !
  !                                         !
  !            Please be patient.           !
  !                                         !
  !   Halt by pressing ATTN and enter HI    !
  !                                         !
$-----------------------------------------$
```

Sample of search results:

When the search has completed, the search results are presented in a standard ISPF view panel.

```
VIEW USER1.SYSLOGD.LIST Command ===> 24 hits found

Appendix A. Using TSO and z/OS UNIX commands in the MVS batch environment

z/OS Communications Server TSO and z/OS UNIX shell commands can be invoked from the MVS batch environment.

**TSO commands**

For TSO commands, specify a program name IKJEFT01 on your MVS batch JCL EXEC statement. For more information on executing IKJEFT01 in the MVS batch environment, see z/OS TSO/E Customization. For example, to invoke the TSO NETSTAT command with the CONN report option, you could use the following JCL statements:

```
//TSOBATCH JOB MSGCLASS=A
//STEP1    EXEC PGM=IKJEFT01
//SYSPRINT DD SYSOUT=*  
//SYSOUT   DD SYSOUT=*  
//SYSTSPRT DD SYSOUT=*  
//SYSTIN   DD DUMMY     
//NETSTAT CONN
```

The output from the command is written to the following DD statements:

- SYSTSPRT - Normal command output
- SYSOUT - Error messages

**z/OS UNIX shell commands**

For z/OS UNIX shell commands, specify a program name of BPXBATCH on your MVS batch JCL EXEC statement. For more information on executing BPXBATCH in the MVS batch environment, see the z/OS UNIX System Services Command Reference. For example, to invoke the z/OS UNIX `netstat` command with the `-c` report option, you could use the following JCL statements:

```
//BPXBATCH JOB
//STEP1    EXEC PGM=BPXBATCH,PARM='SH netstat -c'
//STDOUT DD PATH='/tmp/stdonet',
//         PATHOPTS=(OWRONLY,OCREAT,OTRUNC),PATHMODE=SIRWXU
//STDERR DD PATH='/tmp/stdenet',
//         PATHOPTS=(OWRONLY,OCREAT,OTRUNC),PATHMODE=SIRWXU
```

The `netstat` report output is written to z/OS UNIX file `/tmp/stdonet`.

Appendix B. SNMP capability statement

This topic includes the SNMP agent and subagents capability statement for z/OS Communications Server. The SNMP capability statement defines the MIBs supported by the SNMP Agent, `osnmpd`, and the MIBs supported by the subagents shipped as part of z/OS Communications Server.

This information is in the z/OS UNIX file system directory `/usr/lpp/tcpip/samples`. The file name is `mvstcpip.caps`.

  - Added VARIATIONS for IF-MIB MIB objects due to support for SMC-R RNIC interfaces
  - Replaced ibmTCPIPmvsPortGroup4 with ibmTCPIPmvsPortGroup5"

REVISION "201102140000Z"
DESCRIPTION
"Changes for release z/OS V1R13:
- Updated copyright
- Updated PRODUCT-RELEASE statements for V1R13
- Corrected lines longer than 72 characters
- Updated the VARIATION statement for the ifPhysAddress MIB object"

REVISION "201002080000Z"
DESCRIPTION
"Changes for release z/OS V1R12:
- Updated copyright
- Updated PRODUCT-RELEASE statements for V1R12
- Modified the ibmTcpIpMvsDpiSaCaps AGENT-CAPABILITIES statement:
  - Removed the VARIATION for the ipDefaultRouterPreference MIB object now that the TCP/IP stack supports RFC 4191
  - Added a VARIATION for the inetCidrRouteMetric1 MIB object for indirect routes created by router advertisements.
  - Updated the VARIATIONS for the ifCounterDiscontinuityTime and the ipSystemStatsDiscontinuityTime MIB objects since they are now set to a non-zero value when the interface is defined.
  - Added a VARIATION for the ipAdEntNetMask MIB object for DVIPA IP addresses on target stacks."

REVISION "200809240000Z"
DESCRIPTION
"Changes for release z/OS V1R11:
- Updated copyright
- Updated PRODUCT-RELEASE statements for V1R11
- A value of random(6) is now supported for the ipAddressOrigin object."

REVISION "200803010000Z"
DESCRIPTION
"Changes for release z/OS V1R10:
- Updated copyright
- Updated PRODUCT-RELEASE statements for V1R10
- Modified the ibmTcpIpMvsDpiSaCaps AGENT-CAPABILITIES statement:
  - Replaced ibmTCPIPmvsInterfacesGroup9 with ibmTCPIPmvsInterfacesGroup10"
- Added the `ibmTCPIPvmsIfNotificationGroup`
- Changed the IF-MIB and Ether-like MIB capabilities
- Support for the following MIB modules was upgraded from an IETF internet draft version to the RFC version:
  - IP-MIB
  - IP-FORWARD-MIB
  - TCP-MIB
  - UDP-MIB

REVISION "200606280000Z"

DESCRIPTION

"Changes for release z/OS V1R9:
- Updated copyright
- Updated PRODUCT-RELEASE statements for V1R9
- Modified the `ibmTcpIpMvsDpiSaCaps` AGENT-CAPABILITIES statement:
  - Replaced `ibmTCPIPvmsDVIPAGroup5` with `ibmTCPIPvmsDVIPAGroup6`
  - Replaced `ibmTCPIPvmsRoutingGroup2` with `ibmTCPIPvmsRoutingGroup3`"

REVISION "200506210000Z"

DESCRIPTION

"Changes for release z/OS V1R8:
- Updated copyright
- Updated PRODUCT-RELEASE statements for V1R8
- Modified the `ibmTcpIpMvsDpiSaCaps` AGENT-CAPABILITIES statement:
  - Replaced `ibmTCPIPvmsTcpGroup9` with `ibmTCPIPvmsTcpGroup10`
  - Replaced `ibmTCPIPvmsSystemGroup9` with `ibmTCPIPvmsSystemGroup10`
  - Replaced `ibmTCPIPvmsInterfacesGroup7` with `ibmTCPIPvmsInterfacesGroup8`
  - Replaced `ibmTCPIPvmsDVIPAGroup3` with `ibmTCPIPvmsDVIPAGroup4`
  - Removed the `ibmTcpIpMvsSlapmCaps` statement for the Service Level Agreement subagent, pagsnmp.
To monitor Network Service Level Agreement Performance data, use the SNMP subagent, nslapm2, which supports the data defined in the NETWORK-SLAPM2-MIB module."

REVISION "200501110000Z"

DESCRIPTION

"Changes for release z/OS V1R7:
- Updated copyright
- Updated PRODUCT-RELEASE statements for V1R7
- Modified the `ibmTcpIpMvsDpiSaCaps` AGENT-CAPABILITIES statement:
  - Replaced `ibmTCPIPvmsDVIPAGroup2` with `ibmTCPIPvmsDVIPAGroup3`
  - Replaced `ibmTCPIPvmsTcpGroup7` with `ibmTCPIPvmsTcpGroup8`
  - Replaced `ibmTCPIPvmsSystemGroup8` with `ibmTCPIPvmsSystemGroup9`
  - Replaced `ibmTCPIPvmsInterfacesGroup6` with `ibmTCPIPvmsInterfacesGroup7`
  - Added `ibmTCPIPvmsRoutingGroup2`
  - Updated support for the IP-MIB, the IP-FORWARD-MIB and the TCP-MIB
  - Replaced `ibmTCPIPvmsOsaExpGroup` with `ibmTCPIPvmsOsaExpGroup2` and `ibmTCPIPvmsOsaExpGroupOld`
  - Added VARIATION statements for IF-MIB objects:
    - `ifInBroadcastPkts/ifHCInBroadcastPkts`
    - `ifOutBroadcastPkts/ifHCOutBroadcastPkts`

SNMP capability statement 921
- ifPhysAddress

REVISION "200302270000Z"
DESCRIPTION
"Changes in this revision
- Modified the ibmTcpIpMvsDpiSaCaps AGENT-CAPABILITIES statement:
  - Updated the inetNetToMediaLastUpdated variation.
  - Replaced ibmTCPmvsTcpGroup6 with ibmTCPmvsTcpGroup7 and ibmTCPmvsTcpGroup0ld."

REVISION "200301080000Z"
DESCRIPTION
"Changes in this revision
- Modified the ibmTcpIpMvsDpiSaCaps AGENT-CAPABILITIES statement:
  - Updated the inetNetToMediaLastUpdated variation.
  - Replaced ibmTCPmvsTcpGroup6 with ibmTCPmvsTcpGroup7 and ibmTCPmvsTcpGroup0ld
  - The support for the IP-MIB, IP-FORWARD-MIB, and TCP-MIB is now based on the IP version-neutral IETF internet drafts. These drafts support both IPv4 and IPv6 data."

REVISION "200212180000Z"
DESCRIPTION
"Changes in this revision
- ibmTcpIpMvsAgtCaps capabilities extended to support transportDomainUdpIpv4 and transportDomainUdpIpv6 for tAddress/tDomain pairs as described in RFC 3419"

REVISION "200209130000Z"
DESCRIPTION
"Changes in this revision
- Add new subagent, nslapm2, for NETWORK-SLAPM2-MIB to monitor Network Service Level Agreement Performance.
- Updated PRODUCT-RELEASE for V1R5
- Modified the ibmTcpIpMvsDpiSaCaps AGENT-CAPABILITIES statement:
  - Replaced ibmTCPmvsPortGroup2 with ibmTCPmvsPortGroup3 and ibmTCPmvsPortGroup0ld

REVISION "200203110000Z"
DESCRIPTION
"Modified the ibmTcpIpMvsDpiSaCaps AGENT-CAPABILITIES statement:
  - ipRoutingDiscards not supported

REVISION "200103160000Z"
DESCRIPTION
"Modified the ibmTcpIpMvsDpiSaCaps AGENT-CAPABILITIES statement in regards to the following MIB groups:
- Replaced ibmTCPmvsTcpGroup5 with ibmTCPmvsTcpGroup6
- Added ibmTCPmvsIpGroup
- Added support for ifVHCPacketGroup from RFC 2233
- ifAdminstatus no longer supported for enabling/disabling an OSA ATM physical port.
- Replaced ibmTCPmvsSystemGroup6 with ibmTCPmvsSystemGroup7
- Added ibmTCPmvsSsaExpGroup
- Replaced ibmTCPmvsInterfaceGroup4 with ibmTCPmvsInterfaceGroup5

REVISION "200003010000Z"
DESCRIPTION
"Modified the ibmTcpIpMvsDpiSaCaps AGENT-CAPABILITIES statement in regards to the following MIB groups:
- Replaced ibmTCPmvsSystemGroup5 with ibmTCPmvsSystemGroup6
- Added ibmTCPmvsSystemGroup7
- Replaced ibmTCPmvsSystemGroup6 with ibmTCPmvsSystemGroup7
- Added ibmTCPmvsSystemInterfaceGroup4

REVISION "200002090000Z"
DESCRIPTION
"Changed product name from SecureWay Communications 922 z/OS Communications Server: IP System Administrator's Commands
Server for OS/390 to IBM Communications Server for OS/390

REVISION "200002030000Z"
DESCRIPTION
"Modified the ibmTcpIpMvsDpiSaCaps AGENT-CAPABILITIES
statement in regards to the following MIB objects:
- ipAdEntReasmMaxSize
- ifInNUcastPkts
- ifOutNUcastPkts
- ifISpecific."

REVISION "200001240000Z"
DESCRIPTION
"Modified the ibmTcpIpMvsSlapmCaps AGENT-CAPABILITIES
statement to reflect the implementation of a newer
version of the SLAPM-MIB."

REVISION "9911160000Z"
DESCRIPTION
"Changes in this revision
- Added ibmTCPIPmvsTcpGroup5
- Added ibmTCPIPmvsUdpGroup3
- Added support for EtherLike-MIB in RFC2665"

REVISION "9908310000Z"
DESCRIPTION
"Changes in this revision
- Removed variations that restricted the use of UTF8
  characters for SnmpAdminString objects.
- Added support for snmpNotifyFilterGroup
- Added support for inform type notifications"

REVISION "9908060000Z"
DESCRIPTION
"Modified the ibmTcpIpMvsSlapmCaps AGENT-CAPABILITIES
statement to reflect the implementation of a newer
version of the SLAPM-MIB."

REVISION "9907010000Z"
DESCRIPTION
"Changes in this revision
- Added ibmTCPIPmvsInterfacesGroup4
- Added ibmTCPIPmvsPortGroup2
- Added ibmTCPInPmvsAtmSupportGroup4"

REVISION "9903300000Z"

VARIATION osasfChannelTable
DESCRIPTION "The OSA-Express ATM155 adapter management data has been moved to the
osasfChannelTable as of V1R2. Therefore, the OSA-Express ATM155 values for the
following MIB objects will never be set:
- ibmMvsAtmOsasfChannelType
- ibmMvsAtmOsasfChannelSubType
- ibmMvsAtmOsasfChannelHwModel"

VARIATION osaexpEthPortTable
DESCRIPTION "The table entries are indexed by the
interface index of either, an interface
defined by the DEVICE profile statement,
or a dynamically generated OSA-Express
QDIO port interface."

VARIATION osaexpEthSnaTable
DESCRIPTION "The table entries are indexed by the
interface index of either, an interface
defined by the DEVICE profile statement,
or a dynamically generated OSA-Express
QDIO port interface."

VARIATION ibmMvsDVIPARangeConfMoveable
ACCESS read-only
DESCRIPTION "This object is supported for read-only
access."

VARIATION ibmMvsDVIPARangeConfStatus
SYNTAX INTEGER { active(1) }
ACCESS read-only
DESCRIPTION "This implementation does not support dynamic
row creation of a conceptual row in the
ibmMvsDVIPARangeConfTable via an snmp set
command to this object. The object is
supported for read-only access and the only
value supported is active(1)."

VARIATION ibmMvsDVIPADistConfStatus
SYNTAX INTEGER { active(1) }
ACCESS read-only
DESCRIPTION "This implementation does not support dynamic
row creation of a conceptual row in the
ibmMvsDVIPADistConfTable via an snmp set
command to this object. The object is
supported for read-only access and the only
value supported is active(1)."

VARIATION ibmMvsDVIPADistConfTimedAffinity
ACCESS read-only
DESCRIPTION "This implementation does not support dynamic
row creation of a conceptual row in the
ibmMvsDVIPADistConfTable via an snmp set
command to this object. The object is
supported for read-only access."

VARIATION ibmMvsDVIPADistConfSplxPortsEn
ACCESS read-only
DESCRIPTION "This implementation does not support dynamic
row creation of a conceptual row in the

ibmMvsDVIPADistConfTable via an snmp set command to this object. The object is supported for read-only access.

VARIATION
ibmMvsDVIPADistConfDistMethod
ACCESS      read-only
DESCRIPTION "This implementation does not support dynamic row creation of a conceptual row in the ibmMvsDVIPADistConfTable via an snmp set command to this object. The object is supported for read-only access."

VARIATION
ibmMvsDVIPADistConfIntfName
ACCESS      read-only
DESCRIPTION "This implementation does not support dynamic row creation of a conceptual row in the ibmMvsDVIPADistConfTable via an snmp set command to this object. The object is supported for read-only access."

VARIATION
ibmMvsDVIPARangeConfigMoveable
ACCESS      read-only
DESCRIPTION "This implementation does not support dynamic row creation of a conceptual row in the ibmMvsDVIPARangeConfigTable via an snmp set command to this object. The object is supported for read-only access."

VARIATION
ibmMvsDVIPARangeConfigIntfName
ACCESS      read-only
DESCRIPTION "This implementation does not support dynamic row creation of a conceptual row in the ibmMvsDVIPARangeConfigTable via an snmp set command to this object. The object is supported for read-only access."

VARIATION
ibmMvsDVIPARangeConfigStatus
SYNTAX       INTEGER { active(1) }
ACCESS      read-only
DESCRIPTION "This implementation does not support dynamic row creation of a conceptual row in the ibmMvsDVIPARangeConfigTable via an snmp set command to this object. The object is supported for read-only access and the only value supported is active(1)."

SUPPORTS             IF-MIB   -- RFC 2233
INCLUDES         { ifGeneralInformationGroup,
                    ifStackGroup2,
                    ifPacketGroup,
                    ifHCFixedLengthGroup,
                    ifVHCPacketGroup}
data frame size minus 54 octets for
encapsulation. For ATM LAN Emulation
interfaces not configured for token ring,
this value is the maximum dataframe size.

**VARIATION** ifPhysAddress

**DESCRIPTION** "Only supported for the following interface
types when the interface is active:
- ATM
- HCH
- LCS Ethernet, Token Ring, FDDI
- OSA-Express Ethernet, Token Ring
- RNIC

For OSA-Express Ethernet interfaces, the
value will be one of the following:
- a physical MAC address
- a Virtual MAC address specified by the
  customer
- a Virtual MAC address generated by the
  OSA-Express feature

For HiperSockets IQDX interfaces, the value
will be a HiperSockets-generated Virtual
MAC address

For RNIC interfaces, the value will be
the Virtual MAC address generated by
the VTAM DLC layer.

"**VARIATION** ifAdminStatus

**SYNTAX** INTEGER { up(1), down(2) }

**DESCRIPTION** "Test mode (testing(3)) not supported. The
set operation is not supported for the
following interfaces:
- loopback
- Virtual IP Address (VIPA)
- dynamically created OSA-Express port

This object reflects the desired state of
an interface. If a START command has been
invoked for an interface,
ifAdminStatus will be set to up(1). If an
interface has never been started, or if
a STOP command has been invoked for an
interface, ifAdminStatus will be set to
down(2)."

**VARIATION** ifOperStatus

**SYNTAX** INTEGER { up(1), down(2) }

**DESCRIPTION** "Information limited to up or down. Do not
support testing(3), unknown(4), dormant(5),
notPresent(6), nor lowerLayerDown(7).
For dynamically created OSA-Express port
table entries, the value of this object
will be set to up(1) if any interface
associated with the port is up (active).
The value of this object will be set to
down(2) if all interfaces associated with
the port are down (inactive)."

**VARIATION** ifLastChange

**DESCRIPTION** "Use time that TCP/IP was started instead of
sysUpTime to calculate this value, since
sysUpTime represents time relative to the
agents IPL not TCP/IPs."

**VARIATION** ifInUcastPkts

**DESCRIPTION** "For RNIC interfaces, the value in this
MIB object is the number of Remote Direct
Memory Access (RDMA) work elements processed
for inbound data over the interface.

For ISM interfaces, the value in this
MIB object is the number of Internal Shared
Memory operations processed for inbound data
over the interface.

"**VARIATION** ifInNUcastPkts

**DESCRIPTION** "This implementation does not maintain this
object. The value of the object will
always be zero."

**VARIATION** ifOutUcastPkts

**DESCRIPTION** "For RNIC interfaces, the value in this
MIB object is the number of RDMA over
Converged Ethernet (ROCE) post
operations for transferring data across
this interface."
For ISM interfaces, the value in this MIB object is the number of Internal Shared Memory operations processed for outbound data over this interface.

VARIATION ifOutNUcastPkts
DESCRIPTION "This implementation does not maintain this object. The value of the object will always be zero."
VARIATION ifSpecific
DESCRIPTION "This implementation does not maintain this object. The value of the object will always be 0.0."
VARIATION ifXTable
DESCRIPTION "This implementation creates dynamic entries in the table for OSA-Express QDIO Ethernet ports associated with IPAQENET/IPAQENET6 interfaces defined by the INTERFACE profile statement.

For RNIC and ISM interfaces, the following counter MIB objects are not supported and will always be set to a value of zero:

- ifHCInMulticastPkts
- ifHCInBroadcastPkts
- ifHCOutMulticastPkts
- ifHCOutBroadcastPkts

RNIC interfaces can be identified by the value of rnic(39) set in MIB object ibmMvsIfType for an interface.

ISM interfaces can be identified by the value of ism(40) set in MIB object ibmMvsIfType for an interface.

VARIATION ifHCInUcastPkts
DESCRIPTION "For RNIC interfaces, the value in this MIB object is the number of Remote Direct Memory Access (RDMA) work elements processed for inbound data over the interface.

For ISM interfaces, the value in this MIB object is the number of Internal Shared Memory operations processed for inbound data over the interface.

VARIATION ifInBroadcastPkts
DESCRIPTION "Only supported for the following interface types:
- LCS Ethernet, Token Ring, FDDI
- MPCIPA Ethernet, Token Ring, HiperSockets"

VARIATION ifHCOutUcastPkts
DESCRIPTION "For RNIC interfaces, the value in this MIB object is the number of RDMA over Converged Ethernet (ROCE) post operations for transferring data across this interface.

For ISM interfaces, the value in this MIB object is the number of Internal Shared Memory operations processed for outbound data over this interface.

VARIATION ifOutBroadcastPkts
DESCRIPTION "Only supported for the following interface types:
- LCS Ethernet, Token Ring, FDDI
- MPCIPA Ethernet, Token Ring, HiperSockets"

VARIATION ifHCinBroadcastPkts
DESCRIPTION "Only supported for the following interface types:
- LCS Ethernet, Token Ring, FDDI
- MPCIPA Ethernet, Token Ring, HiperSockets"

VARIATION ifHCOutBroadcastPkts
DESCRIPTION "Only supported for the following interface types:
- LCS Ethernet, Token Ring, FDDI
- MPCIPA Ethernet, Token Ring, HiperSockets"

VARIATION ifLinkUpDownTrapEnable
SYNTAX INTEGER { enabled(1), disabled(2) }
DESCRIPTION "A value of enabled(1), is not supported for
interface table entries which represent a
dynamically generated OSA-Express QDIO
Ethernet port."

VARIATION ifPromiscuousMode
ACCESS read-only
DESCRIPTION "Write access is not required, nor supported."

VARIATION ifCounterDiscontinuityTime
DESCRIPTION "Use time that TCP/IP was started instead of
sysUpTime to calculate this value, since
sysUpTime represents time relative to the
agents IPL not TCP/IPs. This value is
set for the following events:
- when an interface is first defined.
- when an existing interface is deleted from
and then defined again to the stack
- when certain errors occur on an interface.
"

VARIATION ifStackTable
DESCRIPTION "This implementation creates dynamic entries
in the table for OSA-Express QDIO Ethernet
ports associated with IPAQNET/IPAQNET6
interfaces defined by the INTERFACE profile
statement."

VARIATION ifStackStatus
SYNTAX INTEGER { active(1) }
ACCESS read-only
DESCRIPTION "Write access is not required, nor supported.
Only one enumerated values for the RowStatus
textual convention is supported."

VARIATION ifStackLastChange
DESCRIPTION "Not supported"

SUPPORTS IP-MIB -- RFC 4293
INCLUDES 
{ ipgroup, icmpGroup, 
ipSystemStatsGroup, ipAddressGroup, 
ipNetToPhysicalGroup, ipDefaultRouterGroup, 
icmpStatsGroup, 
ipSystemStatsHCOctetGroup, 
ipSystemStatsHCPacketGroup, 
ipv6GeneralGroup2, 
ipv6IfGroup, 
ipAddressPrefixGroup, 
ipLastChangeGroup }

VARIATION ipReasmTimeout
ACCESS read-write
DESCRIPTION "This implementation of the TCP/IP
protocols allows this configuration
parameter to be changed."

VARIATION ipNetToMediaIfIndex
ACCESS read-only
DESCRIPTION "Write access not supported."

VARIATION ipNetToMediaPhysAddress
ACCESS read-only
DESCRIPTION "Write access not supported."

VARIATION ipNetToMediaNetAddress
ACCESS read-only
DESCRIPTION "Write access not supported."

VARIATION ipNetToMediaType
ACCESS read-only
DESCRIPTION "Write access not supported."

VARIATION ipAddrTable
DESCRIPTION "Not all existing instances can be supported
because the index is an IP address and
the TCP/IP stack allows the same IP
address to be defined for multiple
interfaces."

VARIATION ipAdEntNetMask
DESCRIPTION "For dynamic VIPA (DVIPA) IP addresses on
target stacks of the Sysplex Distributor
function, a value of 0 will be set for this
object to indicate that the IP address is
not owned or advertised by the target stack."

SNMP capability statement 929
VARIATION        ipAdEntReasmMaxSize
DESCRIPTION  "Since this implementation does not support
unique reassembly size values per interface,
the value for this object for all interfaces
will be the constant 65535."
VARIATION        ipRoutingDiscards
DESCRIPTION  "This implementation does not maintain this
object. The value of the object will
always be 0."
VARIATION        icmpOutRedirects
DESCRIPTION  "This implementation does not send ICMP
Redirect messages but, since it includes
in this object any Redirect messages sent
by an application, this object may not be 0."
VARIATION        ipv6IpForwarding
DESCRIPTION  "If an snmp set request is processed for this
object, the value from the set request is
not written to non-volatile storage. So
the new value is only in effect until the
next set request for the object, until a
VARY TCPIP,,OBEYFILE commend is processed
that changes the value, or until the TCP/IP
stack is recycled."
VARIATION        ipv6IpDefaultHopLimit
DESCRIPTION  "Value of 0 not supported. Supports values
of 1-255.
If an snmp set request is processed for this
object, the value from the set request is
not written to non-volatile storage. So
the new value is only in effect until the
next set request for the object, until a
VARY TCPIP,,OBEYFILE commend is processed
that changes the value, or until the TCP/IP
stack is recycled."
VARIATION        ipv6InterfaceTableLastChange
DESCRIPTION  "Uses time that TCP/IP was started instead of
sysUpTime to calculate this value, since
sysUpTime represents time relative to the
agents IPL not TCP/IPs."
VARIATION        ipv6InterfaceReasmMaxSize
DESCRIPTION  "The value of this MIB object will always
be 65535."
VARIATION        ipv6InterfaceEnableStatus
ACCESS        read-only
DESCRIPTION  "The value of this MIB object will always
be up(1). Write access is not supported."
VARIATION        ipv6InterfaceForwarding
ACCESS        read-only
DESCRIPTION  "The value of this MIB object will always
be forwarding(1) since this implementation
does not provide per-interface control of
the forwarding function. Write access
is not supported."
VARIATION        ipSystemStatsDiscontinuityTime
DESCRIPTION  "Uses time that TCP/IP was started instead of
sysUpTime to calculate this value, since
sysUpTime represents time relative to the
agents IPL not TCP/IPs. This value is
set for the following events:
- when an interface is first defined.
- when an existing interface is deleted
  from and then defined again to the stack
- when certain errors occur on an interface.
"
VARIATION        ipSystemStatsRefreshRate
DESCRIPTION  "This object will be set to the TCP/IP
Subagent's current cache time since a
management application will not see a
change in the counter values until the
cache time expires."
VARIATION        ipAddressPrefixTable
DESCRIPTION  "This implementation does not support
IPv6 entries in this table for prefixes
from Router Advertisements where the
on-link flag was 'off' and either the
autonomous flag was 'off' or
autoconfiguration of IP addresses was not
being performed for the interface."
VARIATION        ipAddressPrefixOnLinkFlag
DESCRIPTION  "This implementation does not support
entries in this table for which this

object would have a value of false(2).
The value of this object will be true(1) for all entries.

VARIATION ipAddressSpinLock
ACCESS read-only
DESCRIPTION "The value of this MIB object will always be 0. Write access is not supported."

VARIATION ipAddressOrigin
SYNTAX INTEGER {

Appendix C. Management Information Base (MIB) objects

This topic lists the objects defined by the Management Information Base (MIB), which are supported by the SNMP agent and subagents on the z/OS Communications Server, and the maximum access allowed.

**Note:** If an SNMP SET (write) is attempted against a variable for which the maximum access is read-only, an error code is returned. For an SNMPv2 request, the error code is noAccess or notWritable.

The object types are defined using the following fields:

**Object Descriptor**
A textual name for the object type, along with its corresponding OBJECT IDENTIFIER.

**Object Identifier**
The name for the object type, using ASN.1 notation.

**Supported by**
Support by the agent or subagents. If support is by one of the subagents, the subagent is named. Supported subagents include:

- TCP/IP
- OMPRoute
- Network SLAPM2
- TN3270

**Defined by**
The location of the description of the object.

The SNMP agent provides support of the following Enterprise-specific MIBs:

- Subagent MIB
- Extensions to the DPI20 MIB defined by RFC 1592

The TCP/IP subagent provides support of the following Enterprise-specific MIBs:

- IBM 3172 MIB
- IBM TCP/IP MVS Enterprise-specific MIB (which includes Remote Ping)

The TN3270 subagent provides support of the TN3270 Enterprise-specific MIB.

Copies of the SMI syntax for the previously mentioned MIBs are installed in the z/OS UNIX file system directory /usr/lpp/tcpip/samples as:

- mvstcpip.mi2 (SMIv2)
- saMIB.mi2 (SMIv2)
- saMIB.mib (SMIv1)
- slapm2.mi2 (SMIv2)
- rfc1592b.mi2 (SMIv2)
- rfc1592b.mib (SMIv1)
- ibm3172.mi2 (SMIv2)
- ibm3172.mib (SMIv1)
- mvstn3270.mi2 (SMIv2)

**Access Allowed**
- Read-only (R/O)

Appendix E. SNMP trap types

This topic lists the generic and Enterprise-specific trap types that can be received by SNMP.

SNMP Generic trap types

Table 22 on page 1109 lists the generic trap types that can be received by SNMP.

Table 22. Generic trap types

<table>
<thead>
<tr>
<th>Value</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>coldStart</td>
<td>A coldStart trap signifies that the sending protocol entity is reinitializing itself so that the agent’s configuration or the protocol entity implementation can be altered.</td>
</tr>
<tr>
<td>1</td>
<td>warmStart</td>
<td>A warmStart trap signifies that the sending protocol entity is reinitializing itself so that neither the agent configuration nor the protocol entity implementation can be altered.</td>
</tr>
<tr>
<td>2</td>
<td>linkDown</td>
<td>A linkDown trap signifies that the sending protocol entity recognizes a failure in one of the communication links represented in the agent’s configuration. A Trap-PDU of type linkDown contains, as the first element of its variable-bindings, the name and value of the ifIndex instance for the affected interface.</td>
</tr>
<tr>
<td>3</td>
<td>linkUp</td>
<td>A linkUp trap signifies that the sending protocol entity recognizes that one of the communication links represented in the agent’s configuration has come up. A Trap-PDU of type linkUp contains, as the first element of its variable-bindings, the name and value of the ifIndex instance for the affected interface.</td>
</tr>
<tr>
<td>4</td>
<td>authenticationFailure</td>
<td>An authenticationFailure trap signifies that the sending protocol entity is the addressee of a protocol message that is not properly authenticated.</td>
</tr>
<tr>
<td>5</td>
<td>egpNeighborLoss</td>
<td>An egpNeighborLoss trap signifies that an EGP neighbor for whom the sending protocol entity was an EGP peer has been marked down and the peer relationship no longer exists. The Trap-PDU of the egpNeighborLoss contains, as the first element of its variable-bindings, the name and value of the egpNeighAddr instance for the affected neighbor.</td>
</tr>
<tr>
<td>6</td>
<td>enterpriseSpecific</td>
<td>An enterpriseSpecific trap signifies that the sending protocol entity recognizes that some Enterprise-specific event has occurred. The specific-trap field identifies the particular trap that occurred.</td>
</tr>
</tbody>
</table>
SNMP Enterprise-specific trap types

Table 23 on page 1110 lists the Enterprise-specific trap types generated by subagents shipped with z/OS Communications Server. All Enterprise-specific traps are generated with the trap value 6.

### Table 23. MVS Enterprise trap types

<table>
<thead>
<tr>
<th>Value</th>
<th>Subagent</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>TCP/IP</td>
<td>ibmMvsAtmOsasfAtmPvcCreate</td>
<td>This trap is generated when OSA/SF sends an asyn notification to the TCP/IP DPI Subagent that a PVC was created for a given OSA-2 ATM. This notification contains the corresponding ibmMvsAtmOsasfPortName instance. Representation of this contains the port's (aal5 layer interface) 'ifIndex.pvcNameOctetCount. pvcNameInASCIInvt'.</td>
</tr>
<tr>
<td>2</td>
<td>TCP/IP</td>
<td>ibmMvsAtmOsasfAtmPvcDelete</td>
<td>This trap is generated when OSA/SF sends an asyn notification to the TCP/IP DPI Subagent that a PVC was deleted for a given OSA-2 ATM. This notification contains the corresponding ibmMvsAtmOsasfPortName instance. Representation of this contains the port's (aal5 layer interface) 'ifIndex.pvcNameOctetCount. pvcNameInASCIInvt'.</td>
</tr>
<tr>
<td>3</td>
<td>TCP/IP</td>
<td>ibmMvsDVIPAStatusChange</td>
<td>This trap is generated when a dynamic VIPA interface is either defined to a TCP/IP stack or its status changes. This notification contains the status, the origin value, the rank value, the moveable attribute, and the service manager indicator. The origin value indicates why the dynamic VIPA interface was originally defined.</td>
</tr>
<tr>
<td>4</td>
<td>TCP/IP</td>
<td>ibmMvsDVIPARemoved</td>
<td>This trap is generated when a dynamic VIPA interface is removed from a TCP/IP stack. This notification contains the status, the origin value, the rank value, the moveable attribute, and the service manager indicator prior to removal. The origin value indicates why the dynamic VIPA interface was previously activated.</td>
</tr>
<tr>
<td>5</td>
<td>TCP/IP</td>
<td>ibmMvsDVIPATargetAdded</td>
<td>This trap is generated by a sysplex distributor stack when it determines a designated target stack is active. Stacks are designated as target stacks on the VIPADISTRIBUTE profile statement. This notification contains the ibmMvsDVIPADistConfStatus object whose instance indicates the dynamic VIPA IP address, distributed port, and target stack dynamic XCF IP address.</td>
</tr>
<tr>
<td>Value</td>
<td>Subagent</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>----------</td>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>6</td>
<td>TCP/IP</td>
<td>ibmMvsDVIPATargetRemoved</td>
<td>This trap is by a sysplex distributor stack when an active target stack is removed from distribution. This can occur when a VIPADISTRIBUTE DELETE profile statement is processed, or the target stack ends. This notification contains the ibmMvsDVIPADistConfStatus object whose instance indicates the dynamic VIPA IP address, distributed port, and target stack dynamic XCF IP address.</td>
</tr>
<tr>
<td>7</td>
<td>TCP/IP</td>
<td>ibmMvsDVIPATargetServerStarted</td>
<td>This trap is generated by a sysplex distributor stack when it receives notification from a target stack that a server has become active on a distributed port. This notification contains the count of servers ready at the port and the instance indicates the dynamic VIPA IP address, the distributed port, and the target stack dynamic XCF IP address.</td>
</tr>
<tr>
<td>8</td>
<td>TCP/IP</td>
<td>ibmMvsDVIPATargetServerEnded</td>
<td>This trap is generated by a sysplex distributor stack when it receives notification from a target stack that a server has ended on a distributed port. This notification contains the count of servers ready at the port and the instance indicates the dynamic VIPA IP address, the distributed port, and the target stack dynamic XCF IP address.</td>
</tr>
<tr>
<td>9</td>
<td>TCP/IP</td>
<td>ibmMvsTcpipSubagentColdStart</td>
<td>This trap is generated by the TCP/IP Subagent. It signifies that the Subagent, acting in a subagent role, has reinitialized itself and that its configuration might have been altered.</td>
</tr>
<tr>
<td>10</td>
<td>TCP/IP</td>
<td>ibmMvsTcpipIntfDown</td>
<td>This trap is generated when a network interface transitions to the down state, meaning that it is now inactive. This trap is similar to the standard linkDown trap but provides the ifName value of the interface, along with the interface index and status values.</td>
</tr>
<tr>
<td>11</td>
<td>TCP/IP</td>
<td>ibmMvsTcpipIntfUp</td>
<td>This trap is generated when a network interface transitions to the up state, meaning that it is now active. This trap is similar to the standard linkUp trap but provides the ifName value of the interface, along with the interface index and status values.</td>
</tr>
<tr>
<td>Value</td>
<td>Subagent</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>------------</td>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| 1     | Network    | slapm2PolicyRuleMonNotOkay  | This notification is generated when one or more of the following three monitored quantities goes above its high threshold, indicating that its value has become unacceptable:  
  - slapm2PRMonTcpRttCurrentDelay  
  - slapm2PRMonCurrentTcpReXmit  
  - slapm2PRMonAcceptQCurrentDelay  
  The first slapm2PRMonStatus value supplies the current monitor statuses for these three quantities, and the second value supplies the previous values. For a rising quantity, the bit in the previous status is set to off, indicating that the quantity is below the high threshold, and the bit in the current status is set to on, indicating that the quantity is above the high threshold. By examining these two values, it is possible to determine which monitored quantity (or quantities) caused the notification to be issued.  
  slapm2PRMonTrapEnable for the conceptual row must be set to enabled for this notification to be generated. Also, see the definitions of the high threshold objects for a description of the hysteresis behavior for this notification, which reduces the number of notifications that are generated when reporting is enabled. |
<table>
<thead>
<tr>
<th>Value</th>
<th>Subagent</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| 2     | Network  | slapm2PolicyRuleMonOkay       | This notification is generated when one or more of the following three monitored quantities goes below its low threshold, indicating that its value returned to an acceptable level:  
• slapm2PRMonTcpRttCurrentDelay  
• slapm2PRMonCurrentTcpReXmit  
• slapm2PRMonAcceptQCurrentDelay  
The first slapm2PRMonStatus value supplies the current monitor statuses for these three quantities, and the second value supplies their previous values. For a falling quantity, the bit in the previous status is set to on, indicating that the quantity is above the low threshold, and the bit in the current status is set to off, indicating that the quantity is below the low threshold. By examining these two values, it is possible to determine which monitored quantity (or quantities) caused the notification to be issued.  
slapm2PRMonTrapEnable for the conceptual row must be set to enabled for this notification to be generated. Also, see the definitions of the low threshold objects for a description of the hysteresis behavior for this notification, which reduces the number of notifications that are generated when reporting is enabled. |
| 3     | Network  | slapm2PolicyRuleDeleted       | A slapm2PolicyRuleDeleted notification is sent when a slapm2PolicyRuleStatsEntry is deleted if the value of slapm2PolicyTrapDeletedEnable is enabled(1). |
| 4     | Network  | slapm2PolicyRuleMonDeleted    | A slapm2PolicyRuleMonDeleted notification is sent when a slapm2PRMonEntry is deleted if the value of slapm2PolicyDeletedTrapEnable is enabled(1). |
Appendix F. ICMP/ICMPv6 types and codes

For information about the Internet Control Message Protocol (ICMP) types and codes, see http://www.iana.org/assignments/ icmp-parameters.

For information about the Internet Control Message Protocol for IPv6 (ICMPv6) types and codes, see http://www.iana.org/ assignments/icmpv6-parameters.
Appendix G. Related protocol specifications

This appendix lists the related protocol specifications (RFCs) for TCP/IP. The Internet Protocol suite is still evolving through requests for comments (RFC). New protocols are being designed and implemented by researchers and are brought to the attention of the Internet community in the form of RFCs. Some of these protocols are so useful that they become recommended protocols. That is, all future implementations for TCP/IP are recommended to implement these particular functions or protocols. These become the de facto standards, on which the TCP/IP protocol suite is built.

Draft RFCs that have been implemented in this and previous Communications Server releases are listed at the end of this topic.

Many features of TCP/IP Services are based on the following RFCs:

<table>

Internet drafts

Internet drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Other groups can also distribute working documents as Internet drafts. You can see Internet drafts at http://www.ietf.org/ID.html.
Appendix H. Accessibility

Publications for this product are offered in Adobe Portable Document Format (PDF) and should be compliant with accessibility standards. If you experience difficulties when using PDF files, you can view the information through the z/OS Internet Library website http://www.ibm.com/systems/z/os/zos/library/bkiserv/ or IBM Knowledge Center http://www.ibm.com/support/knowledgecenter/. If you continue to experience problems, send a message to Contact z/OS web page (www.ibm.com/systems/z/os/zos/webqs.html) or write to:

IBM Corporation
Attention: MHVRCFS Reader Comments
Department H6MA, Building 707
2455 South Road
Poughkeepsie, NY 12601-5400
USA

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully. The major accessibility features in z/OS enable users to:

- Use assistive technologies such as screen readers and screen magnifier software
- Operate specific or equivalent features using only the keyboard
- Customize display attributes such as color, contrast, and font size

Using assistive technologies

Assistive technology products, such as screen readers, function with the user interfaces found in z/OS. Consult the assistive technology documentation for specific information when using such products to access z/OS interfaces.

Keyboard navigation of the user interface

Users can access z/OS user interfaces using TSO/E or ISPF. See z/OS TSO/E Primer, z/OS TSO/E User’s Guide, and z/OS ISPF User’s Guide Vol I for information about accessing TSO/E and ISPF interfaces. These guides describe how to use TSO/E and ISPF, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

z/OS information

One exception is command syntax that is published in railroad track format, which is accessible using screen readers with IBM Knowledge Center, as described in “Dotted decimal syntax diagrams” on page 1137.

Dotted decimal syntax diagrams

Syntax diagrams are provided in dotted decimal format for users accessing IBM Knowledge Center using a screen reader. In dotted decimal format, each syntax element is written on a separate line. If two or more syntax elements are always present together (or always absent together), they can appear on the same line, because they can be considered as a single compound syntax element.
Each line starts with a dotted decimal number; for example, 3 or 3.1 or 3.1.1. To hear these numbers correctly, make sure that your screen reader is set to read out punctuation. All the syntax elements that have the same dotted decimal number (for example, all the syntax elements that have the number 3.1) are mutually exclusive alternatives. If you hear the lines 3.1 USERID and 3.1 SYSTEMID, you know that your syntax can include either USERID or SYSTEMID, but not both.

The dotted decimal numbering level denotes the level of nesting. For example, if a syntax element with dotted decimal number 3 is followed by a series of syntax elements with dotted decimal number 3.1, all the syntax elements numbered 3.1 are subordinate to the syntax element numbered 3.

Certain words and symbols are used next to the dotted decimal numbers to add information about the syntax elements. Occasionally, these words and symbols might occur at the beginning of the element itself. For ease of identification, if the word or symbol is a part of the syntax element, it is preceded by the backslash (\) character. The * symbol can be used next to a dotted decimal number to indicate that the syntax element repeats. For example, syntax element *FILE with dotted decimal number 3 is given the format 3 \* FILE. Format 3* FILE indicates that syntax element FILE repeats. Format 3 \* FILE indicates that syntax element * FILE repeats.

Characters such as commas, which are used to separate a string of syntax elements, are shown in the syntax just before the items they separate. These characters can appear on the same line as each item, or on a separate line with the same dotted decimal number as the relevant items. The line can also show another symbol giving information about the syntax elements. For example, the lines 5.1*, 5.1 LASTRUN, and 5.1 DELETE mean that if you use more than one of the LASTRUN and DELETE syntax elements, the elements must be separated by a comma. If no separator is given, assume that you use a blank to separate each syntax element.

If a syntax element is preceded by the % symbol, this indicates a reference that is defined elsewhere. The string following the % symbol is the name of a syntax fragment rather than a literal. For example, the line 2.1 %OP1 means that you should see separate syntax fragment OP1.

The following words and symbols are used next to the dotted decimal numbers:

- A question mark (?) means an optional syntax element. A dotted decimal number followed by the ? symbol indicates that all the syntax elements with a corresponding dotted decimal number, and any subordinate syntax elements, are optional. If there is only one syntax element with a dotted decimal number, the ? symbol is displayed on the same line as the syntax element, (for example 5? NOTIFY). If there is more than one syntax element with a dotted decimal number, the ? symbol is displayed on a line by itself, followed by the syntax elements that are optional. For example, if you hear the lines 5 ?, 5 NOTIFY, and 5 UPDATE, you know that syntax elements NOTIFY and UPDATE are optional; that is, you can choose one or none of them. The ? symbol is equivalent to a bypass line in a railroad diagram.

- An exclamation mark (!) means a default syntax element. A dotted decimal number followed by the ! symbol and a syntax element indicate that the syntax element is the default option for all syntax elements that share the same dotted decimal number. Only one of the syntax elements that share the same dotted decimal number can specify a ! symbol. For example, if you hear the lines 2? FILE, 2.1! (KEEP), and 2.1 (DELETE), you know that (KEEP) is the default option for the FILE keyword. In this example, if you include the FILE keyword but do not specify an option, default option KEEP will be applied. A default option also applies to the next higher dotted decimal number. In this example, if the FILE keyword is omitted, default FILE(KEEP) is used. However, if you hear the lines 2? FILE, 2.1, 2.1.1! (KEEP), and 2.1.1 (DELETE), the default option KEEP applies only to the next higher dotted decimal number, 2.1 (which does not have an associated keyword), and does not apply to 2? FILE. Nothing is used if the keyword FILE is omitted.

- An asterisk (*) means a syntax element that can be repeated 0 or more times. A dotted decimal number followed by the * symbol indicates that this syntax element can be used zero or more times; that is, it is optional and can be repeated. For example, if you hear the line 5.1* data area, you know that you can include one data area, more than one data area, or no data area. If you hear the lines 3*, 3 HOST, and 3 STATE, you know that you can include HOST, STATE, both together, or nothing.

Notes:

1. If a dotted decimal number has an asterisk (*) next to it and there is only one item with that dotted decimal number, you can repeat that same item more than once.
2. If a dotted decimal number has an asterisk next to it and several items have that dotted decimal number, you can use more than one item from the list, but you cannot use the items more than once each. In the previous example, you could write HOST STATE, but you could not write HOST HOST.

3. The * symbol is equivalent to a loop-back line in a railroad syntax diagram.

- + means a syntax element that must be included one or more times. A dotted decimal number followed by the + symbol indicates that this syntax element must be included one or more times; that is, it must be included at least once and can be repeated. For example, if you hear the line 6.1+ data area, you must include at least one data area. If you hear the lines 2+, 2 HOST, and 2 STATE, you know that you must include HOST, STATE, or both. Similar to the * symbol, the + symbol can only repeat a particular item if it is the only item with that dotted decimal number. The + symbol, like the * symbol, is equivalent to a loop-back line in a railroad syntax diagram.
Notices

This information was developed for products and services that are offered in the USA or elsewhere.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user’s responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Online Privacy Statement

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies
or other technologies to collect product usage information, to help improve the end user experience, to
tailor interactions with the end user, or for other purposes. In many cases no personally identifiable
information is collected by the Software Offerings. Some of our Software Offerings can help enable you to
collect personally identifiable information. If this Software Offering uses cookies to collect personally
identifiable information, specific information about this offering's use of cookies is set forth below.

Depending upon the configurations deployed, this Software Offering may use session cookies that collect
each user’s name, email address, phone number, or other personally identifiable information for purposes
of enhanced user usability and single sign-on configuration. These cookies can be disabled, but disabling
them will also eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect
personally identifiable information from end users via cookies and other technologies, you should seek
your own legal advice about any laws applicable to such data collection, including any requirements for
notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see
IBM’s Privacy Policy at ibm.com/privacy and IBM’s Online Privacy Statement at ibm.com/privacy/details
in the section entitled “Cookies, Web Beacons and Other Technologies,” and the “IBM Software Products
and Software-as-a-Service Privacy Statement” at ibm.com/software/info/product-privacy.

Policy for unsupported hardware

Various z/OS elements, such as DFSMS, JES2, JES3, and MVS, contain code that supports specific
hardware servers or devices. In some cases, this device-related element support remains in the product
even after the hardware devices pass their announced End of Service date. z/OS may continue to service
element code; however, it will not provide service related to unsupported hardware devices. Software
problems related to these devices will not be accepted for service, and current service activity will cease if
a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be
issued.

Minimum supported hardware

The minimum supported hardware for z/OS releases identified in z/OS announcements can subsequently
change when service for particular servers or devices is withdrawn. Likewise, the levels of other software
products supported on a particular release of z/OS are subject to the service support lifecycle of those
products. Therefore, z/OS and its product publications (for example, panels, samples, messages, and
product documentation) can include references to hardware and software that is no longer supported.

• For information about software support lifecycle, see: IBM Lifecycle Support for z/OS (www.ibm.com/
  software/support/systemsz/lifecycle)
• For information about currently-supported IBM hardware, contact your IBM representative.
Policy for unsupported hardware

Various z/OS elements, such as DFSMS, HCD, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

Trademarks

IBM, the IBM logo, and ibm.com are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at Copyright and trademark information at www.ibm.com/legal/copytrade.shtml.
This bibliography contains descriptions of the documents in the z/OS Communications Server library. z/OS Communications Server documentation is available online at the z/OS Internet Library web page at http://www.ibm.com/systems/z/os/zos/library/bkserv/.

**z/OS Communications Server library updates**

Updates to documents are also available on RETAIN and in information APARs (info APARs). Go to http://www.software.ibm.com/support to view information APARs.

Communicating your comments to IBM

If you especially like or dislike anything about this document, you can send us comments electronically by using one of the following methods:

**Internet email:**
comsvrcf@us.ibm.com

**World Wide Web:**

If you would like a reply, be sure to include your name, address, and telephone number. Make sure to include the following information in your comment or note:

- Title and order number of this document
- Page number or topic related to your comment

Feel free to comment on specific errors or omissions, accuracy, organization, subject matter, or completeness of this document. However, the comments you send should pertain to only the information in this manual and the way in which the information is presented. To request additional publications, or to ask questions or make comments about the functions of IBM products or systems, you should talk to your IBM representative or to your IBM authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you.
